   Remove the four flexplate-to-converter nuts by placing a 22mm socket and breaker bar on the crankshaft pulley bolt. Rotate the pulley clockwise (as viewed from the front) to gain access to each of the nuts. Remove and discard nuts.

7. Scribe a mark indexing the driveshaft to the rear axle flange. Remove the shaft (refer to Section 05-00) and install a spare slip-yoke or Extension Housing Seal Plug in the extension housing.

8. Remove the speed control speedometer cable and/or VSS (if equipped) from the extension housing and plug the hole.

9. Disconnect the transmission shift cable at the transmission manual control lever. Remove the transmission shift bellcrank from the ball and stud lever. Depress the tab on the cable and remove the cable from the bracket.

10. Disconnect the digital transmission range (DTR) sensor, overdrive drum speed (ODS) sensor, output shaft speed (OSS) sensor, and the 16-pin transmission connectors.

11. Remove the two rear engine mount-to-crossmember nuts.

tomsn048@gmail.com

12. **CAUTION: Do not allow the transmission to hang freely.**

    Place Transmission Jack 014-00210 under the transmission and raise the transmission slightly.

13. On Ranger and Aerostar vehicles, remove the two crossmember-to-frame sidemember support nuts and bolts. Remove the crossmember.

14. Remove the two rear engine mount-to-extension housing bolts. Remove the rear engine mount. Refer to Section 02-03 .

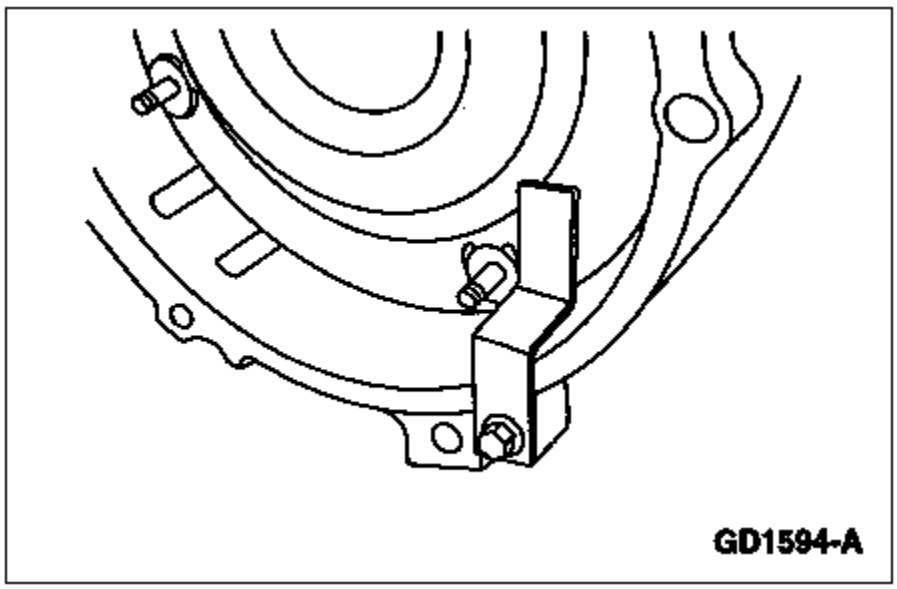
15. On 4.0L vehicles, remove the two catalytic converter-to-exhaust nuts and bolts.

16. On 4.0L vehicles, remove the three catalytic converter-to-crossover pipe nuts using a 15mm socket. Remove the catalytic converter assembly.

17. **CAUTION: Do not allow the transmission to hang freely.**

    Lower the jack under the transmission slightly.

18. Install Torque Converter Holding Tool T97T-7902-A with standard bolt into case.



19. Remove the two upper converter housing-to-engine screws.

20. Remove the fluid filler tube from the lube fluid inlet short tube.

21. Remove the two lower converter housing-to-engine screws.

22. **CAUTION: Care should be taken not to damage the cooler lines.**

    Disconnect the fluid cooler lines at the transmission. Plug all openings to keep out contamination. Refer to Section 07-02 .

tomsn048@gmail.com

23. Remove the four side converter housing-to-engine screws.

24. Route all wire harnesses and hardware out of the way.

25. **WARNING: SECURE THE TRANSMISSION TO THE TRANSMISSION JACK WITH A SAFETY CHAIN.**

    Remove the transmission.

---

tomsn048@gmail.com

Transmission — 4x4

CAUTION: Disconnect the battery ground cable.

NOTE: If the transmission is to be removed for a period of time, support the engine with a safety stand and a wood block.

1. Remove the transmission fluid level indicator.
2. Raise the vehicle on a hoist.
3. Drain the transmission. Refer to the procedure in this section.
4. **NOTE: On 4.0L engines, the converter-to-flexplate attaching nuts are accessed through the starter motor mounting hole.**

   Remove the starter-to-converter housing screws and position the starter motor out of the way.
5. Mark and index the converter stud to flexplate.
6. **NOTE: Flexplate-to-converter attaching nuts are not reusable.**

   Remove the four flexplate-to-converter attaching nuts by placing a 22mm socket and breaker bar on the crankshaft pulley attaching bolt. Rotate the pulley clockwise (as viewed from the front) to gain access to each of the nuts. Remove and discard nuts.
7. Scribe a mark on both the transfer case flange and the rear axle flange. Remove the rear drive shaft. Refer to Section 05-00 .
8. **CAUTION: The vehicle speed sensor (VSS) may be broken if not removed prior to transfer case removal.**

   Remove the VSS from the transfer case.
9. Disconnect the transmission shift cable at the transmission manual control lever. Remove the transmission shift bellcrank from the ball stud lever. Depress the tab on the cable and remove the cable from the bracket.
10. Disconnect the digital transmission range (DTR) sensor, overdrive drum speed (ODS) sensor, output shaft speed (OSS) sensor, and the 16-pin transmission connectors.
11. Remove the four transfer case skid plate screws and remove the transfer case skid plate.
12. Remove the four screws attaching the front axle driveshaft to the transfer case flange.
13. **CAUTION: Wire-tie the front axle driveshaft out of the way of the frame.**

tomsn048@gmail.com

Remove the front axle driveshaft from the transfer case flange.

14. Disconnect the transfer case electrical connectors.

15. Remove the two rear engine mount-to-crossmember nuts.

16. **CAUTION: Do not allow the transmission to hang freely.**

    Place Transmission Jack 014-00210 under the transmission and raise the transmission slightly.

17. On Ranger and Aerostar vehicles, remove the two crossmember-to-frame through bolts and nuts. Remove the crossmember.

18. Remove the two rear engine mount-to-extension housing screws. Remove the rear engine mount. Refer to Section 02-03 .

19. On 4.0L vehicles, remove the two catalytic converter-to-exhaust nuts and bolts.

20. On 4.0L vehicles, remove the three catalytic converter-to-crossover pipe nuts. Remove the catalytic converter assembly.

21. Support the transfer case.

22. Remove the five transfer case-to-extension housing screws.

23. Remove the transfer case vent bracket screws and remove the transfer case vent bracket.

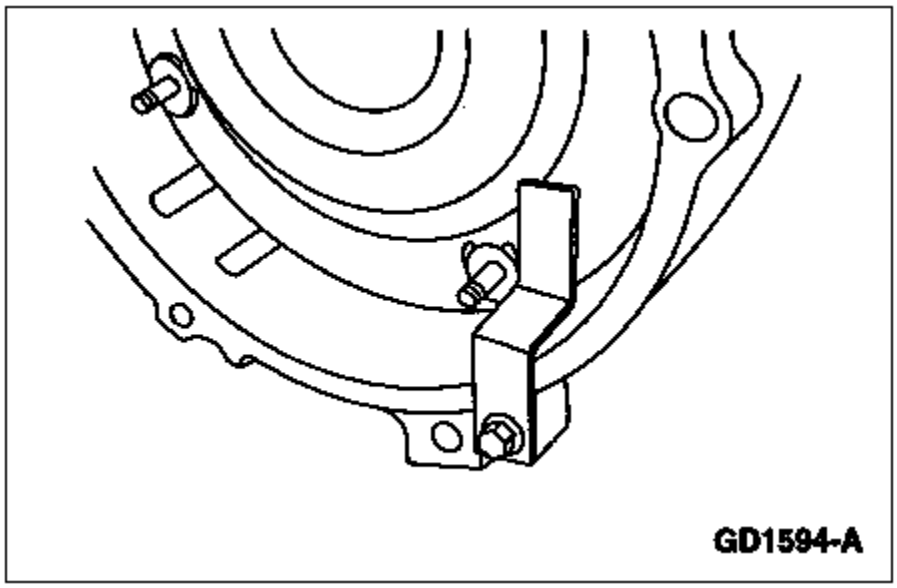
24. Carefully remove the transfer case and discard the transfer case-to-extension housing gasket.

25. **CAUTION: Do not allow the transmission to hang freely.**

    Lower the jack under the transmission slightly.

26. Install Torque Converter Holding Tool T97T-7902-A with standard bolt into case.

tomsn048@gmail.com



27. Remove the two upper converter housing-to-engine attaching screws.

28. Remove the fluid filler tube from the lube fluid inlet short tube.

29. Remove the two lower converter housing-to-engine attaching screws.

30. **CAUTION: Care should be taken not to damage the fluid cooler lines.**

    Disconnect the fluid cooler lines at the transmission. Plug all openings to keep out contamination. Refer to Section 07-02 .

31. Remove the four side converter housing-to-engine attaching screws.

32. Route all wire harnesses and hardware out of the way.

33. **WARNING: SECURE THE TRANSMISSION TO THE TRANSMISSION JACK WITH A SAFETY CHAIN.**

    Remove the transmission.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Torque Converter Handles	T81P-7902-C
Impact Slide Hammer	T50T-100-A
Extension Housing Bushing Remover	T77L-7697-E
A4LD Holding Fixture Adapter	T93T-77002-AH
Bench-Mounted Holding Fixture	T57L-500-B
Servo Cover Compressor	T95L-77028-A
4R44E/4R55E Transmission Test Plate	T95L-77000-AH
Servo Removal Tool	T97T-7D021-A

SPECIAL SERVICE TOOLS DESIRED

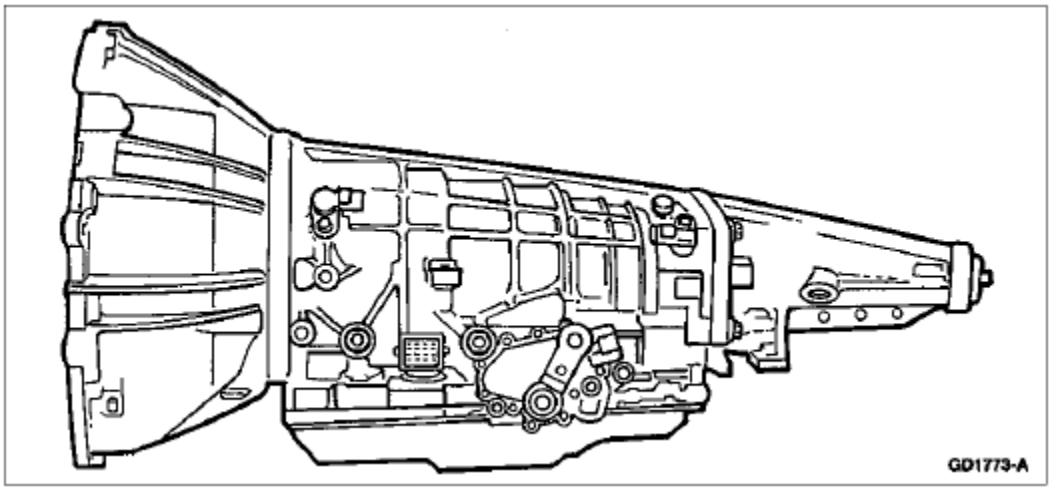
Tool Number	Description
T94P-77001-BH	Seal Remover

Disassembly

1. **WARNING: DO NOT REMOVE THE TORQUE CONVERTER OR TRANSFER CASE FROM THE TRANSMISSION WHILE STILL ON THE JACK. DOING SO COULD CAUSE THE TRANSMISSION TO FALL OFF THE JACK.**

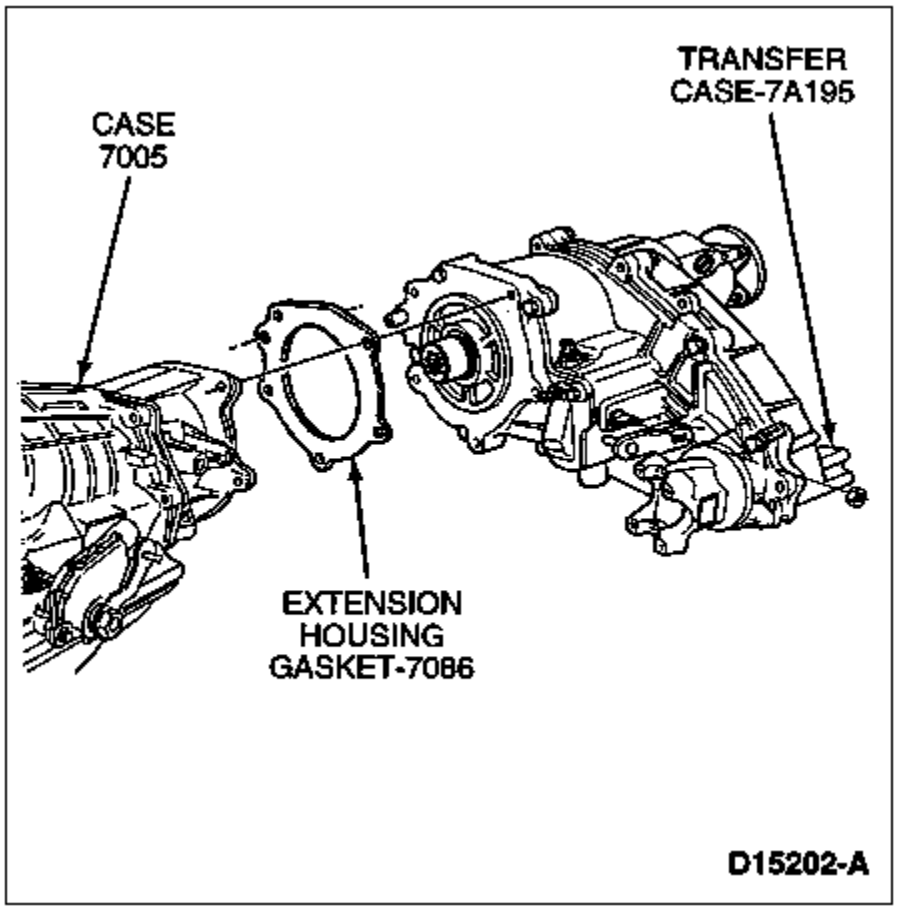
   Relocate the transmission to the top of a flat workbench.

tomsn048@gmail.com



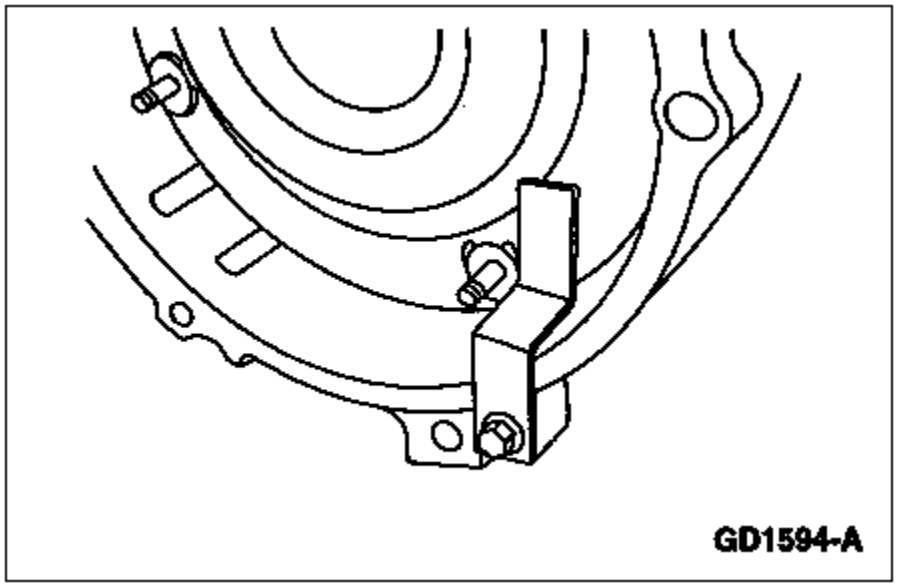
2. **NOTE: Refer to Section 07-07A , Section 07-07B , Section 07-07C , Section 07-07D for transfer case service.**

   If the vehicle has a transfer case, use a 13mm socket to remove the five transfer case-to-extension housing screws. Remove the transfer case and set aside for assembly.



3. Remove Torque converter Holding Tool T97T-7902-A form transmission.

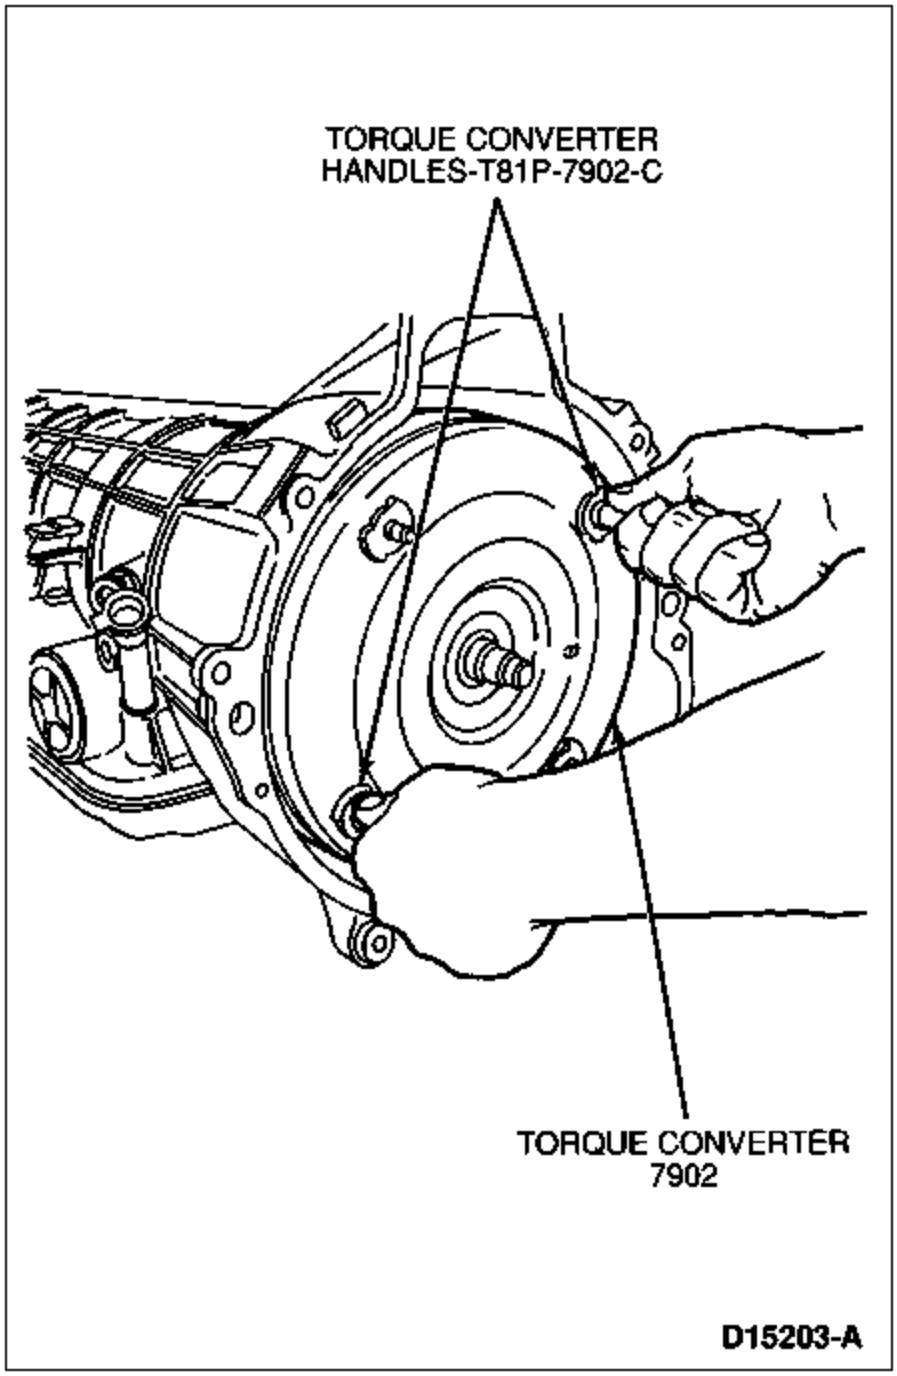
tomsn048@gmail.com



4. **WARNING: THE TORQUE CONVERTER IS HEAVY, ESPECIALLY WHEN FULL OF FLUID.**

   Remove the torque converter using Torque Converter Handles T81P-7902-C.

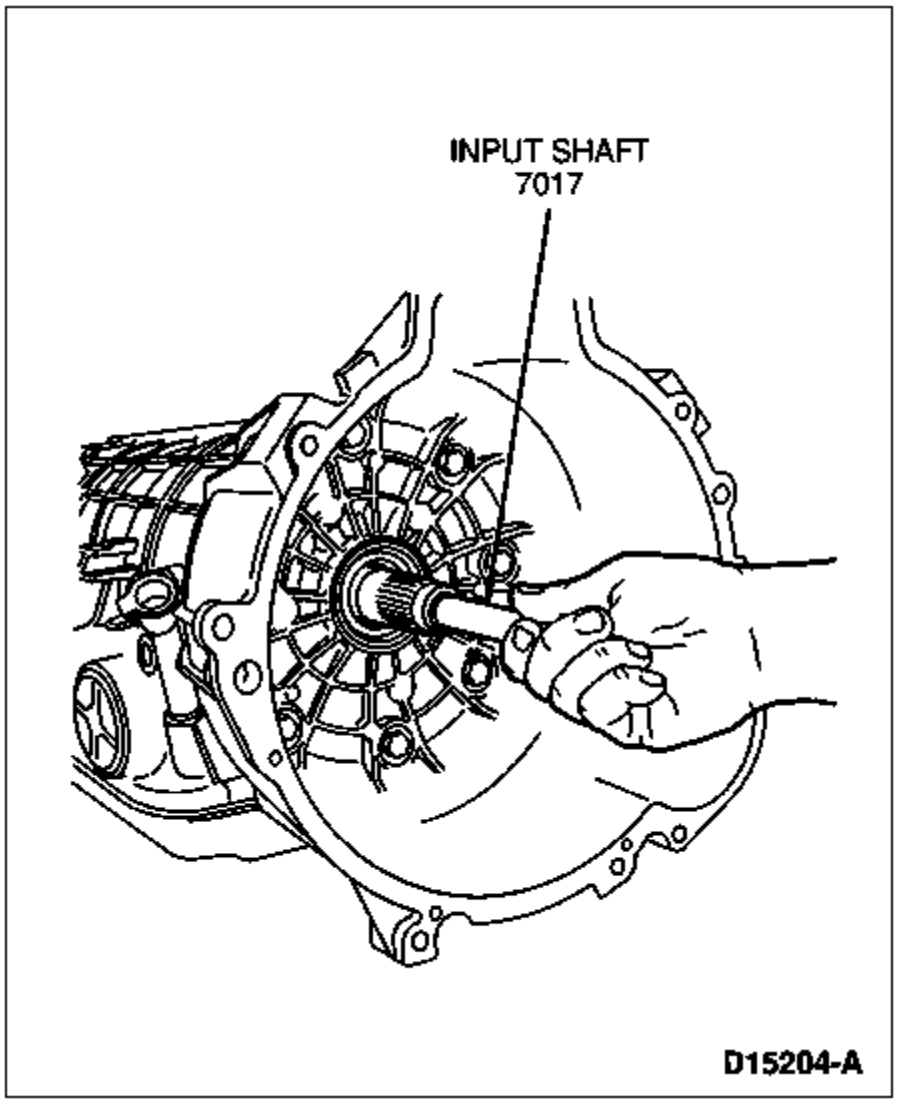
tomsn048@gmail.com



5. **NOTE: The splines on the input shaft are not the same on both ends. The end with the shorter spline goes into the assembly.**

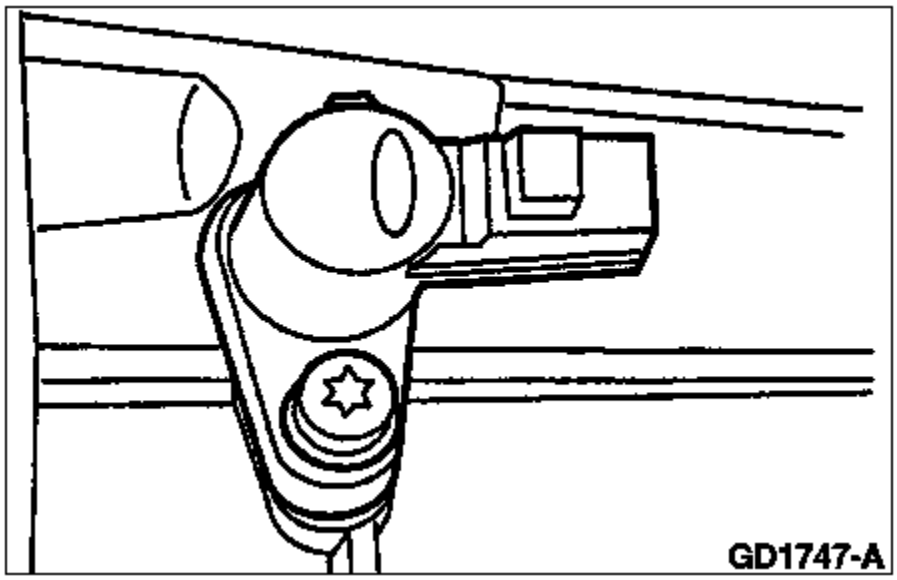
   Remove the input shaft.

tomsn048@gmail.com

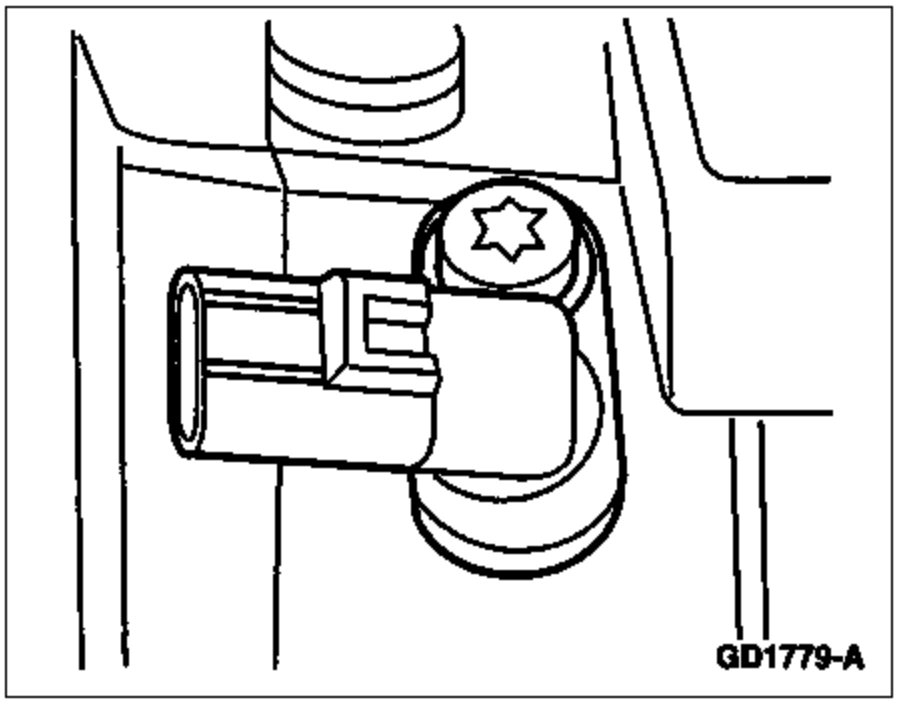


6. Use a T30 torx socket to remove overdrive drum speed sensor attaching bolt, then remove sensor.

tomsn048@gmail.com

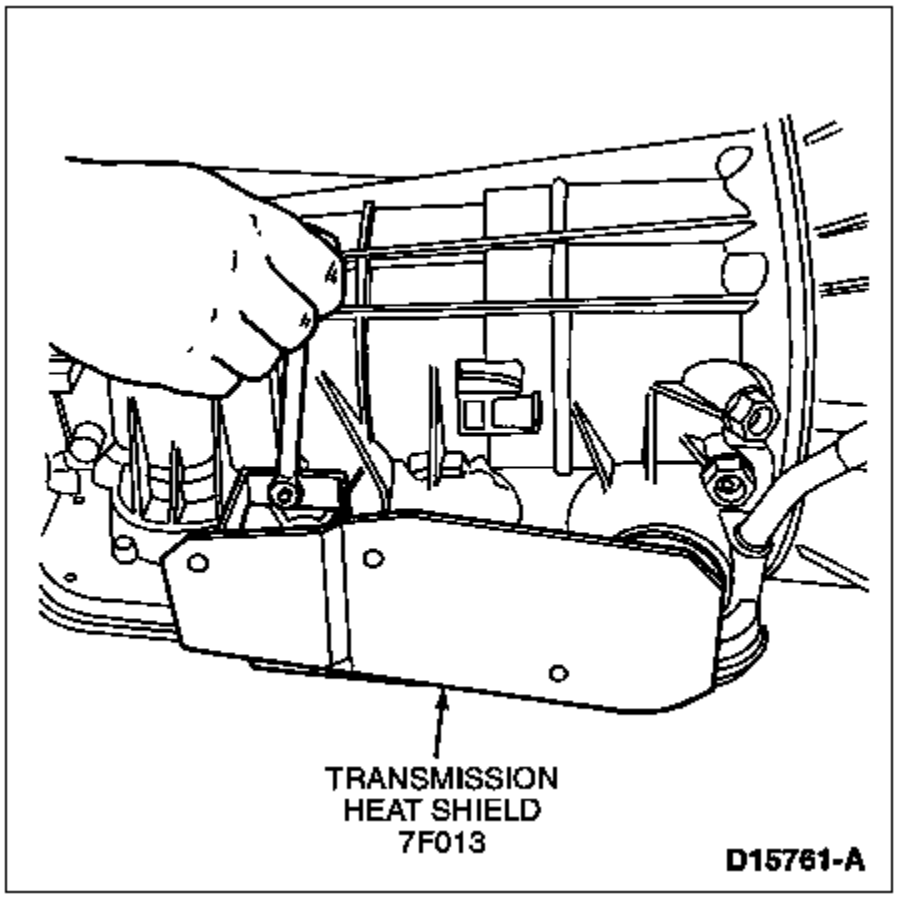


7. Use a T30 torx socket to remove output shaft speed sensor attaching bolt, then remove sensor.



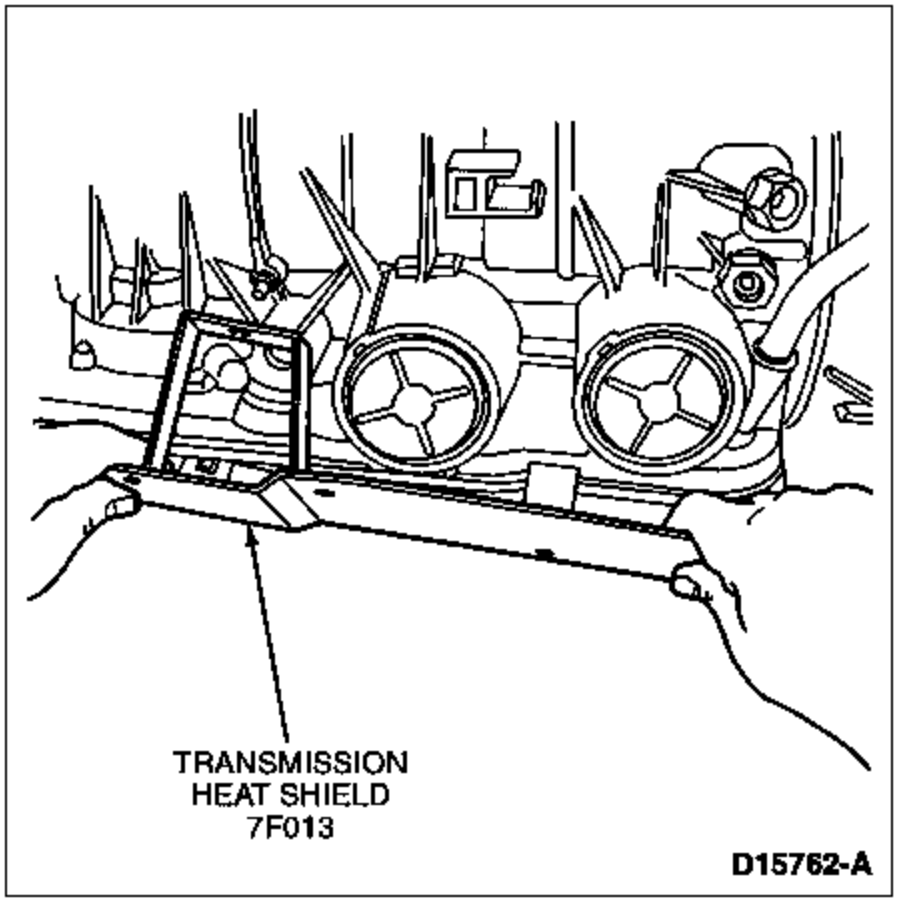
8. Remove the M6 x 1.0 transmission heat shield nut from the studded screw.

tomsn048@gmail.com



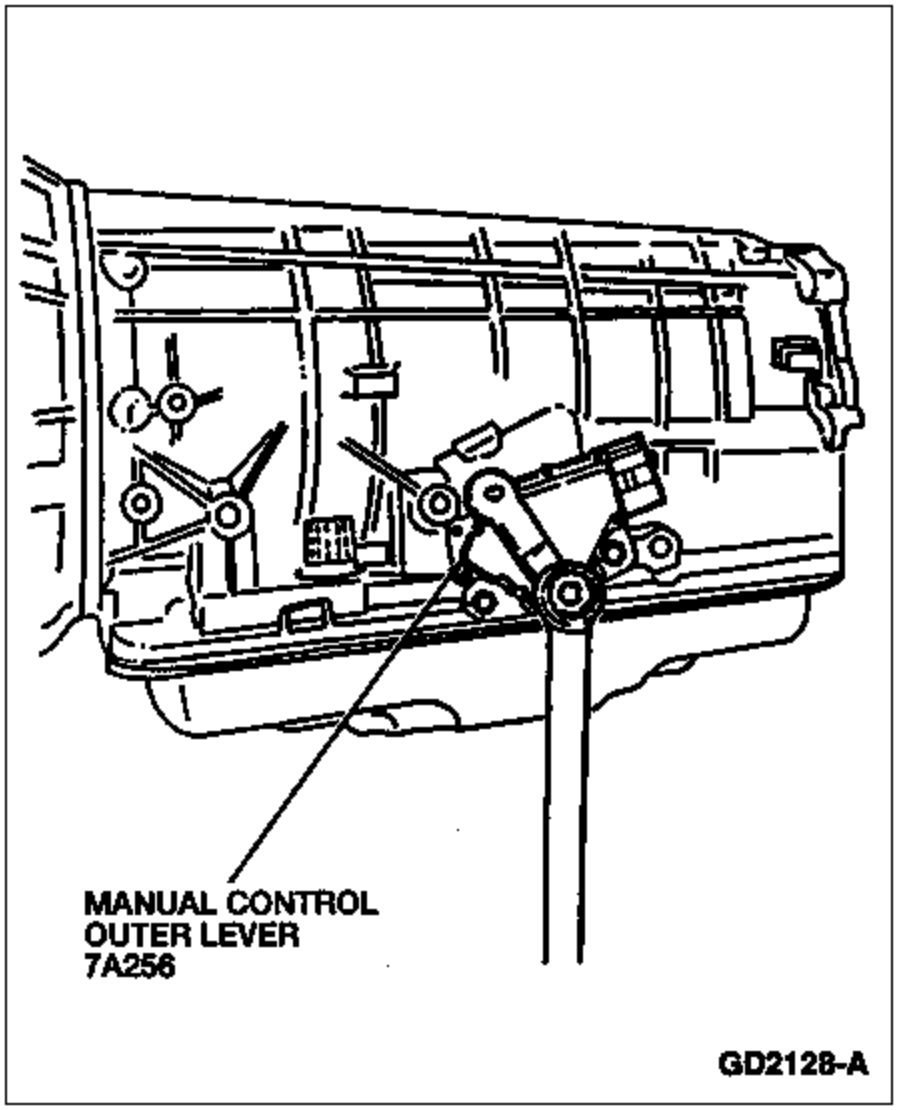
9. Carefully pry the transmission heat shield off of the fluid pan rail near the retaining clips.

tomsn048@gmail.com



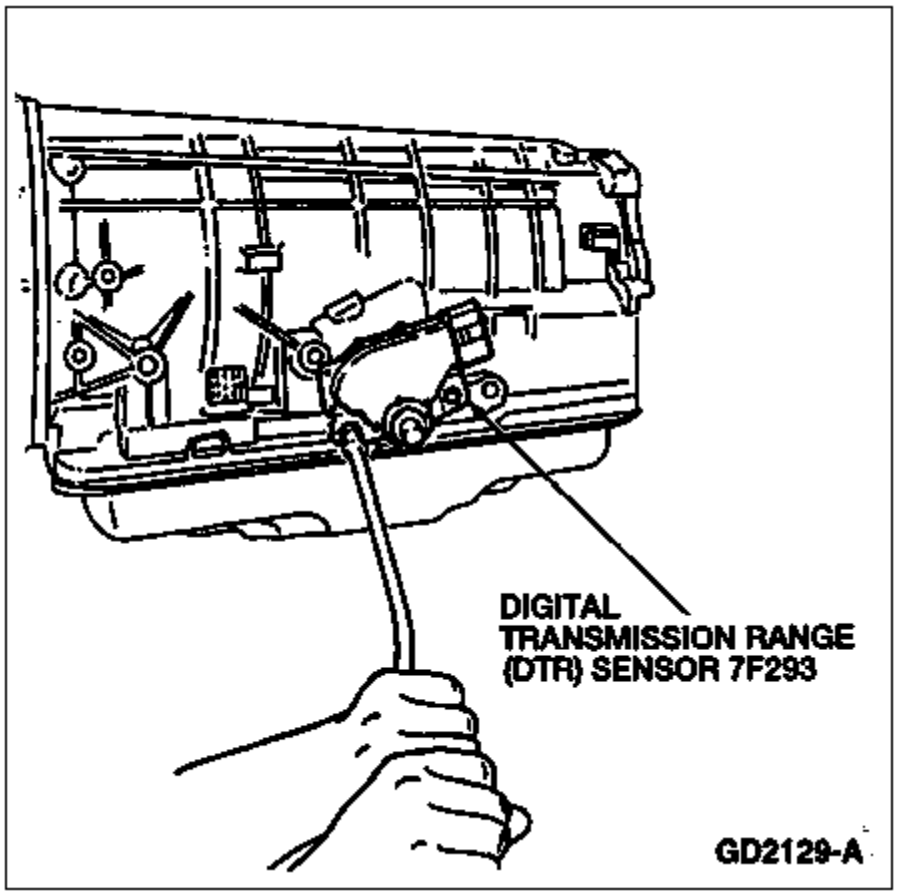
10. Remove the manual control outer lever nut and manual control outer lever.

tomsn048@gmail.com

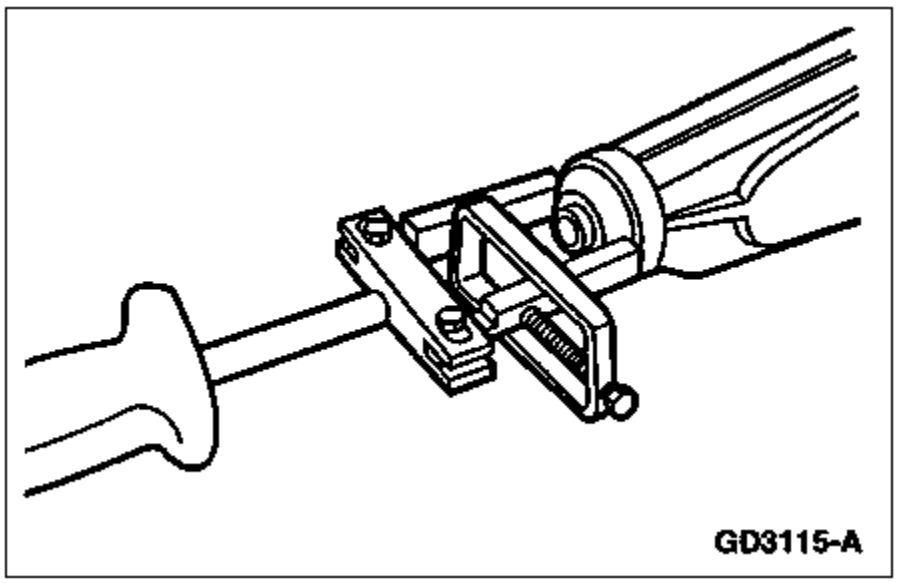


11. Remove the two M6 x 25 digital transmission range (DTR) sensor screws and remove the DTR sensor.

tomsn048@gmail.com



12. Remove the extension housing seal using Seal Remover T94P-77001-BH and Impact Slide Hammer T50T-100-A.

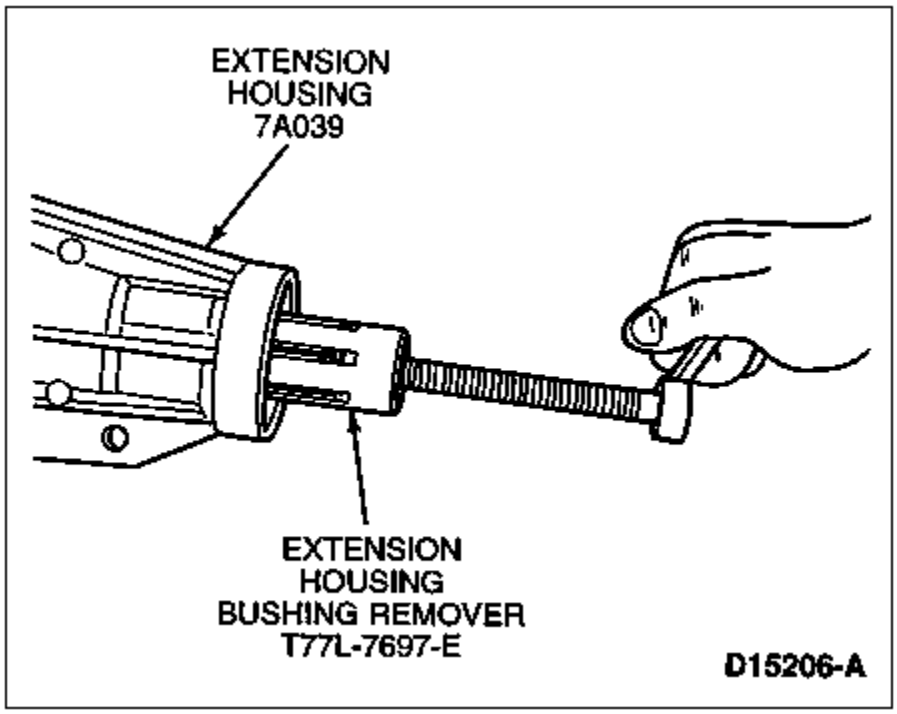


13. **NOTE: Remove the extension housing bushing only if service is required.**

tomsn048@gmail.com

Inspect the extension housing bushing and driveshaft slip-yoke for nicks, gouges, scoring and wear.

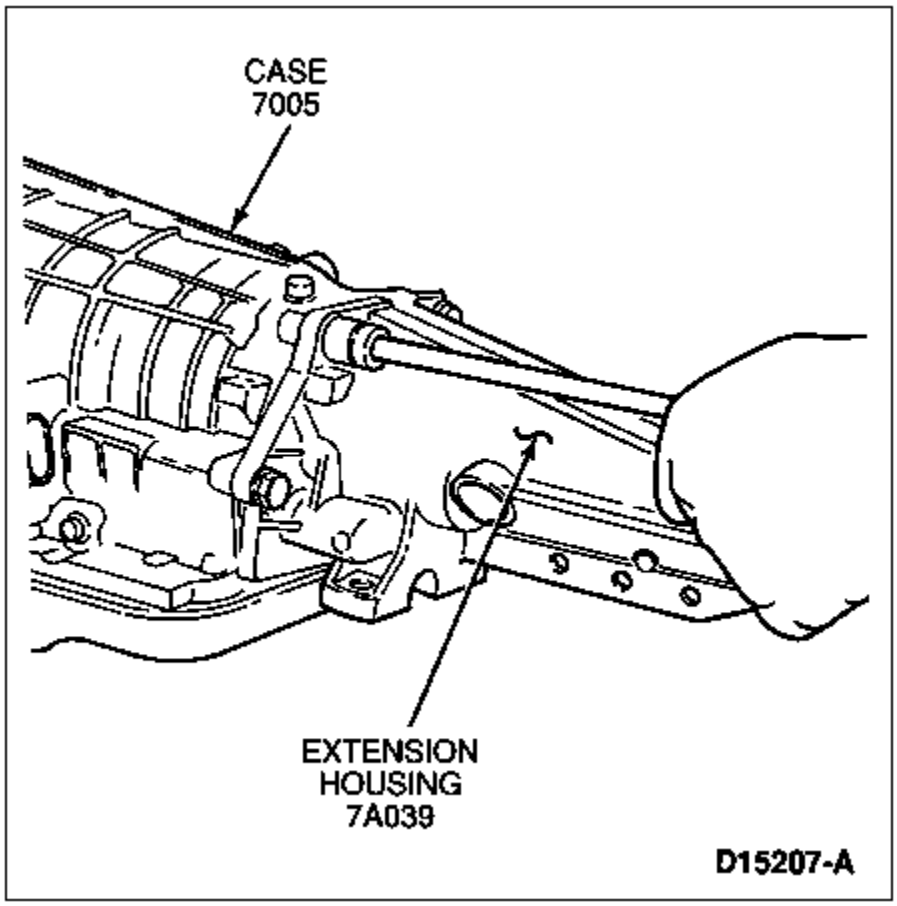
Remove the extension housing bushing using Extension Housing Bushing Remover T77L-7697-E.



14. **CAUTION: The parking pawl, parking pawl return spring and parking pawl shaft could fall out during removal of the extension housing.**

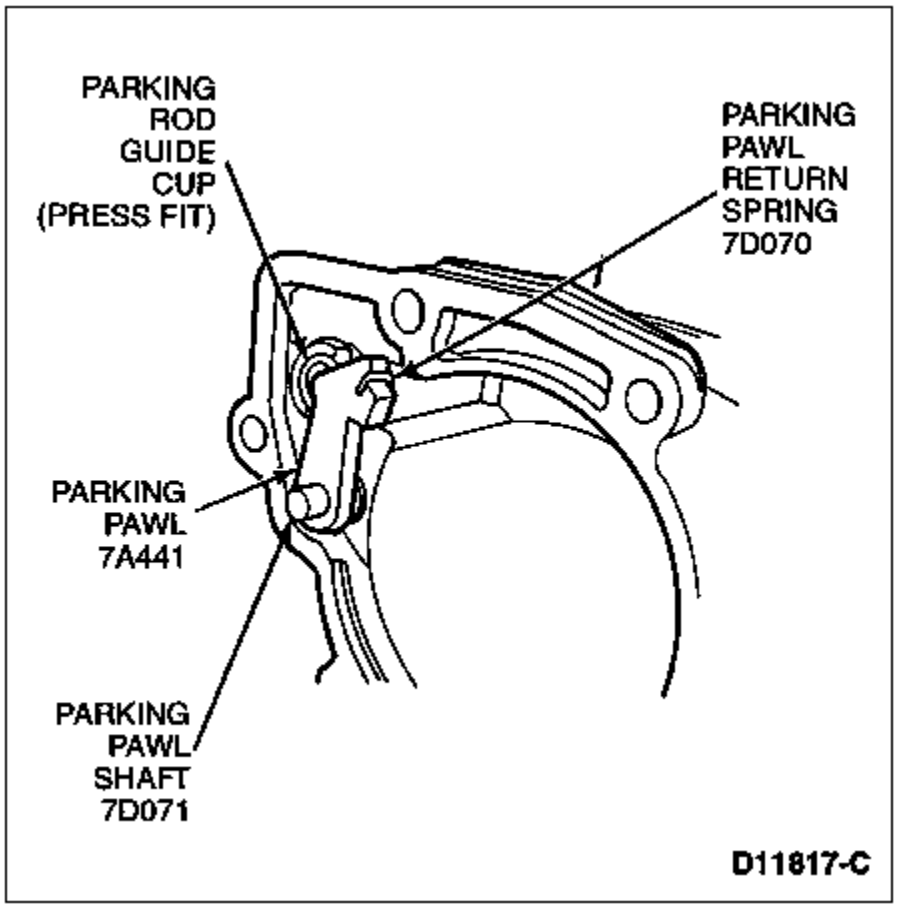
Use a 17mm socket to remove the five M10 x 30mm extension housing-to-transmission case screws, one stud and gasket. Discard gasket.

tomsn048@gmail.com



15. Remove the parking pawl, parking pawl return spring and parking pawl shaft.

tomsn048@gmail.com

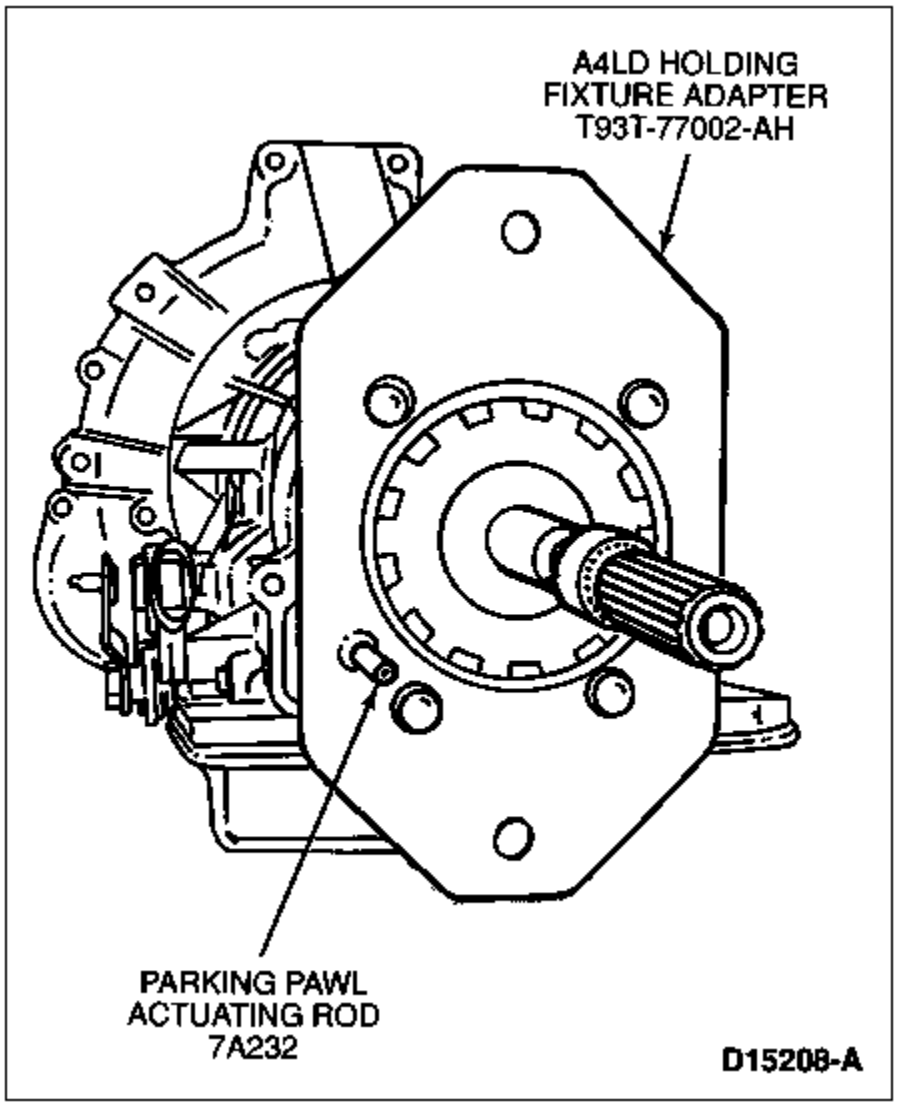


16. **CAUTION: The parking pawl actuating rod must slip freely into the clearance hole in the adapter plate.**

NOTE: See the special service tool section for a drawing of this optional adapter plate.

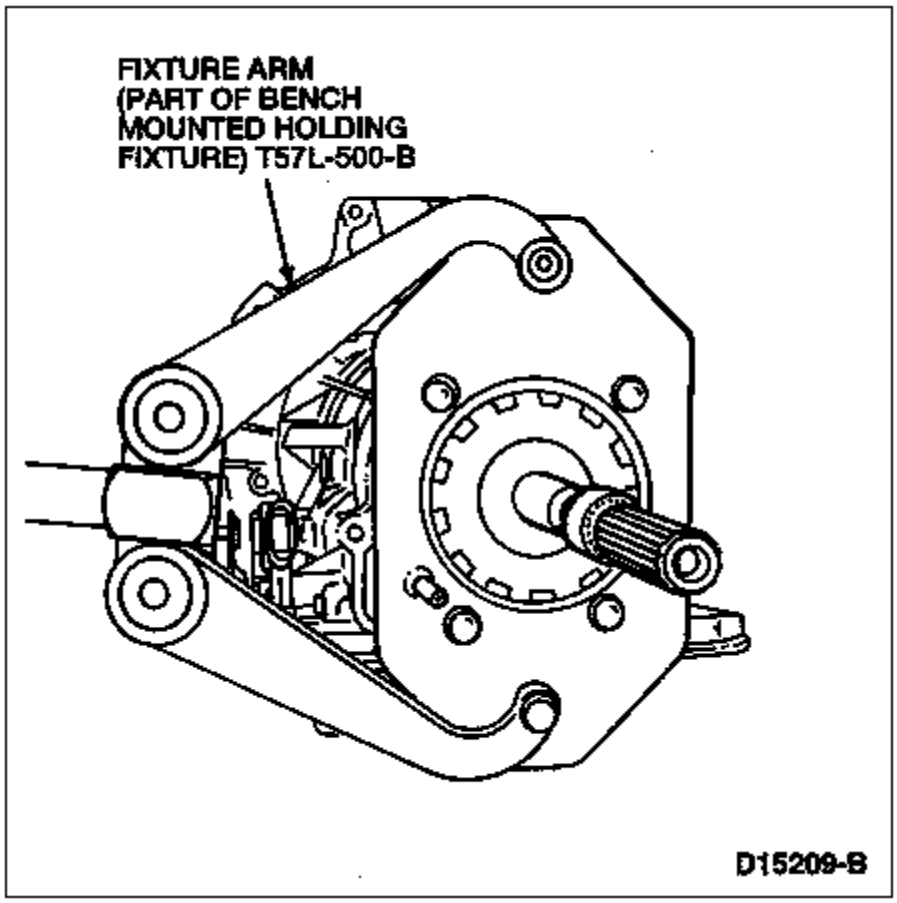
Use the four M10 x 30mm extension housing to transmission case screws to attach the adapter plate to the transmission.

tomsn048@gmail.com



17. Attach the fixture arm assembly (part of T57L-500-B) with two 7/16 x 2-inch bolts and nuts.

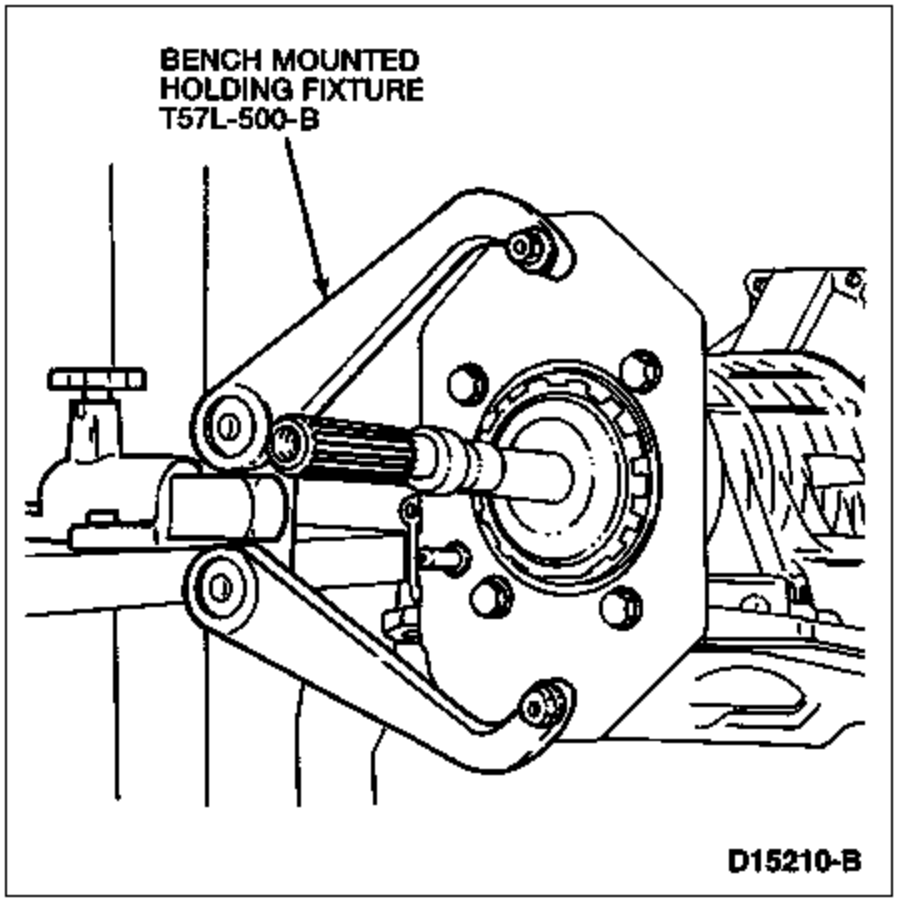
tomsn048@gmail.com



18. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Install the transmission assembly to Bench-Mounted Holding Fixture T57L-500-B. Rotate to the position shown. Place a drain pan under the assembly.

tomsn048@gmail.com



19. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

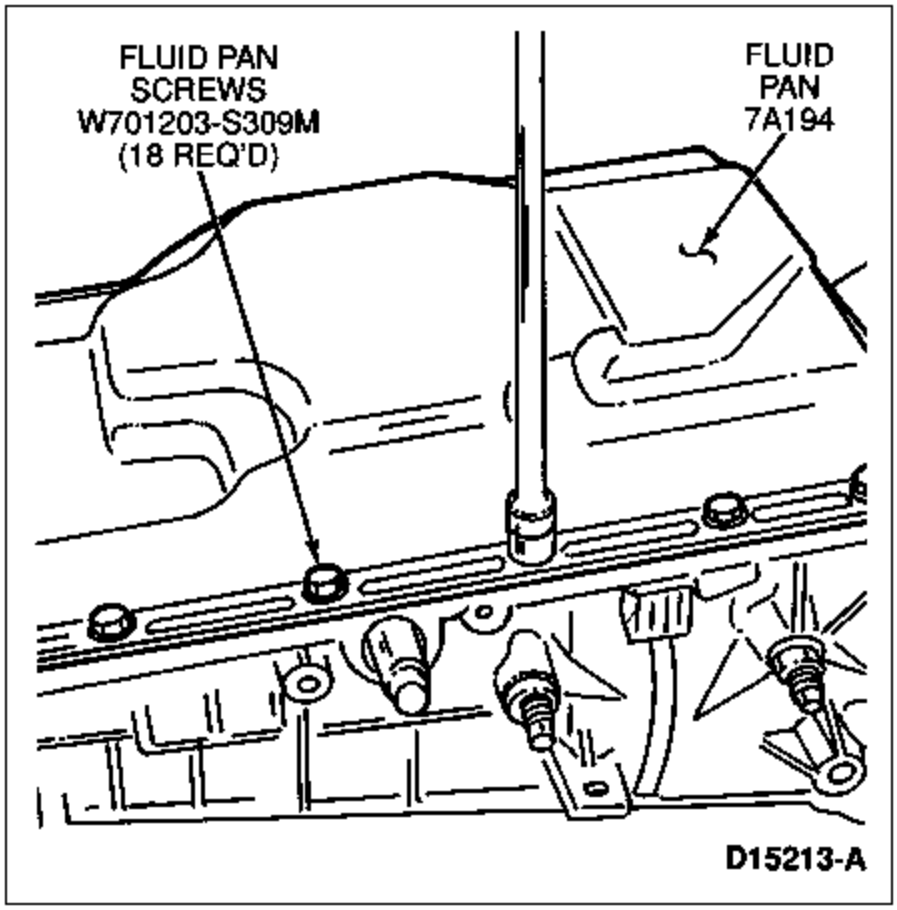
    Rotate transmission assembly so that the fluid pan is facing up.

20. **CAUTION: Do not reuse the fluid pan gasket.**

    Use a 13mm socket to remove the eighteen M8 x 16mm fluid pan screws. Remove the fluid pan and fluid pan gasket. Discard the fluid pan gasket.

Fluid Pan Removal

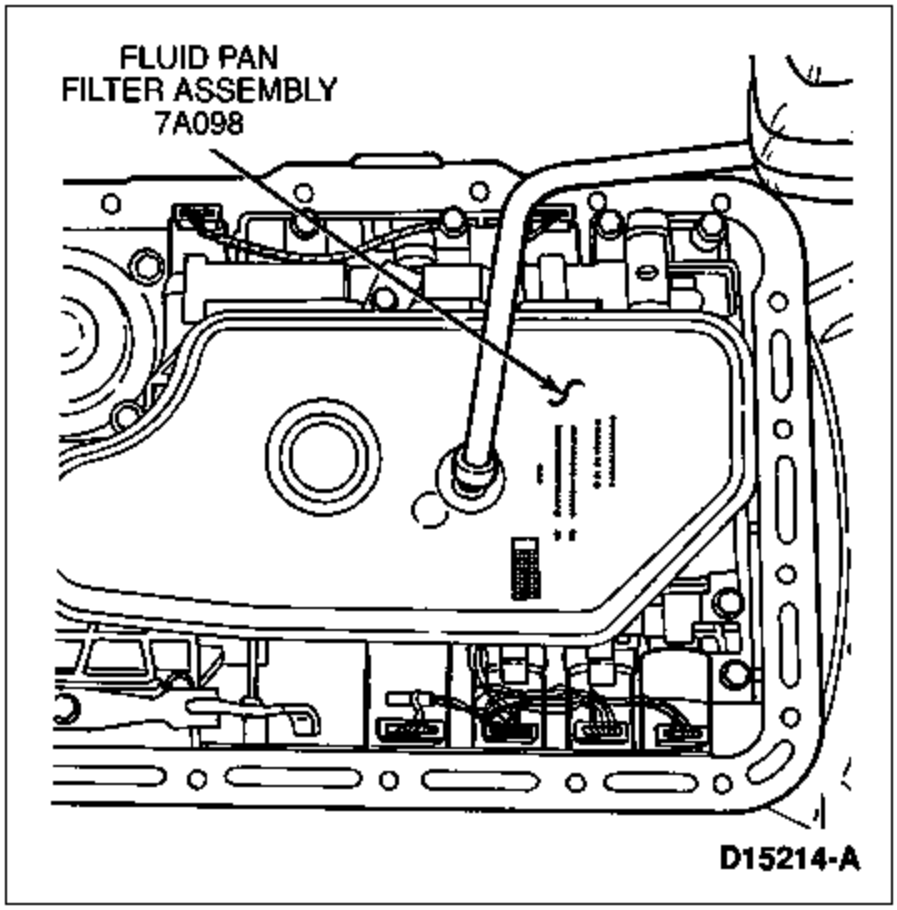
tomsn048@gmail.com



21. Use a 10mm socket to remove the M6 x 55mm fluid pan filter assembly screw. Remove and discard the fluid pan filter assembly.

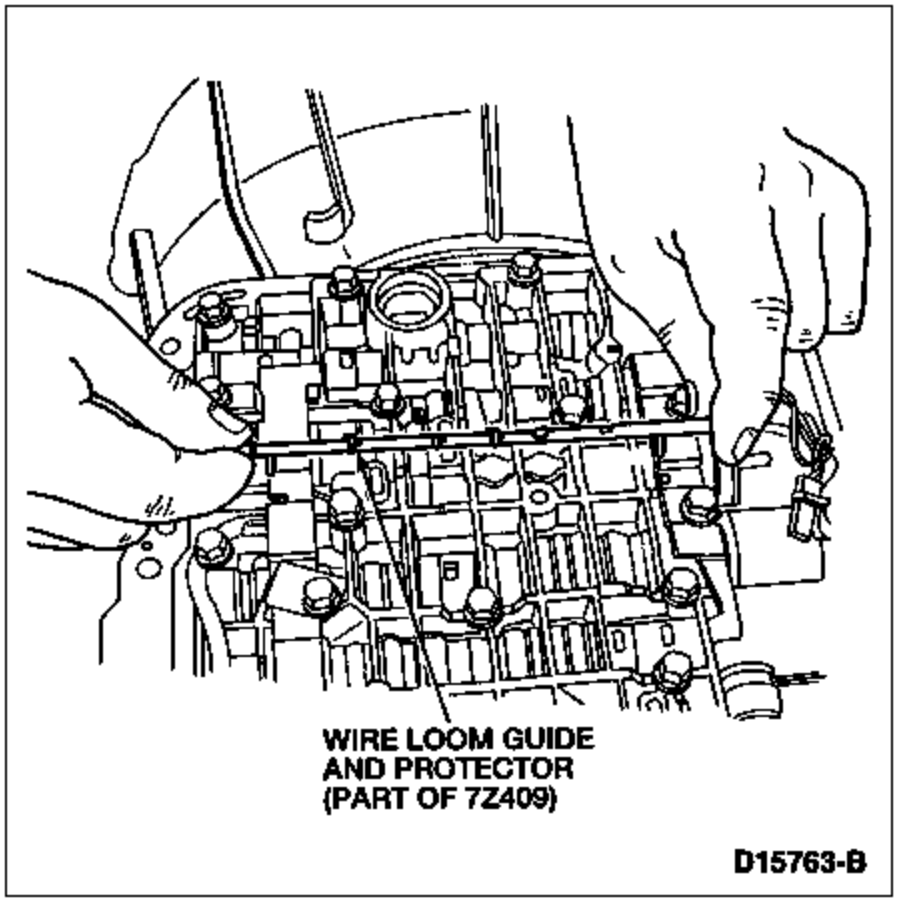
Fluid Pan Filter Removal

tomsn048@gmail.com



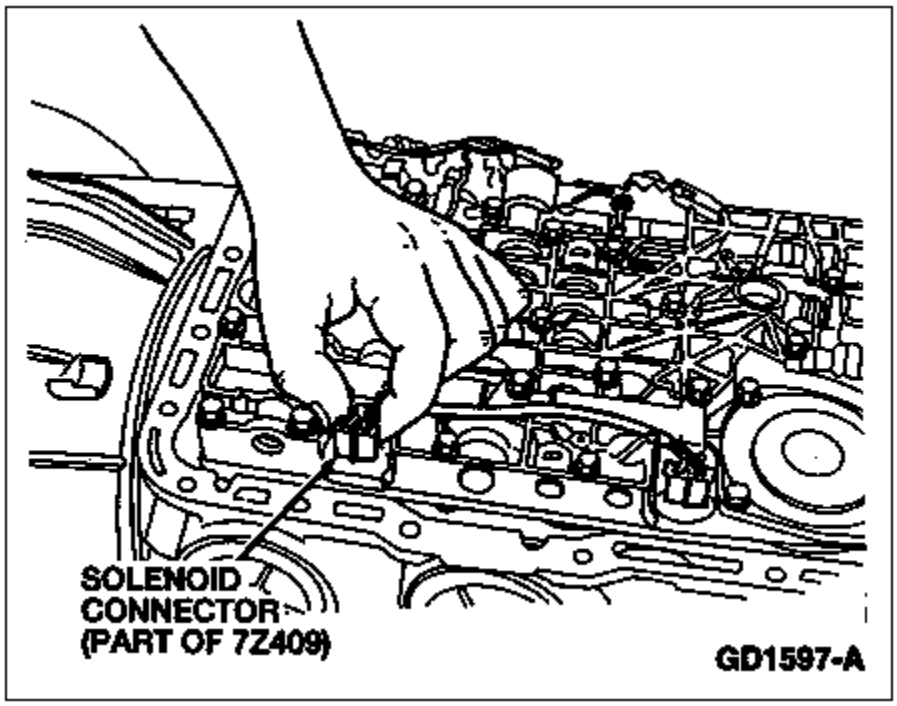
22. Carefully lift up on the wire loom guide and protector. Disengage the retaining pins from the solenoid clamps.

tomsn048@gmail.com



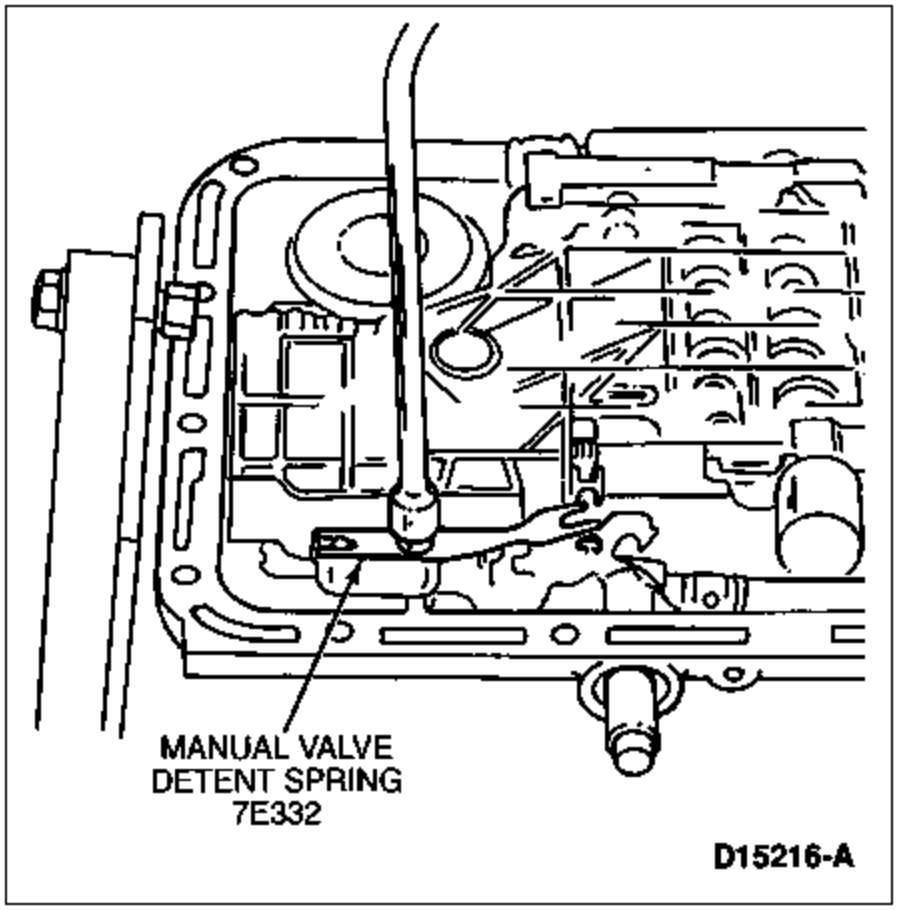
23. Disconnect the six solenoid connectors from the solenoids by carefully pulling upward and wiggling side to side.

tomsn048@gmail.com



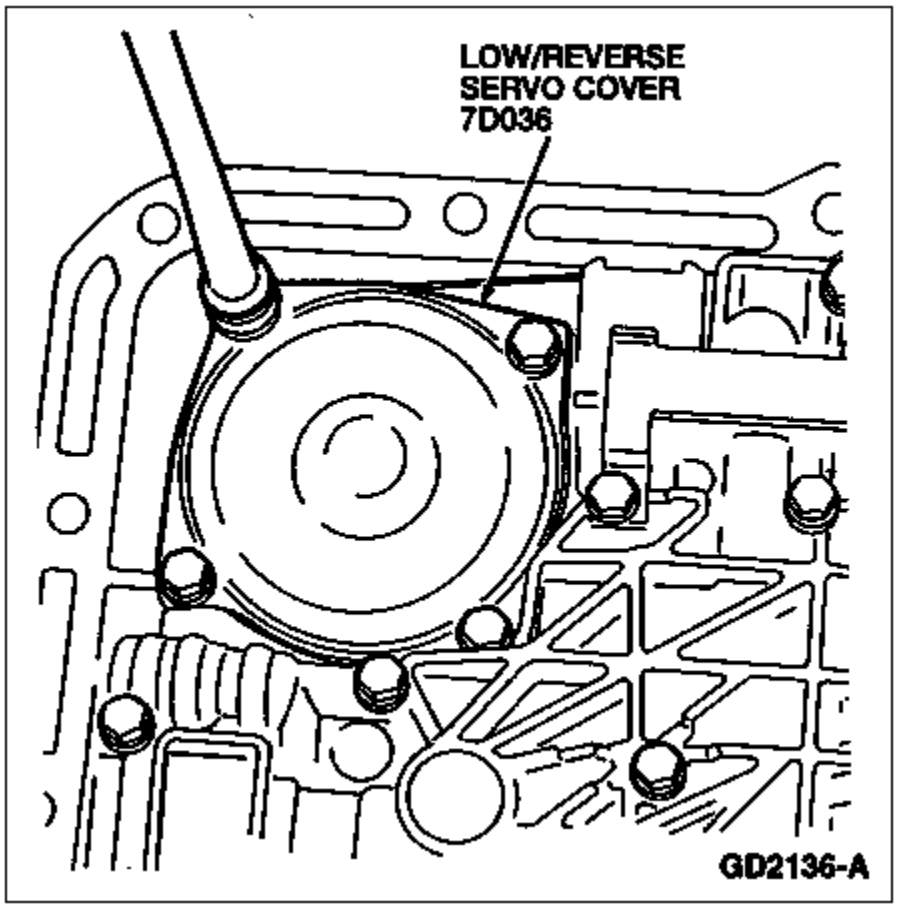
24. Use a 10mm socket to remove the M6 x 30mm manual valve detent spring screw. Remove the manual valve detent spring.

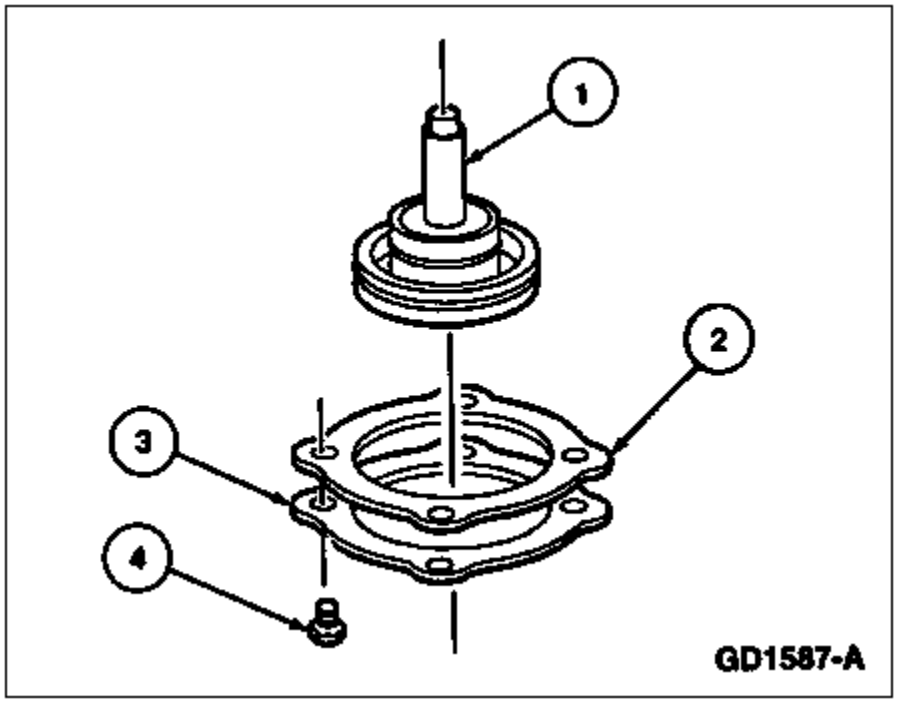
tomsn048@gmail.com



25. Use a 10mm socket to remove the four M6 x 20mm low/reverse servo cover screws. Remove the low/reverse servo cover, gasket and piston and rod assembly.

tomsn048@gmail.com





tomsn048@gmail.com

Item	Part Number	Description
1	7D189	Low/Reverse Servo and Rod Assembly
2	7L173	Low/Reverse Servo-to-Case Gasket
3	7D036	Low/Reverse Servo Cover
4	E800156-S	Low/Reverse Servo Cover-to-Case Screw (4 Req'd)

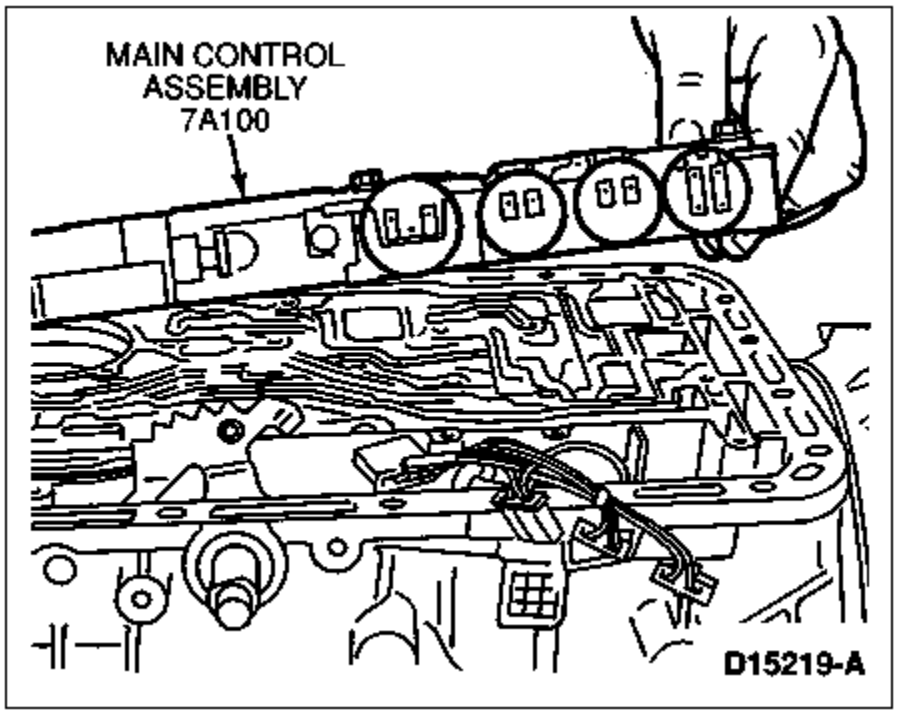
26. **CAUTION: To prevent solenoid valves from falling out, do not remove the two screws shown below.**

    NOTE: Refer to the Main Control disassembly and assembly in this section.

    Use a 10mm socket to remove the sixteen M6 x 40mm, four M6 x 45mm, two M6 x 35mm and one M6 x 30mm main control valve body screws.

27. Remove the main control assembly, separator plate and gasket. Discard gasket.

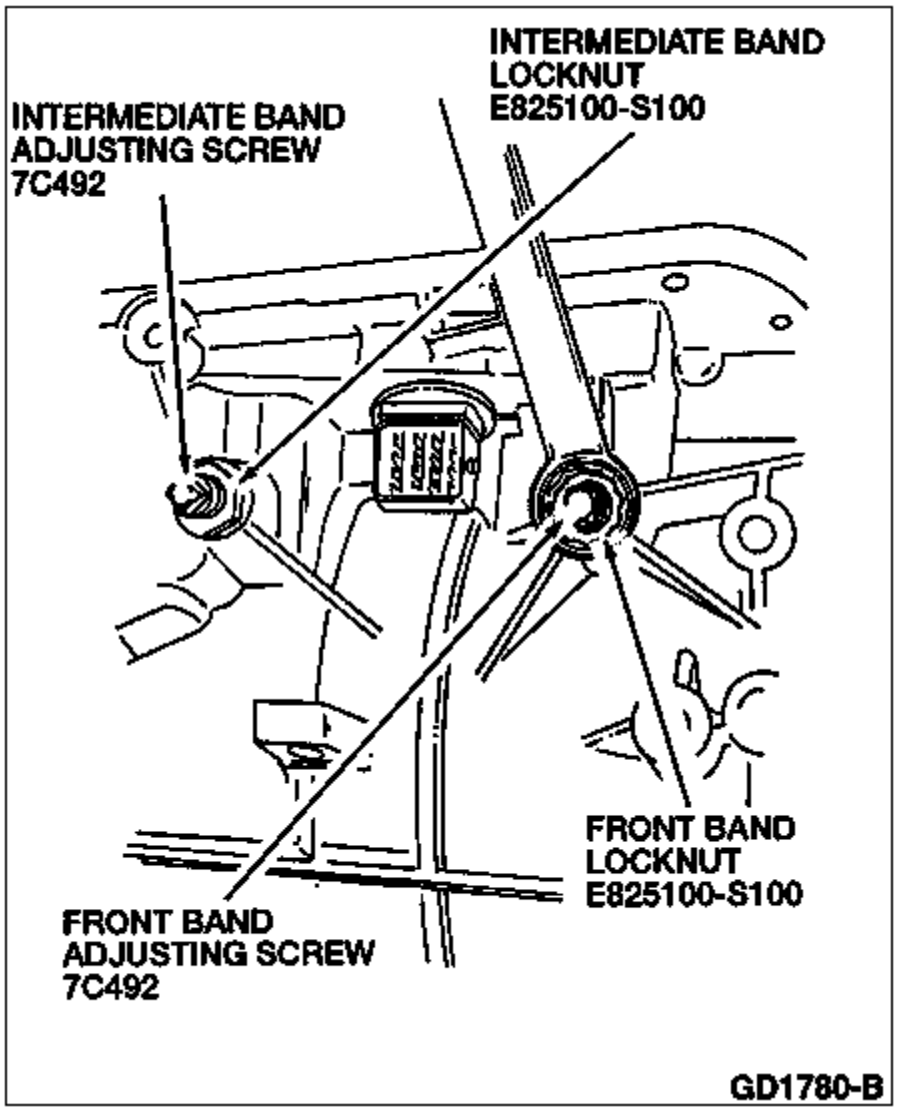
tomsn048@gmail.com



28. **CAUTION: Throw the locknuts away. The locknuts are not reusable for assembly.**

Remove the front and intermediate band locknuts and discard. Back off the band adjusting screws.

tomsn048@gmail.com

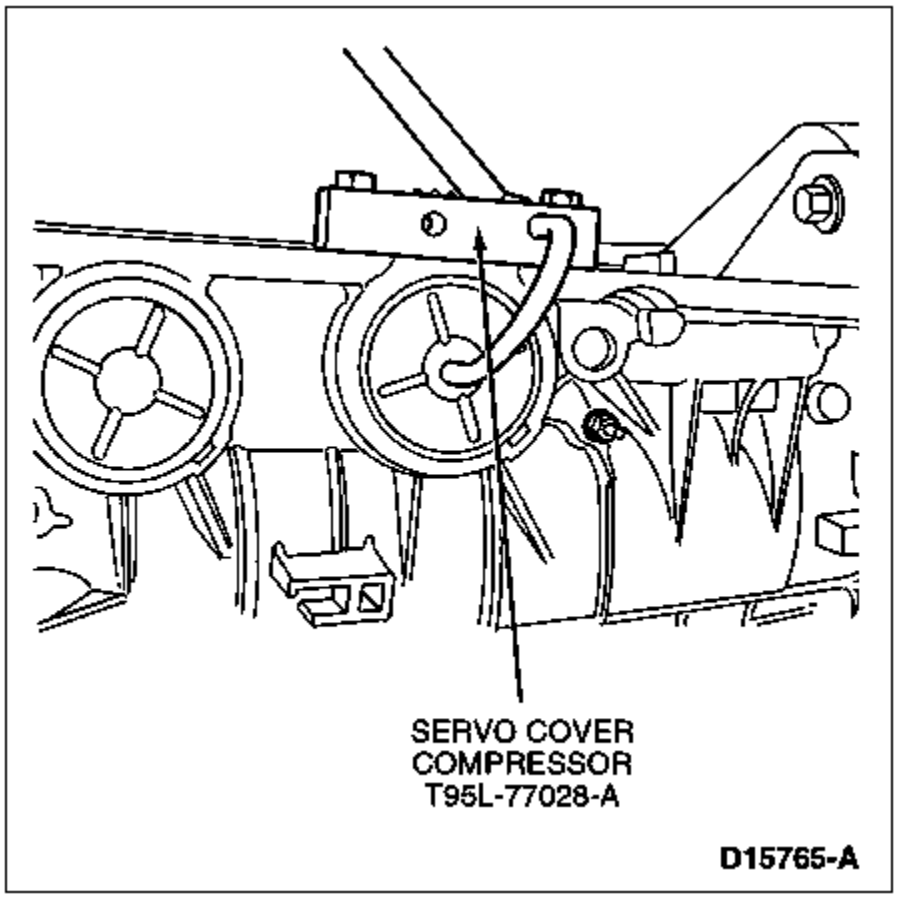


29. **NOTE: The J-hook must be in the appropriate hole for the servo being removed.**

    Install Servo Cover Compressor T95L-77028-A over the intermediate servo cover at the fluid pan rail with tool stamping facing up. Tighten the screws.

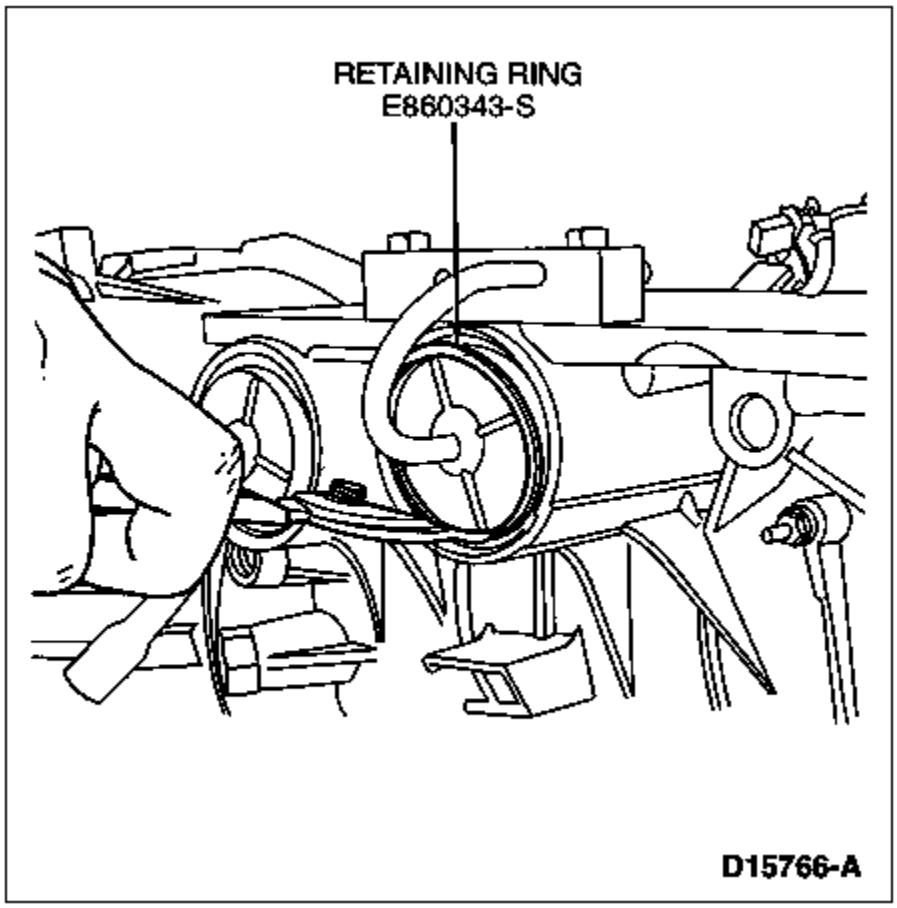
30. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



31. Carefully remove the servo cover retaining ring.

tomsn048@gmail.com

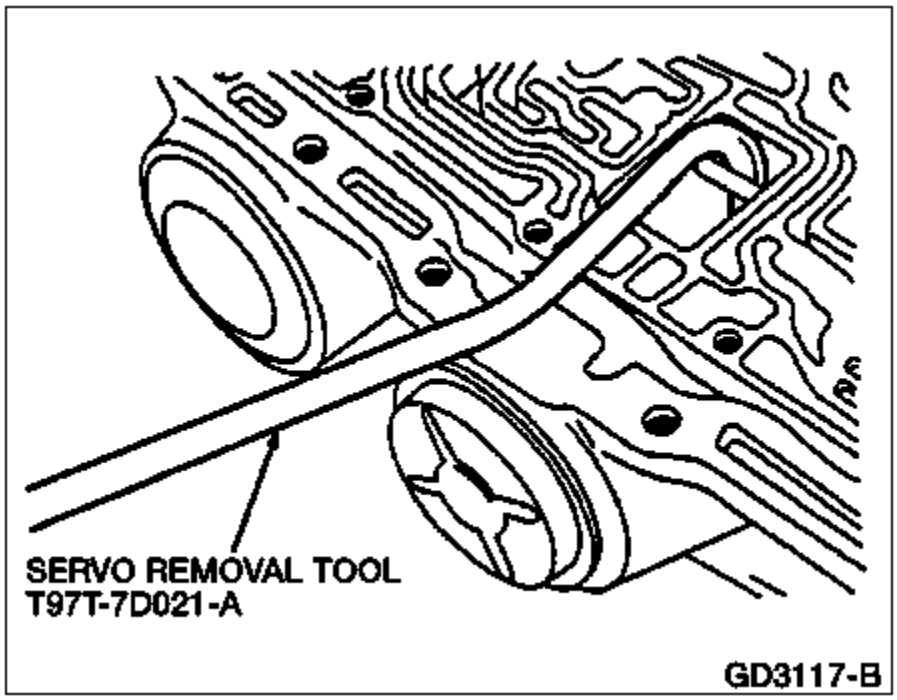


32. **CAUTION: The servo cover is under spring tension.**

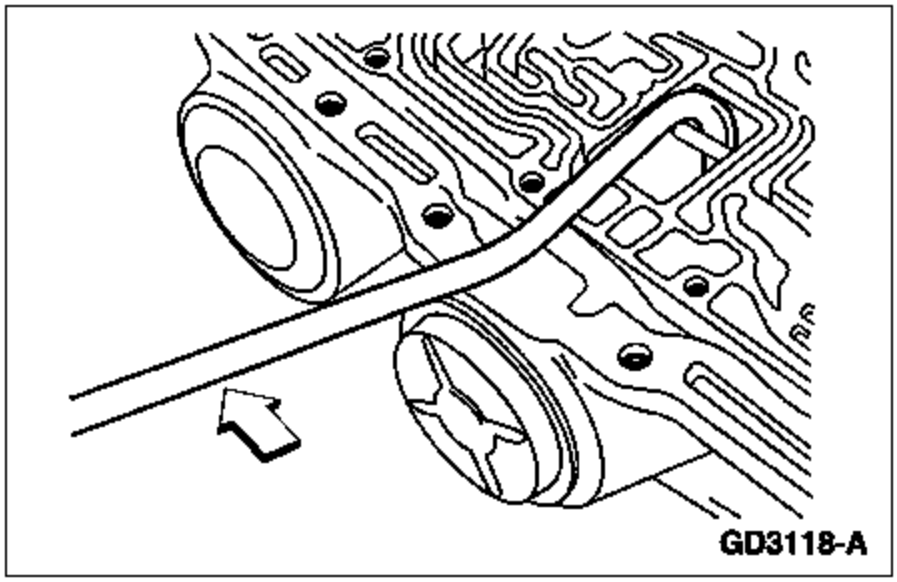
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

33. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.

tomsn048@gmail.com



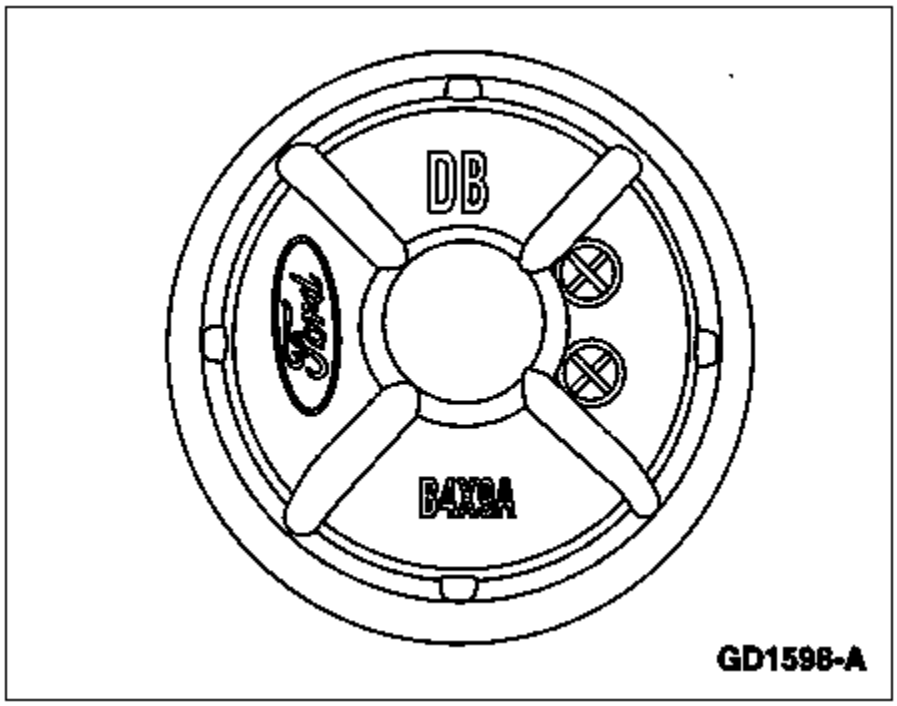
34. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.



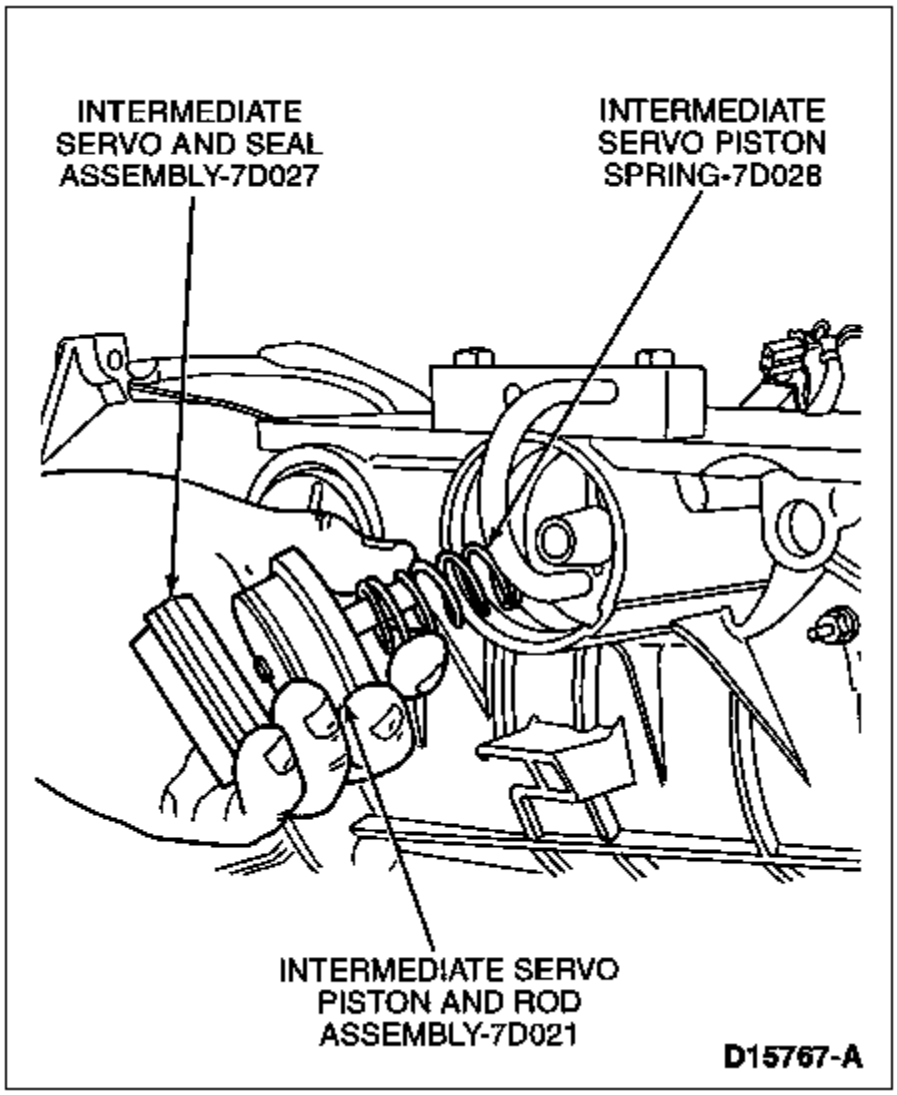
35. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

    Remove the intermediate servo cover, piston and spring.

tomsn048@gmail.com



tomsn048@gmail.com



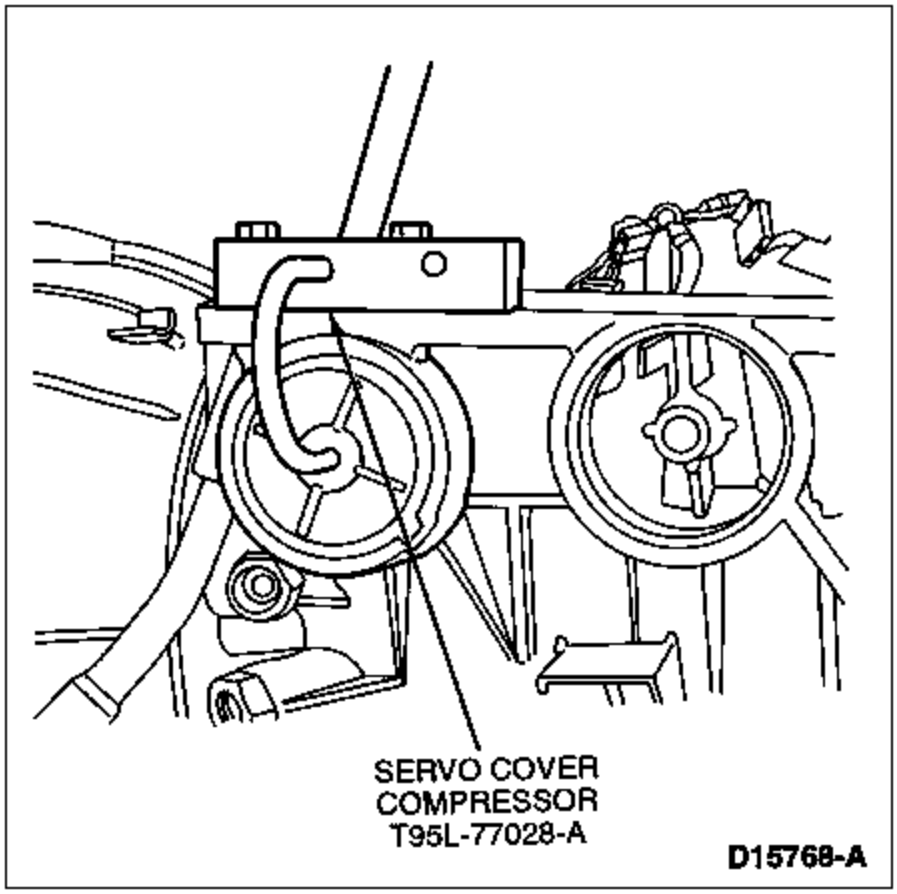
36. Remove Servo Cover Compressor T95L-77028-A.

37. **NOTE: The J-hook must be in the appropriate hole for the servo being removed.**

    Install Servo Cover Compressor T95L-77028-A over the front servo cover at the fluid pan rail. Tighten the screws.

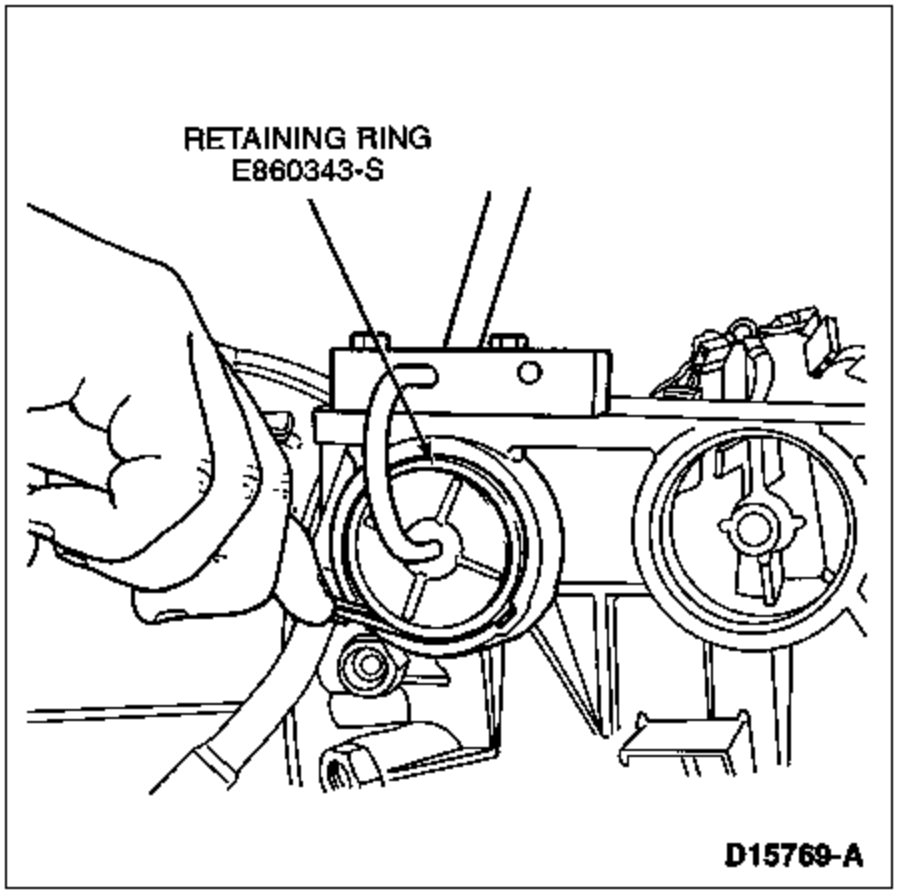
38. Using a 1/2-inch wrench, tighten the nut on the J-hook until there is a gap between the servo cover and the retaining ring.

tomsn048@gmail.com



39. Carefully remove the servo cover retaining ring.

tomsn048@gmail.com

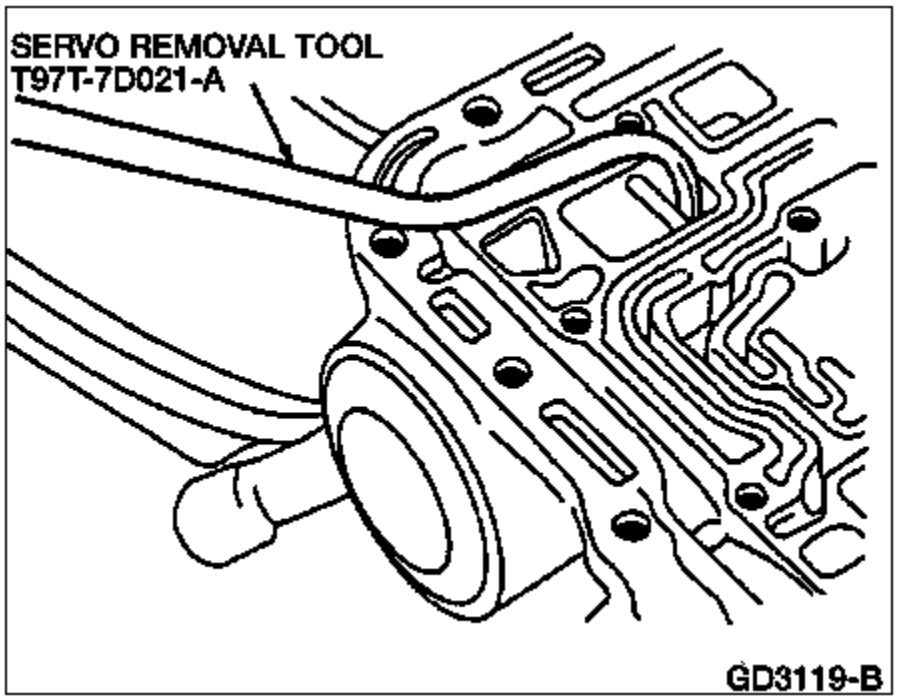


40. **CAUTION: The servo cover is under spring tension.**

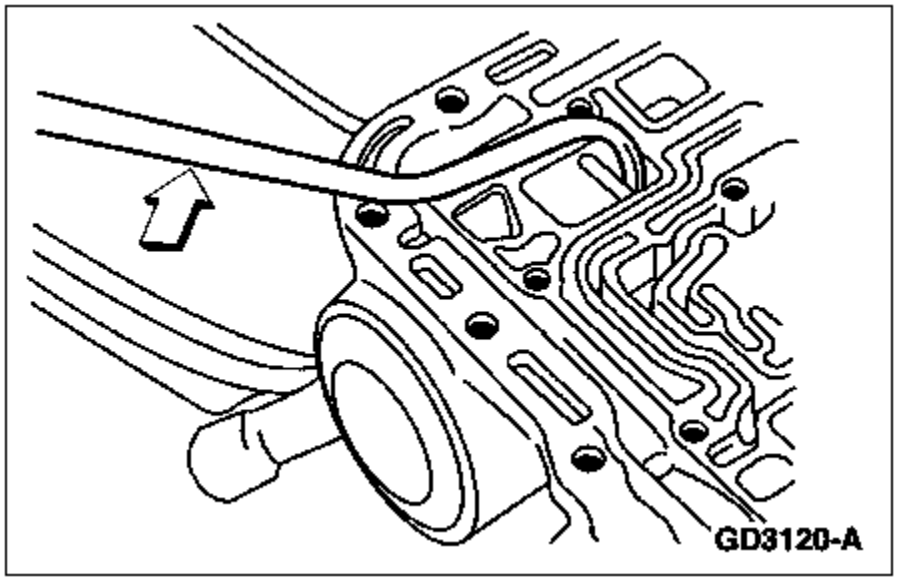
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

41. Insert Servo Removal Tool T97T-7D021-A into case and locate on servo rod.

tomsn048@gmail.com



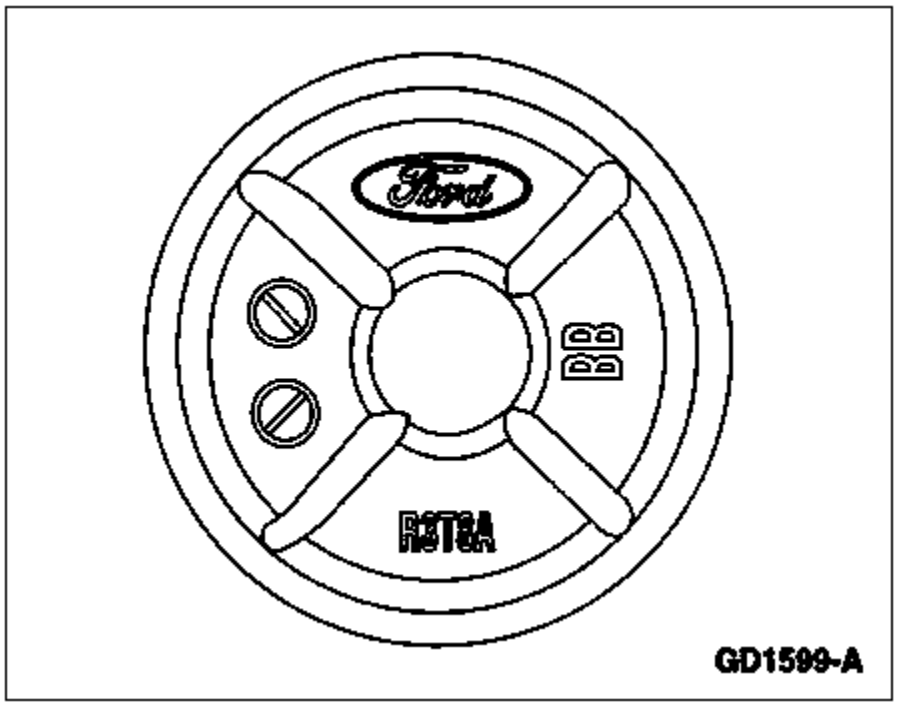
42. Gently push on Servo Removal Tool T97T-7D021-A to remove front servo cover, piston and spring.



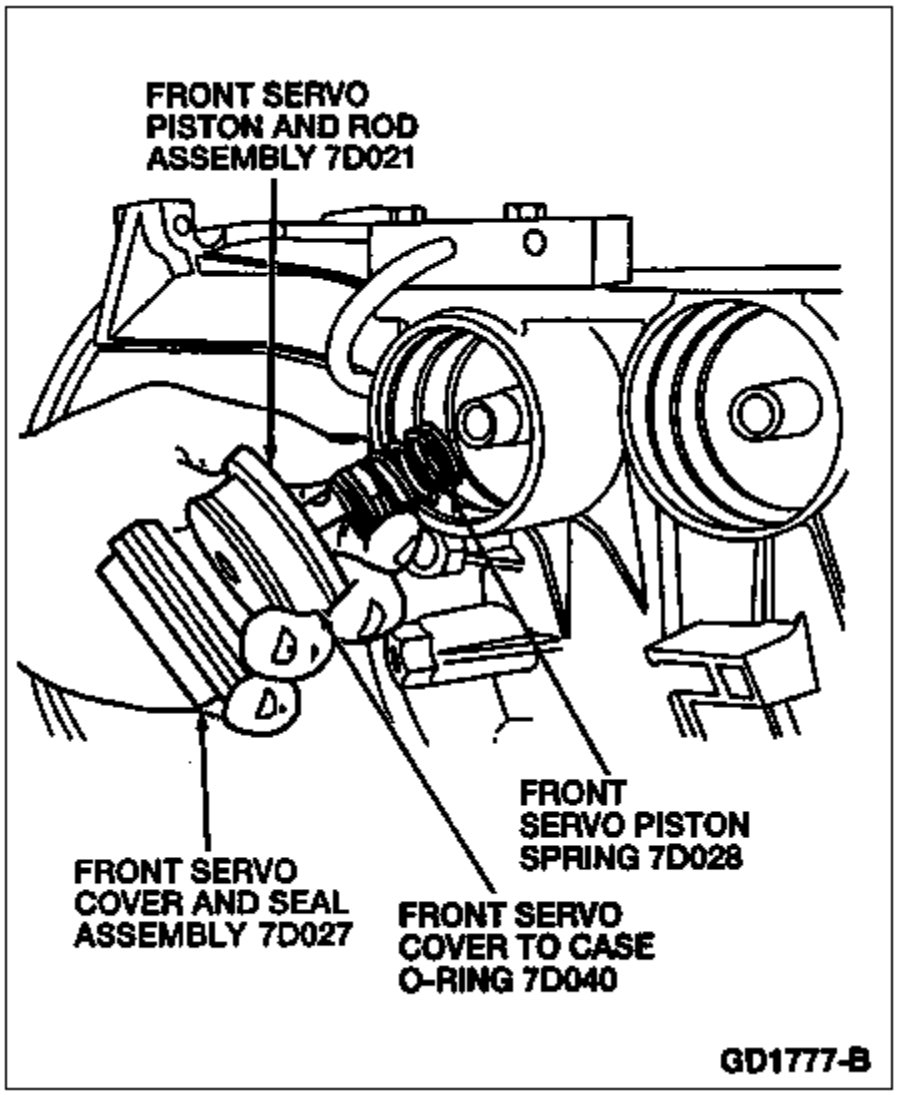
43. **NOTE: Tag the spring, piston and cover assembly. Label accordingly for assembly. The covers have letters cast on the outer surface for identification.**

Remove the front servo cover, piston and spring.

tomsn048@gmail.com



tomsn048@gmail.com



44. Remove Servo Cover Compressor T95L-77028-A.

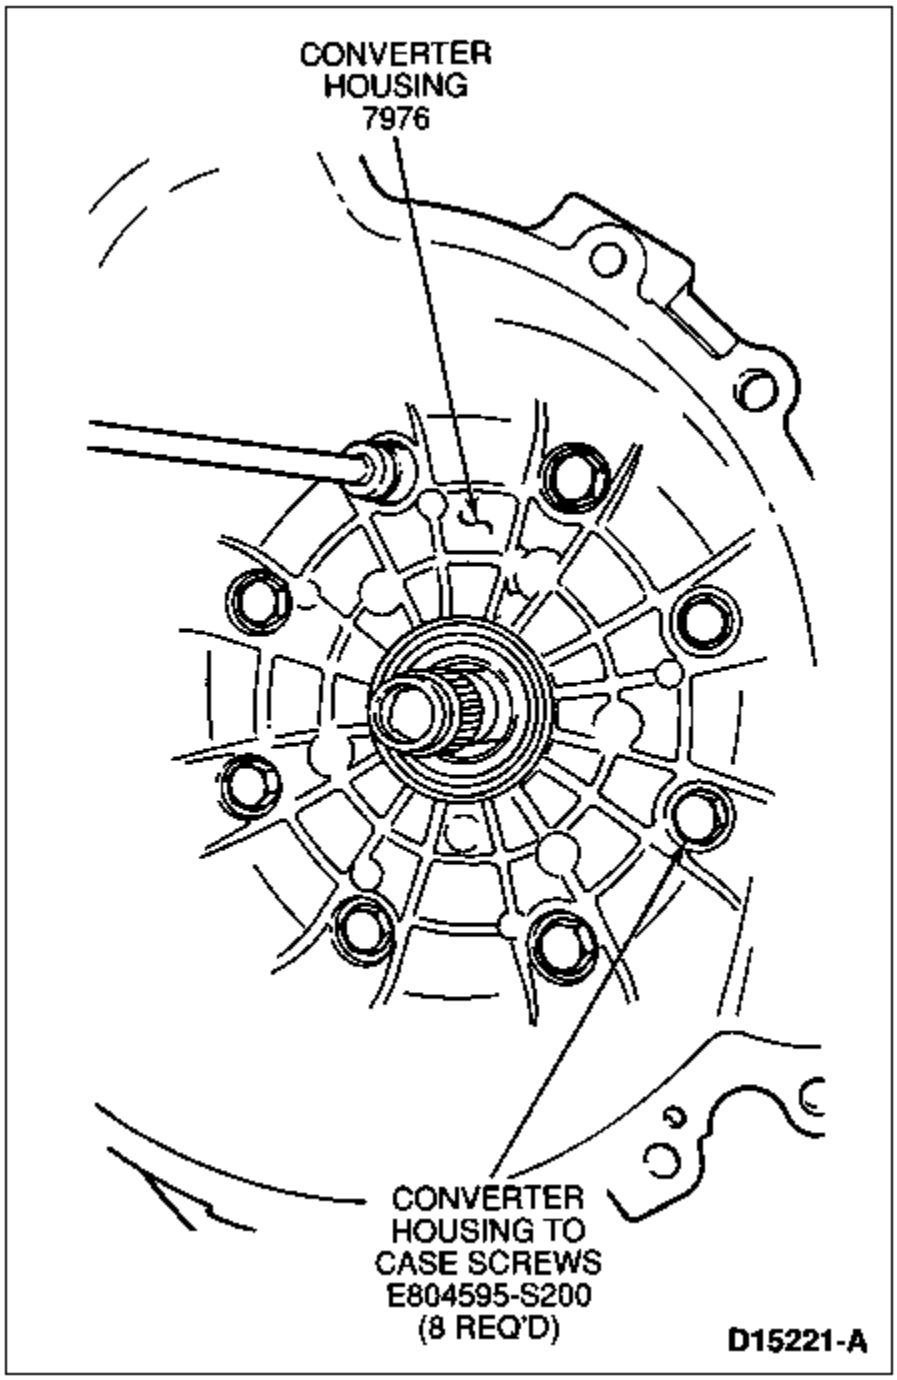
45. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Rotate the transmission assembly with the converter housing facing up.

46. **CAUTION: Throw the screws away. The screws are not reusable for assembly.**

    Use a 17mm socket to remove the eight M10 x 33mm converter housing-to-case screws. Discard the screws.

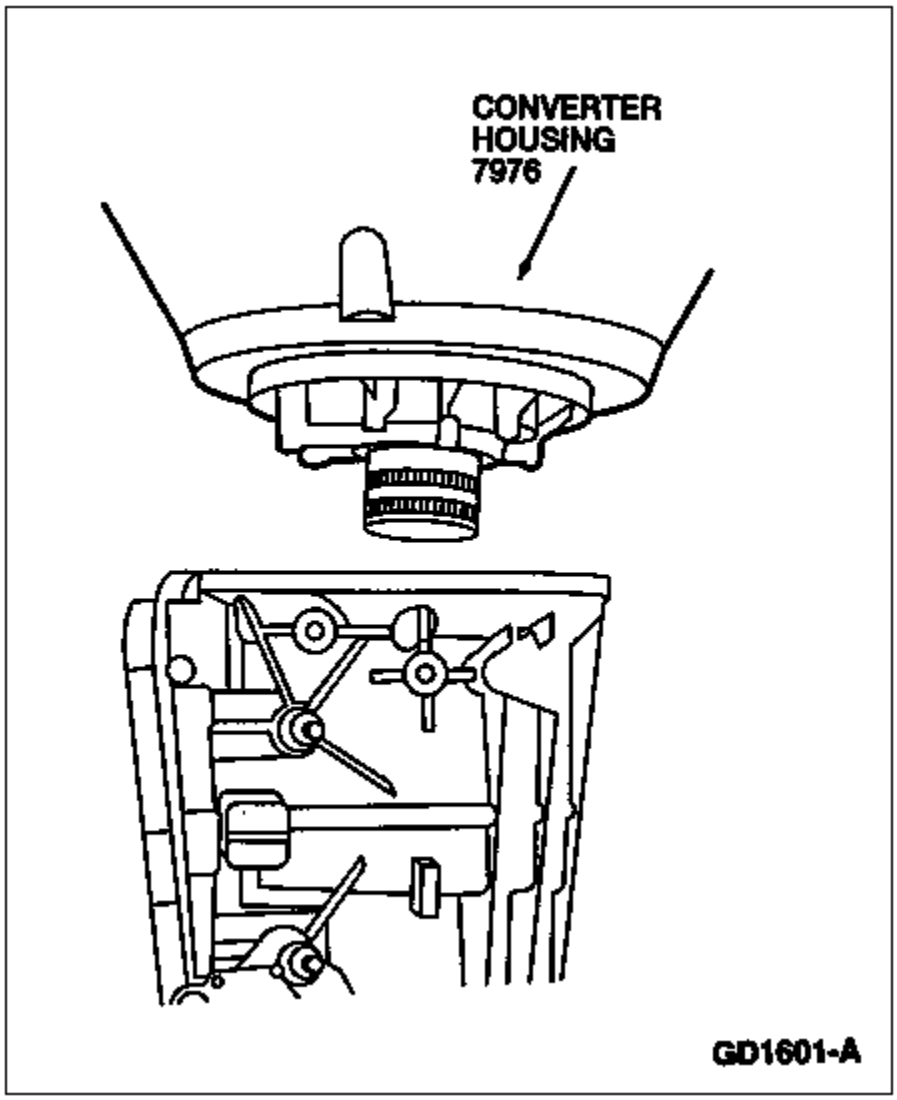
tomsn048@gmail.com



47. **NOTE: Rotate and lift the converter housing so that the clutch assemblies will stay in place.**

    Remove the converter housing and fluid pump support and gear assembly.

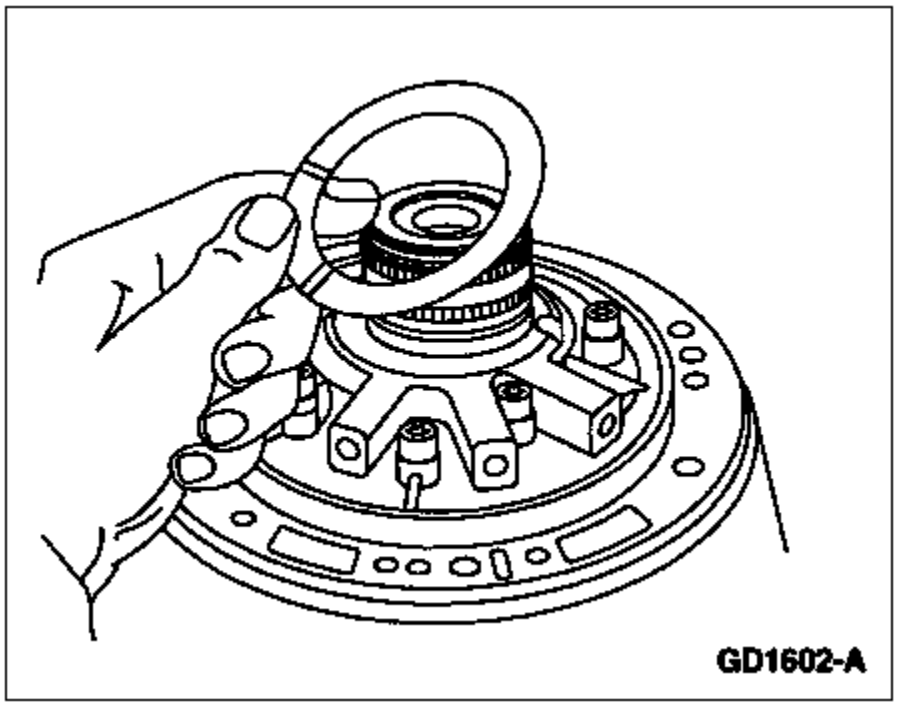
tomsn048@gmail.com



48. **NOTE: Refer to Converter Housing And Pump Assembly under subassemblies for service information.**

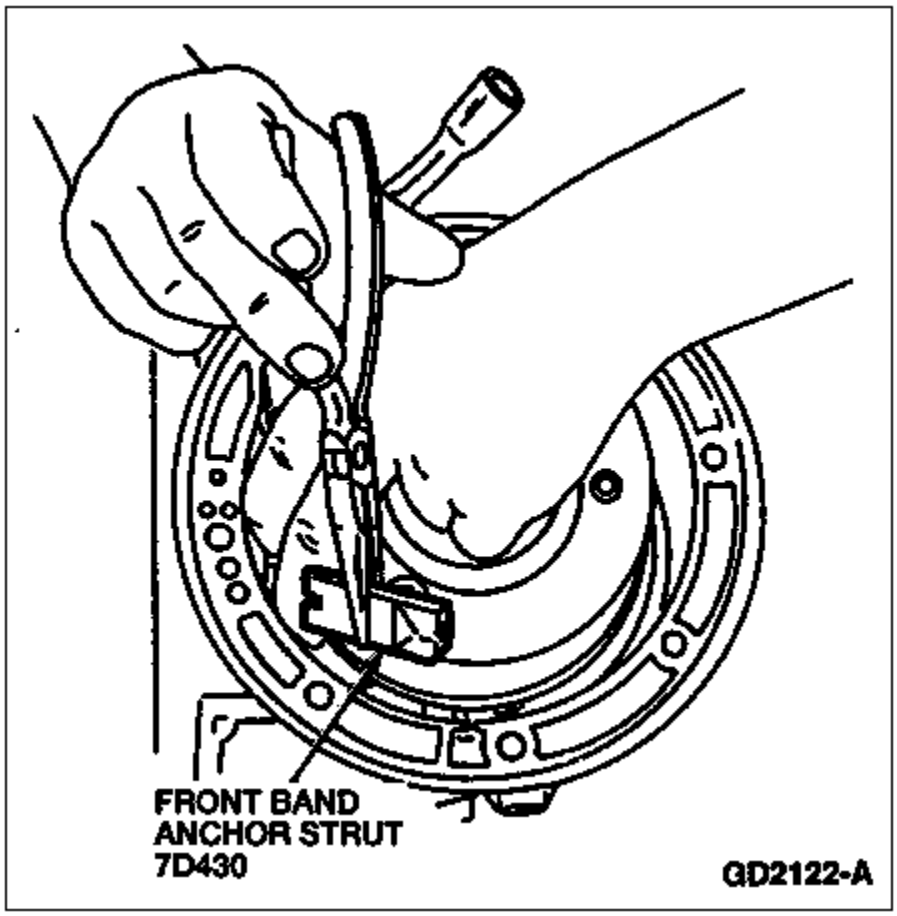
    Remove the No. 1 fluid pump thrust washer. Tag the No. 1 fluid pump thrust washer for identification.

tomsn048@gmail.com



49. Remove front band adjusting screw. Compress the front band around the front brake and coast clutch drum. Remove the front band anchor strut.

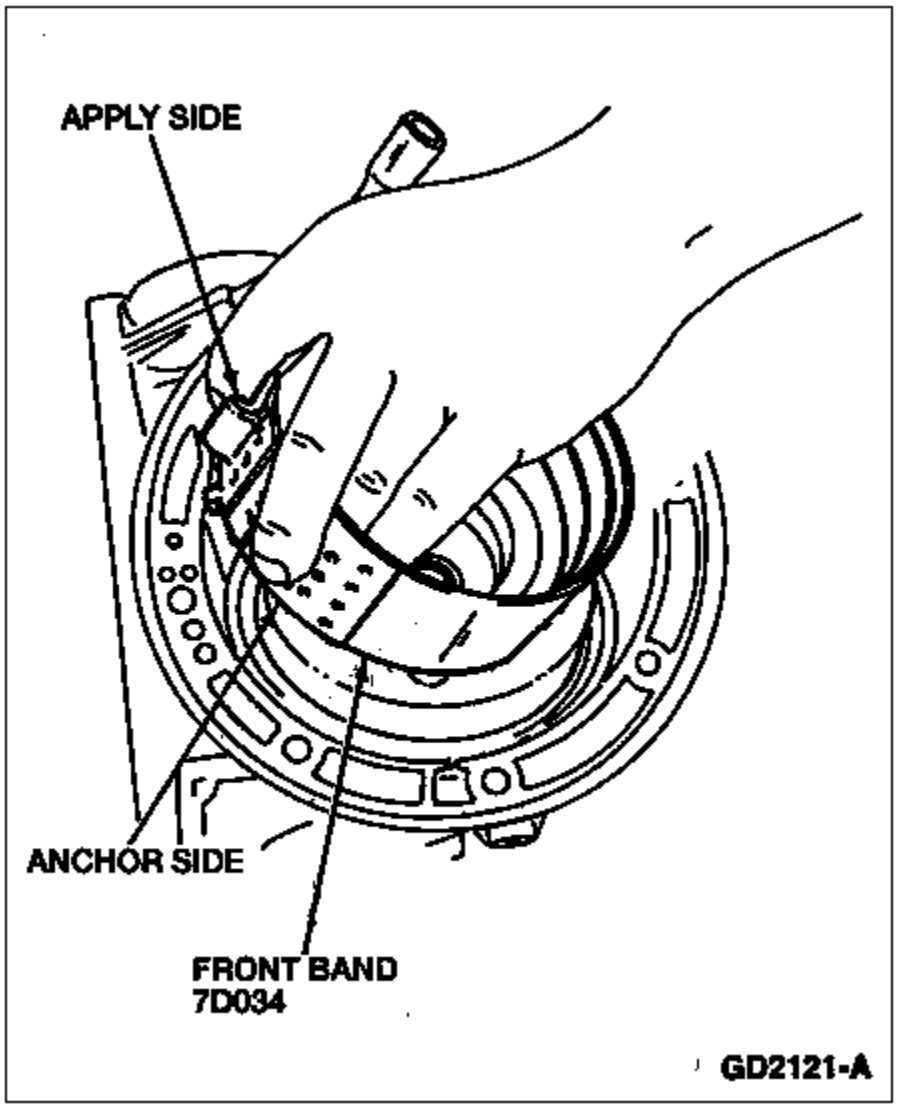
tomsn048@gmail.com



50. **CAUTION: Identify which end of the overdrive band is the anchor side or the apply side.**

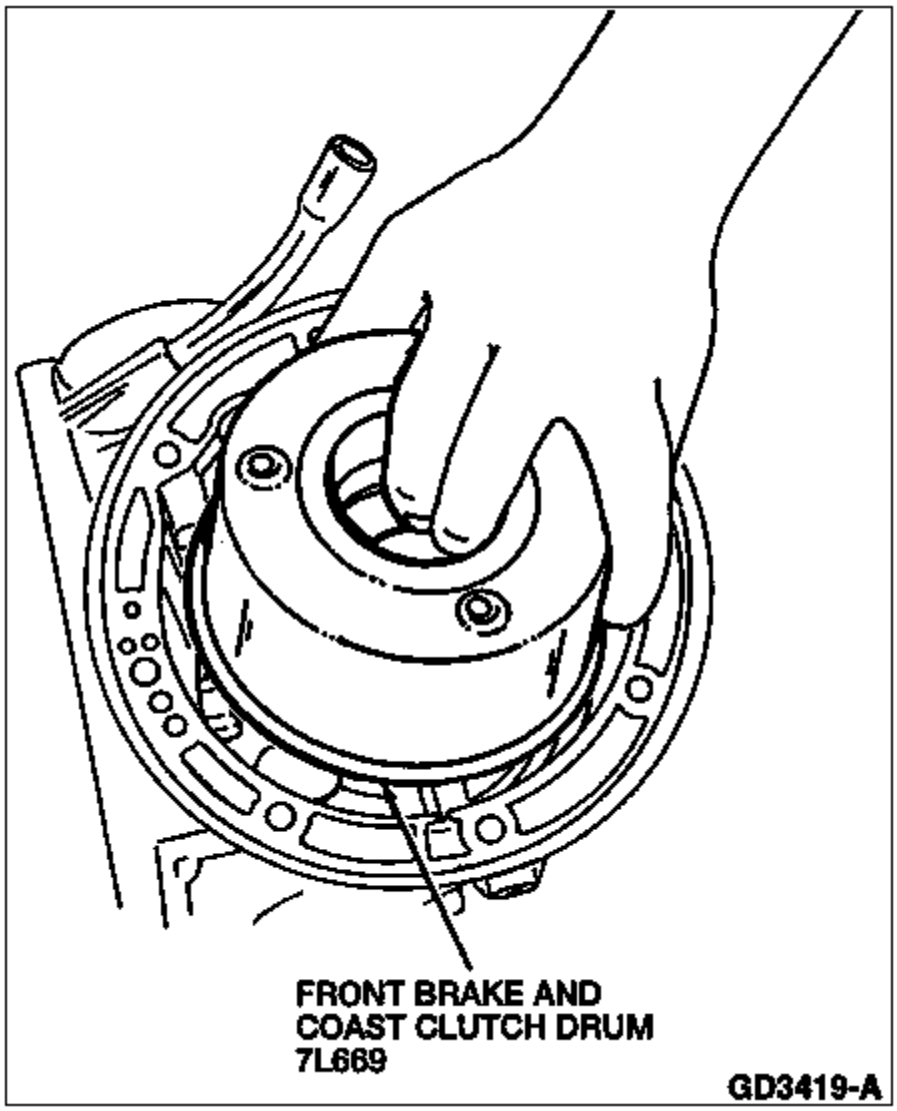
Remove the front band.

tomsn048@gmail.com



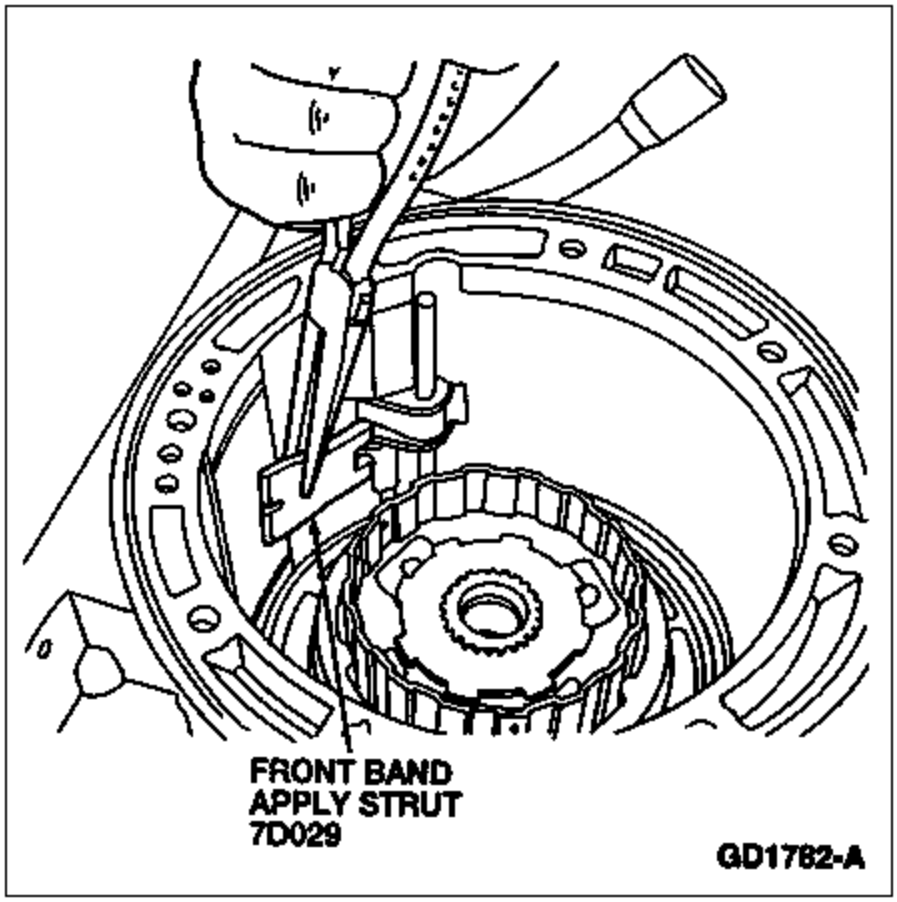
51. Remove the front brake and coast clutch drum.

tomsn048@gmail.com



52. Remove the front band apply strut.

tomsn048@gmail.com

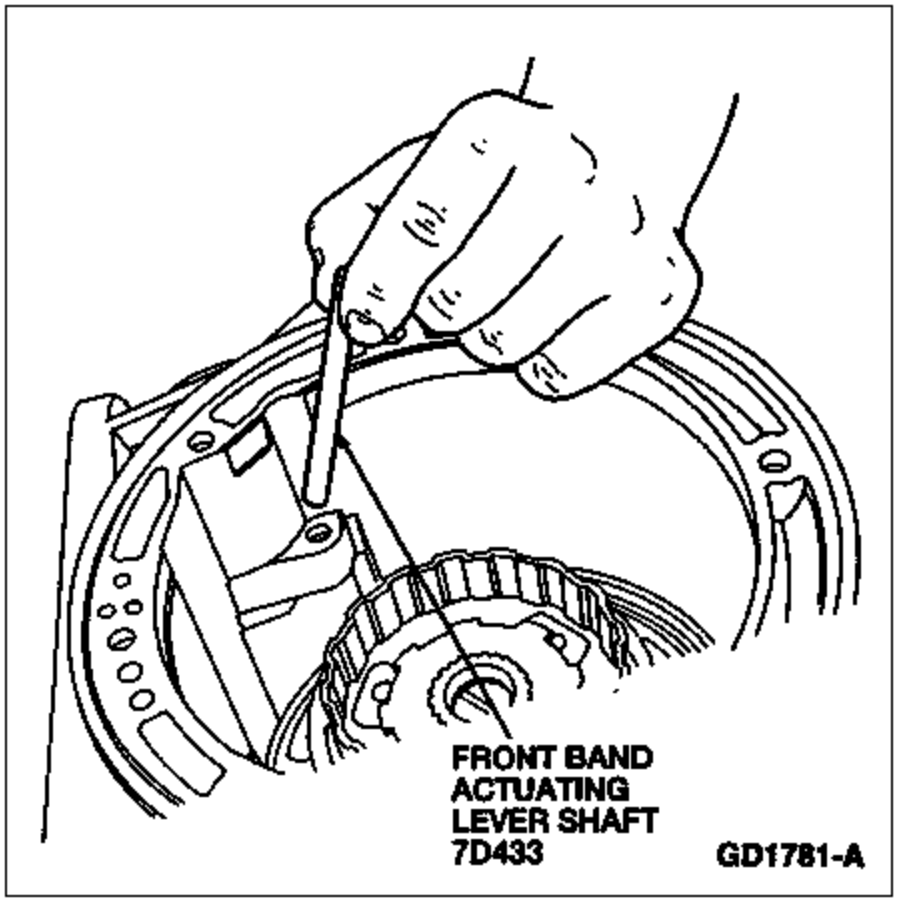


53. **NOTE: Tag and identify the front lever for assembly. The front lever has a letter stamped into its side.**

    NOTE: The front band actuating lever shaft is longer than the intermediate shaft.

    Remove the front band actuating lever shaft.

tomsn048@gmail.com

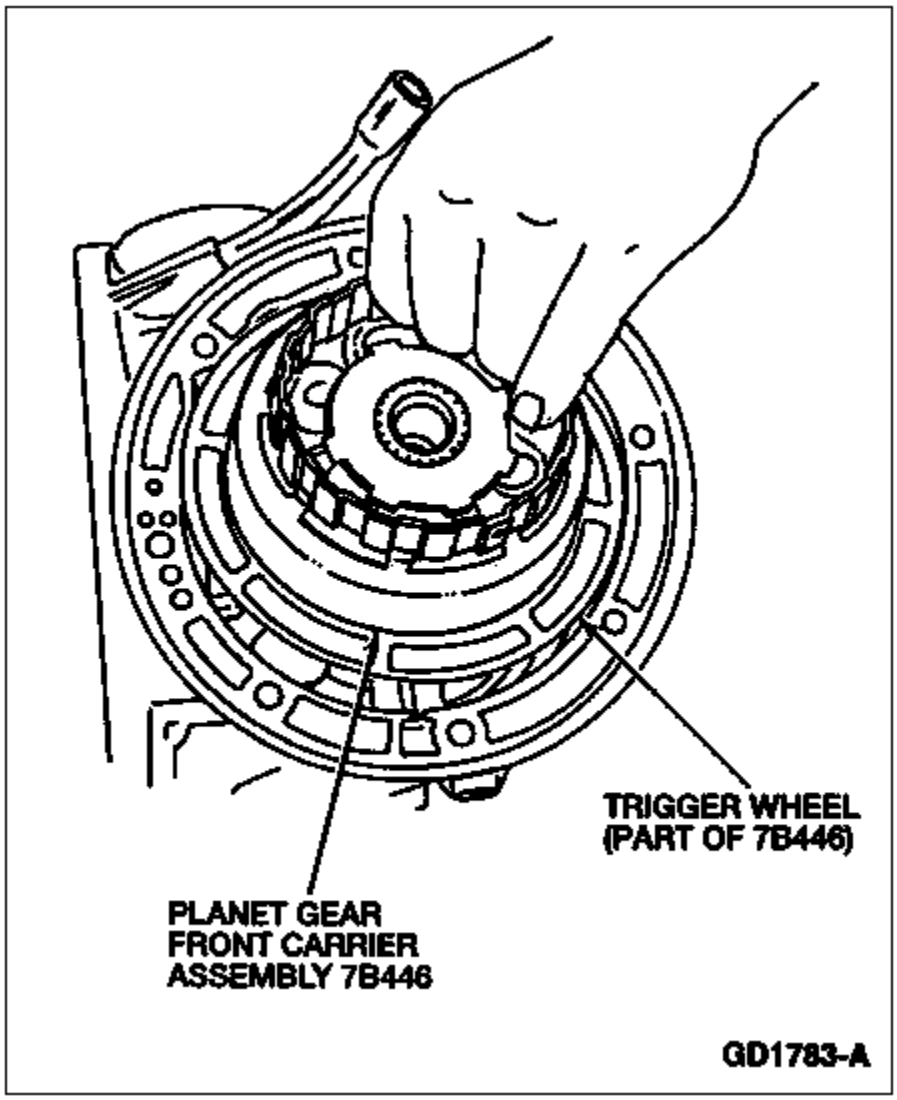


54. **CAUTION: Do not bend the trigger wheel.**

NOTE: No. 2 thrust bearing is in this assembly.

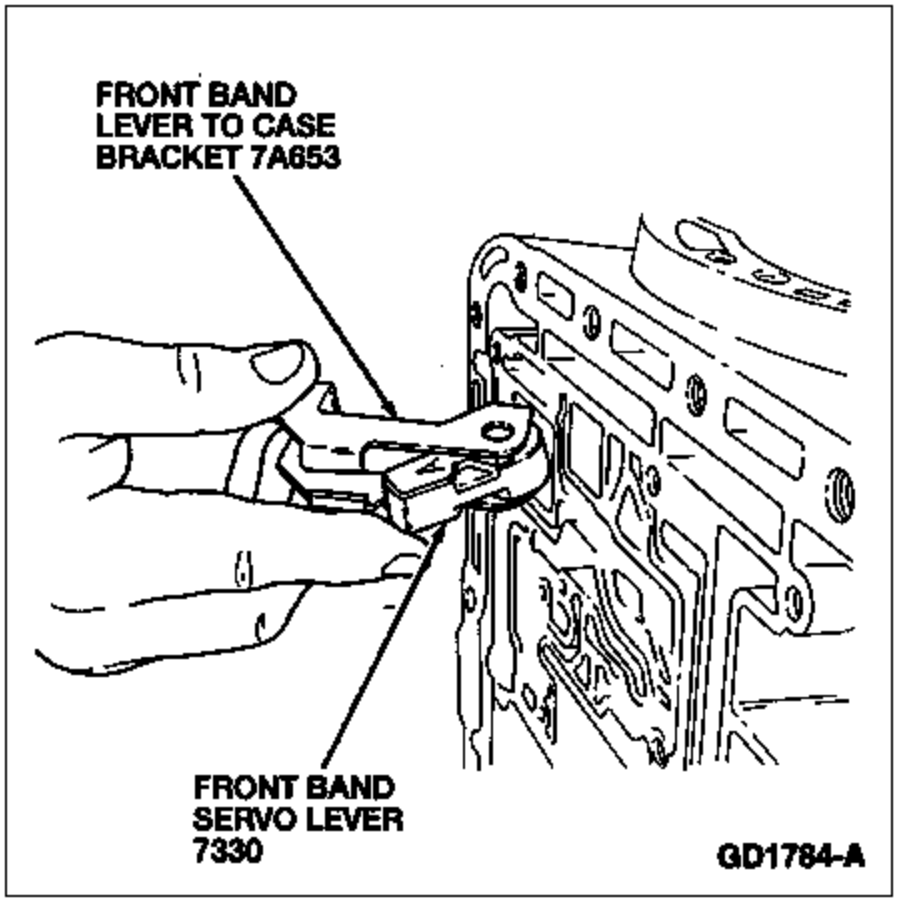
Remove the planetary gear front carrier.

tomsn048@gmail.com



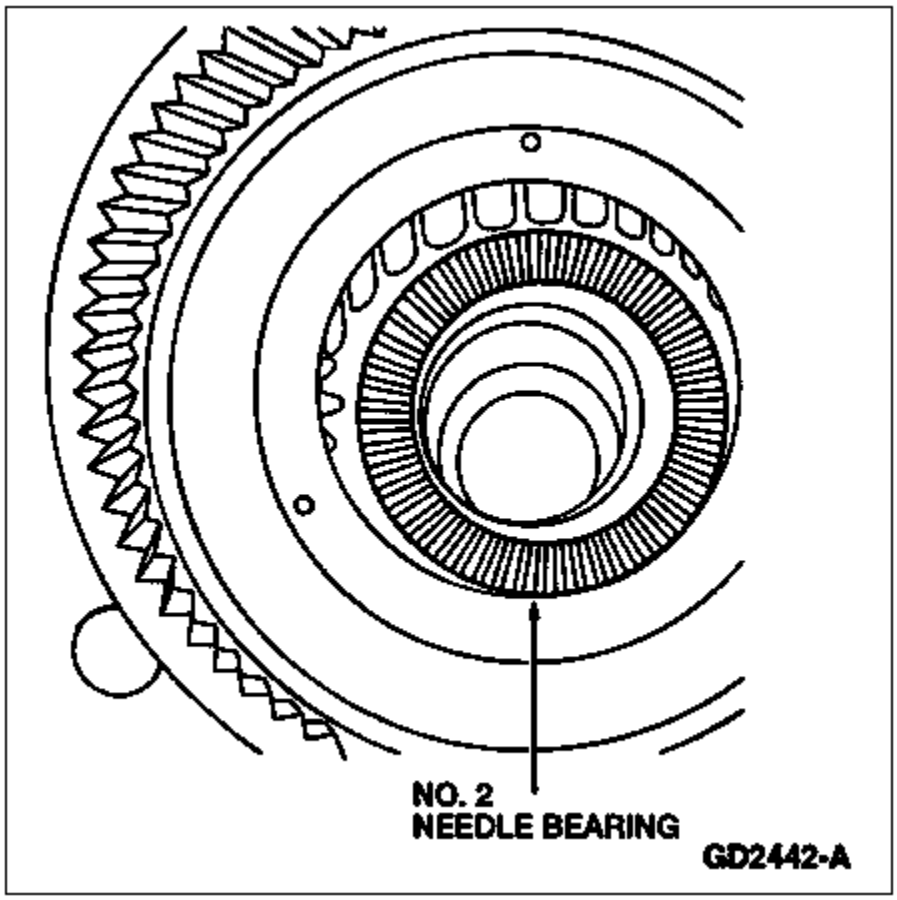
55. Remove the servo band lever and front control bracket.

tomsn048@gmail.com



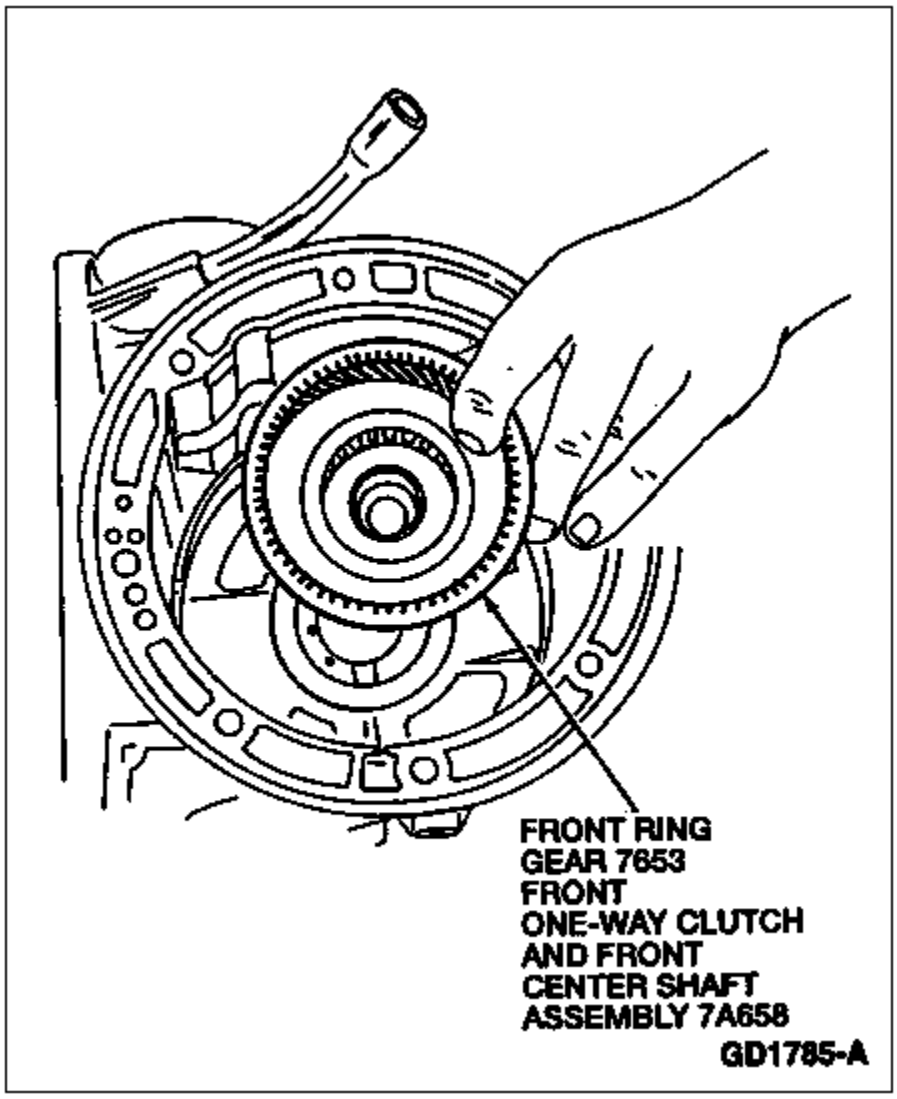
56. Remove the No. 2 needle bearing if not already removed with planetary gear front carrier.

tomsn048@gmail.com



57. Remove the front ring gear, front one-way clutch and front center shaft assembly.

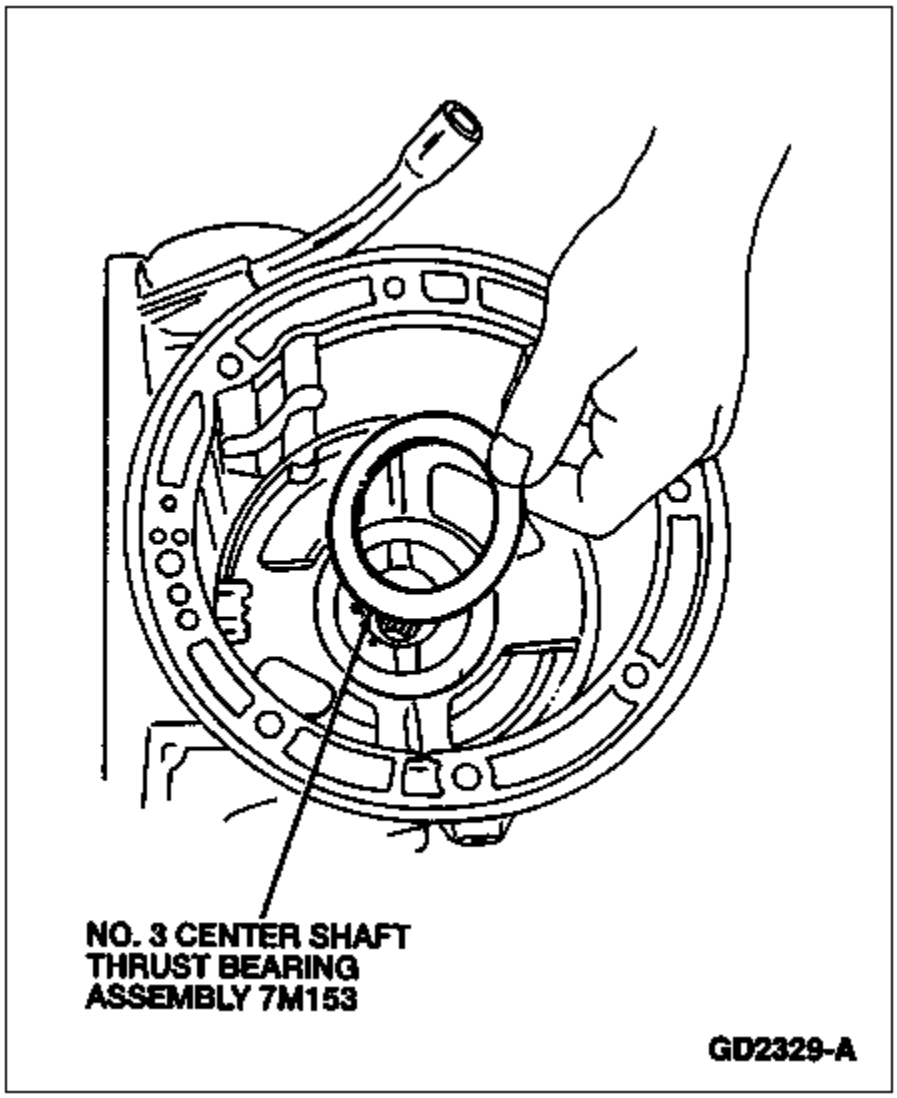
tomsn048@gmail.com



58. **NOTE: Tag and identify the No. 3 center shaft thrust bearing assembly for assembly.**

Remove the No. 3 center shaft thrust bearing assembly.

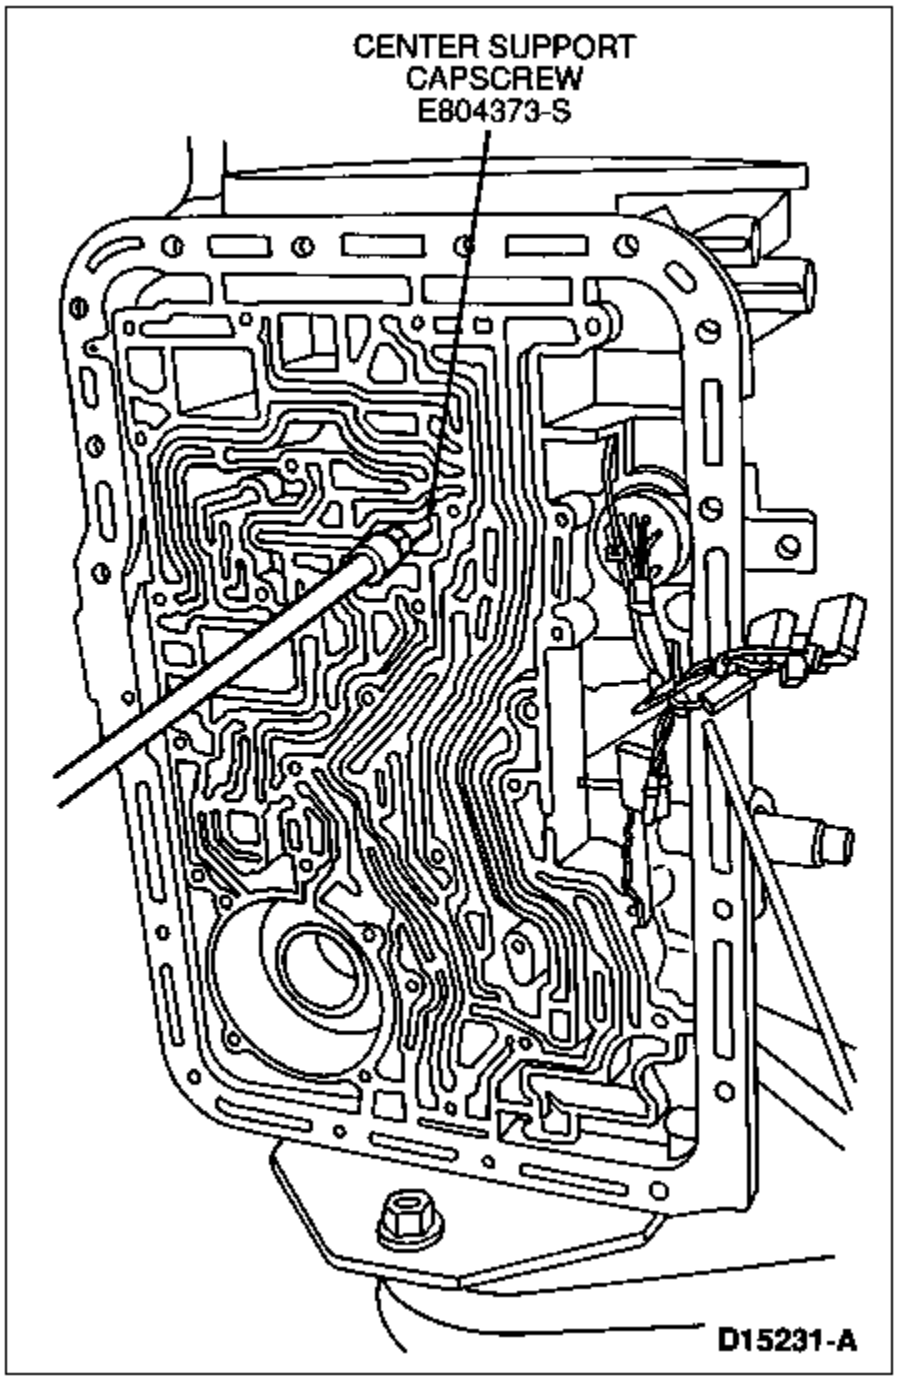
tomsn048@gmail.com



59. **CAUTION: The center support locking nut could fall into the remaining assembly if not removed.**

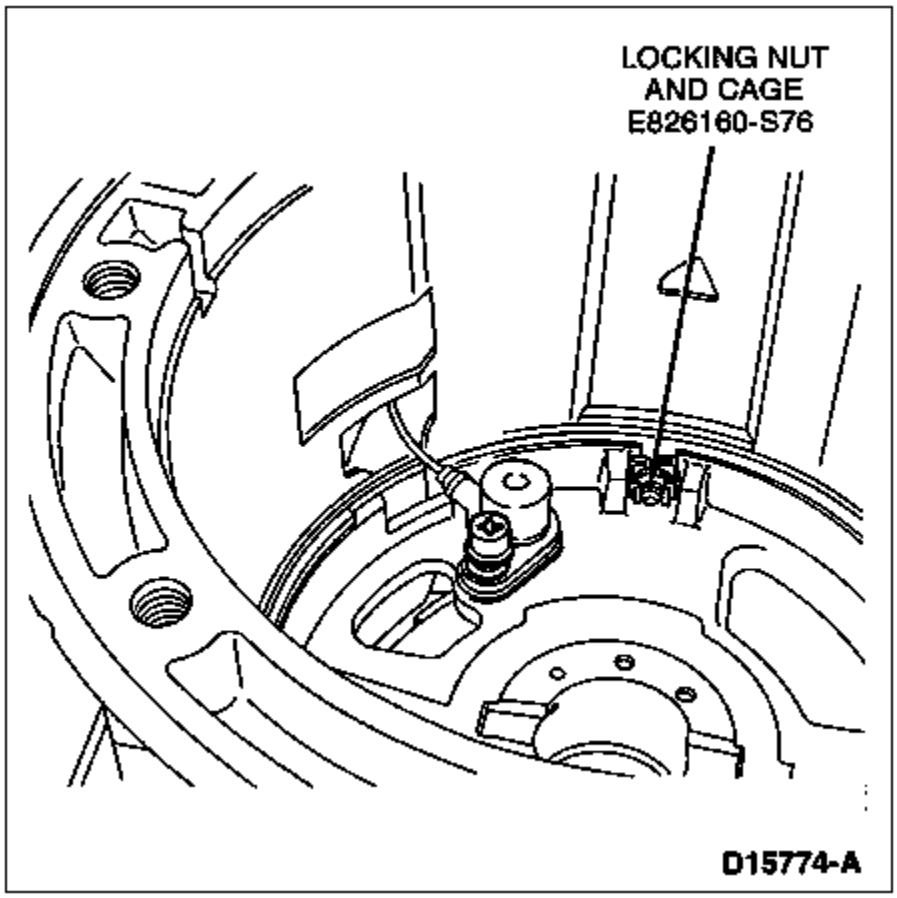
Use a 5mm Allen wrench to remove the M6 x 20mm center support capscrew.

tomsn048@gmail.com



60. Remove the locking nut and cage from center support.

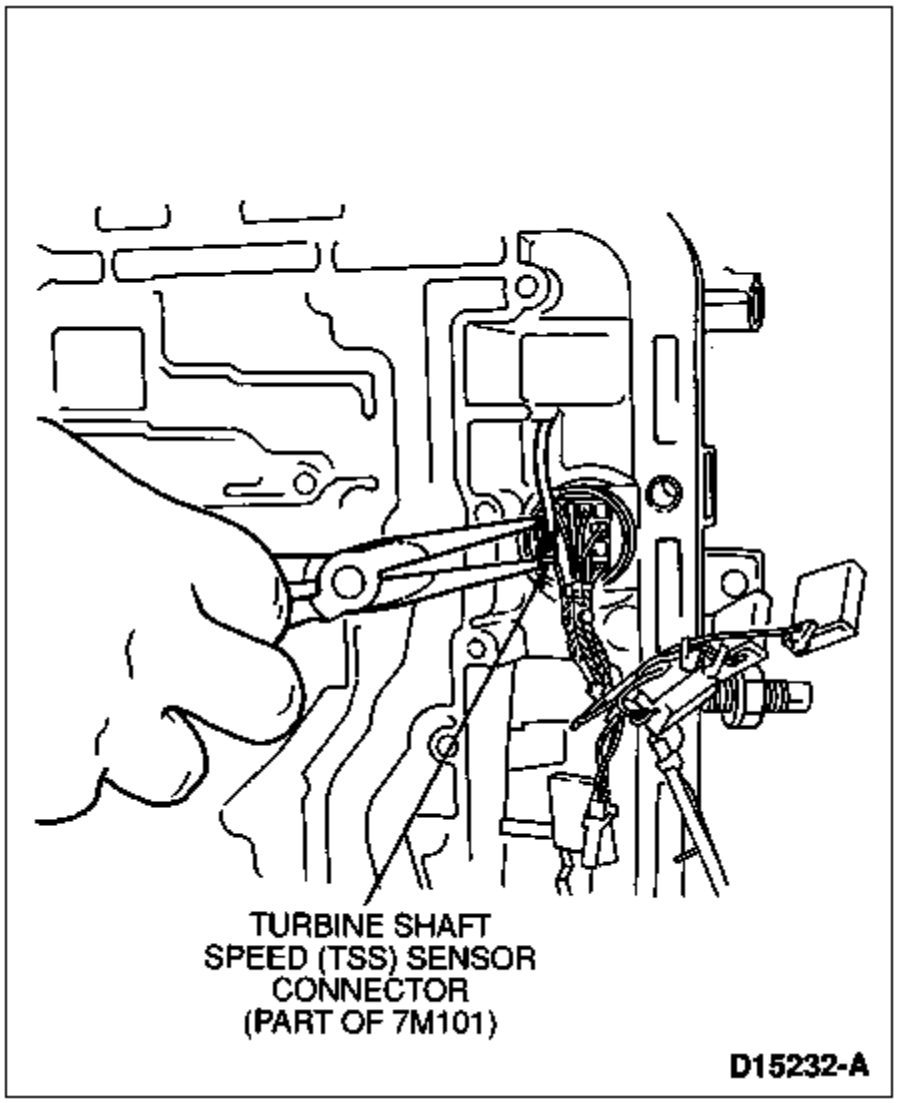
tomsn048@gmail.com



61. **CAUTION: Do not pry on other wires or damage the connector or case surface.**

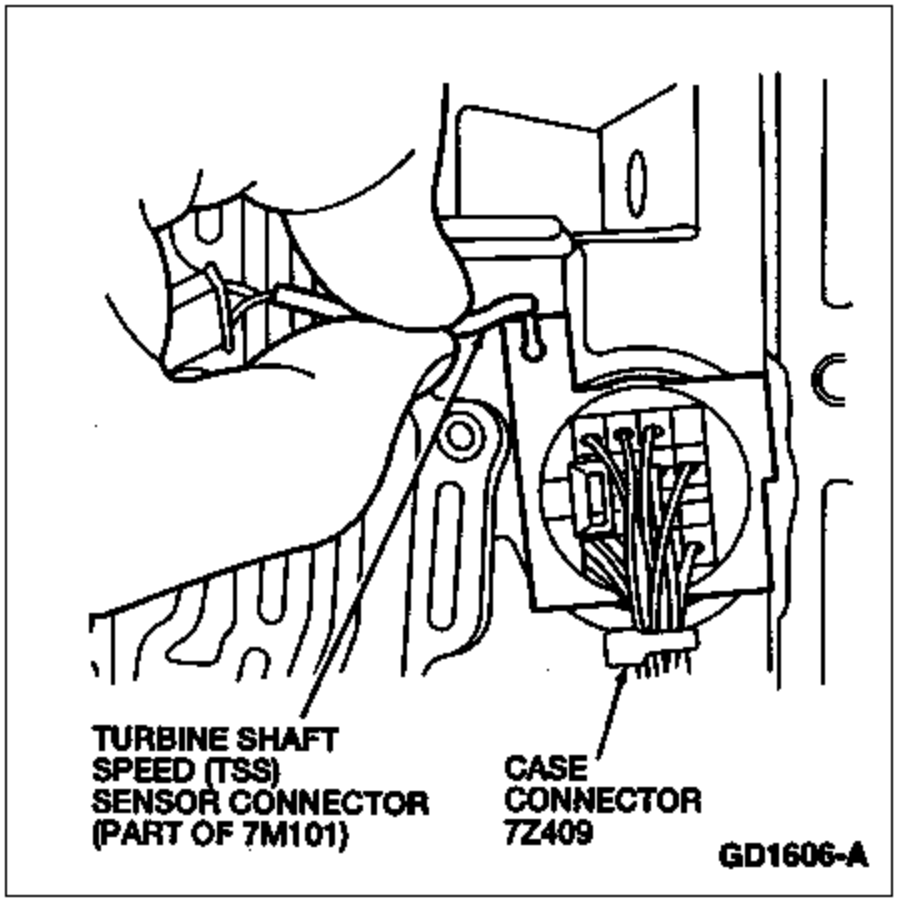
Carefully disconnect the turbine shaft speed (TSS) sensor connector from the 16-pin case connector.

tomsn048@gmail.com



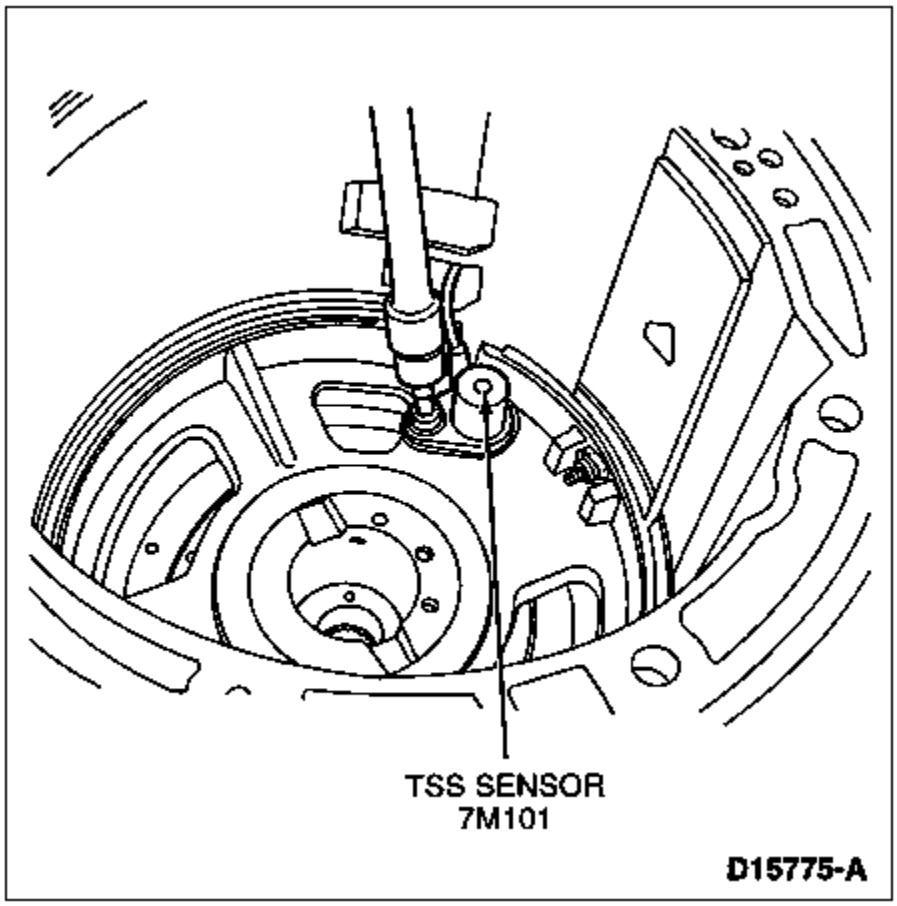
62. Carefully remove TSS sensor connector wires from the retaining slot on the 16-pin case connector.

tomsn048@gmail.com



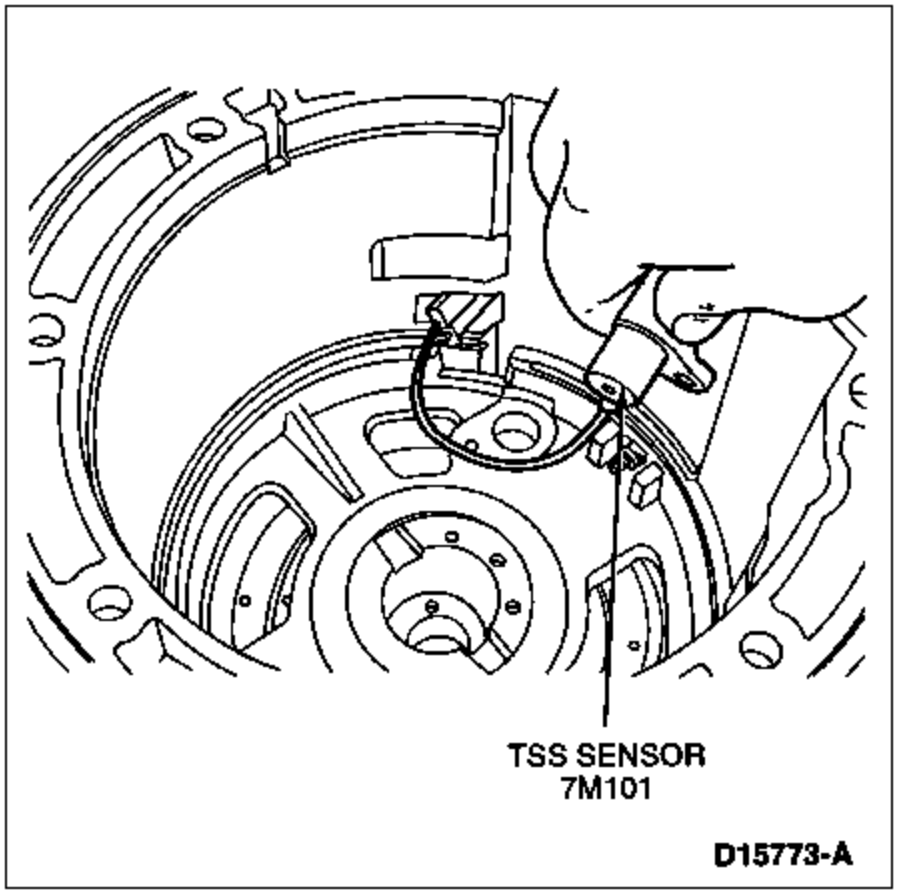
63. Use a T30 Torx® bit to remove the TSS screw.

tomsn048@gmail.com



64. Carefully route the TSS connector and wiring into the transmission through the opening in the case. Remove the TSS.

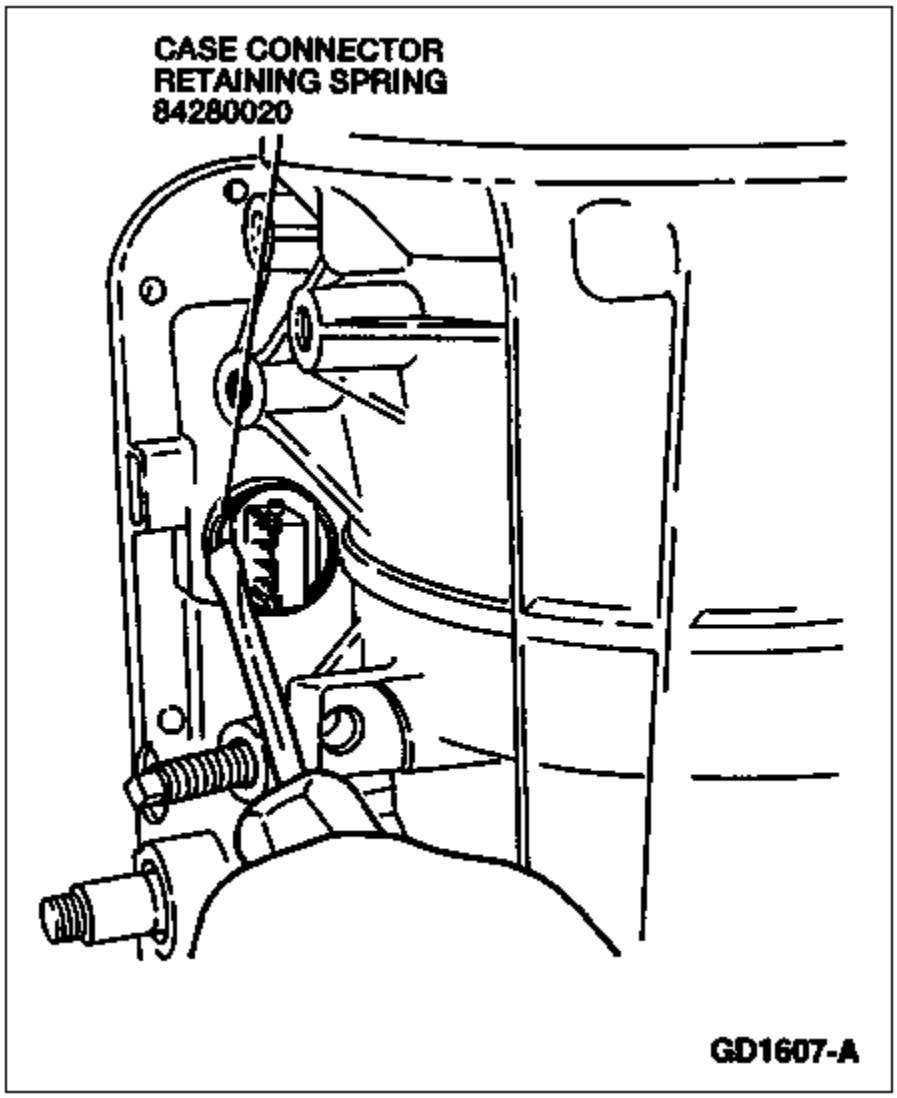
tomsn048@gmail.com



65. **CAUTION: Do not overstretch the case connector retaining spring.**

Use a screwdriver to carefully remove the case connector retaining spring.

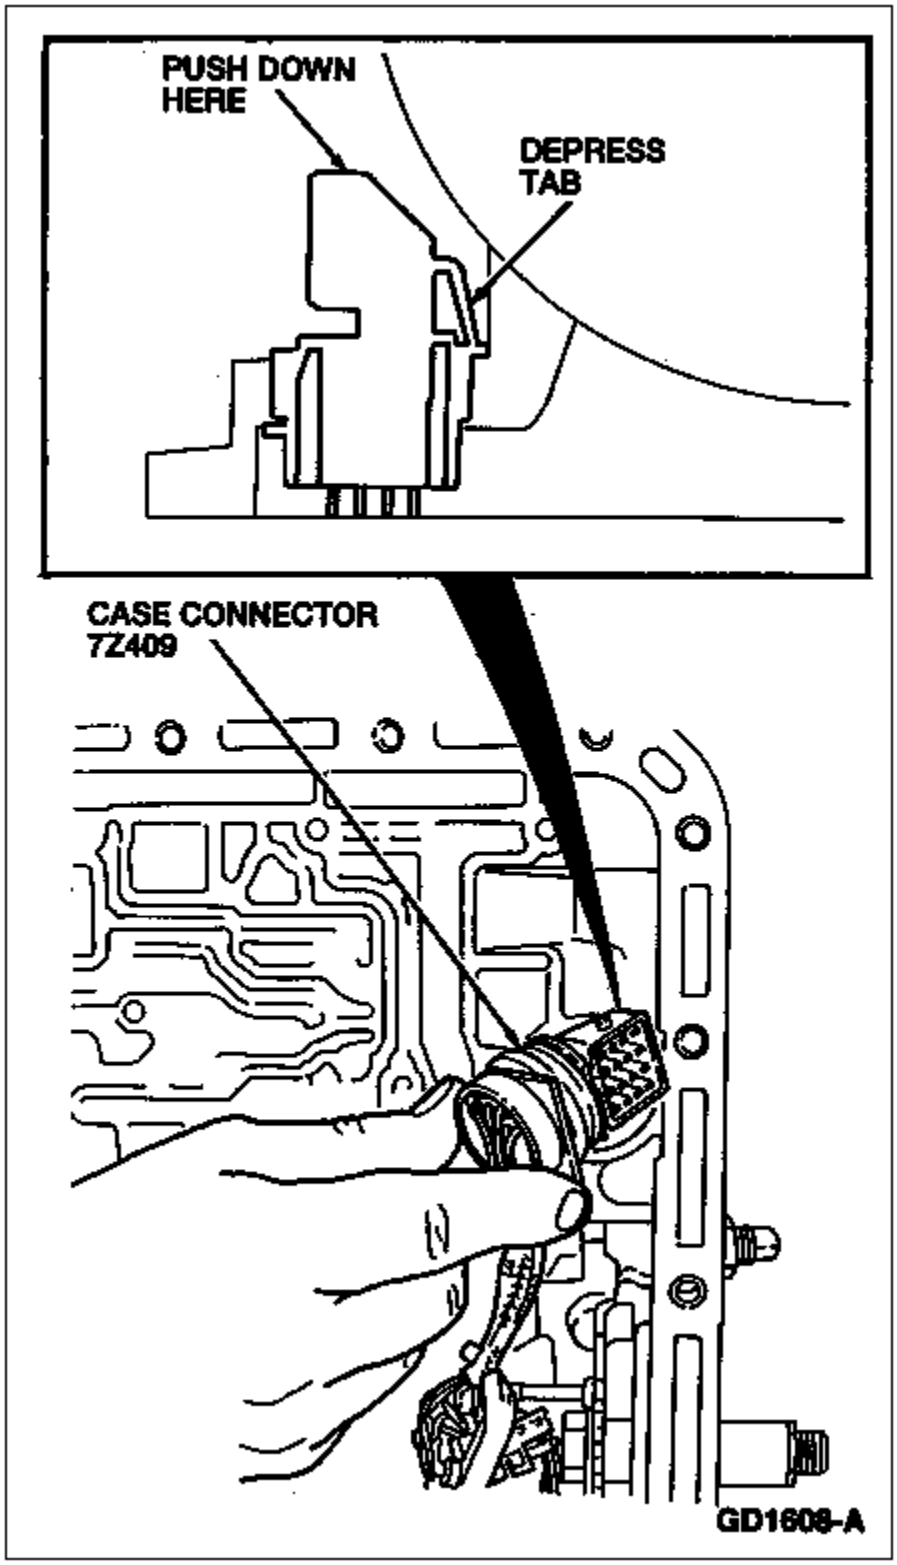
tomsn048@gmail.com



66. **CAUTION: Do not damage the connector or harness.**

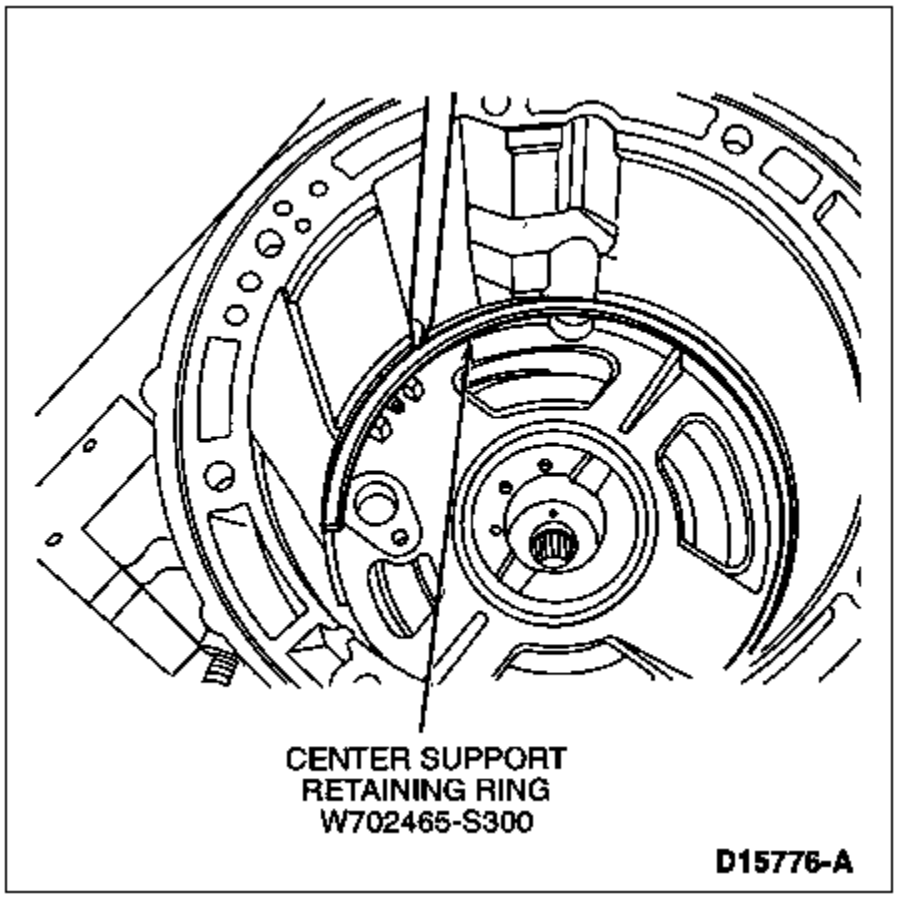
Carefully push down on the top of the connector until it stops. Depress the tab on the back side of the connector and push down on the connector. Remove the connector and harness through the bottom of the case.

tomsn048@gmail.com



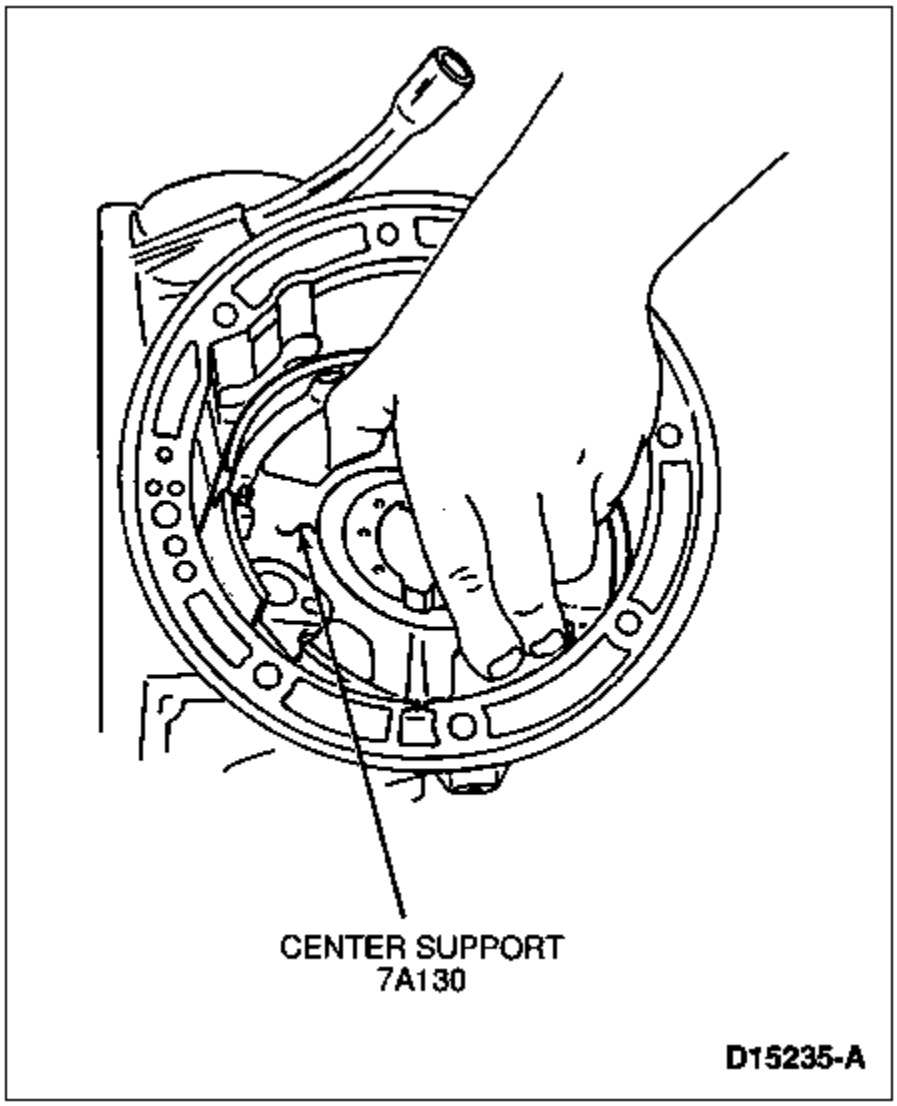
67. Remove the center support retaining ring.

tomsn048@gmail.com



68. Remove the center support by pulling evenly around the center support web.

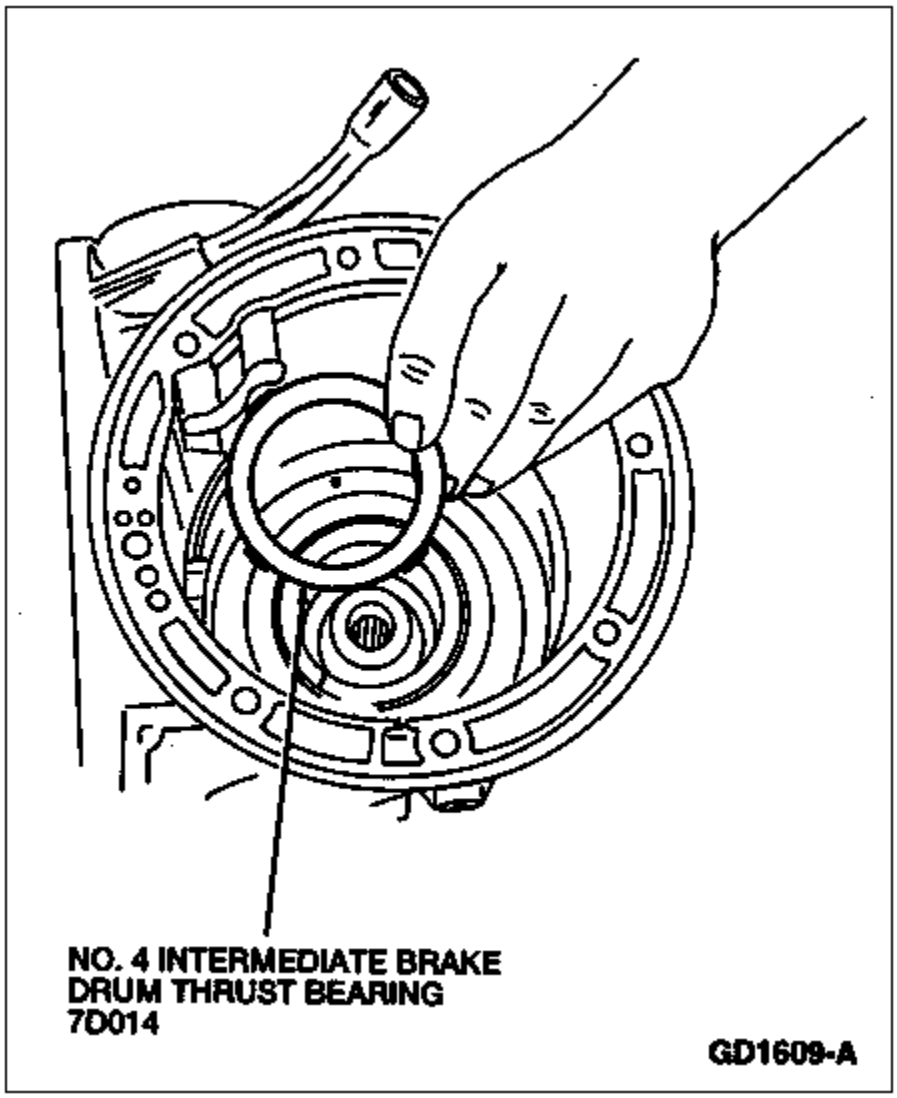
tomsn048@gmail.com



69. **NOTE: Tag and identify the No. 4 intermediate brake drum thrust bearing for assembly.**

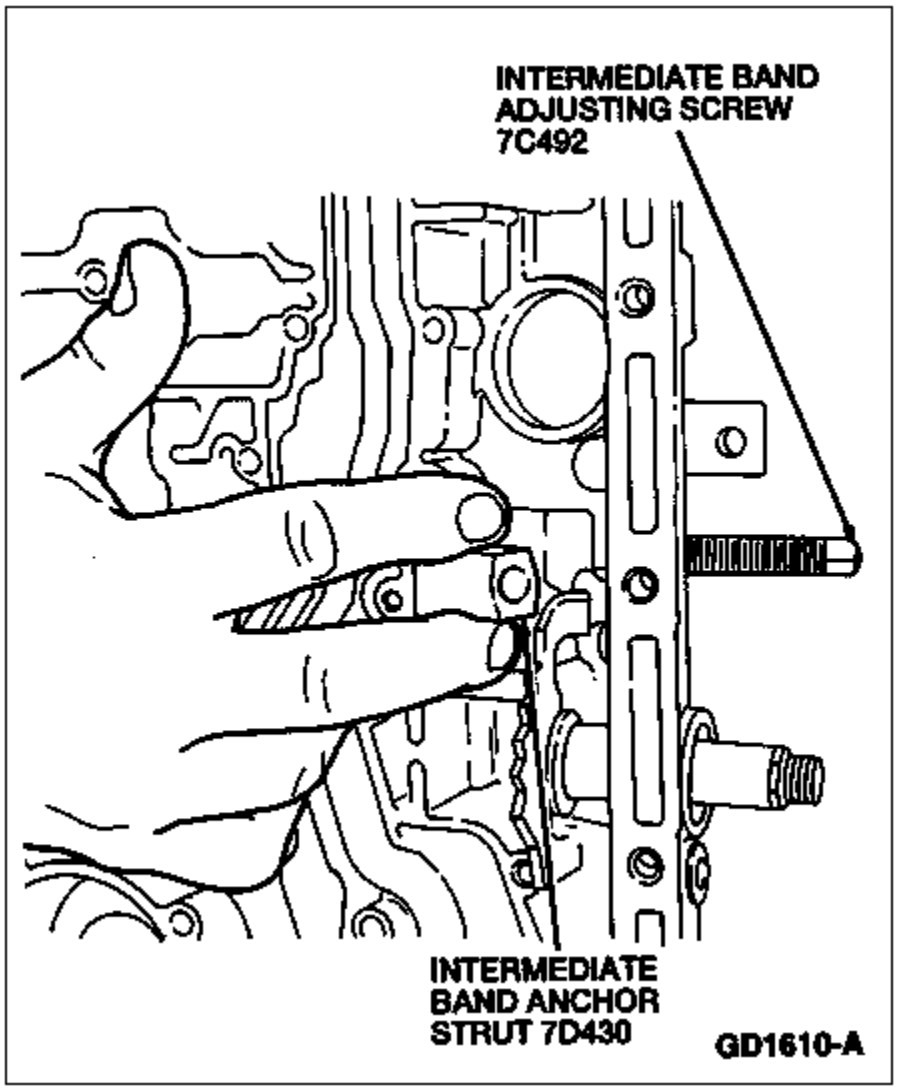
Remove the No. 4 intermediate brake drum thrust bearing.

tomsn048@gmail.com



70. Remove the intermediate band anchor strut through the bottom of the case. Remove intermediate band adjusting screw.

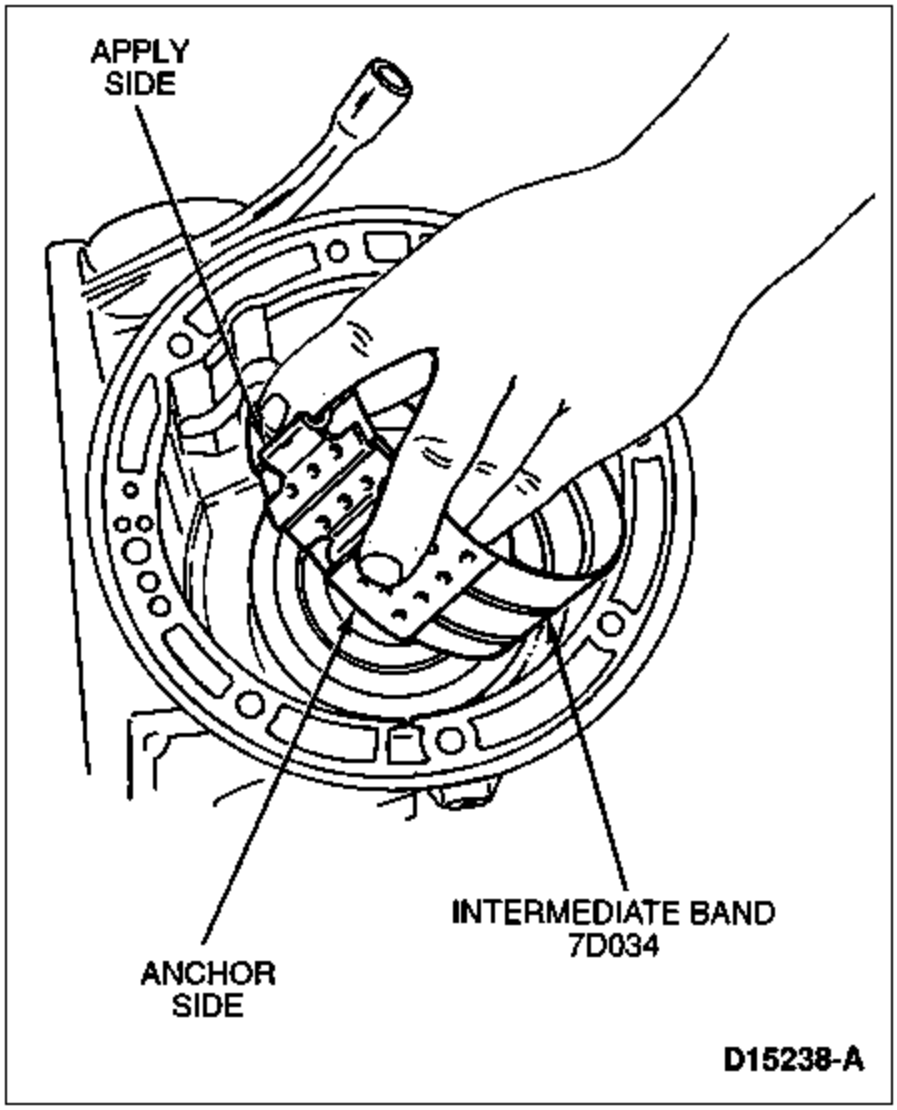
tomsn048@gmail.com



71. **CAUTION: Identify which end of the intermediate band is the anchor side or the apply side.**

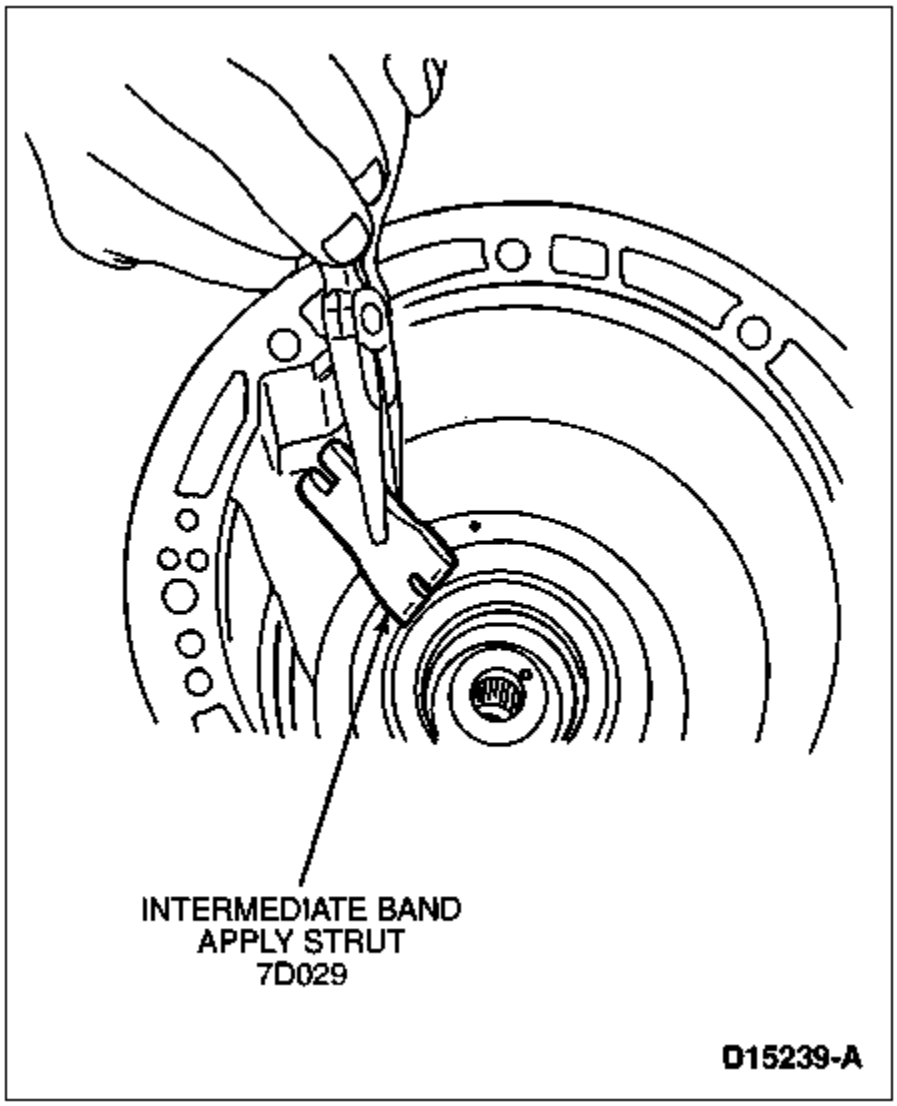
Remove the intermediate band.

tomsn048@gmail.com



72. Remove the intermediate band apply strut.

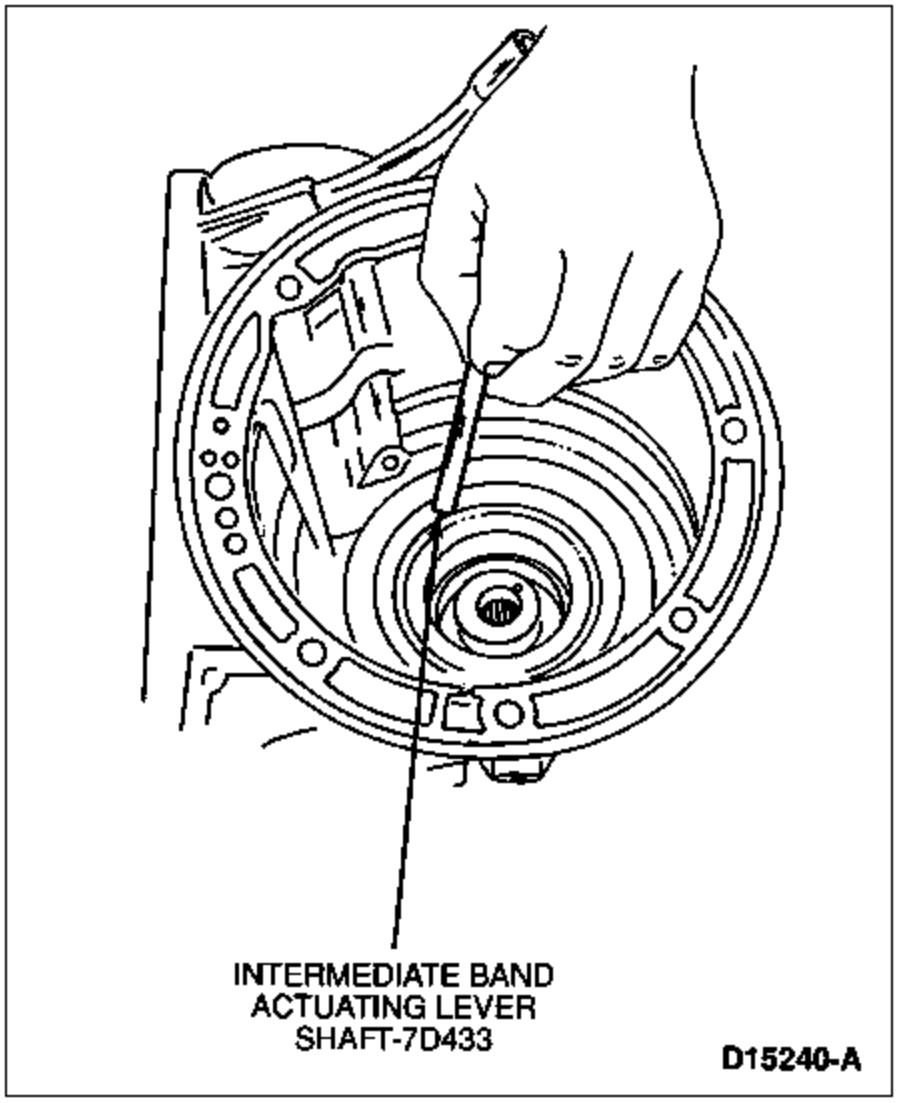
tomsn048@gmail.com



73. **NOTE: The intermediate band actuating lever shaft is shorter than the overdrive band actuating lever shaft.**

    Remove the intermediate band actuating lever shaft.

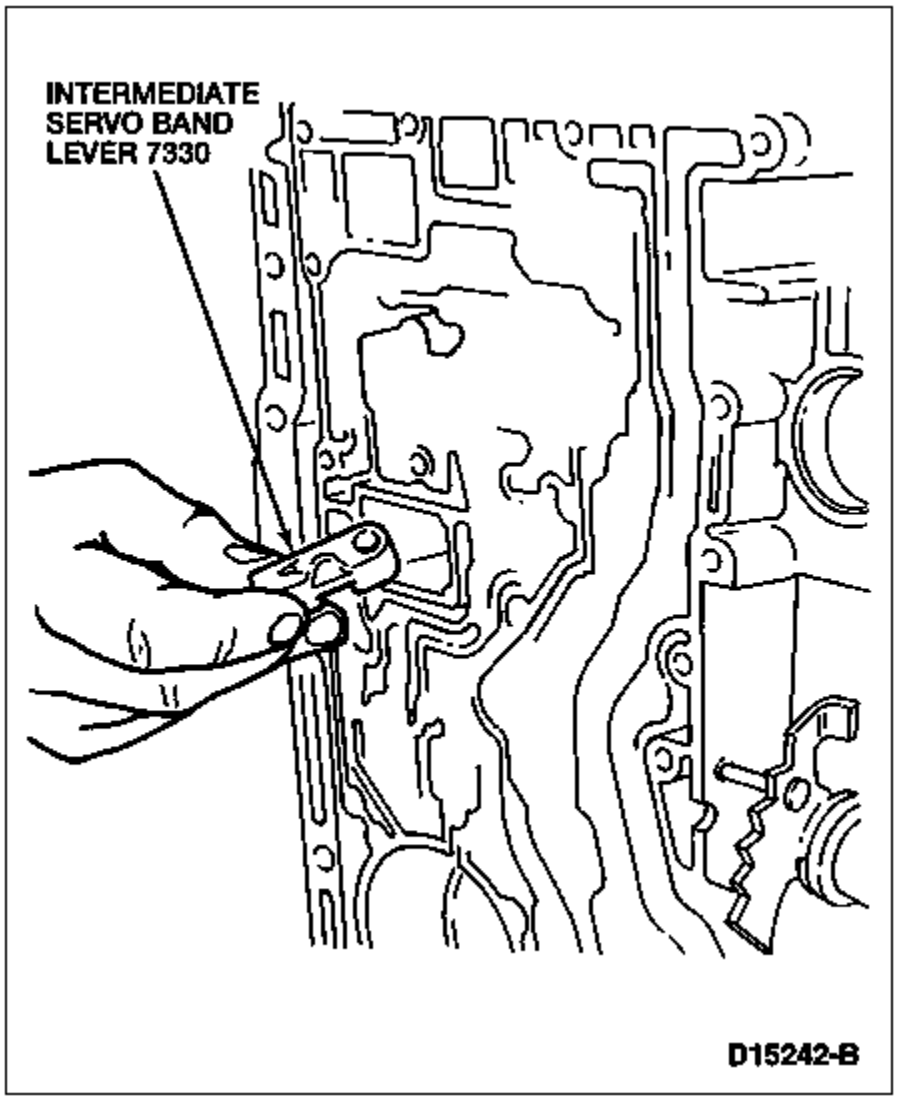
tomsn048@gmail.com



74. **NOTE: Tag and identify the intermediate band servo lever for assembly. The intermediate band servo lever has a letter stamped on its side for identification.**

    Remove the intermediate band servo lever.

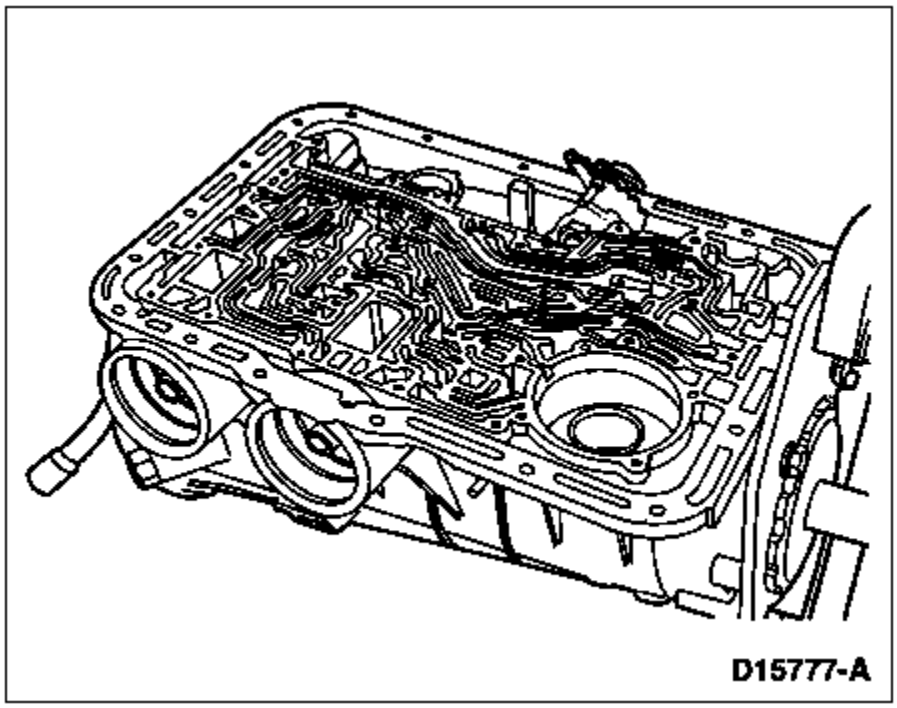
tomsn048@gmail.com



75. **CAUTION: Make sure the lock pin on Bench-Mounted Holding Fixture T57L-500-B is secure.**

Rotate the transmission so the fluid pan surface is facing up.

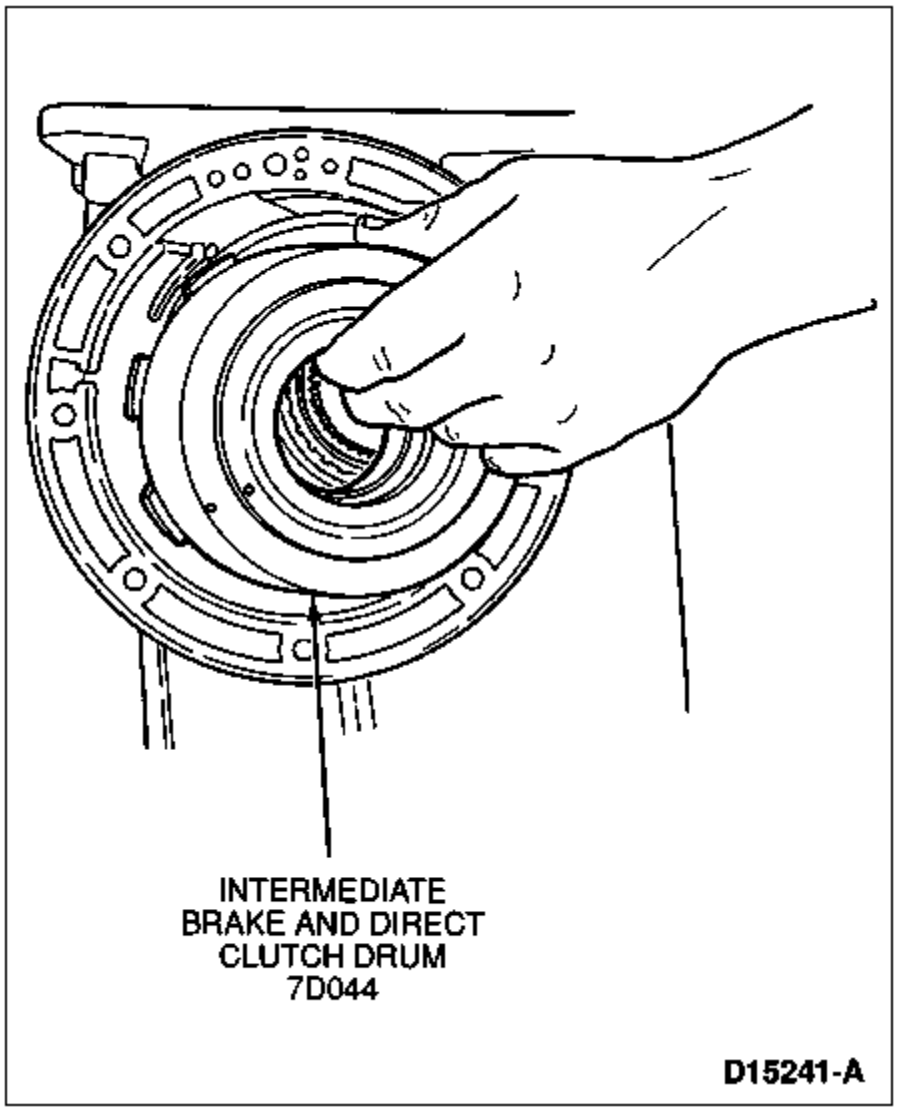
tomsn048@gmail.com



76. **NOTE: The No. 5 forward clutch cylinder thrust bearing may come out with the intermediate brake and direct clutch drum.**

Remove the intermediate brake and direct clutch drum.

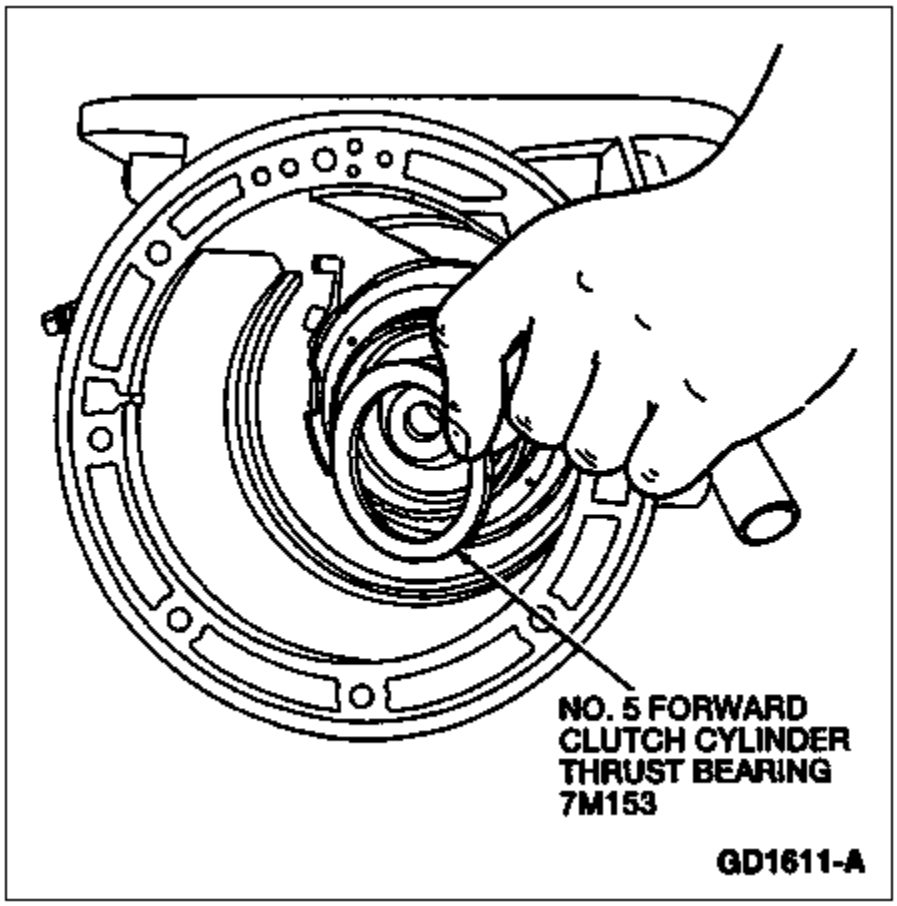
tomsn048@gmail.com



77. **NOTE: Tag and identify the No. 5 forward clutch cylinder thrust bearing for assembly.**

Remove the No. 5 forward clutch cylinder thrust bearing.

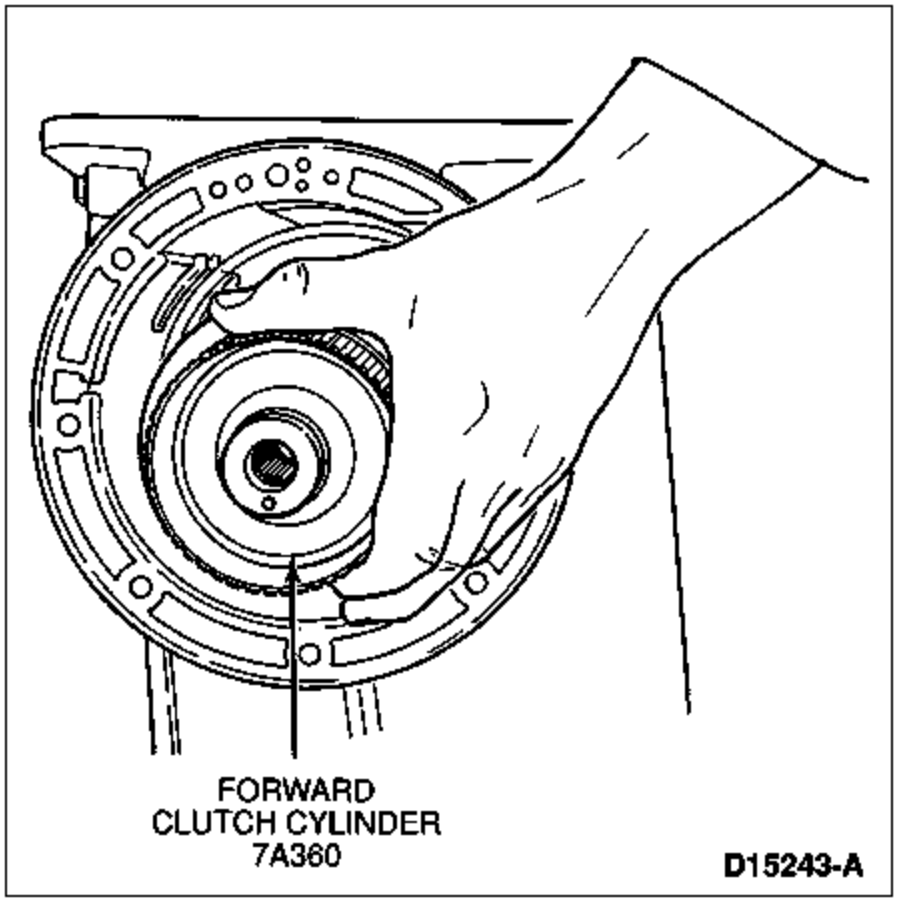
tomsn048@gmail.com



78. **NOTE: The No. 5 forward clutch cylinder thrust bearing may come out with the forward clutch cylinder.**

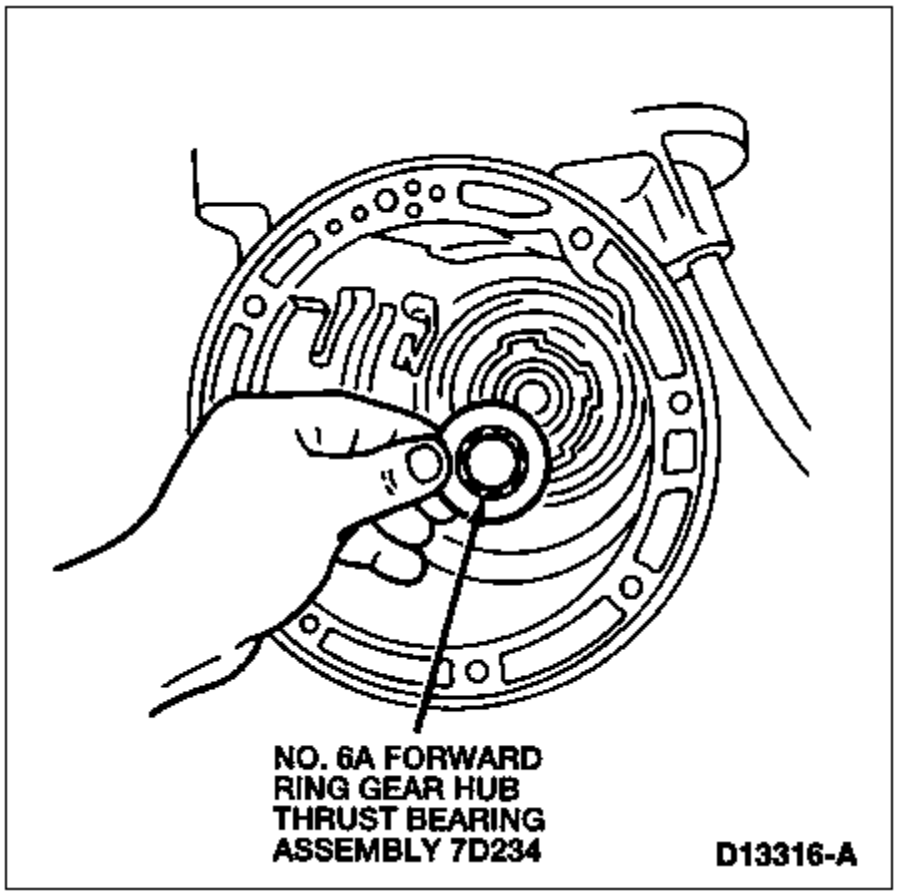
    Remove the forward clutch cylinder.

tomsn048@gmail.com



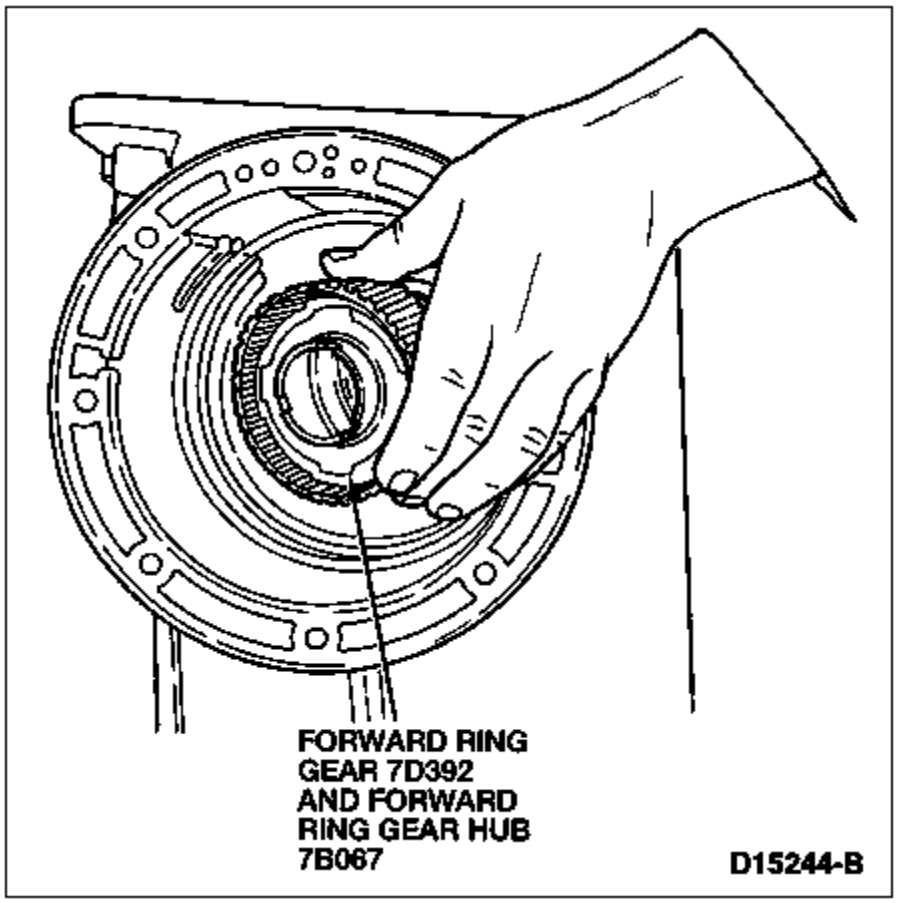
79. Remove No. 6A forward ring gear hub thrust bearing assembly.

tomsn048@gmail.com

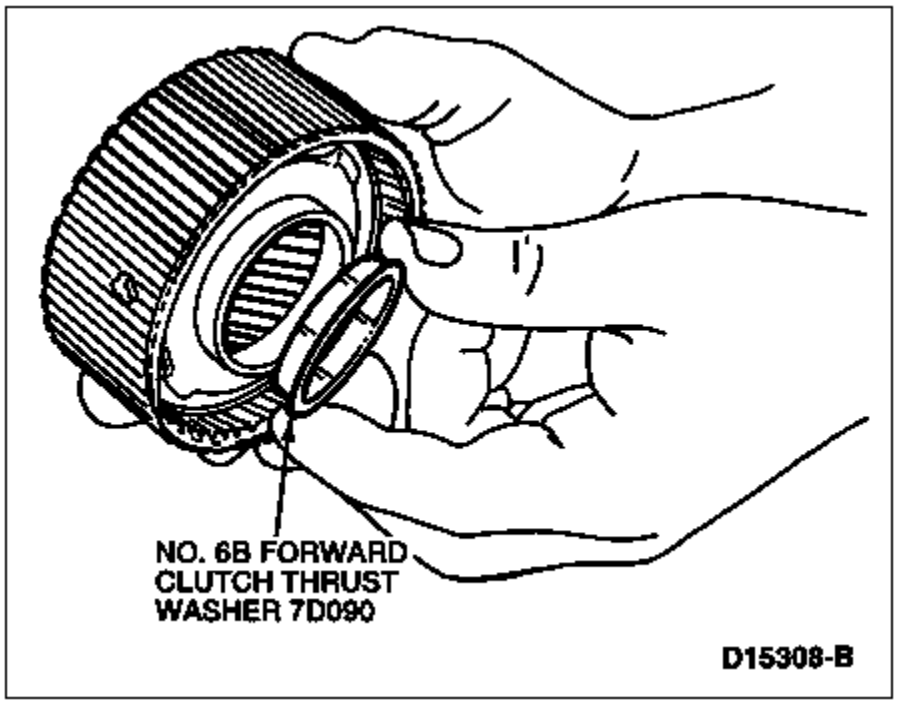


80. Remove the forward ring gear and forward ring gear hub.

tomsn048@gmail.com



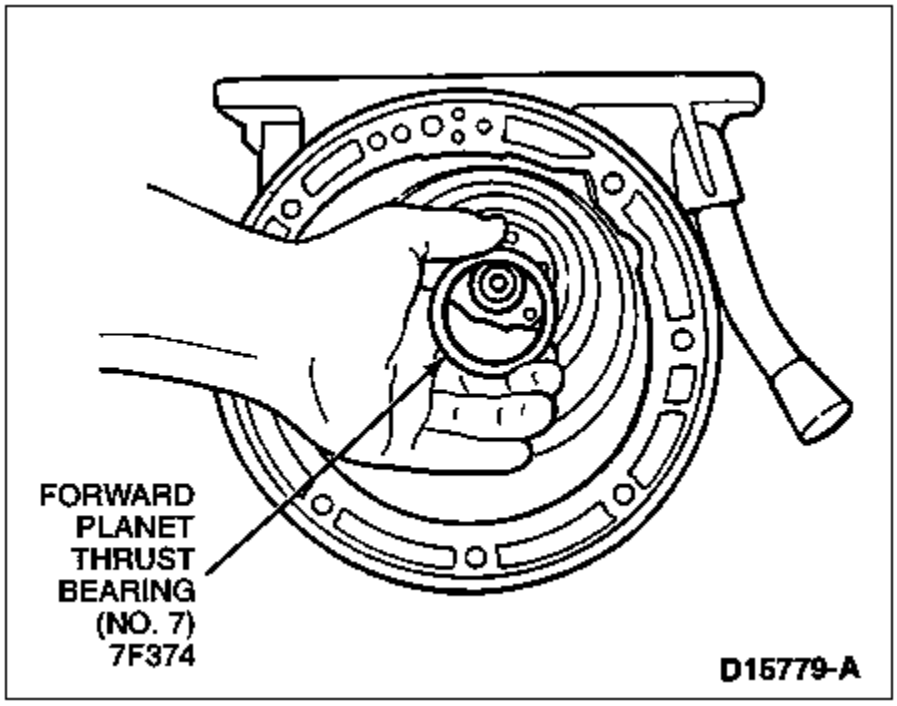
81. Remove No.6B forward clutch thrust washer.



tomsn048@gmail.com

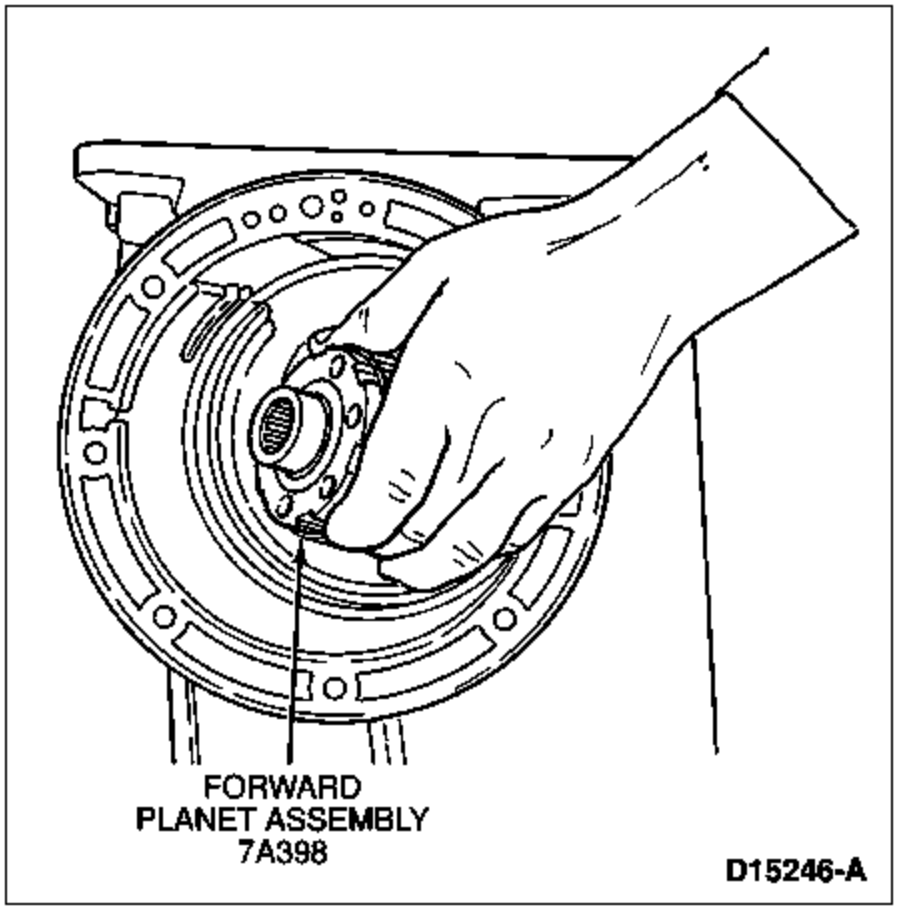
82. **NOTE: Check black oxidized side during removal to ensure correct placement during reassembly. Black oxidized side must be toward planetary assembly. The uncoated side must face up.**

    Remove the No. 7 forward planetary thrust bearing.



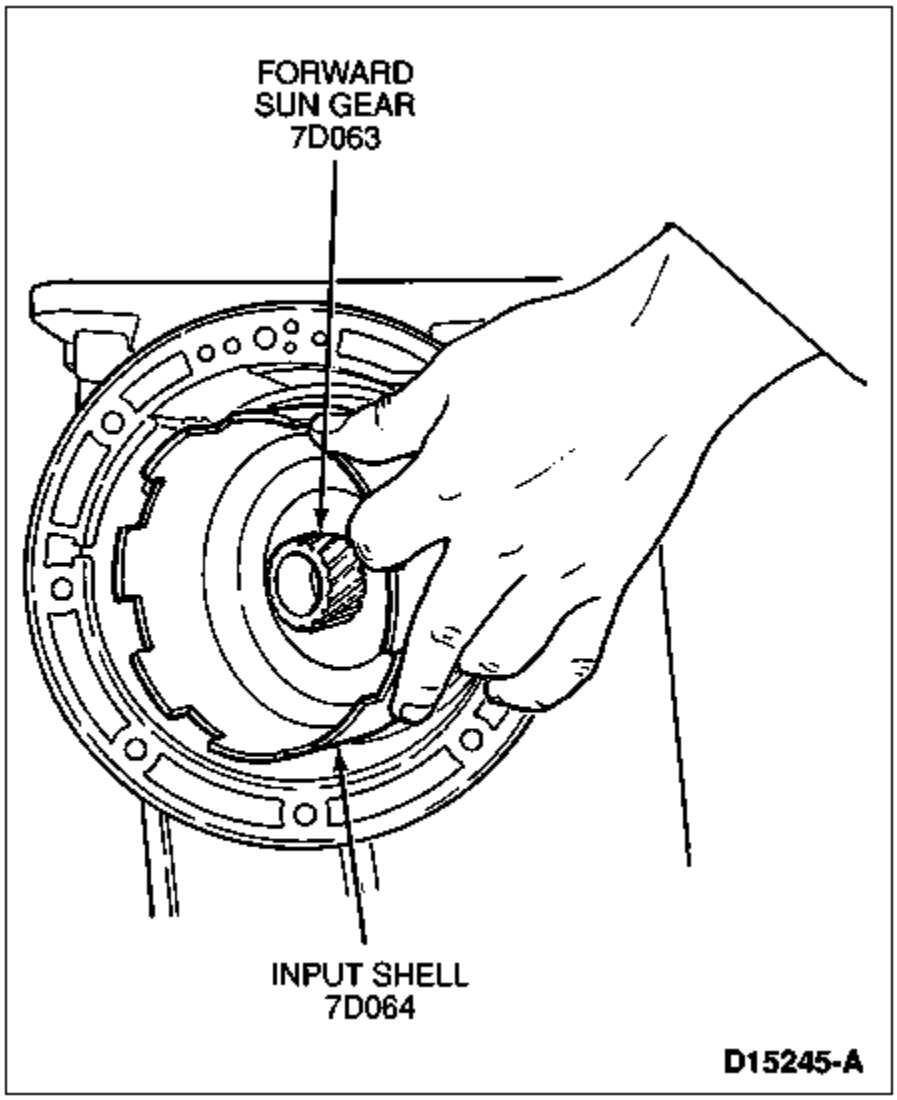
83. Remove the forward planetary assembly.

tomsn048@gmail.com



84. Remove the input shell with forward sun gear.

tomsn048@gmail.com



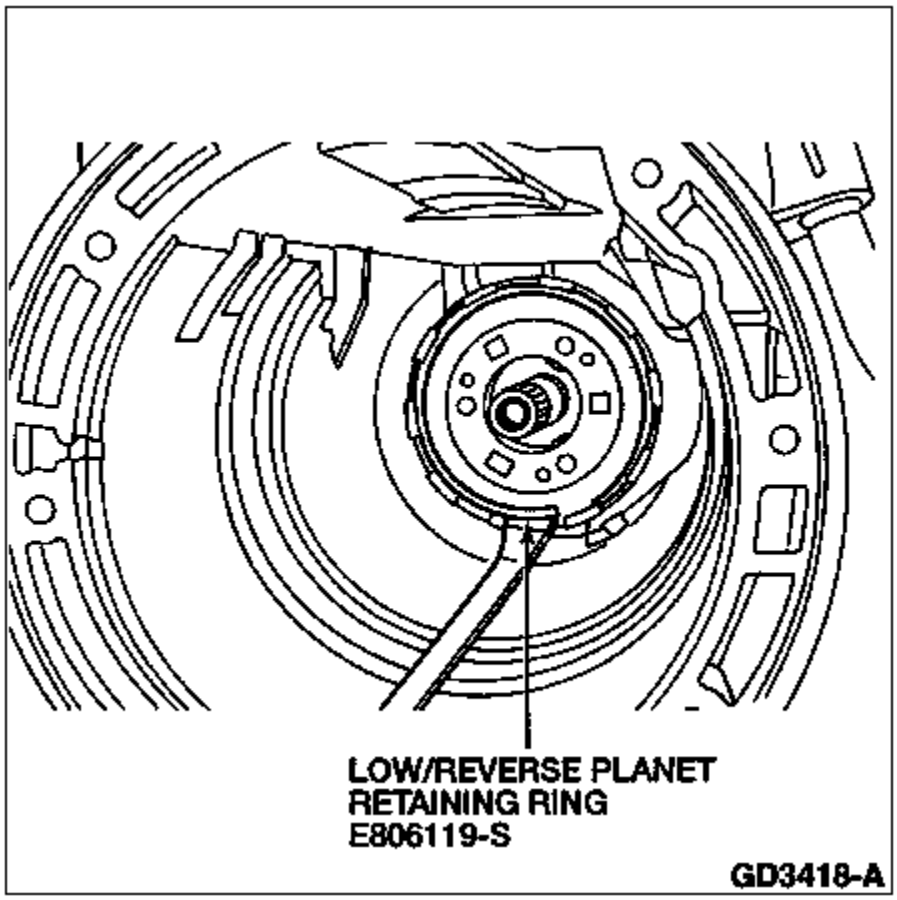
85. **NOTE: Tag and identify the No. 8 reverse planetary carrier thrust bearing for assembly.**

Remove the No. 8 low/reverse planetary carrier thrust bearing from the reverse planetary assembly.

tomsn048@gmail.com

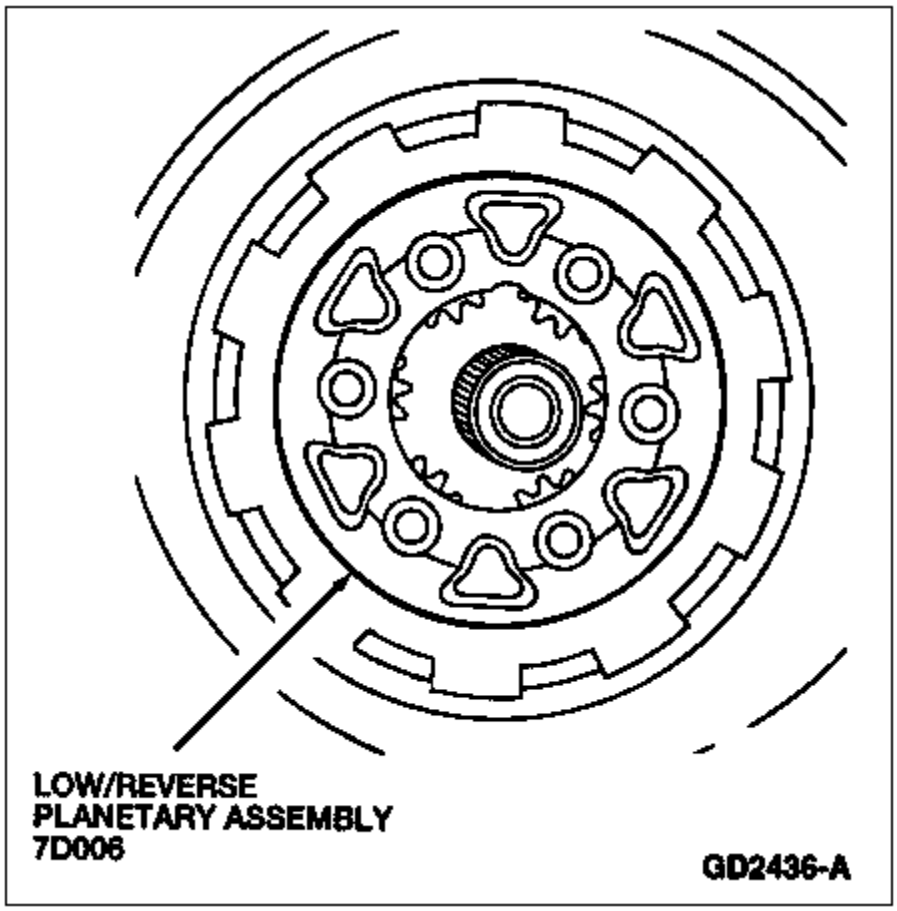
86. Remove the low/reverse planetary retaining ring.

tomsn048@gmail.com



87. Remove low/reverse planetary assembly.

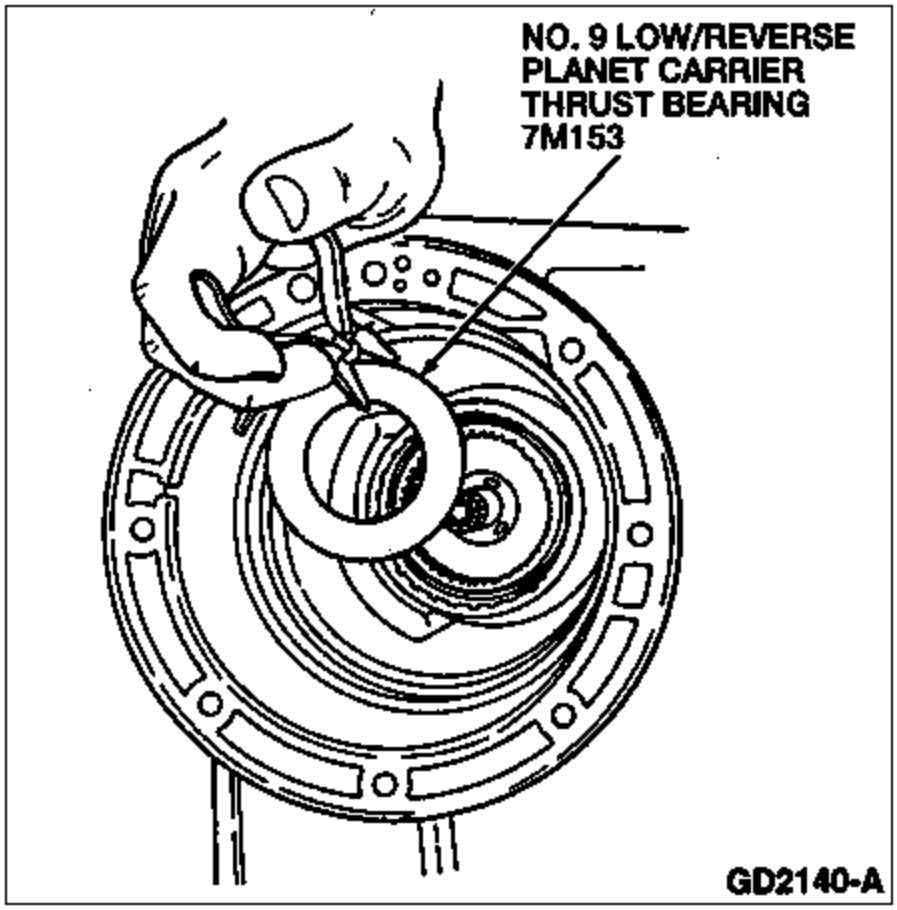
tomsn048@gmail.com



88. **NOTE: Tag and identify the No. 9 low/reverse planetary carrier thrust bearing for reassembly.**

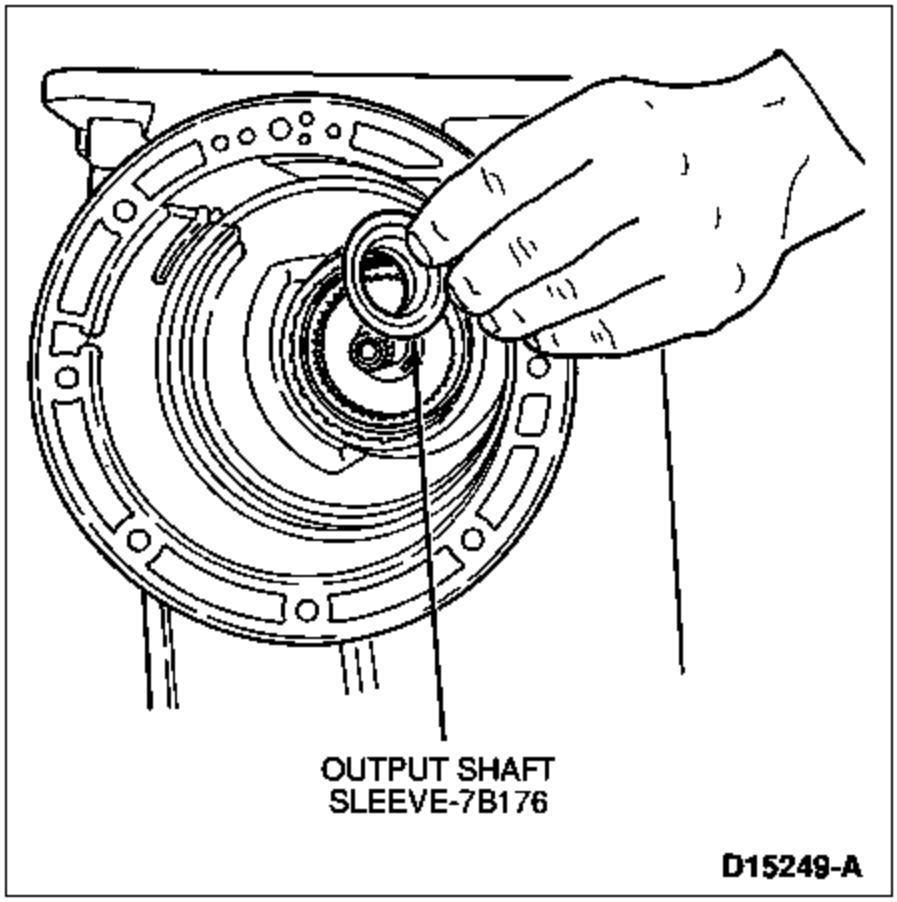
Remove the No. 9 low/reverse planetary carrier thrust bearing.

tomsn048@gmail.com



89. Remove the output shaft sleeve.

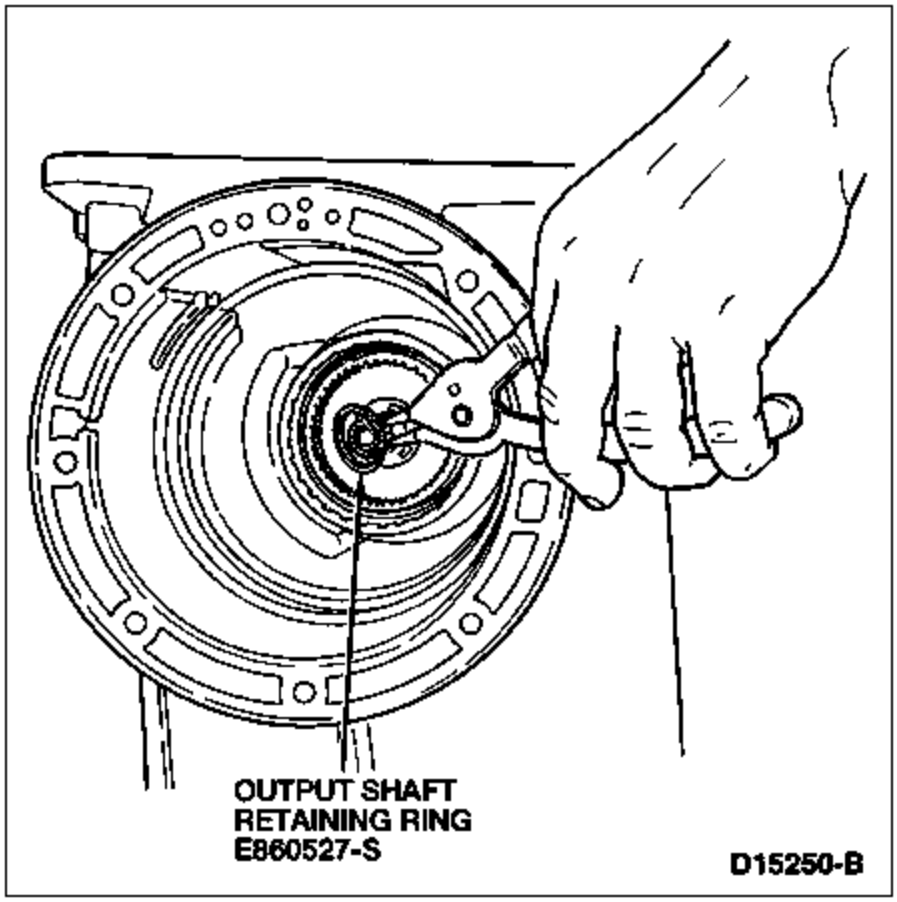
tomsn048@gmail.com



90. **CAUTION: Discard the output shaft retaining ring. A new retaining ring must be used for assembly.**

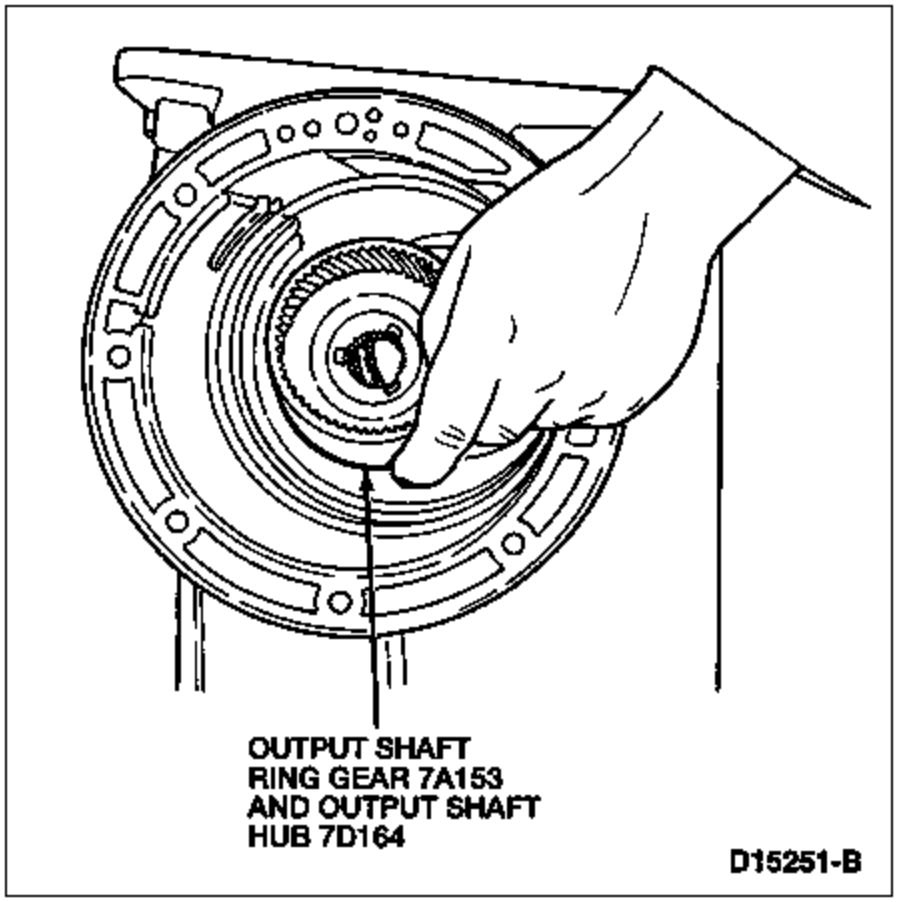
Remove the output shaft retaining ring from inside the case on the output shaft.

tomsn048@gmail.com



91. Remove the output shaft ring gear and output shaft hub.

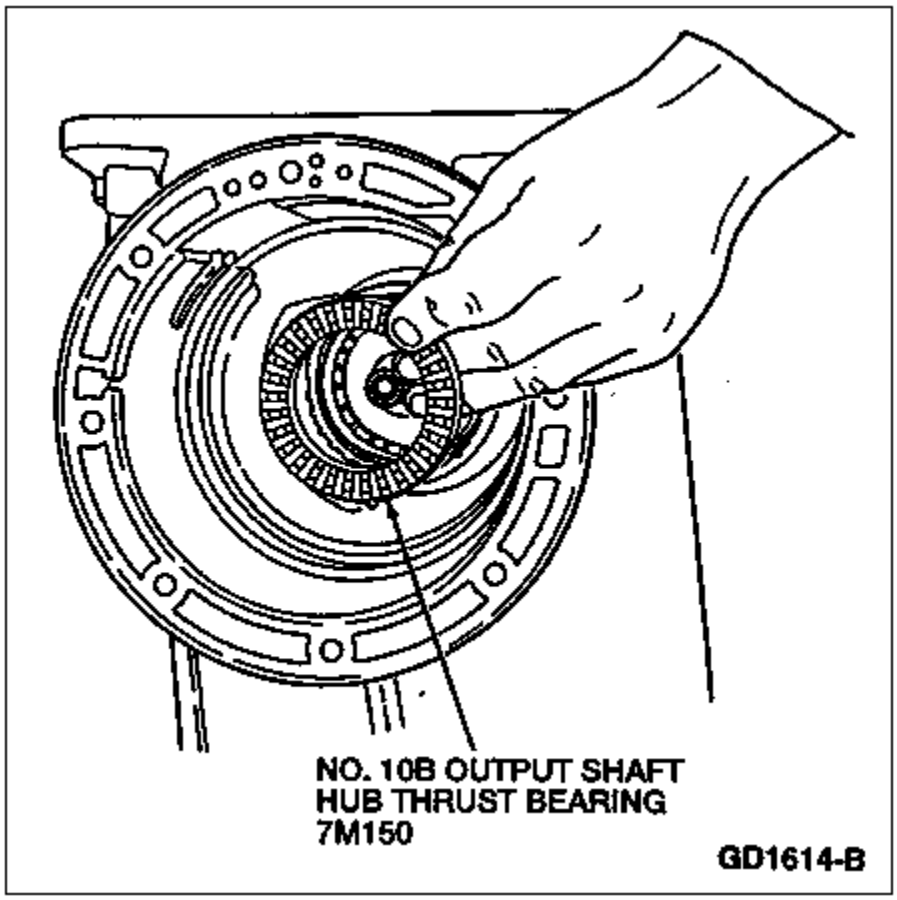
tomsn048@gmail.com



92. **NOTE: Tag and identify the No. 10B output shaft hub thrust bearing for assembly.**

Remove the No. 10B output shaft hub thrust bearing.

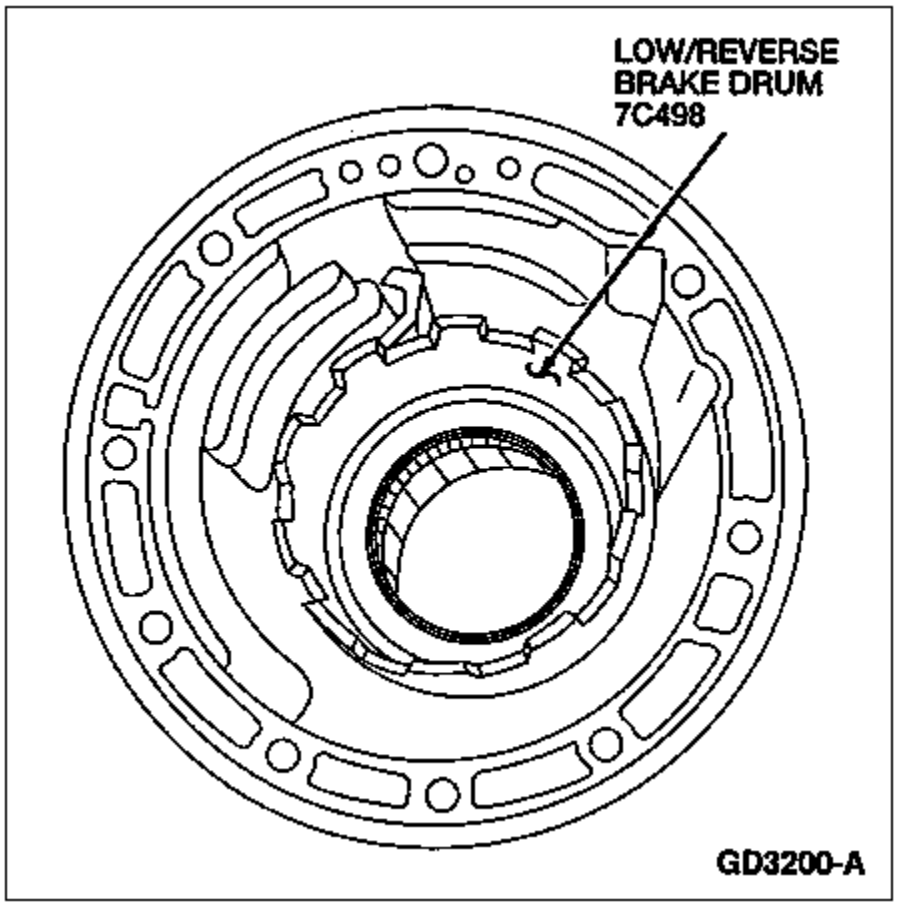
tomsn048@gmail.com



93. **NOTE: The inner race of the rear one-way clutch is not removable. It is serviced in the case.**

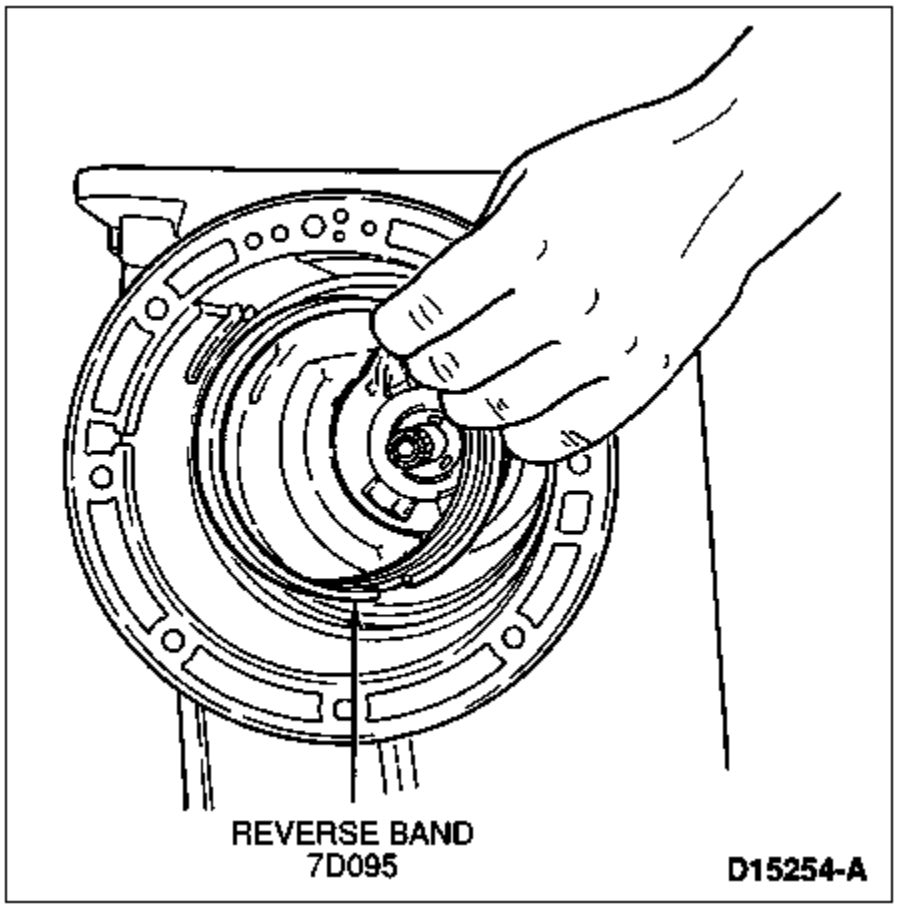
Remove the low/reverse brake drum and the one-way clutch assembly.

tomsn048@gmail.com



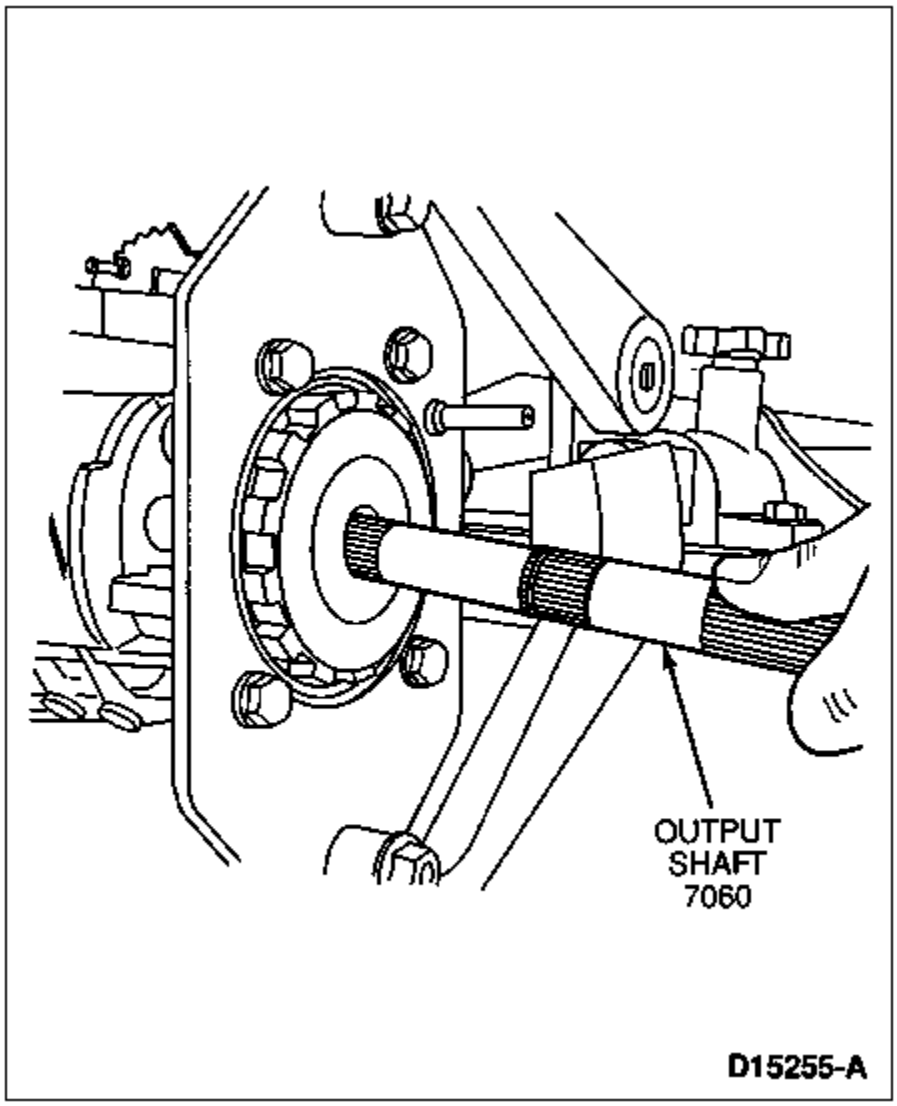
94. Remove the reverse band.

tomsn048@gmail.com



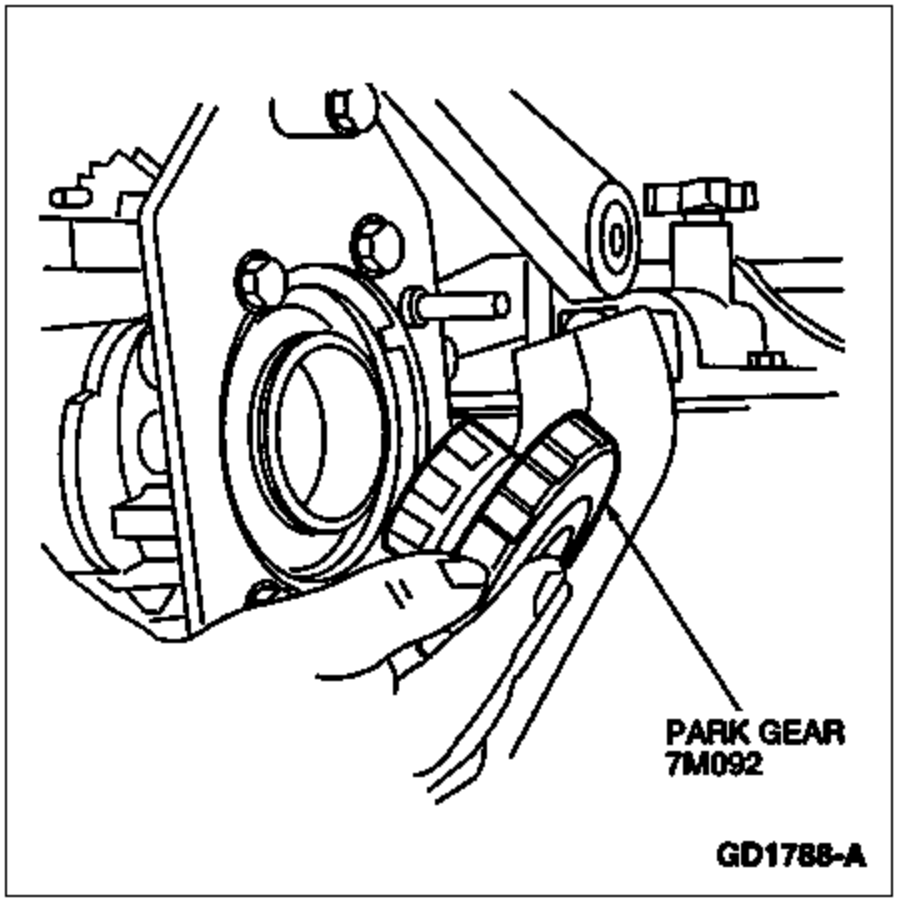
95. Remove the output shaft.

tomsn048@gmail.com



96. Remove the park gear.

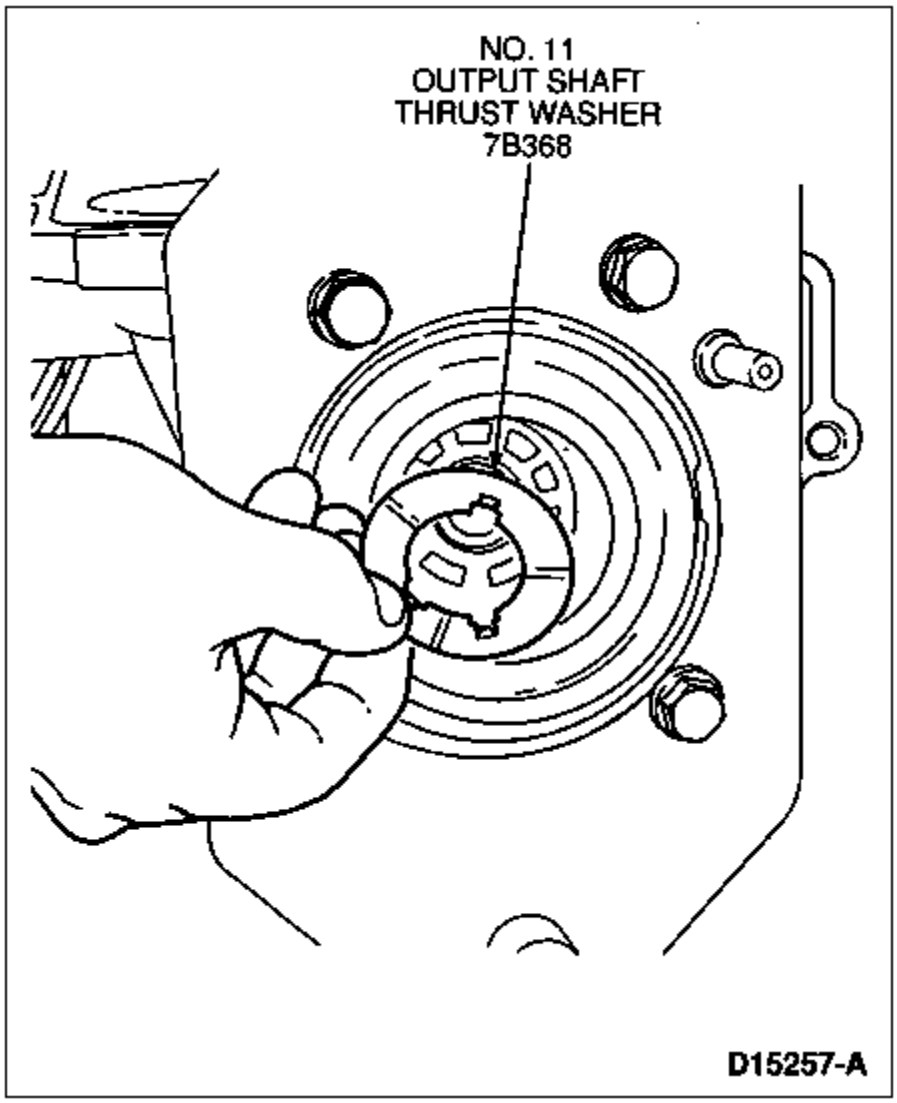
tomsn048@gmail.com



97. **NOTE: Tag and identify the No. 11 output shaft thrust washer for assembly.**

Remove the No. 11 output shaft thrust washer.

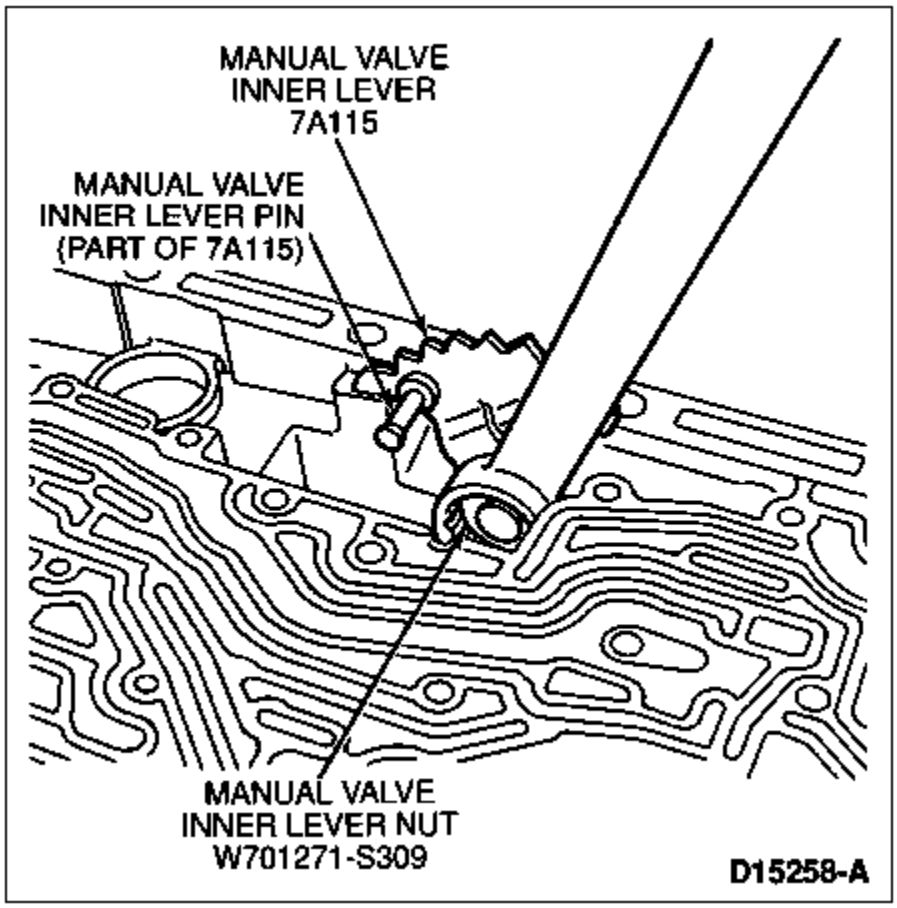
tomsn048@gmail.com



98. **CAUTION: To avoid damage, make sure wrench does not strike the manual valve inner lever pin.**

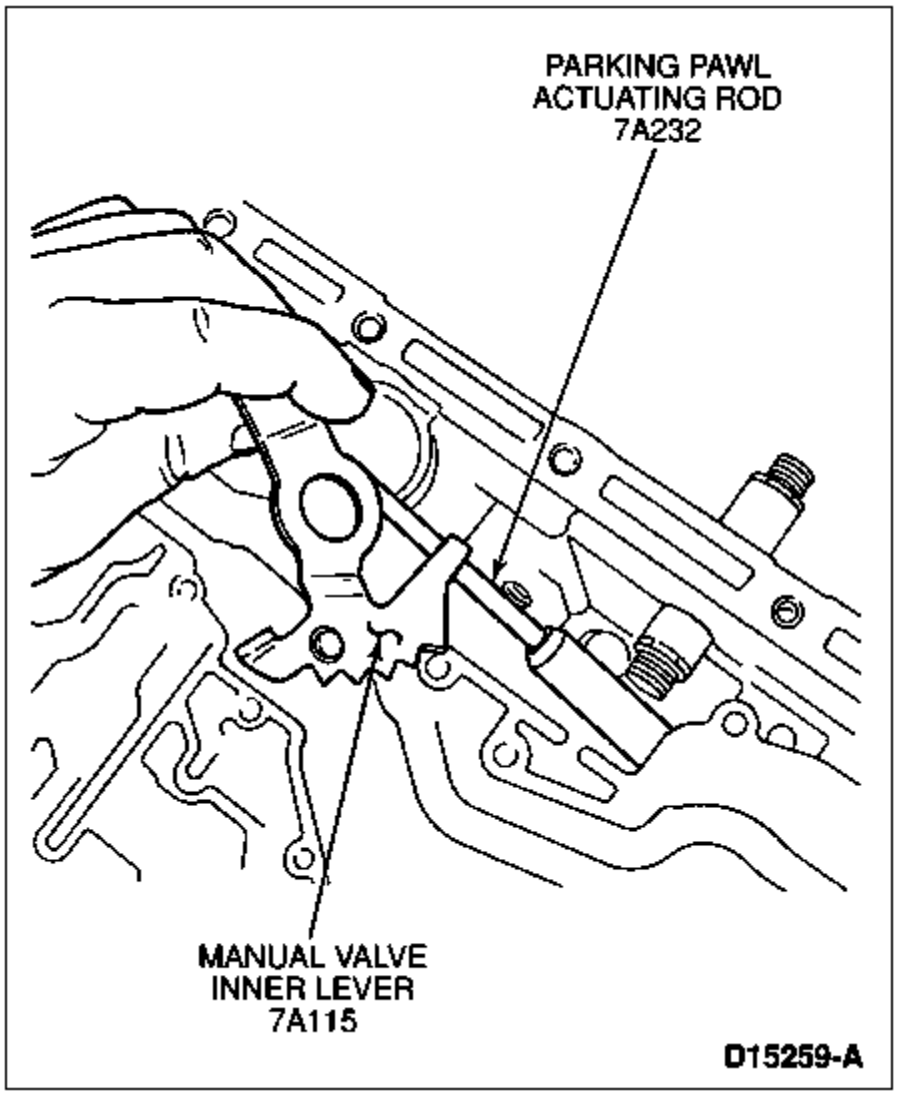
Remove the manual valve inner lever nut.

tomsn048@gmail.com



99. Remove the manual valve inner lever and parking pawl actuating rod assembly.

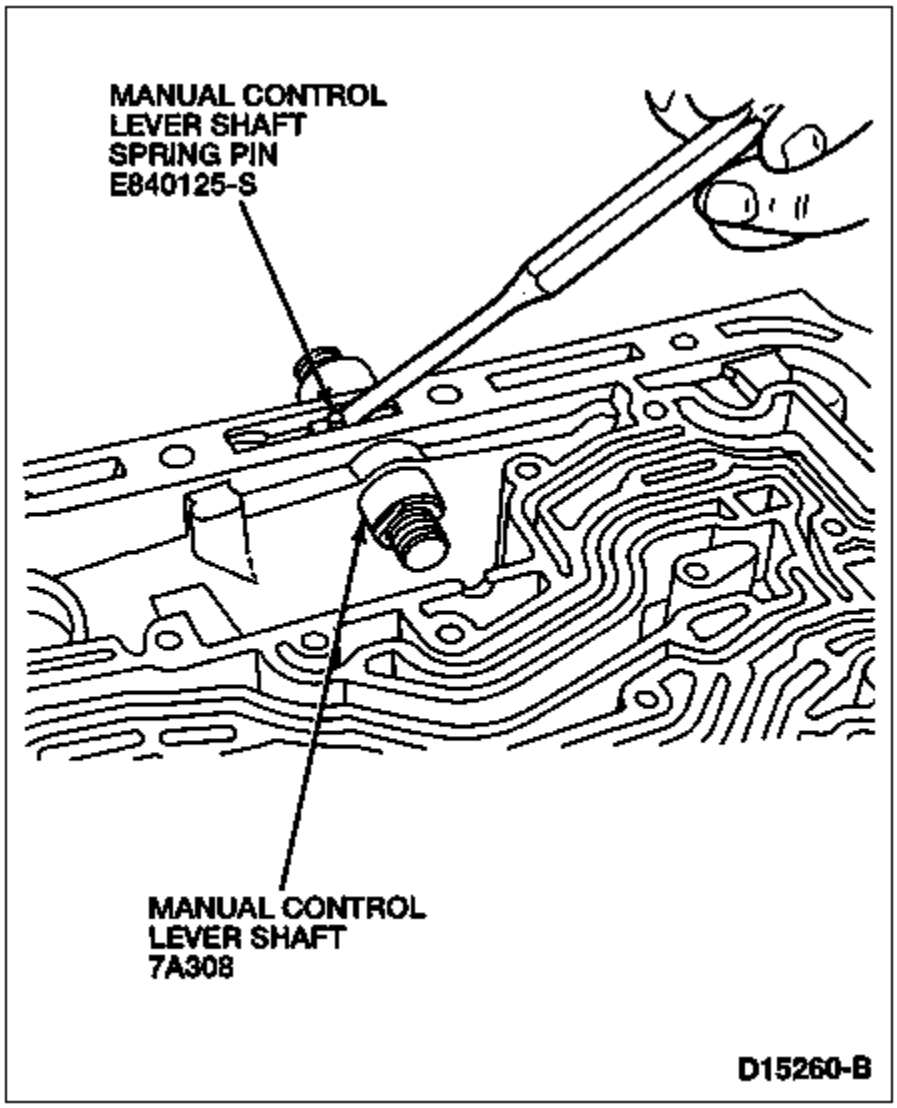
tomsn048@gmail.com



100. **CAUTION: Do not damage the case fluid pan rail.**

Using a small hammer and drift, tap lightly on each side of the manual control lever shaft retaining pin (two or three times). This will loosen the pin prior to removal.

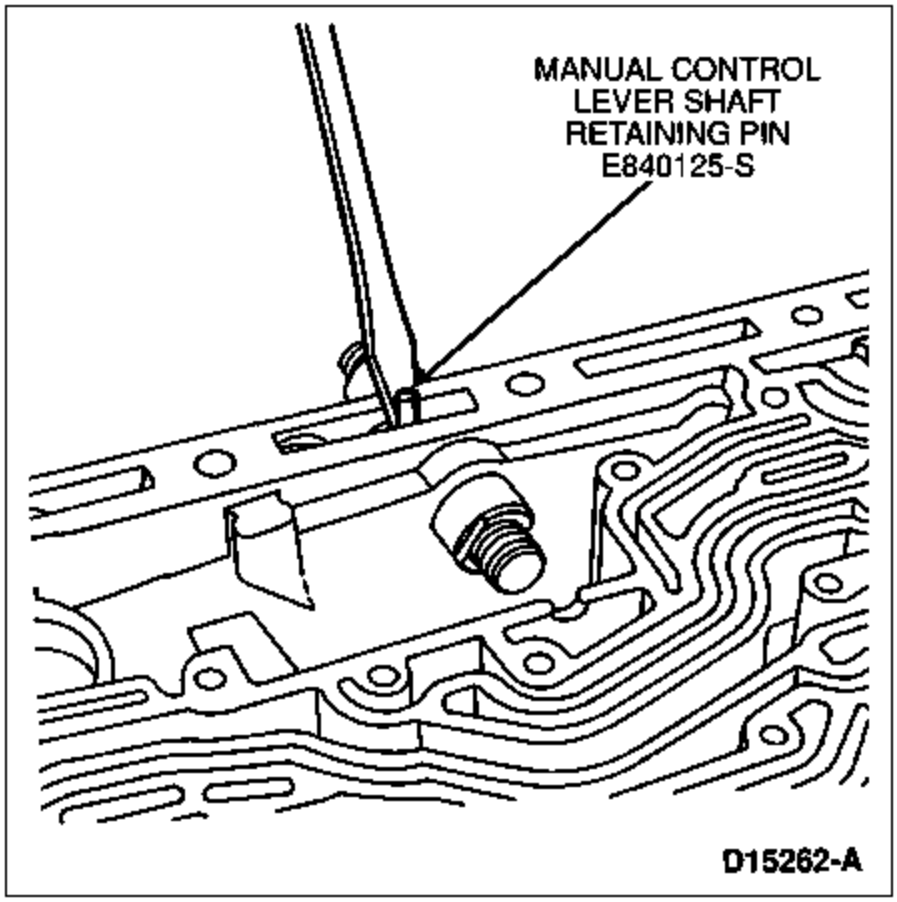
tomsn048@gmail.com



101. **CAUTION: Do not damage the case fluid pan rail.**

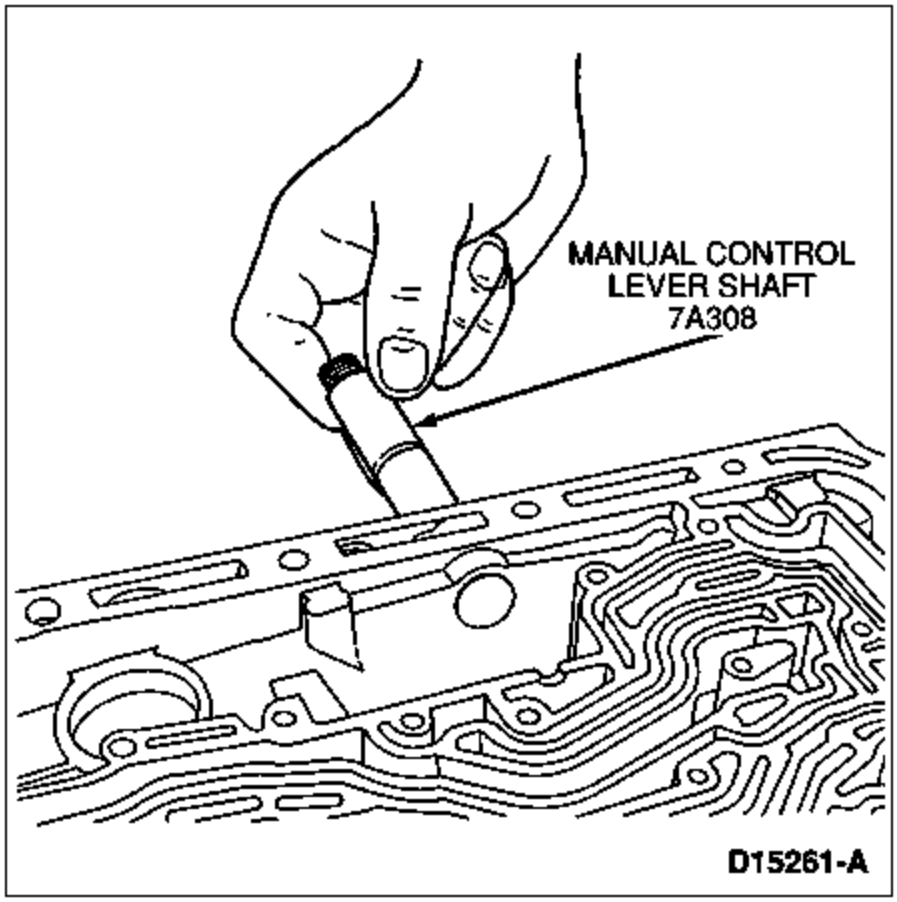
Remove the manual control lever shaft retaining pin with a narrow, sharp edged screwdriver from the side as shown.

tomsn048@gmail.com



102. Remove the manual control lever shaft.

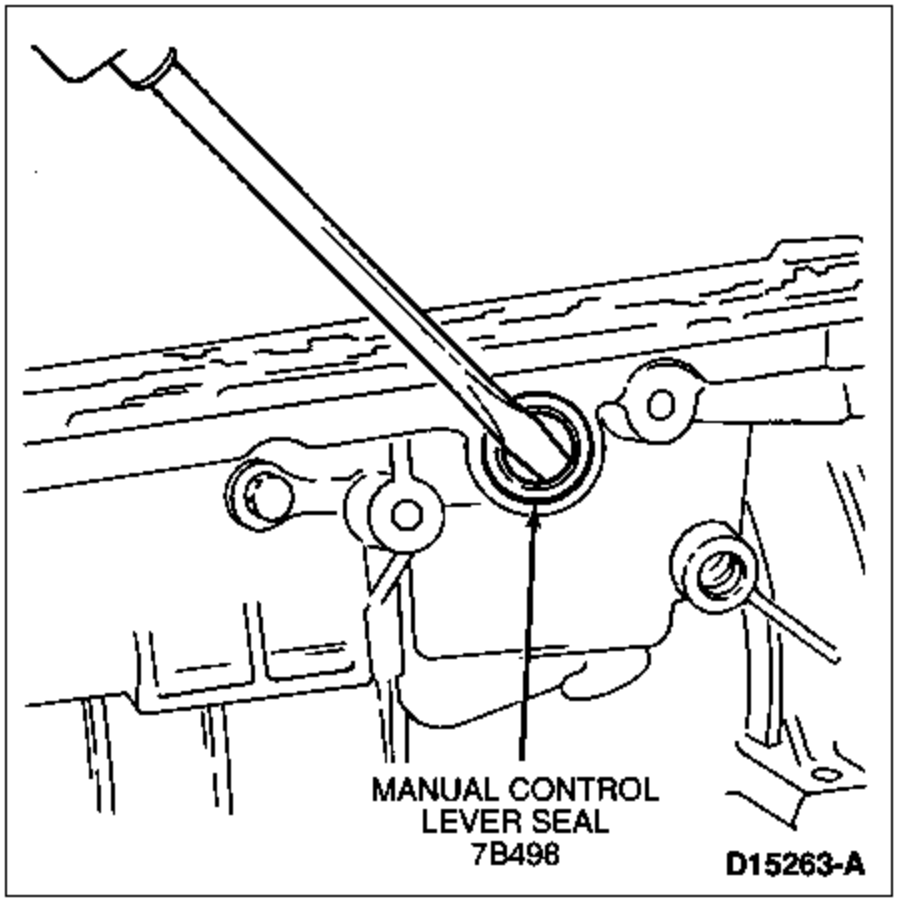
tomsn048@gmail.com



103. **CAUTION: Do not damage the bore.**

Remove the manual control lever seal.

tomsn048@gmail.com



tomsn048@gmail.com

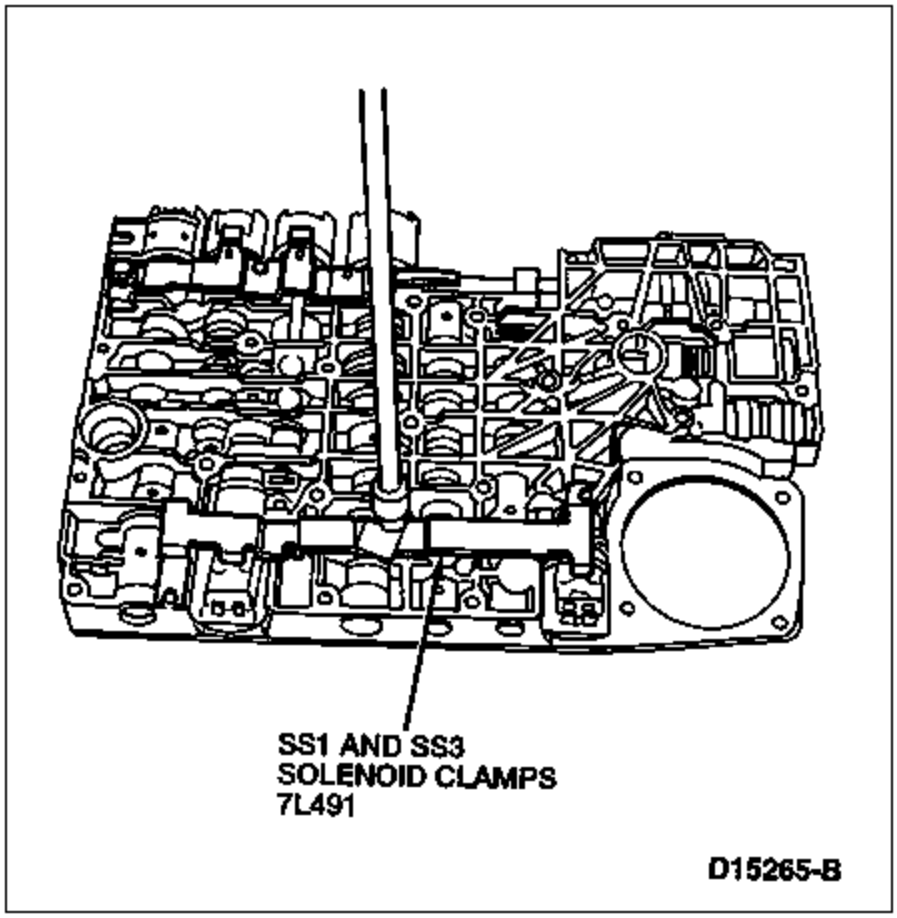
1. **CAUTION: SS3 may pop out of its bore. This may damage the solenoid.**

   Use a 10mm socket to remove the SS1 and SS3 solenoid clamp screws. Remove the solenoid clamp and the solenoids.

tomsn048@gmail.com

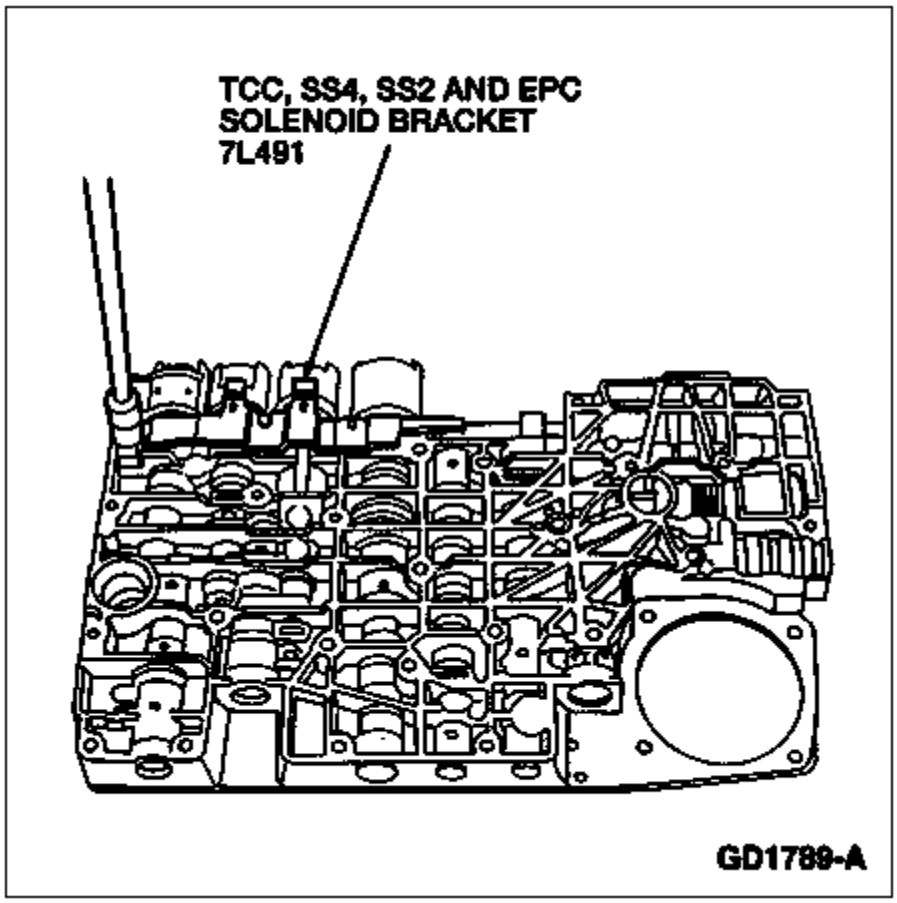


2. **NOTE: The TCC solenoid may pop out of its bore.**

   The converter modulator valve may come out after the TCC solenoid has been removed. This may damage the solenoid or converter modulator valve.

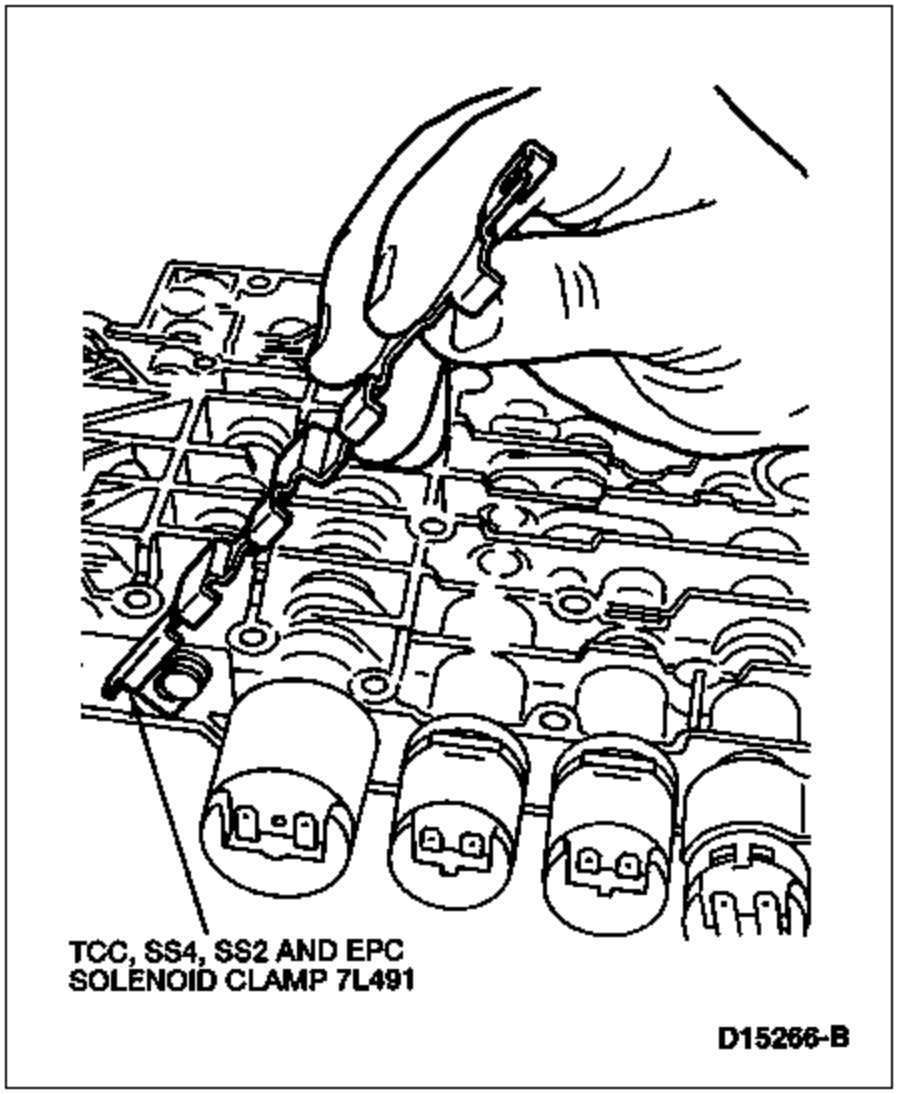
   Remove the TCC, SS4, SS2 and EPC solenoid clamp screw.

tomsn048@gmail.com



3. Remove the solenoid clamp and the solenoids.

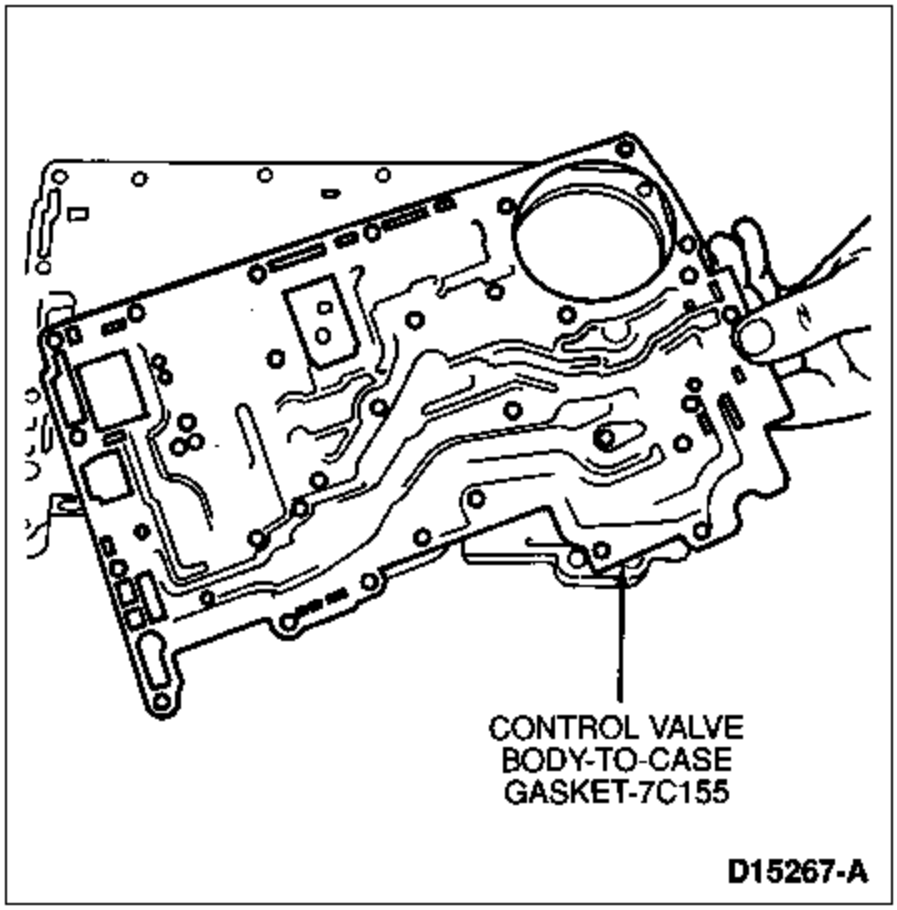
tomsn048@gmail.com



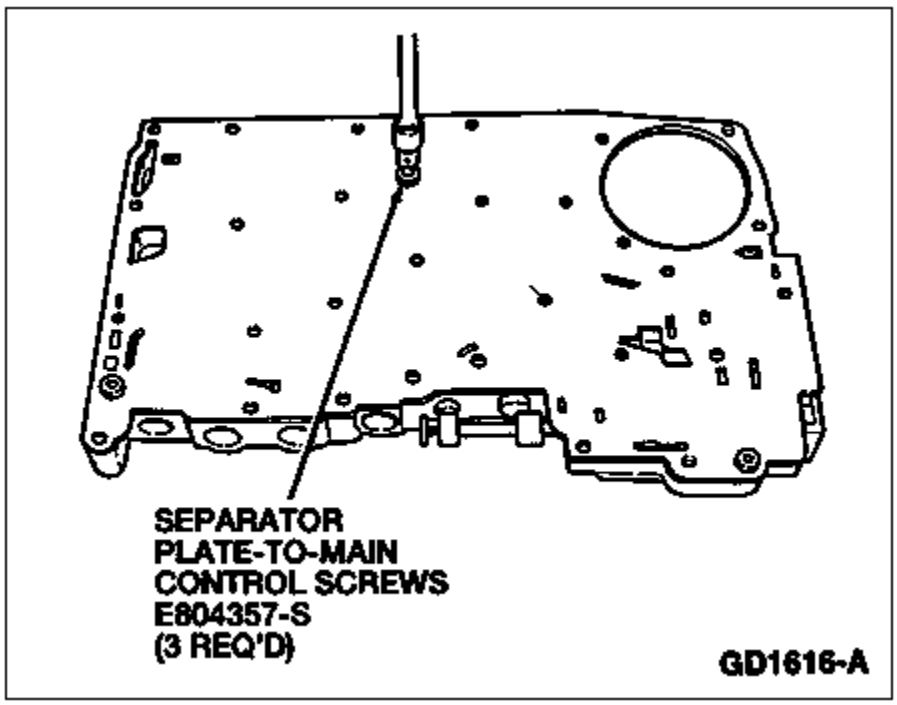
4. **CAUTION: Valves may come out when rotating the main control.**

   Carefully rotate the main control assembly so that the control valve body-to-case gasket is facing up. Remove and discard the control valve body-to-case gasket.

tomsn048@gmail.com



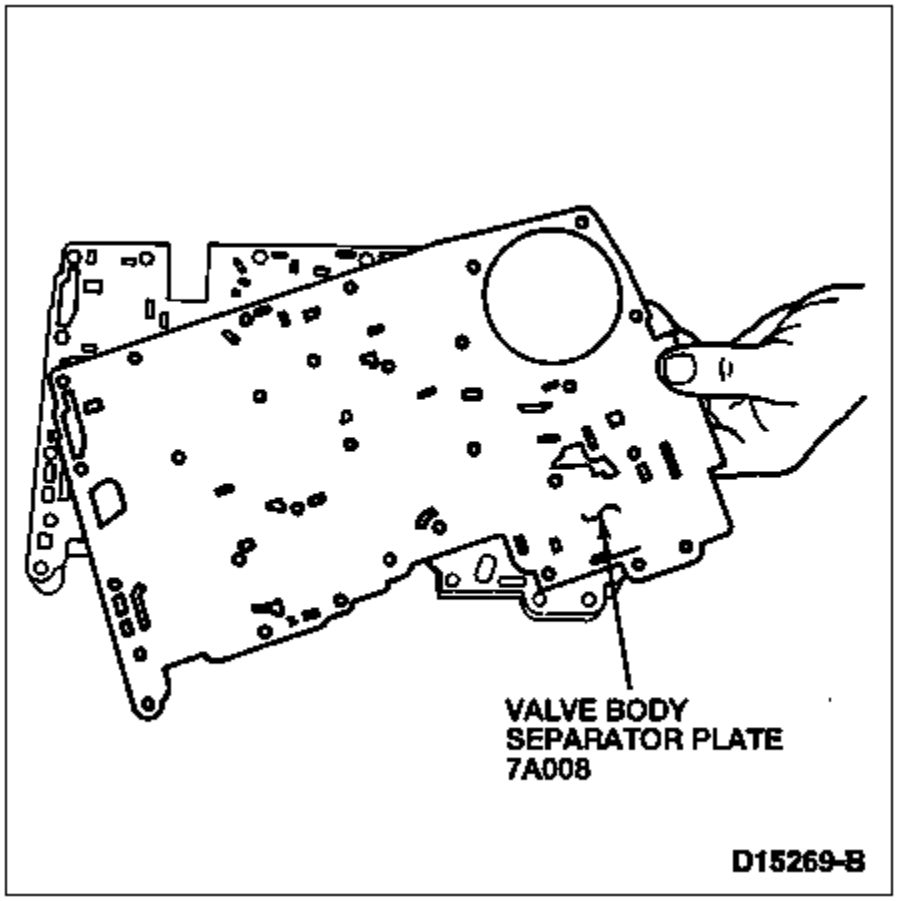
5. Use a T30 Torx® bit to remove the three separator plate-to-main control screws.



tomsn048@gmail.com

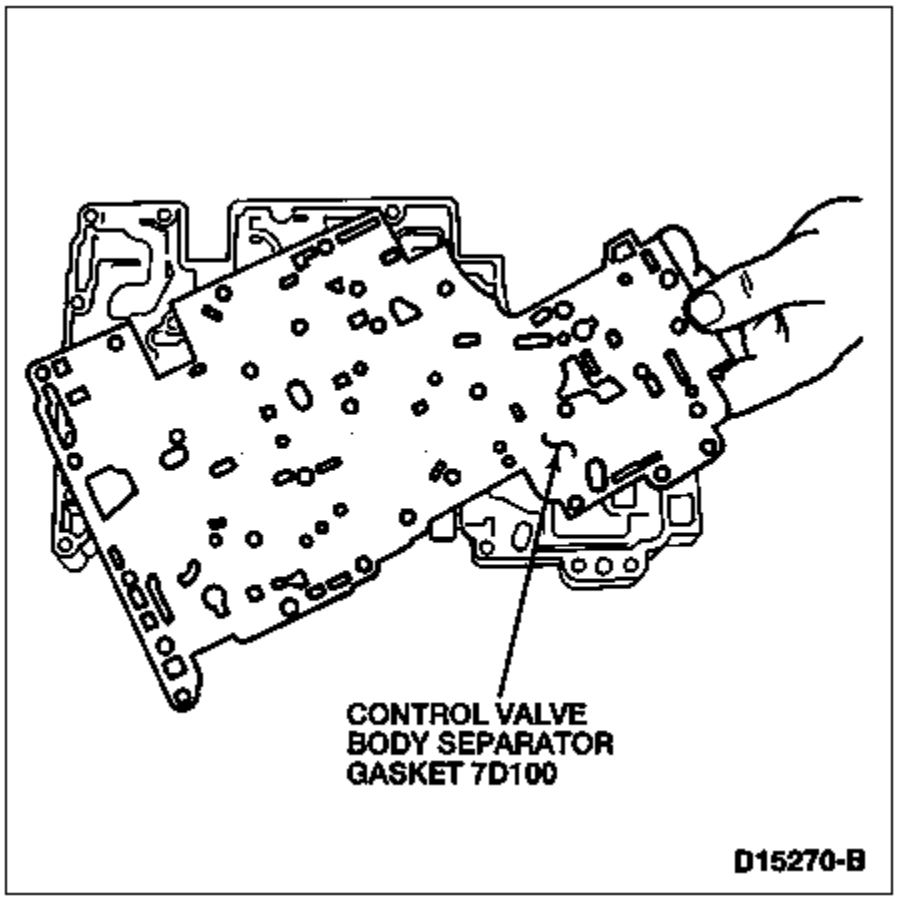
6. **CAUTION: The extension housing lube orifice and relief valves may stick to the separator plate.**

   Remove the valve body separator plate.



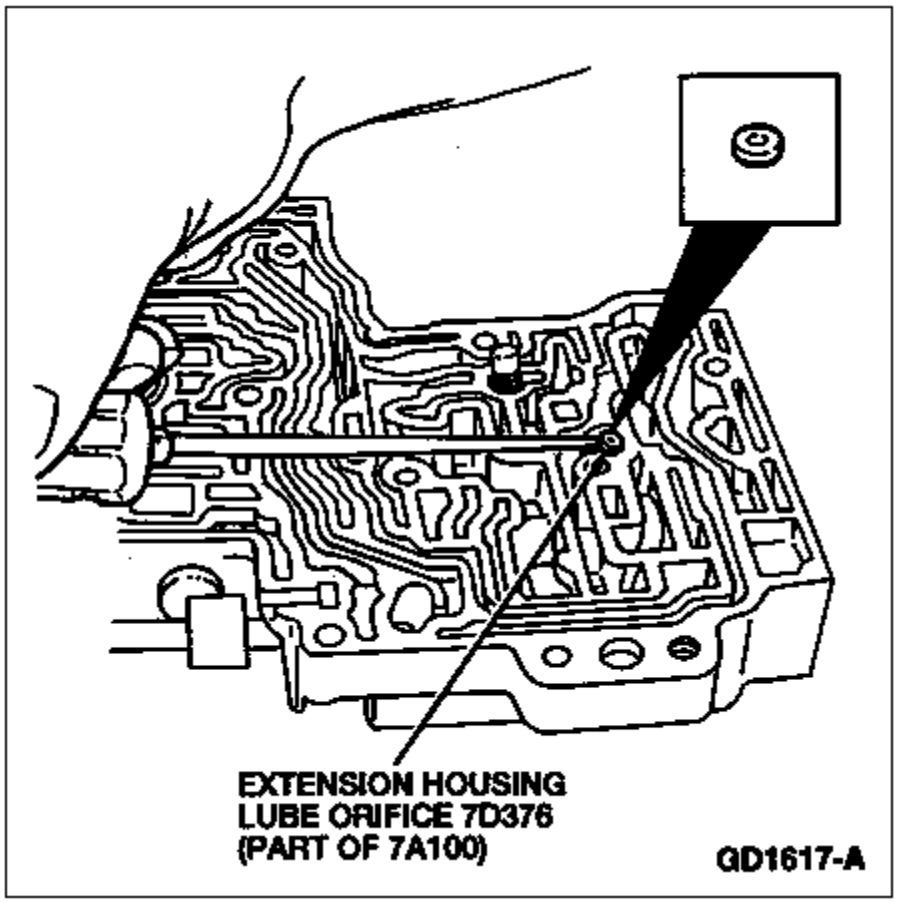
7. Remove and discard the control valve body separator gasket.

tomsn048@gmail.com

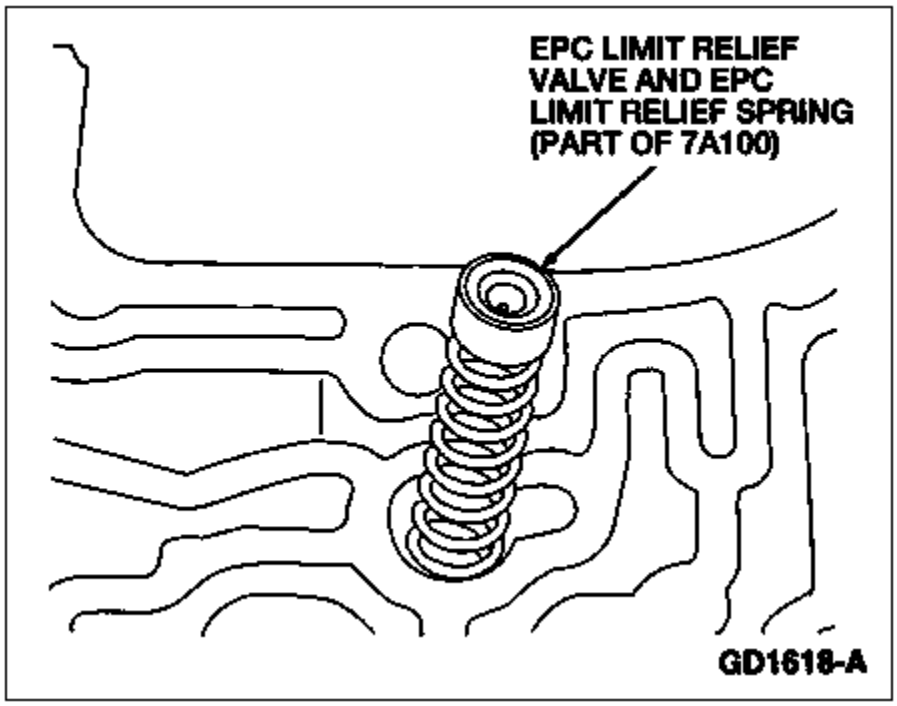


8. Carefully remove the extension housing lube orifice.

tomsn048@gmail.com

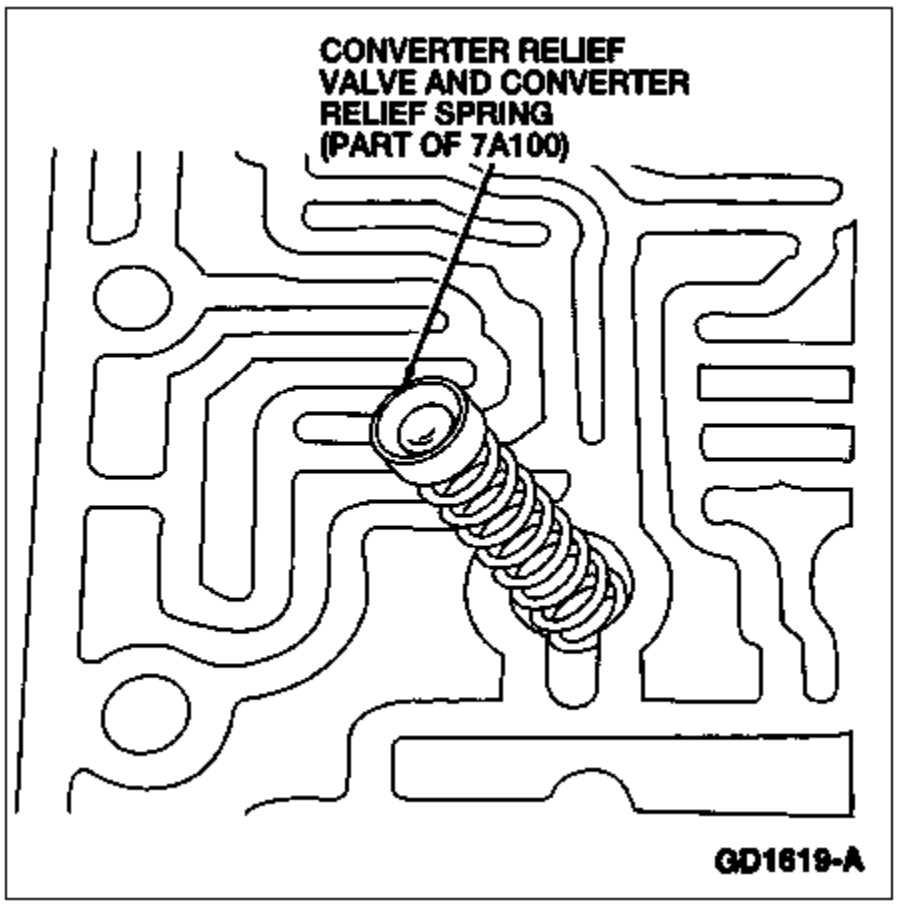


9. Remove the electronic pressure control (EPC) limit relief valve (metal-silver color) and spring.



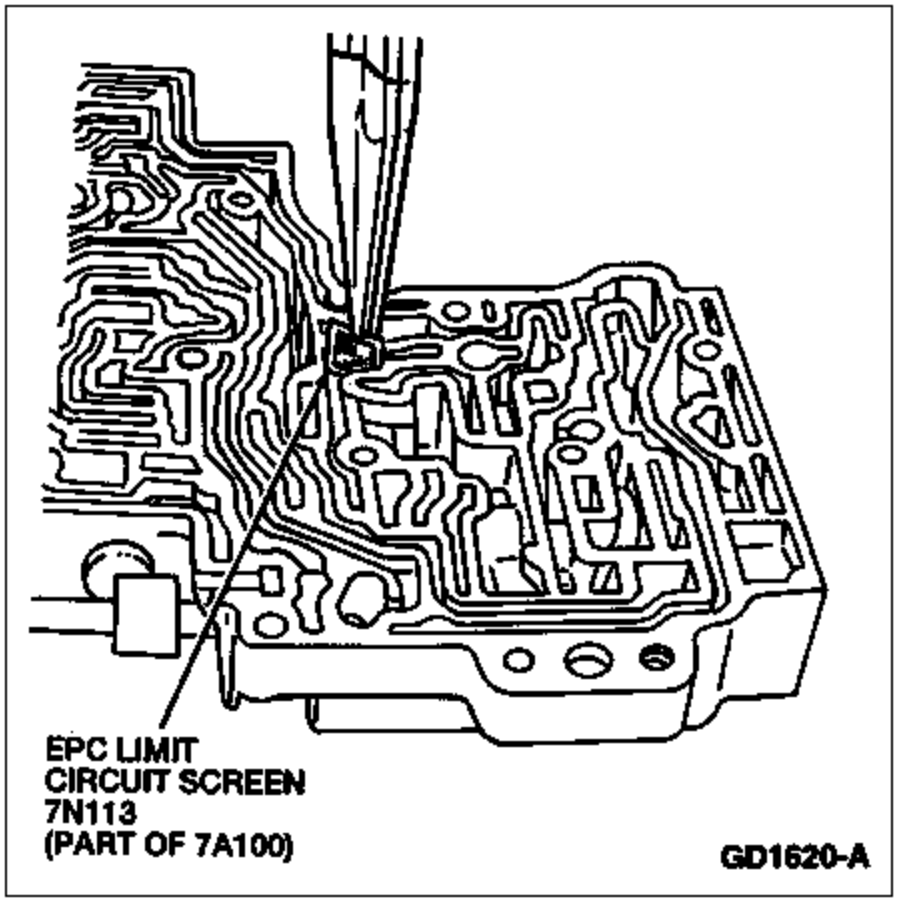
tomsn048@gmail.com

10. Remove the converter relief valve (plastic-dark color) and spring.



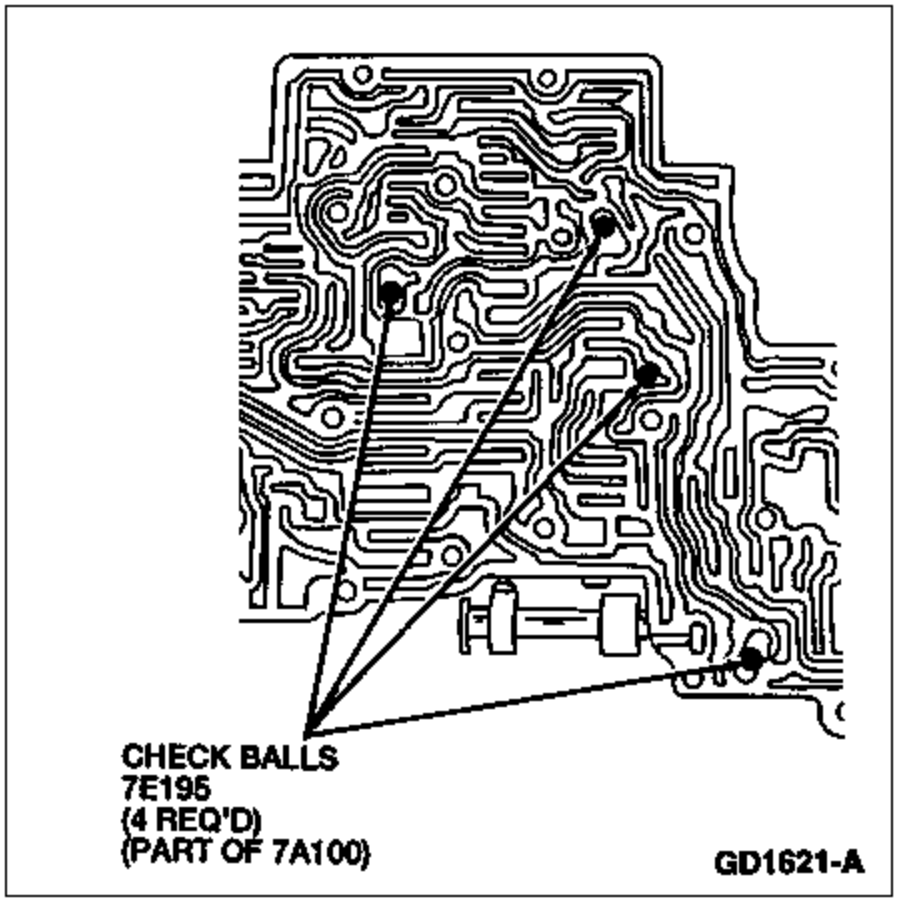
11. Remove the EPC limit circuit screen.

tomsn048@gmail.com



12. Remove the four check balls.

tomsn048@gmail.com



13. **CAUTION: Do not lose parts when cleaning or servicing.**

    Thoroughly clean all parts in solvent and blow dry with moisture-free compressed air.

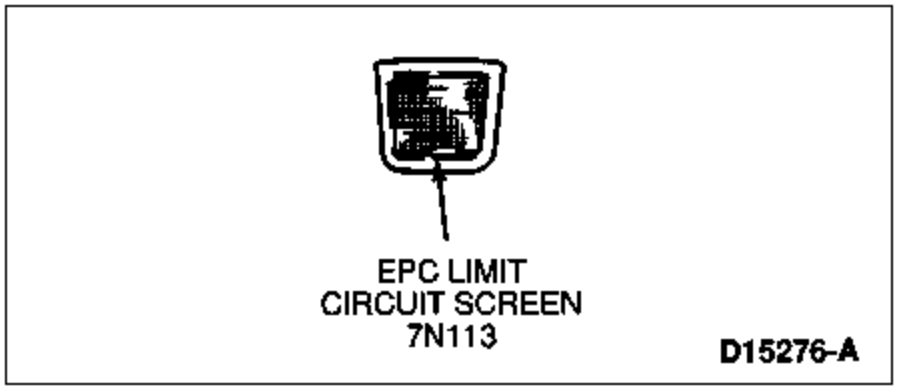
14. Inspect all valve and plug bores for scores. Check all fluid passages for obstructions. Inspect the check valve for free movement. Inspect all mating surfaces for burrs or distortion. Inspect all plugs and valves for burrs or scores. Replace the control valve body if the bores are scored or if the valves are scored beyond the point of being able to be cleaned.

15. Inspect all springs for distortion. Check all valves and plugs for free movement in their respective bores. Valves and plugs, when dry, must fall from their own weight in their respective bores.

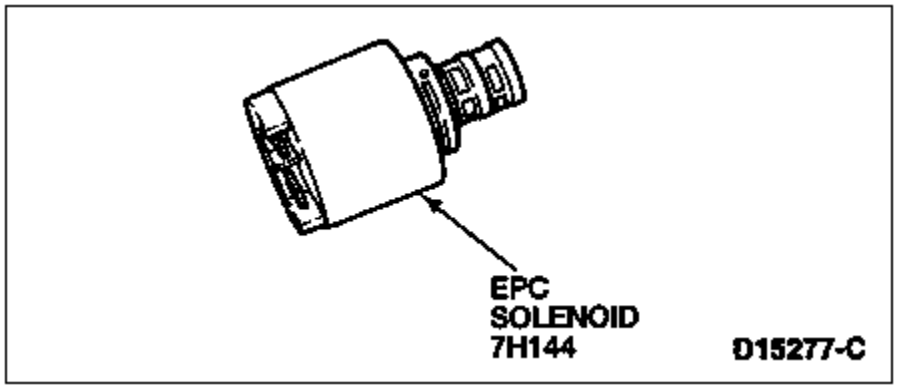
16. Roll the manual valve on a flat surface to check for a bent condition.

17. Clean and inspect the EPC limit circuit screen.

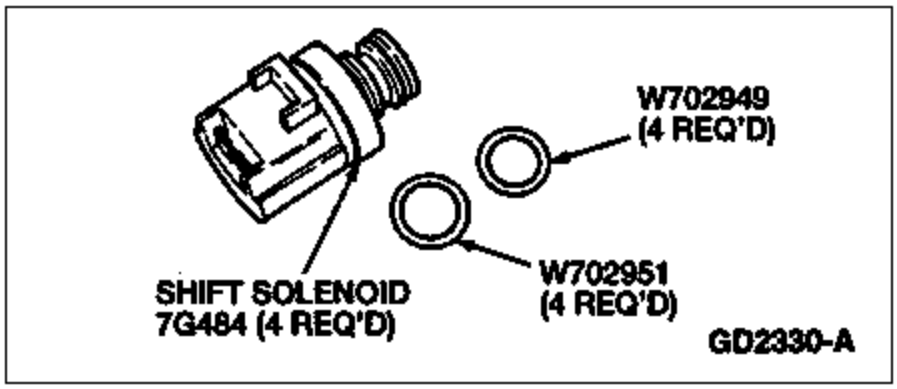
tomsn048@gmail.com



18. Clean and inspect the EPC solenoid screens.

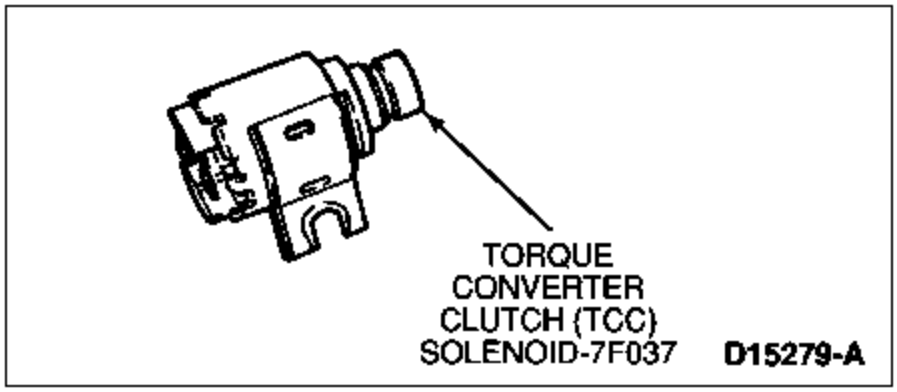


19. Remove and replace all shift solenoid O-rings.



20. Clean and inspect the torque converter clutch (TCC) solenoid.

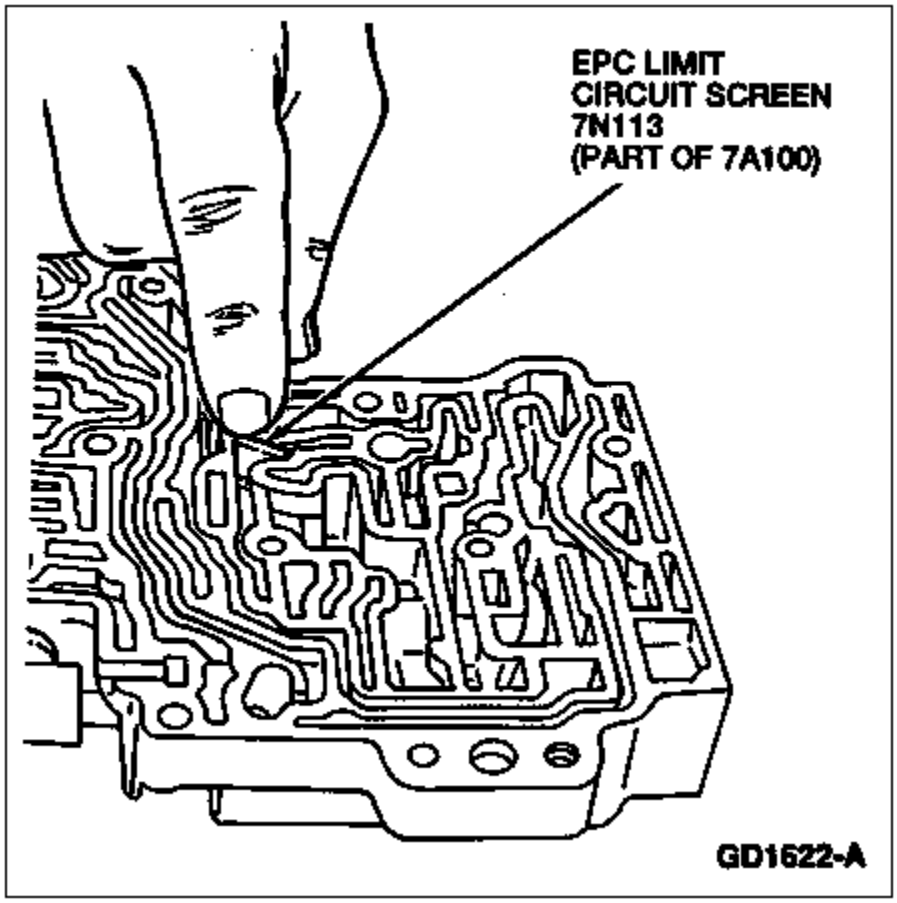
tomsn048@gmail.com



Assembly

1. **CAUTION: Make sure that the screen is properly located.**

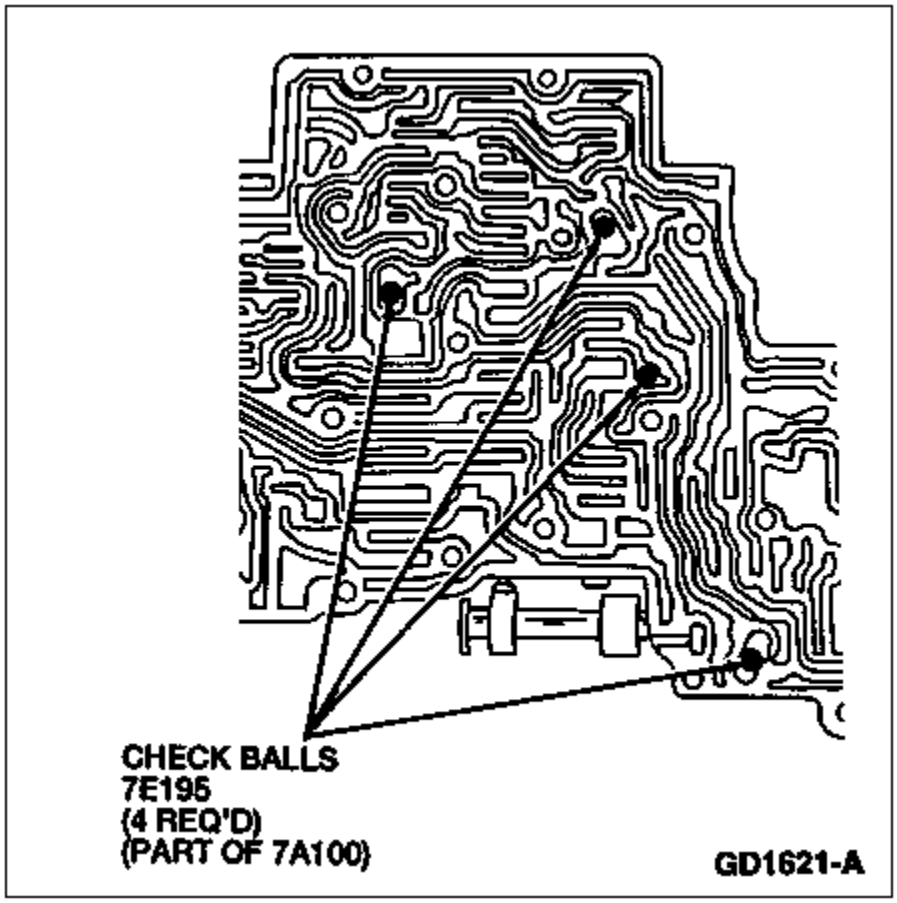
   Install the EPC limit circuit screen. Push down on the EPC limit circuit screen to make sure it is fully seated.



2. Install the four check balls in proper locations as shown.

tomsn048@gmail.com

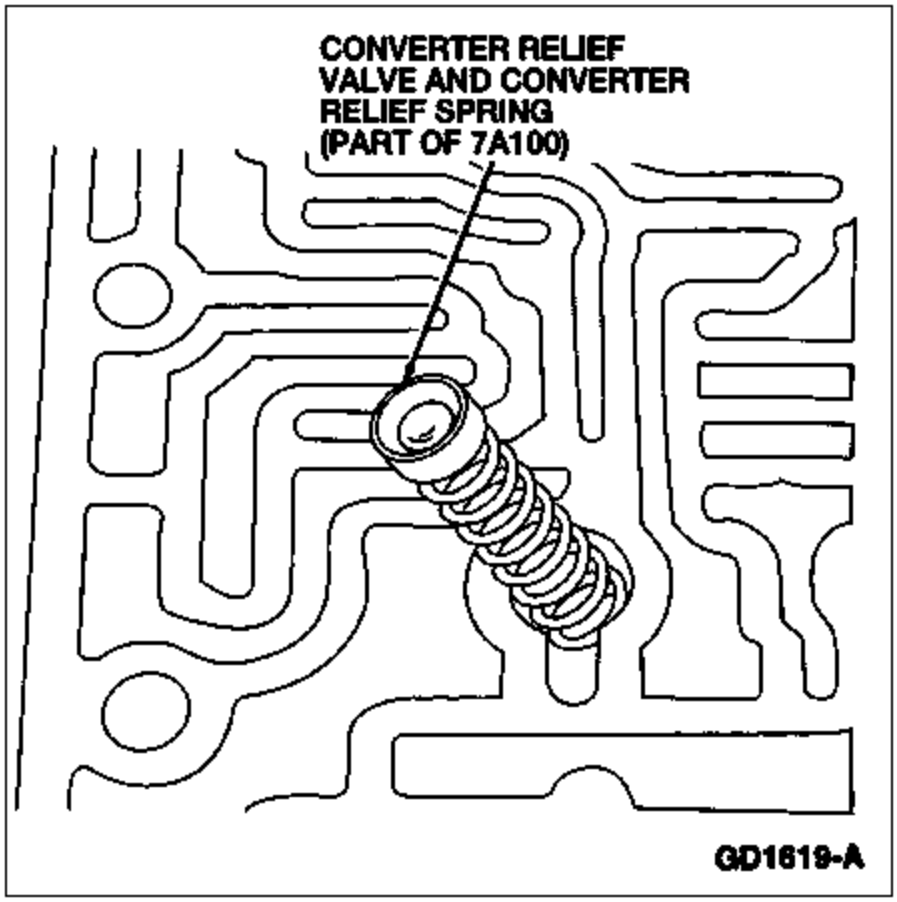
Check Ball Installation



3. **CAUTION: The springs and valves are not interchangeable.**

   Install the converter relief valve (plastic-dark color) and spring.

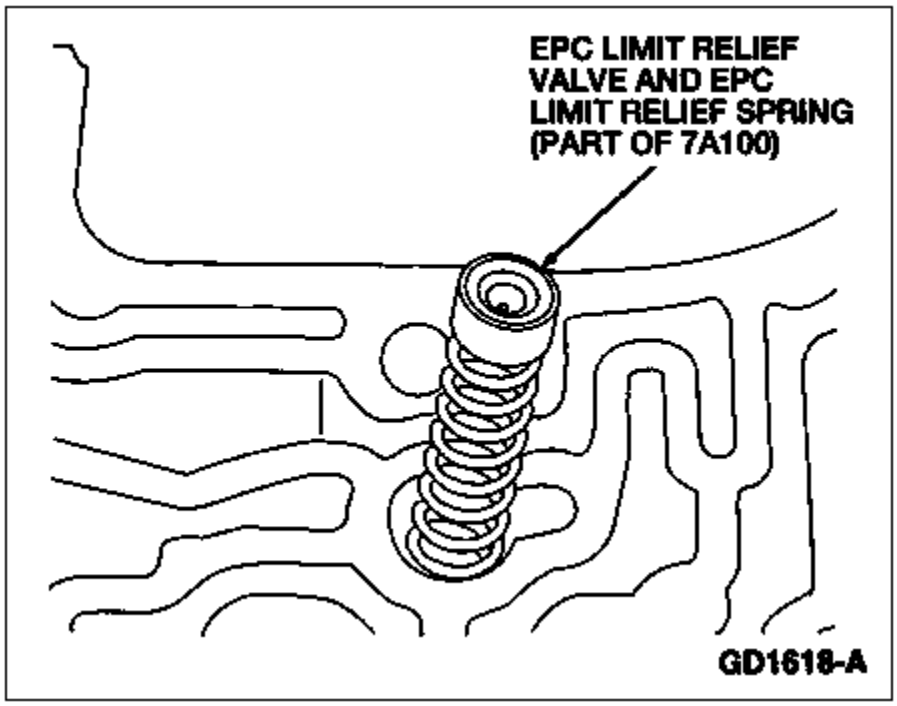
tomsn048@gmail.com



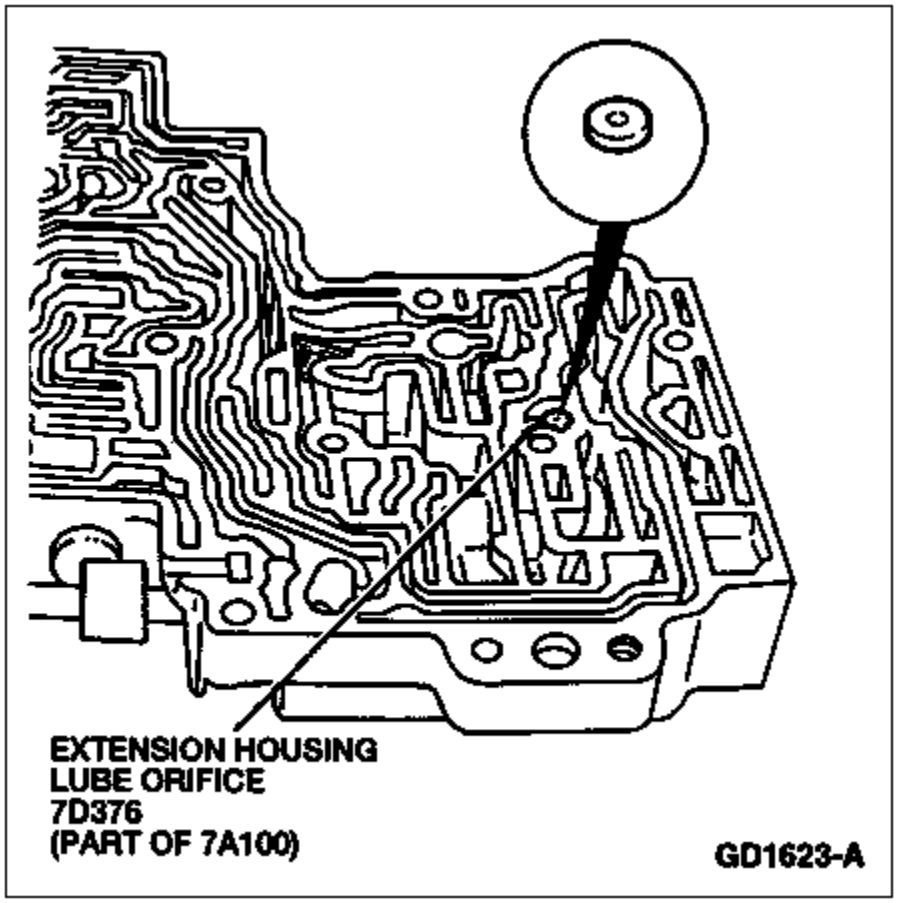
4. **CAUTION: The springs and valves are not interchangeable.**

   Install the EPC limit relief valve (metal-silver color) and spring.

tomsn048@gmail.com

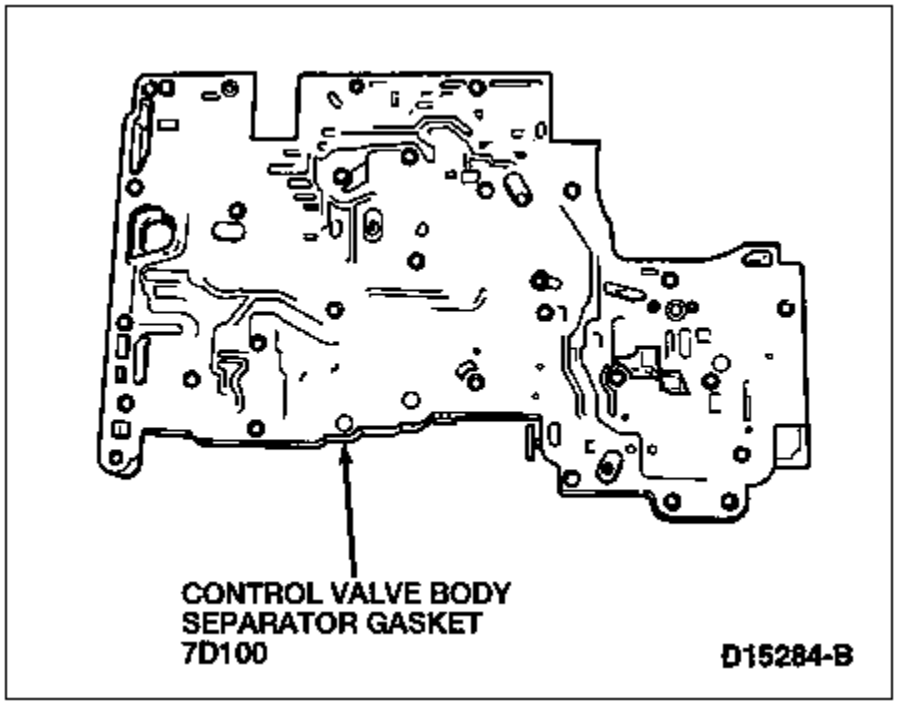


5. Install the extension housing lube orifice.

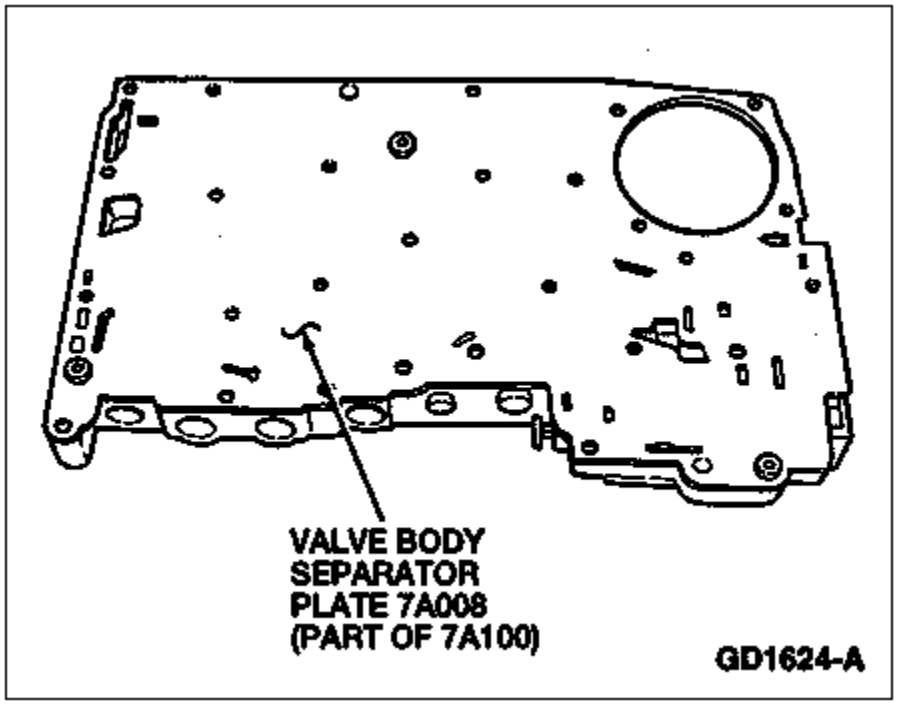


tomsn048@gmail.com

6. Install and align the control valve body separator gasket.

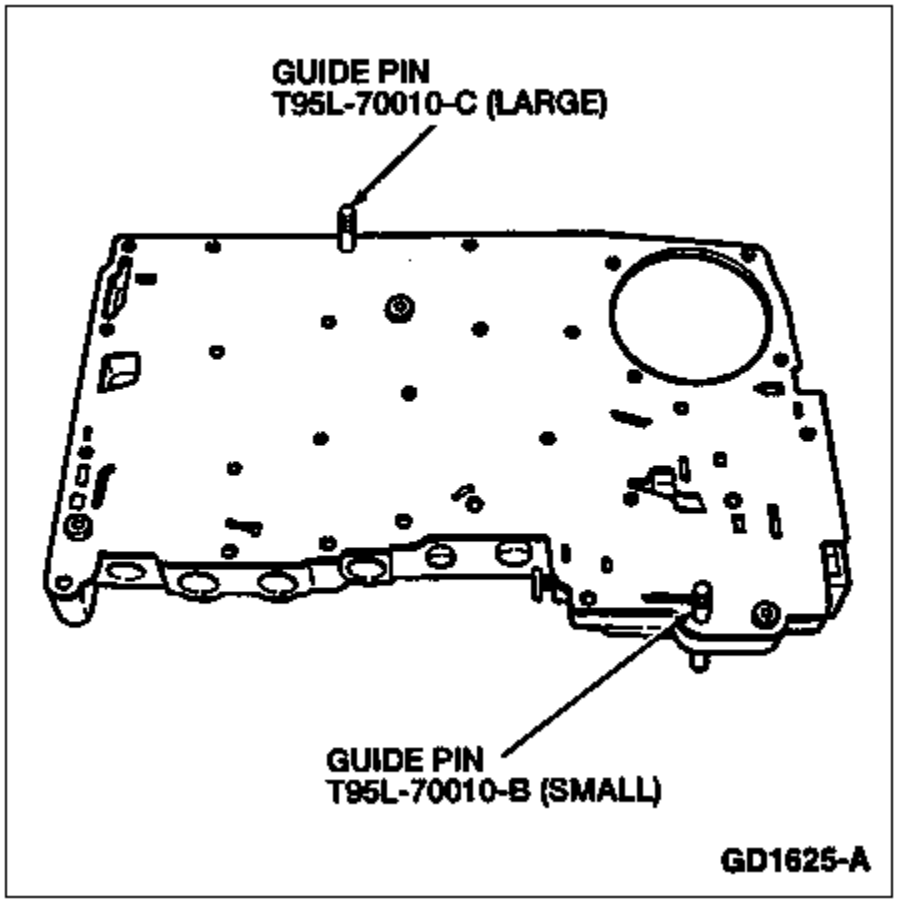


7. Install the valve body separator plate. Install the three (3) separating plate-to-main control screws fingertight.



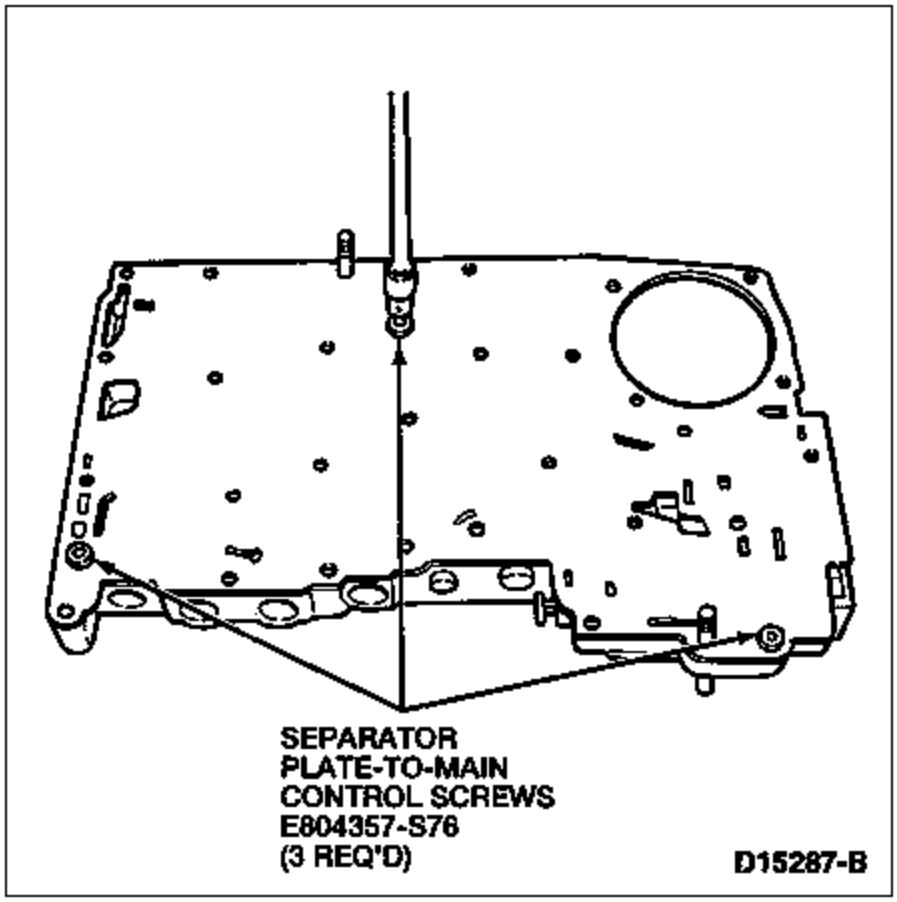
tomsn048@gmail.com

8. Install the alignment pins in the locations shown.



9. Tighten the separator plate-to-main control screws to 6-8 Nm (53-71 lb-in).

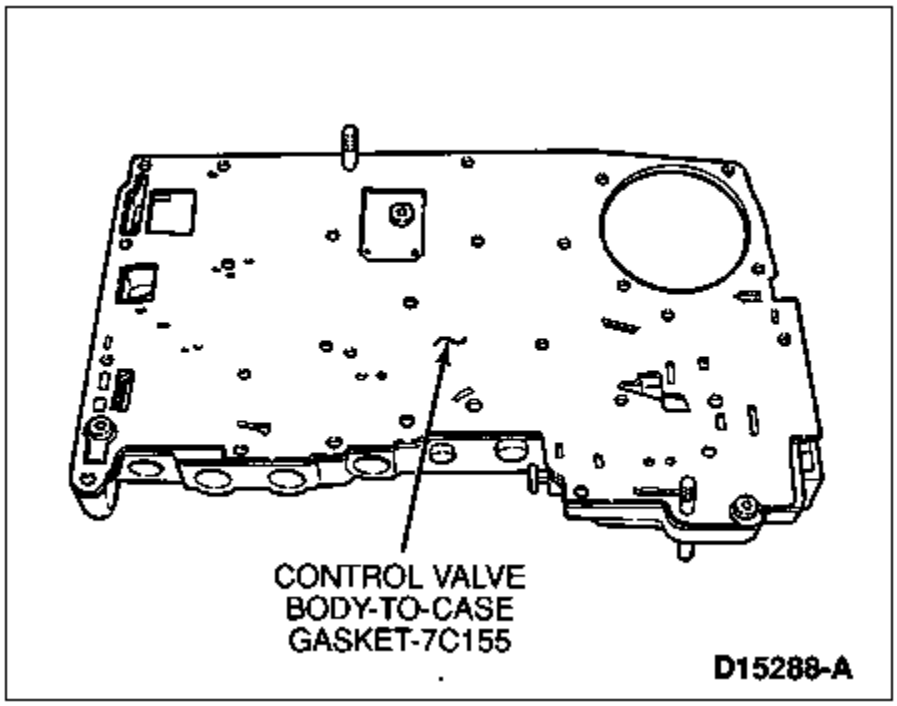
tomsn048@gmail.com



10. **NOTE: Apply petroleum jelly on the separator surface to hold the gasket in place.**

    Install the control valve body-to-case gasket.

tomsn048@gmail.com



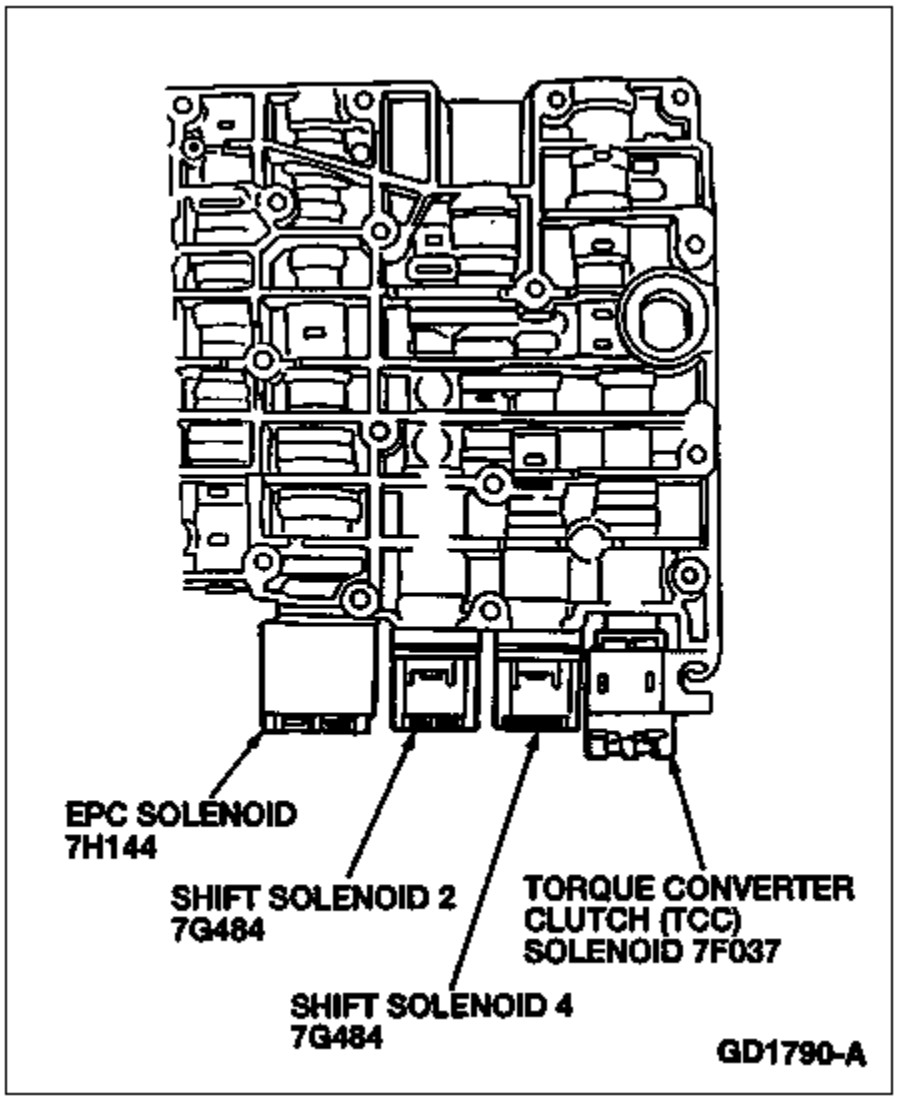
11. Remove the alignment pins.
12. Rotate the main control so that the separator plate is facing down.
13. **CAUTION: The shift solenoid terminals must face upward.**

    NOTE: All the shift solenoids are interchangeable.

    NOTE: If the TCC valve came out, use caution when installing the TCC solenoid.

    Install the solenoids.

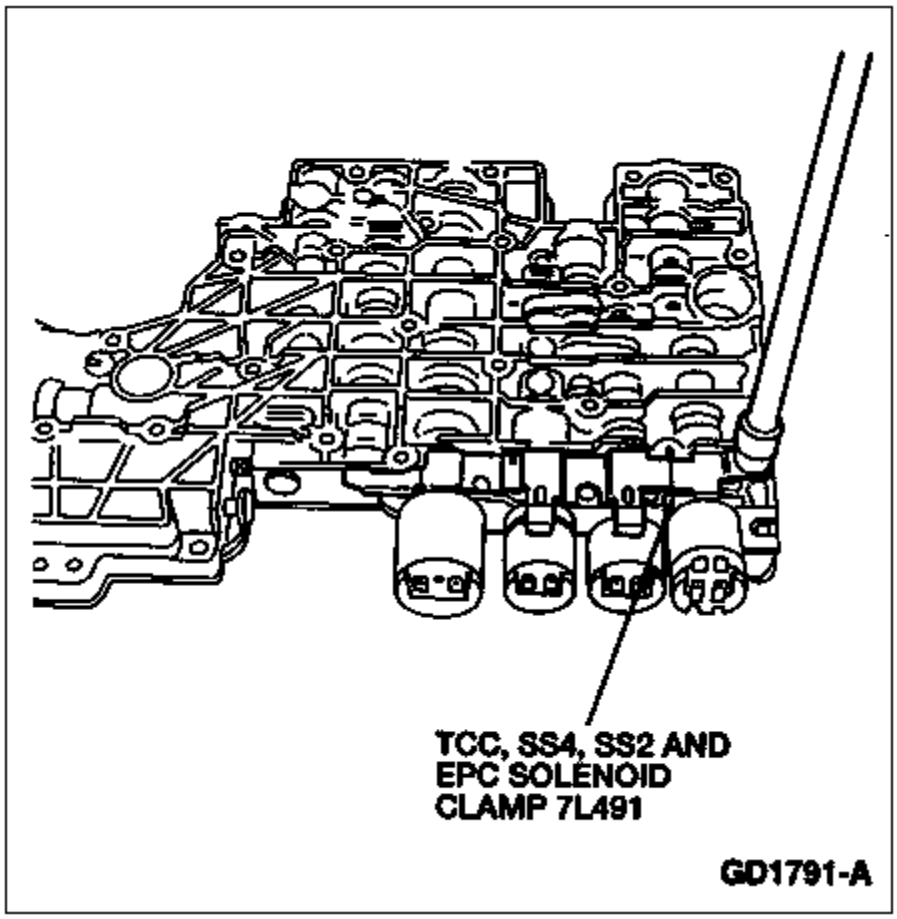
tomsn048@gmail.com



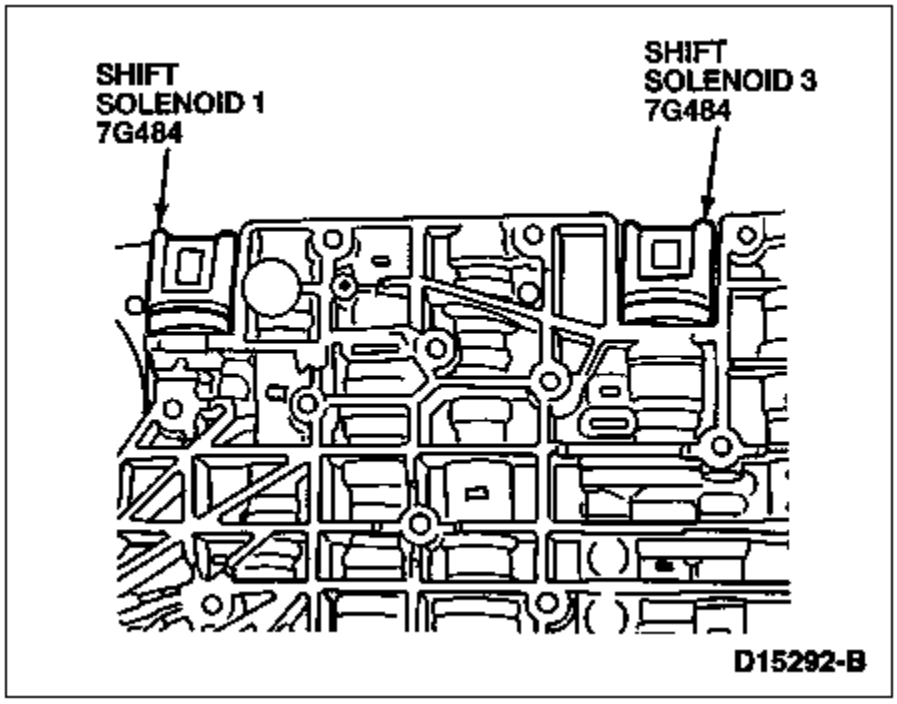
14. **CAUTION: The solenoid clamp must be installed in the TCC and EPC solenoid grooves, shift solenoid pockets and the No. 204 plug.**

    Install the solenoid clamp. Tighten the solenoid clamp screw to 6-8 Nm (53-71 lb-in).

tomsn048@gmail.com

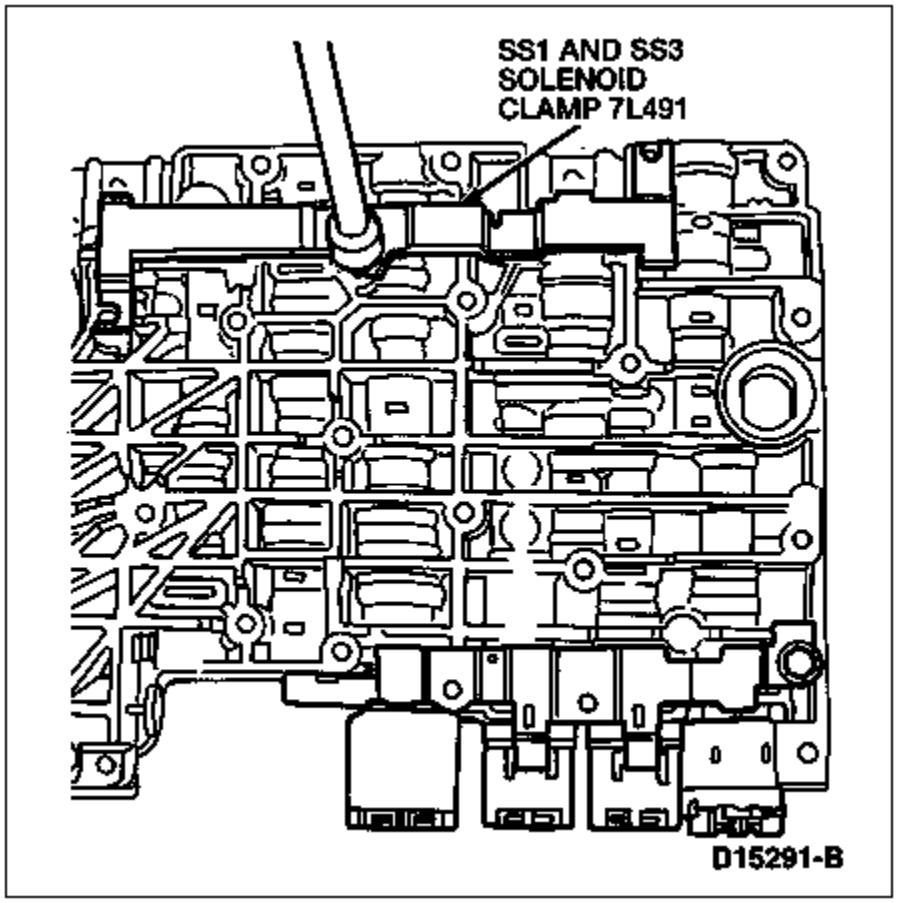


15. Install shift solenoids 1 and 3.



tomsn048@gmail.com

16. Install the solenoid clamp. Tighten the clamp screw to 6-8 Nm (53-71 lb-in).



tomsn048@gmail.com

tomsn048@gmail.com

Converter Housing and Fluid Pump

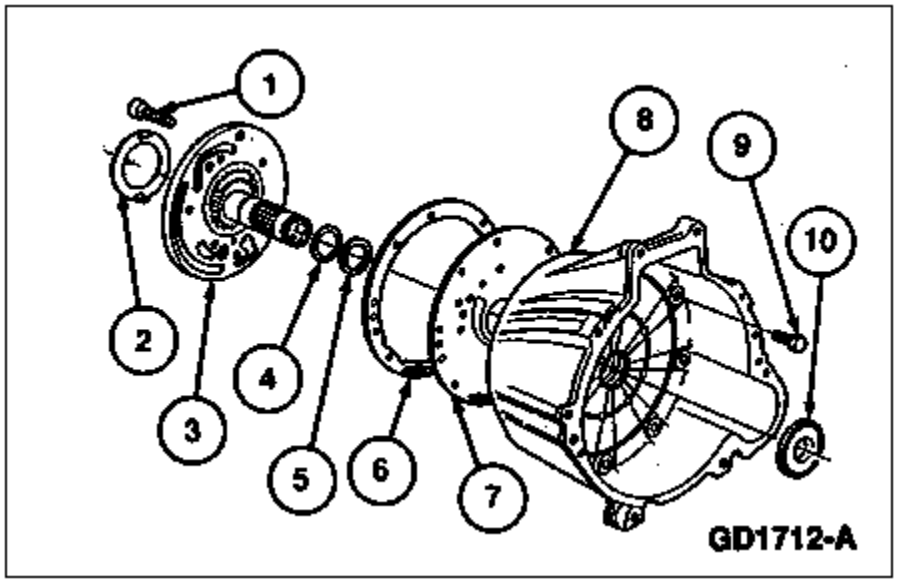
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Converter Housing Seal Replacer	T97T-77000-A

SPECIAL SERVICE TOOLS DESIRED

Tool Number	Description
TOOL-1175-AC	Seal Remover

Converter Housing and Fluid Pump



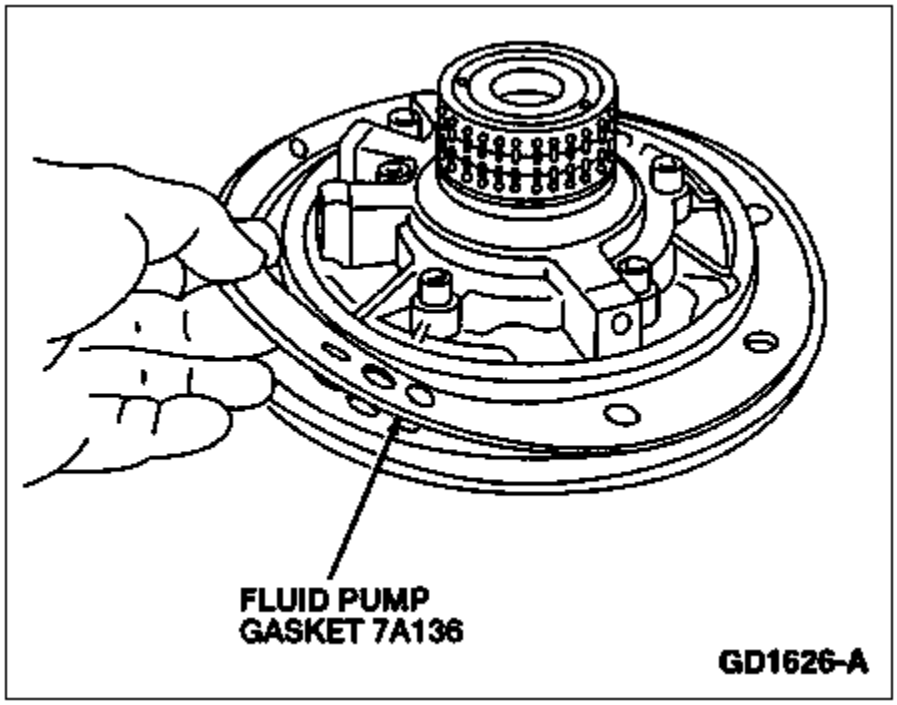
Item	Part Number	Description
1	W701429-S309M	Fluid Pump-to-Converter Housing Screws (6 Req'd)
2	7D014	No. 1 Fluid Pump Input Thrust Washer
3	7A103	Fluid Pump Support and Gear Assembly

tomsn048@gmail.com

4	W701431-S300	Fluid Pump Shaft-to-Inner Gear O-Ring
5	7L323	Fluid Pump Support Seal Ring
6	7A136	Fluid Pump Gasket
7	7B472	Fluid Pump Adapter Plate
8	7976	Converter Housing Assembly
9	E804595-S200	Converter Housing-to-Case Screw and Seal Assembly (8 Req'd)
10	7A248	Converter Hub-to-Converter Housing Seal Assembly

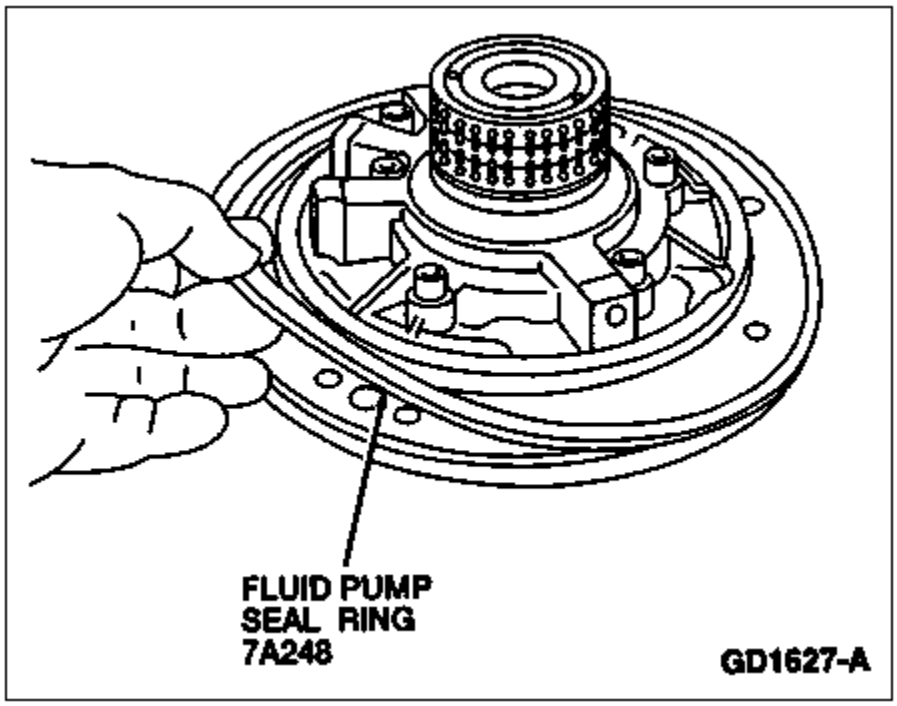
Disassembly

1. Remove and discard the fluid pump gasket.

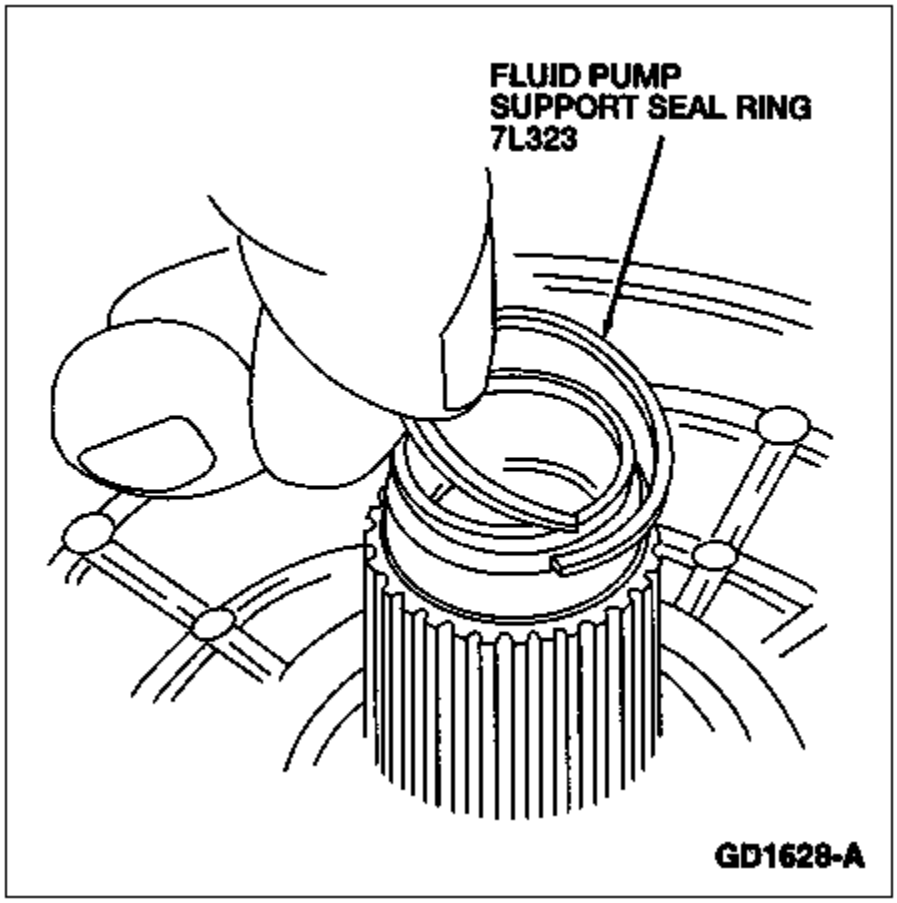


2. Remove and discard the fluid pump square cut seal ring.

tomsn048@gmail.com

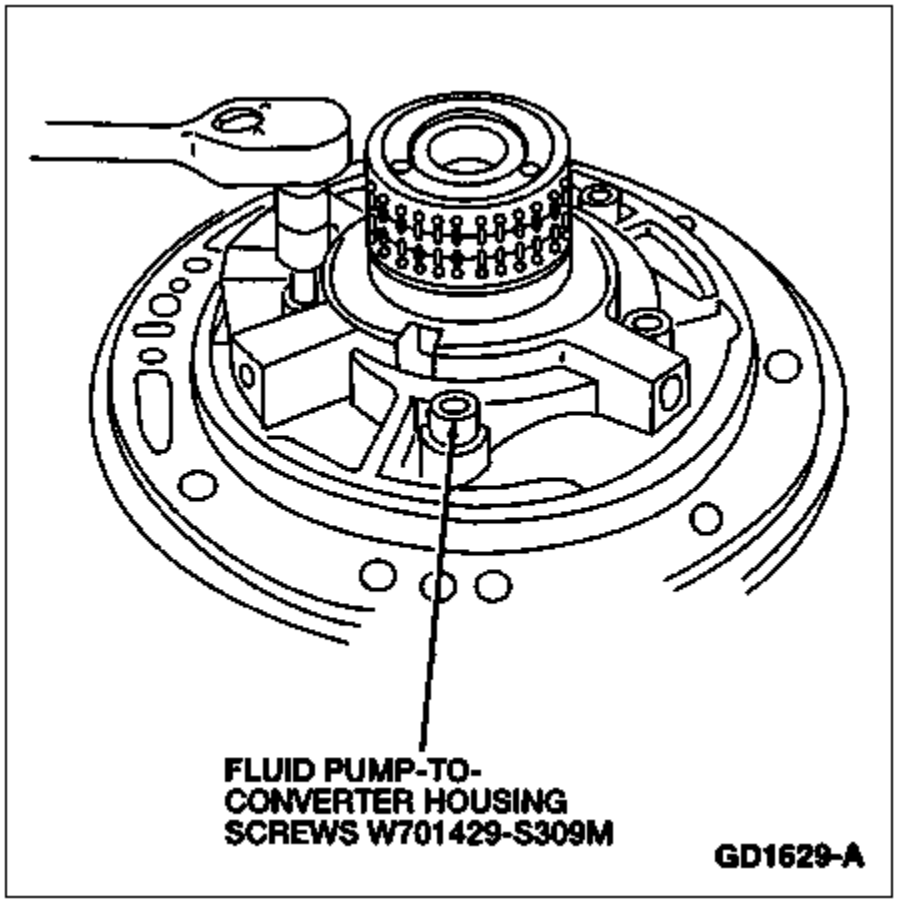


3. Remove the fluid pump support seal ring.



tomsn048@gmail.com

4. Use a Torx® 40 wrench to remove the six M8 x 35mm front pump-to-converter housing screws. Remove the fluid pump support and gear and the fluid pump adapter plate.

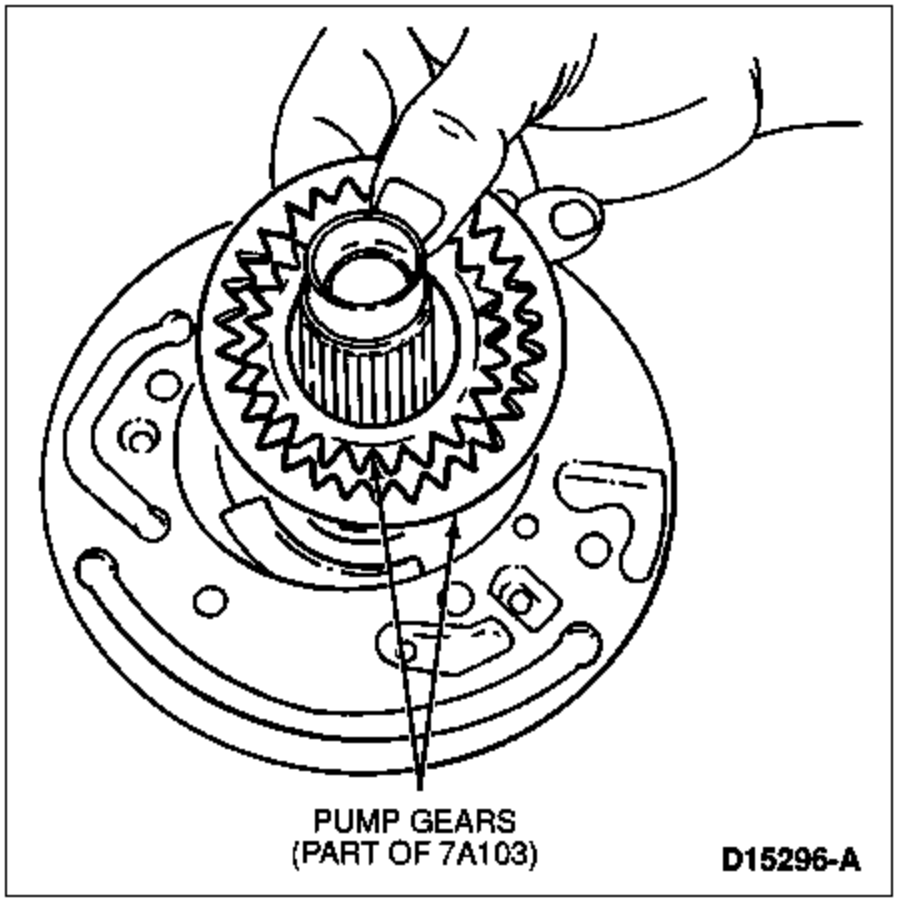


5. **NOTE: The pump gears are part of the pump assembly and are not serviced separately.**

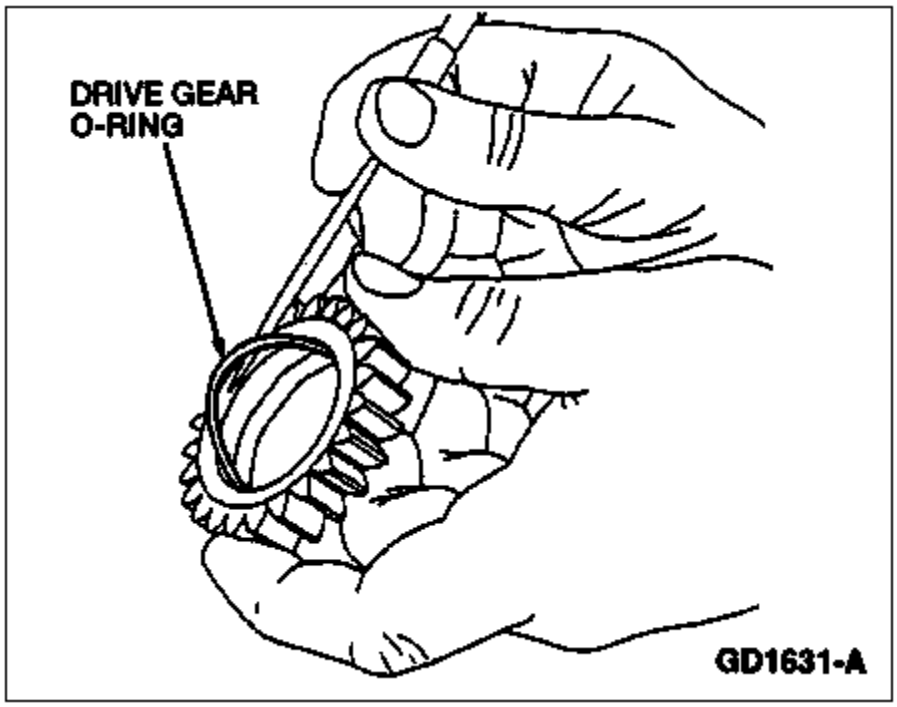
   NOTE: A rough casting on the pump surface crescent is not a flaw.

   Remove the pump gears.

tomsn048@gmail.com



6. Remove the drive gear O-ring and discard.

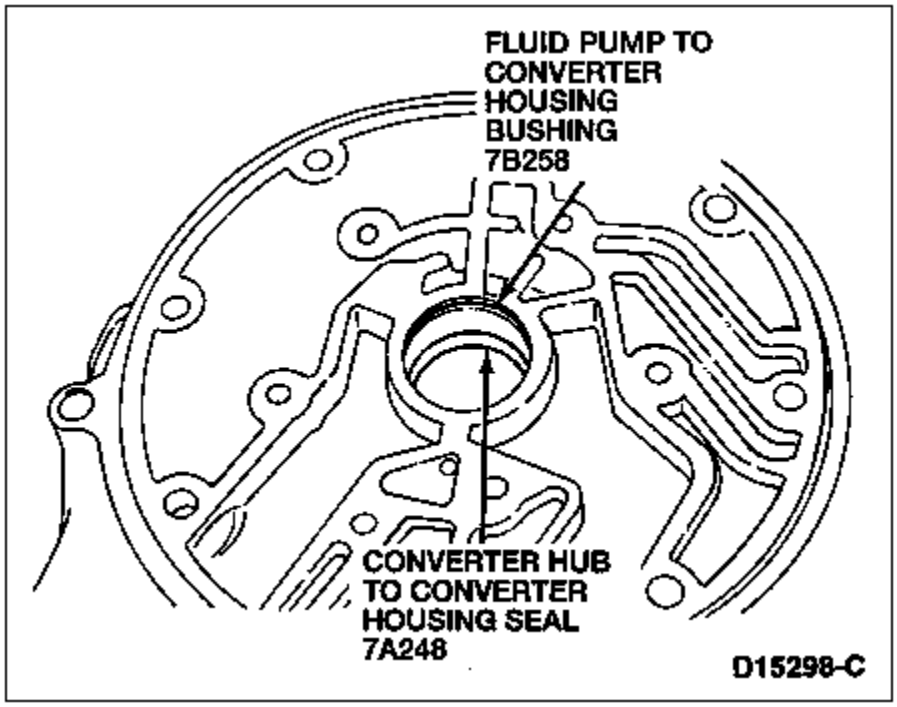


tomsn048@gmail.com

7. Inspect the pump gears for scoring and cracks. Replace pump assembly if damaged.

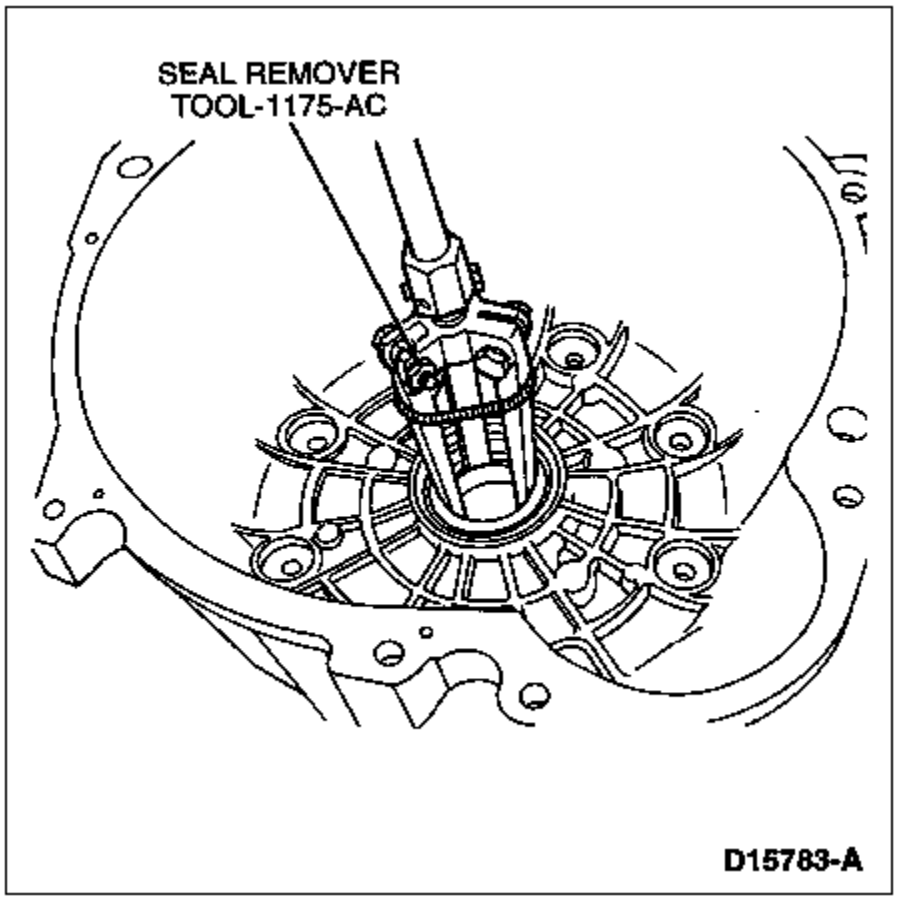
8. **NOTE: Fluid pump-to-converter housing bushing is not serviced separately. If service is required, the converter housing assembly must be replaced.**

   Inspect the fluid pump to converter housing bushing and converter hub to converter housing seal. Replace converter housing assembly if necessary.



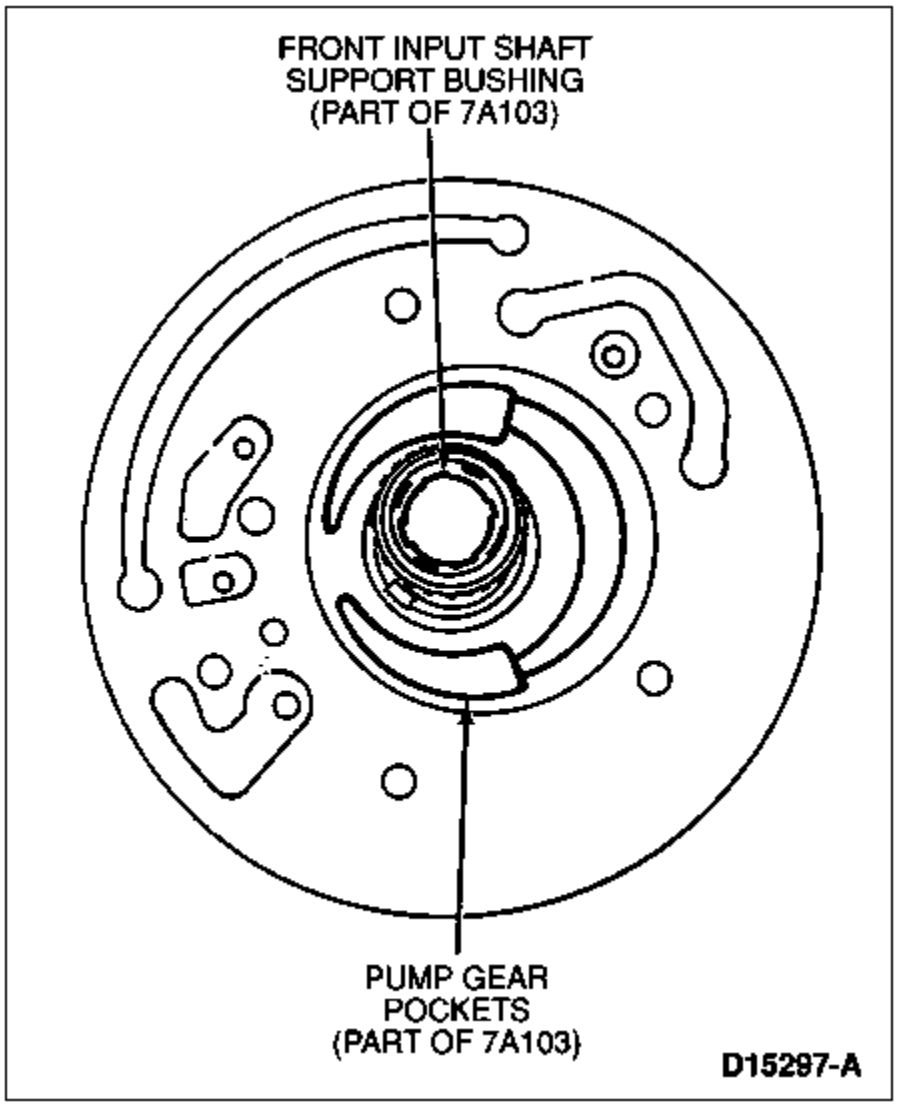
9. Remove and discard the converter hub-to-converter housing seal using Seal Remover TOOL-1175-AC or equivalent from the converter housing as shown.

tomsn048@gmail.com



10. Clean and inspect the front and rear input shaft support bushings. If bushings are worn, scored or damaged, replace the fluid pump support and gear assembly. Inspect the pump gear pockets for scoring and wear. Replace if necessary.

tomsn048@gmail.com



11. Inspect the mating surfaces of the pump body and case for burrs.

    Inspect the drive and driven gear bearing surface for scores and check the gear teeth for burrs.

    Inspect the fluid pump seal for cuts or nicks. Inspect the pump bushing for scoring.

    Check the fluid passages for obstruction.

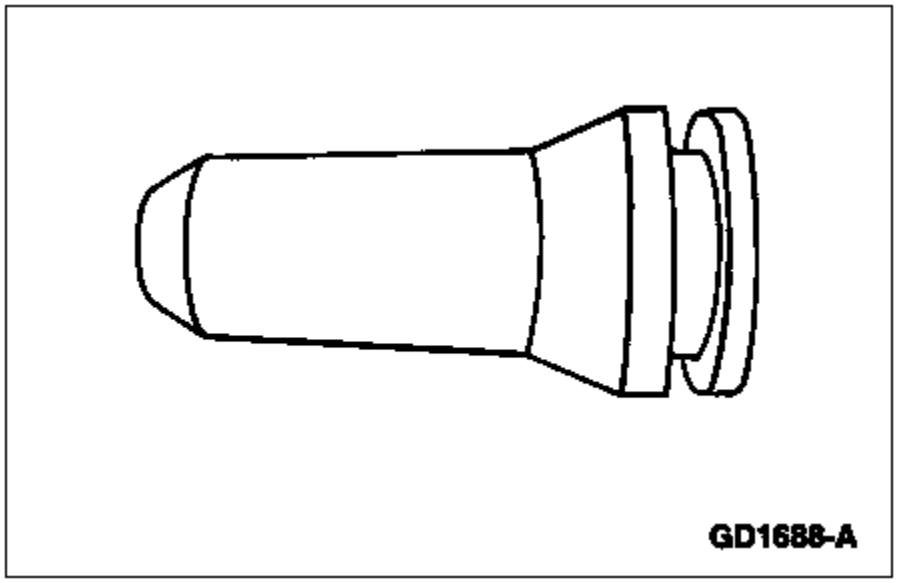
    If any parts are found to be damaged or worn, replace the pump as an assembly. Minor burrs and scores may be removed with a crocus cloth.

Assembly

1. **NOTE: Check and make sure that the garter spring has not popped off of the converter hub-to-converter housing seal.**

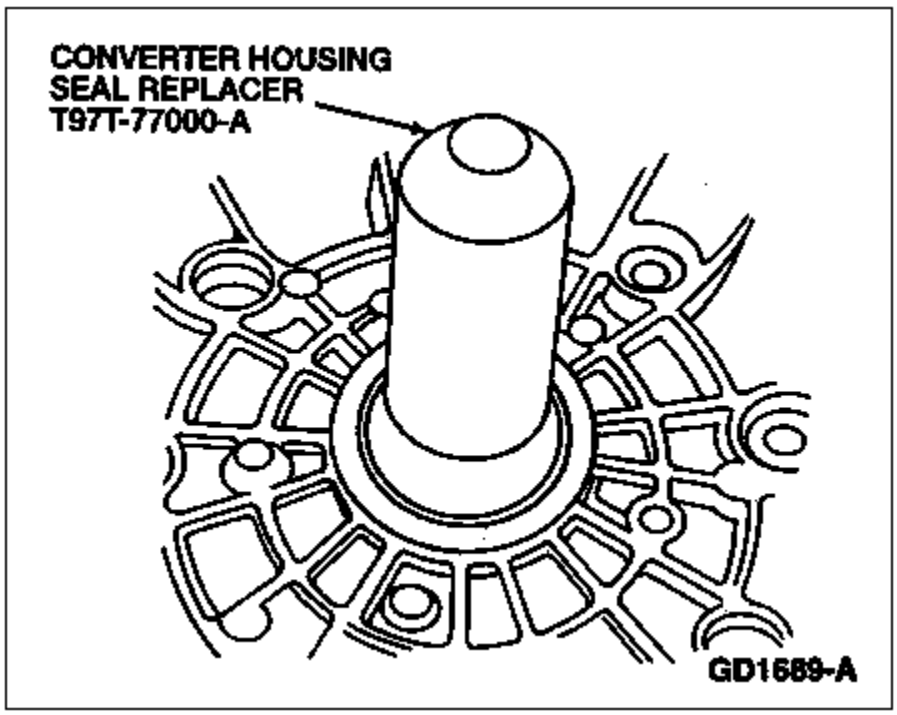
   Install new converter hub to housing seal onto Converter Housing Seal Replacer T97T-77000-A.

tomsn048@gmail.com



2. **CAUTION: Place the converter housing on a block of wood or equivalent to protect the converter hydraulic passages on the back side.**

   Install a new converter hub-to-converter housing seal until it bottoms in housing using Converter Housing Seal Replacer T97T-77000-A.



tomsn048@gmail.com

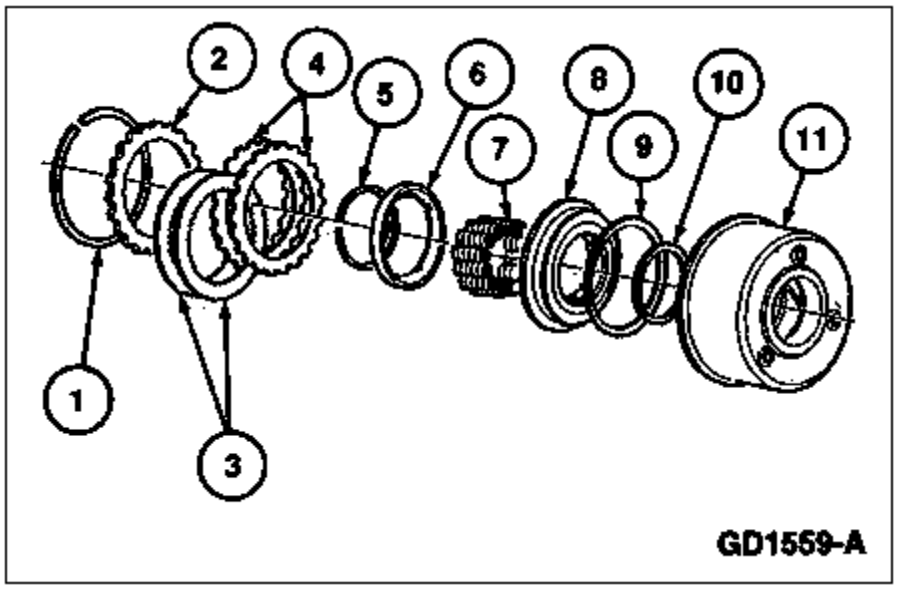
tomsn048@gmail.com

Coast Clutch

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Spring Compressor	T65L-77515-A
Coast Clutch Outer Seal Sizing Tool	T95L-70010-D

Front Brake and Coast Clutch Drum Assembly



Item	Part Number	Description
1	E860126-S/129S	Retaining Ring (Select Fit)
2	7B066	Coast Clutch Pressure Plate
3	7B164	Coast Clutch Internal Plate — Friction
4	7B442	Coast Clutch External Plate — Steel
5	E860125-S	Retaining Ring
6	7A527	Coast Clutch Piston Spring Retainer
7	7A480	Coast Clutch Piston Springs (20 Req'd)
8	7A258	Coast Clutch Piston
9	7D548	Coast Clutch Piston Outer Seal Ring
10	7D404	Coast Clutch Piston Inner Seal Ring

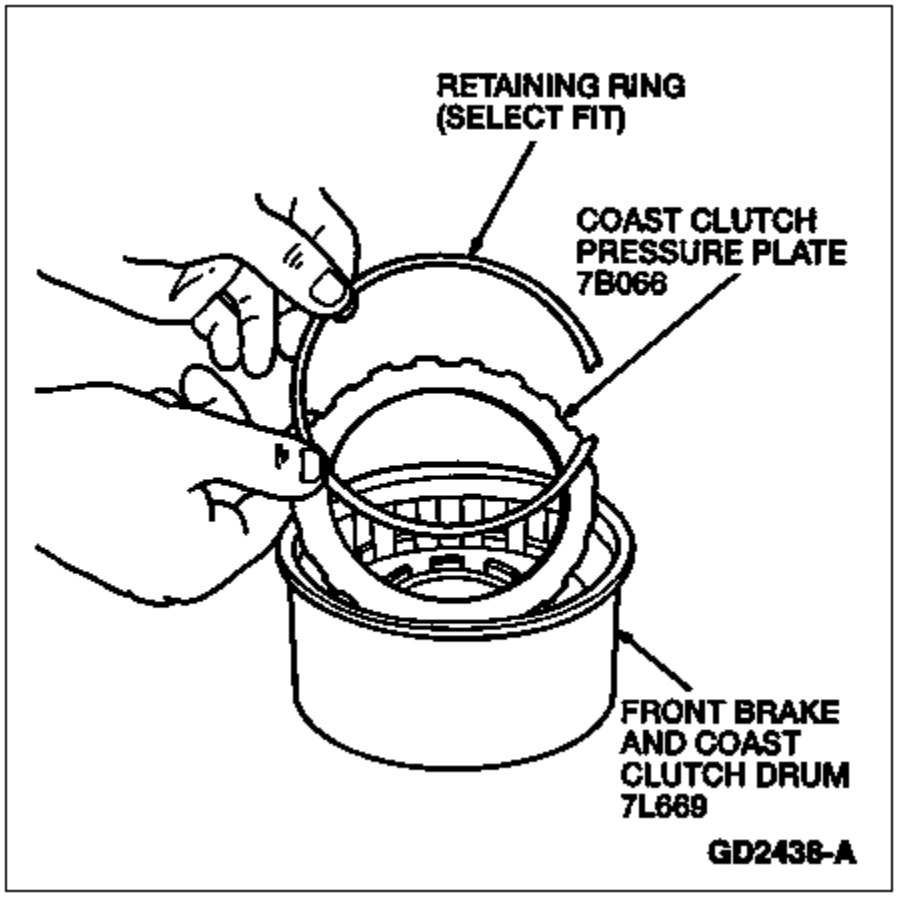
tomsn048@gmail.com

11	7L669	Front Brake and Coast Clutch Drum Assembly

Disassembly

1. **CAUTION: This is a select fit ring. See Assembly procedure if the ring or clutch plate pack is replaced.**

   Remove the retaining ring and coast clutch pressure plate from the front brake and coast clutch drum.

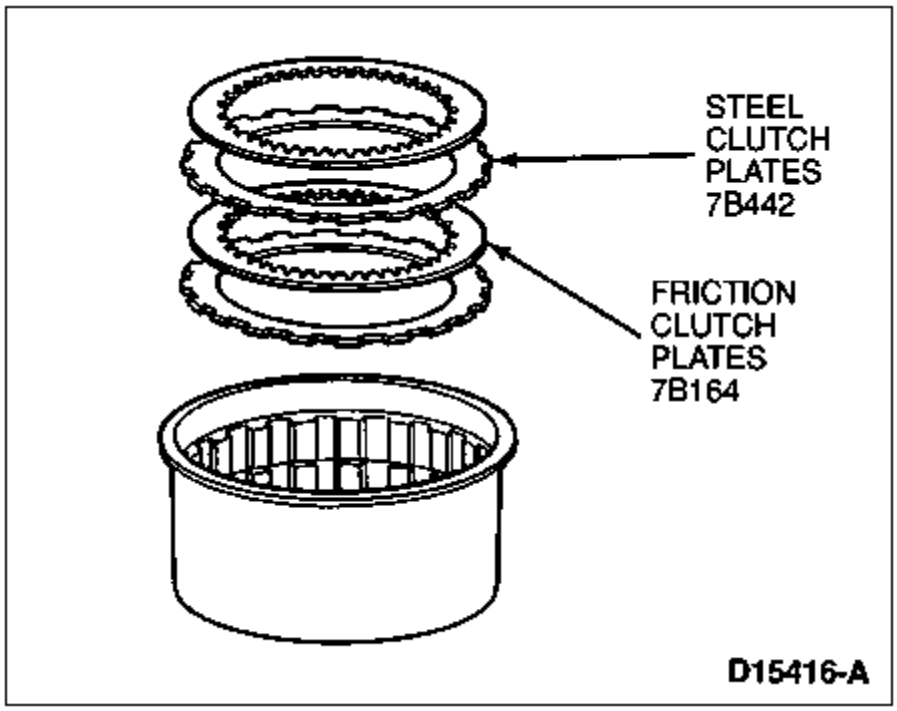


2. **CAUTION: Friction plates are directional. Note direction of grooves for installation.**

   CAUTION: If new clutch plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   Remove the coast clutch pack. Inspect for wear, damage or overheating. Replace as necessary.

tomsn048@gmail.com

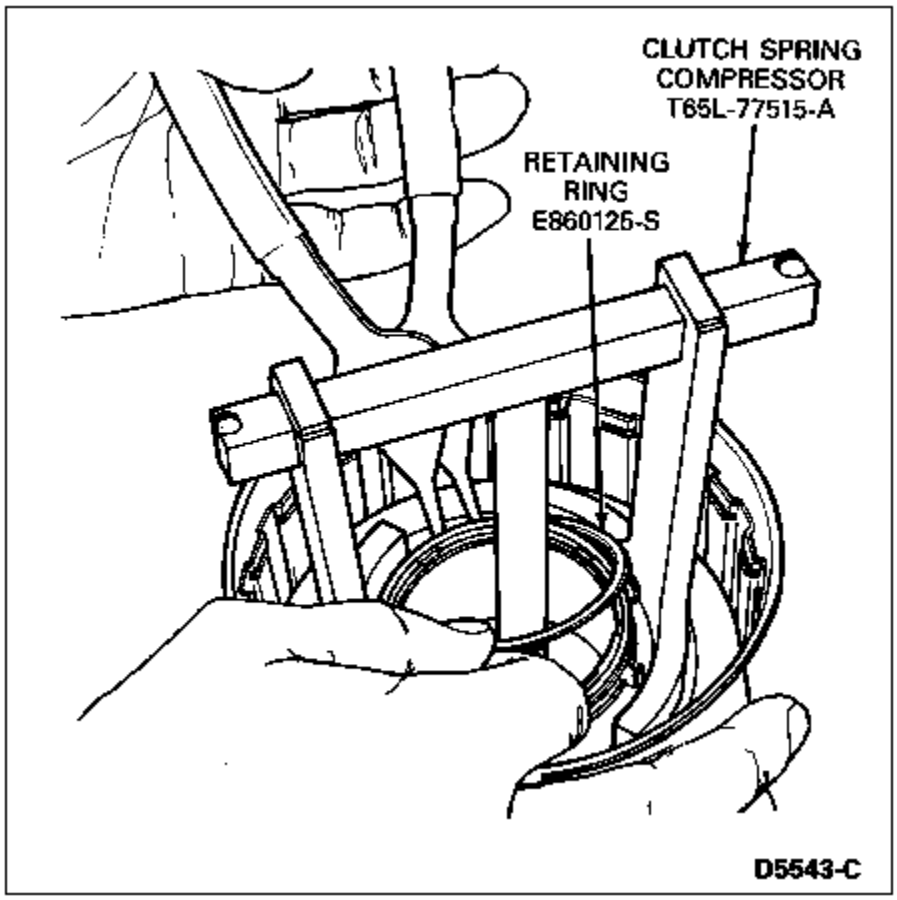


3. **WARNING: USE CAUTION WHEN RELEASING TOOL PRESSURE ON THE REAR CLUTCH PISTON SPRINGS.**

   CAUTION: Do not fully compress the clutch spring compressor or damage to the spring retainer may occur.

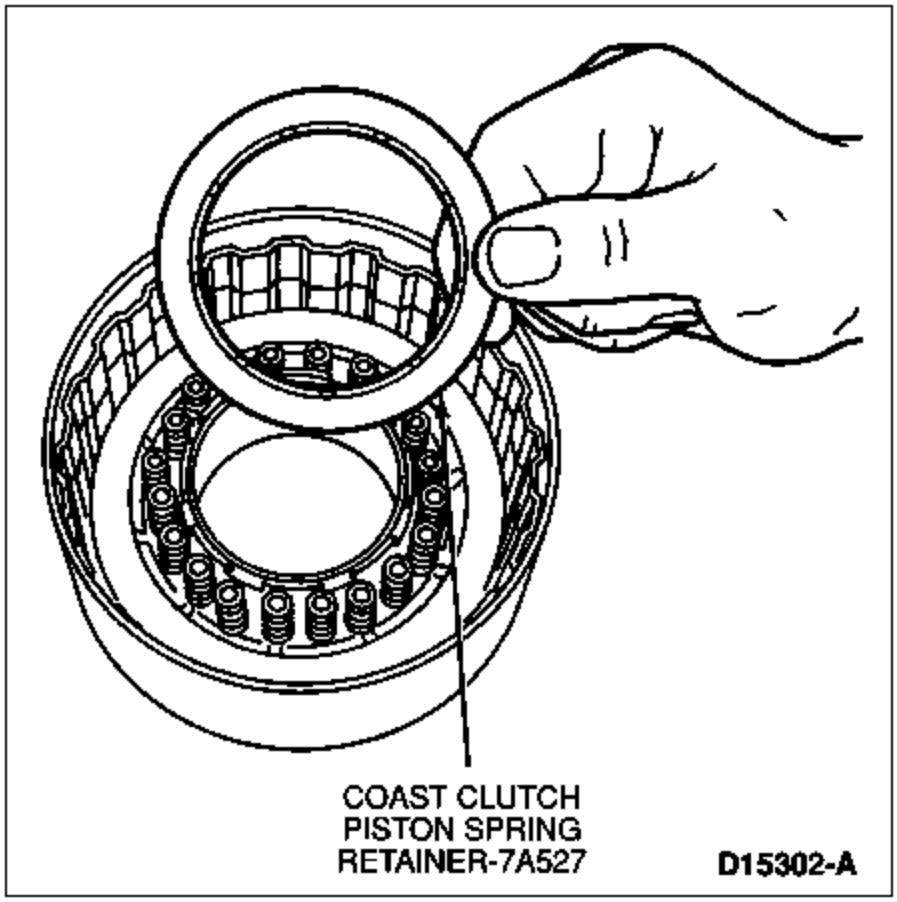
   Compress the clutch piston springs with Clutch Spring Compressor T65L-77515-A. Remove the retaining ring.

tomsn048@gmail.com



4. Remove the clutch piston spring retainer and 20 clutch piston springs.

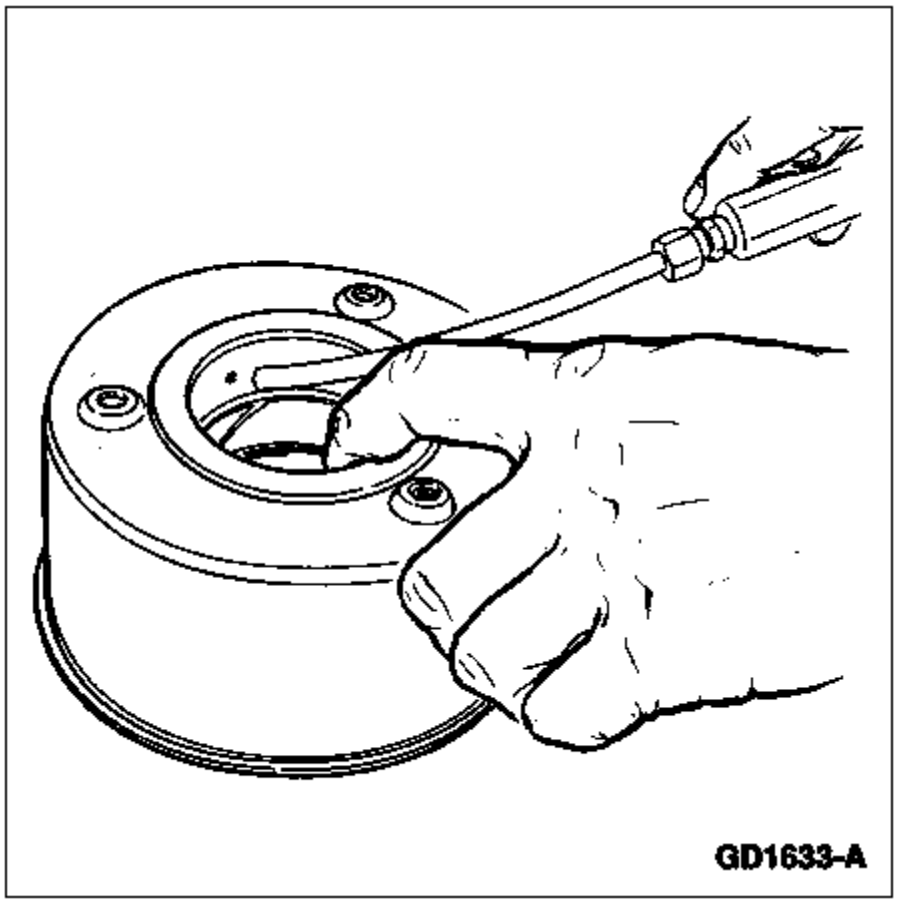
tomsn048@gmail.com



5. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR, AND MAKE SURE DRUM IS FACING DOWN AS SHOWN.**

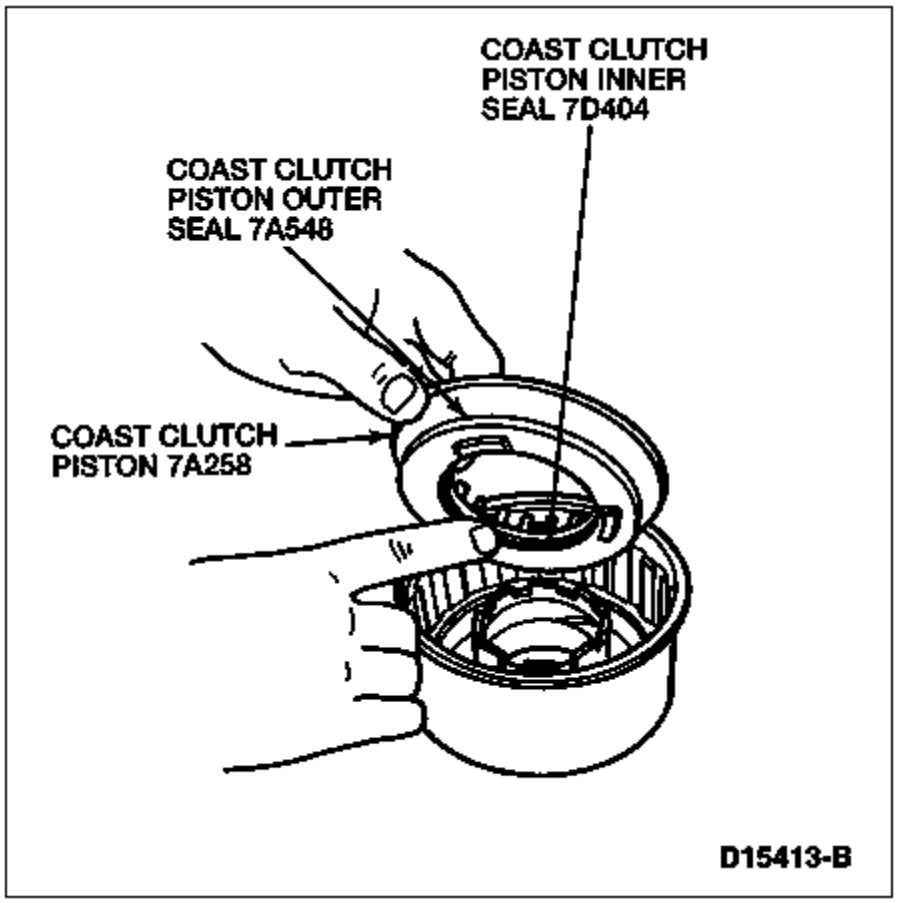
   Remove the coast clutch piston by using air pressure. Apply air pressure to one hole on the inside diameter of the front brake and coast clutch drum while blocking the other hole with a finger.

tomsn048@gmail.com



6. Remove the coast clutch piston inner and outer seal. Clean and replace as necessary.

tomsn048@gmail.com

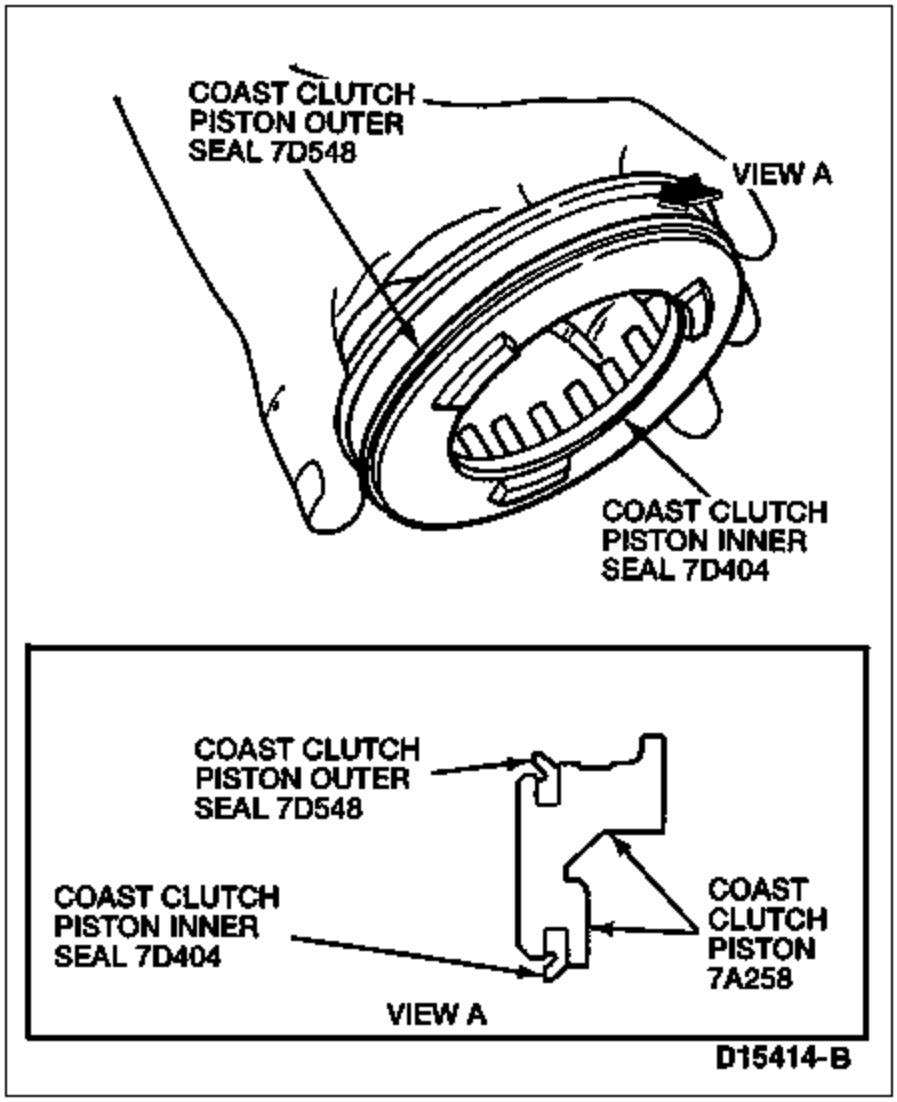


Assembly

1. **CAUTION: The lip seals must be positioned as shown. Care must be taken to prevent roll over of the lip seal.**

   Install new coast clutch piston inner and outer seal on the coast clutch piston.

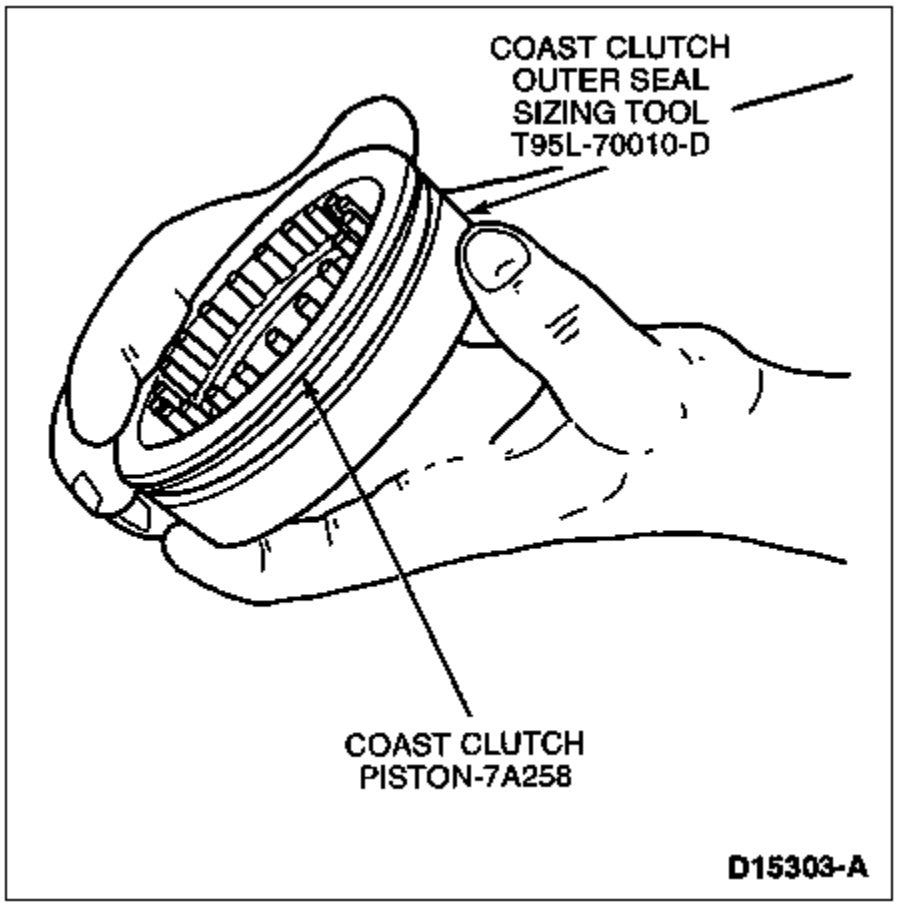
tomsn048@gmail.com



2. **CAUTION: Lubricate the coast clutch piston inner and outer seal.**

   Carefully press the coast clutch piston into Coast Clutch Outer Seal Sizing Tool T95L-70010-D.

tomsn048@gmail.com



3. Inspect the drum band surface, bushing, and thrust surfaces for scores. Minor scores may be removed with a crocus cloth. Badly scored parts must be replaced.

4. Inspect the clutch piston bore and the piston and the piston inner and outer bearing surfaces for scores.

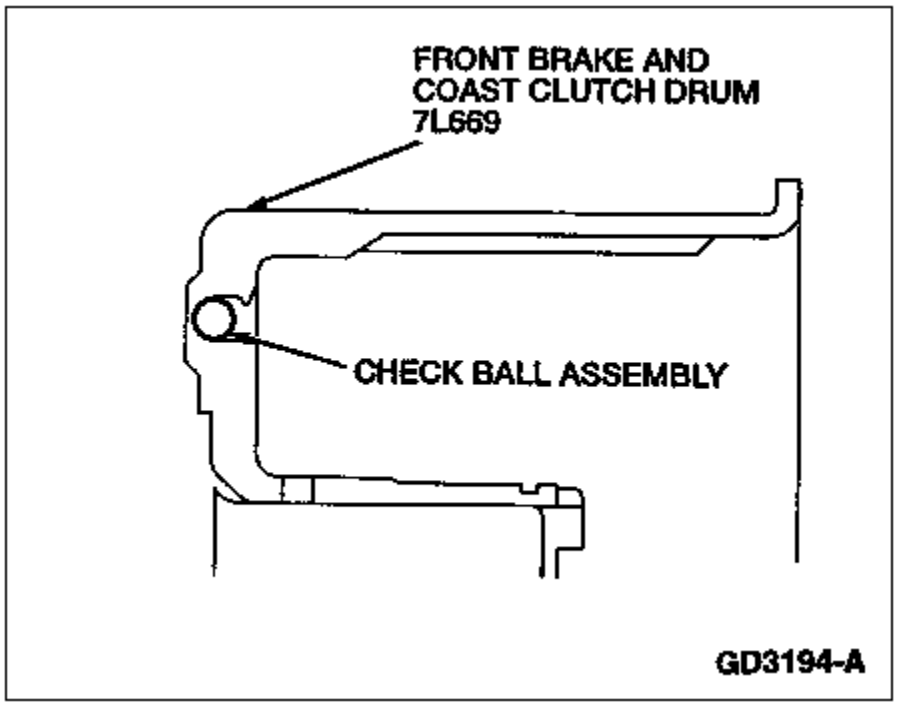
5. Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.

6. Inspect the clutch plates for wear, scoring and fit on the clutch hub serrations. Replace all plates that are badly scored, worn or do not fit freely in the hub serrations.

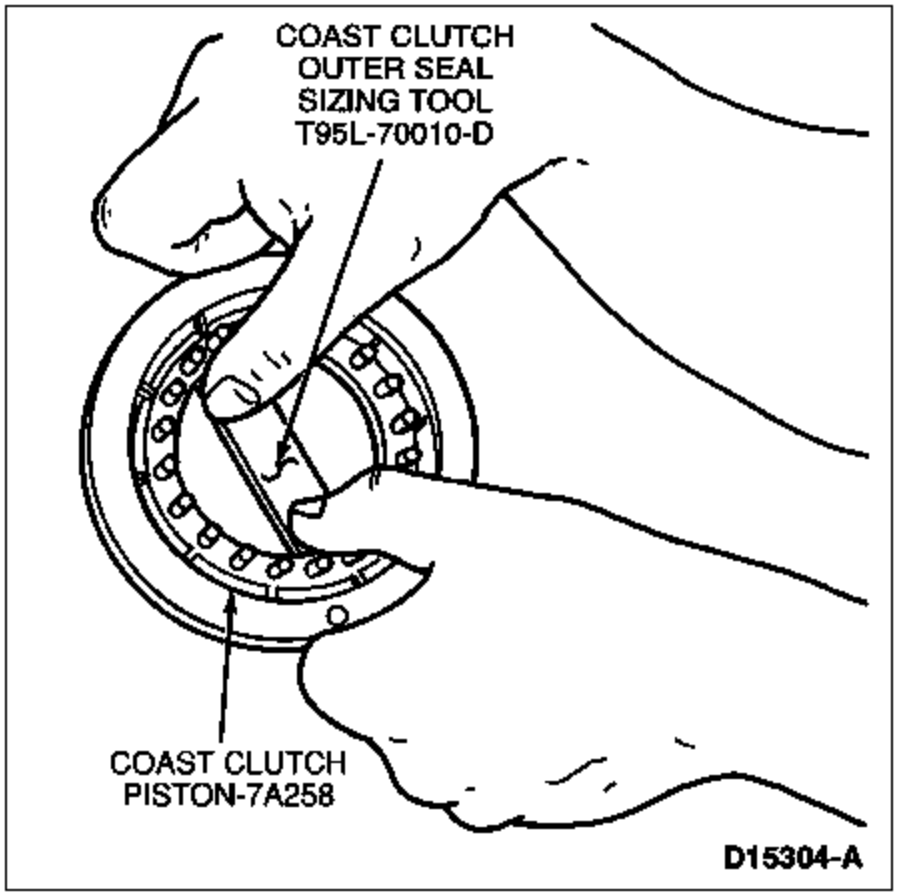
7. Inspect the clutch pressure plate for scores on the clutch plate surface. Check the clutch release spring(s) for distortion.

8. Make sure the check ball is free and clear of debris prior to installing piston. The check ball is located in the front brake and coast clutch drum.

tomsn048@gmail.com



9. Carefully remove the coast clutch piston from Coast Clutch Outer Seal Sizing Tool T95L-70010-D.



tomsn048@gmail.com

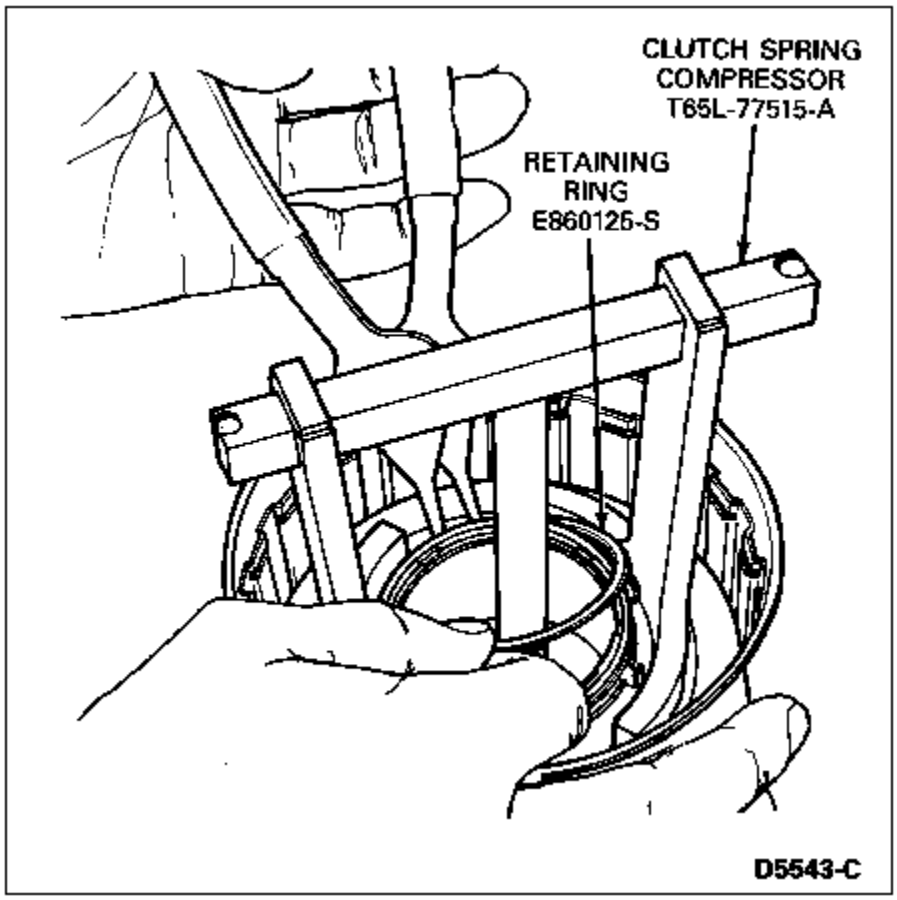
10. **CAUTION: Care must be taken to prevent damage to the seals during installation.**

    Carefully install the coast clutch piston into the front brake and coast clutch drum.

11. Install the 20 coast clutch piston springs and coast clutch piston spring retainer onto the coast clutch piston.

12. **CAUTION: Do not fully compress the clutch spring compressor or damage to the coast clutch piston spring retainer may occur.**

    Compress the coast clutch piston springs with Clutch Spring Compressor T65L-77515-A. Install the retaining ring. Release the load on the springs applied by the tool. Remove the tool.



13. **CAUTION: Coast clutch friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should face up.**

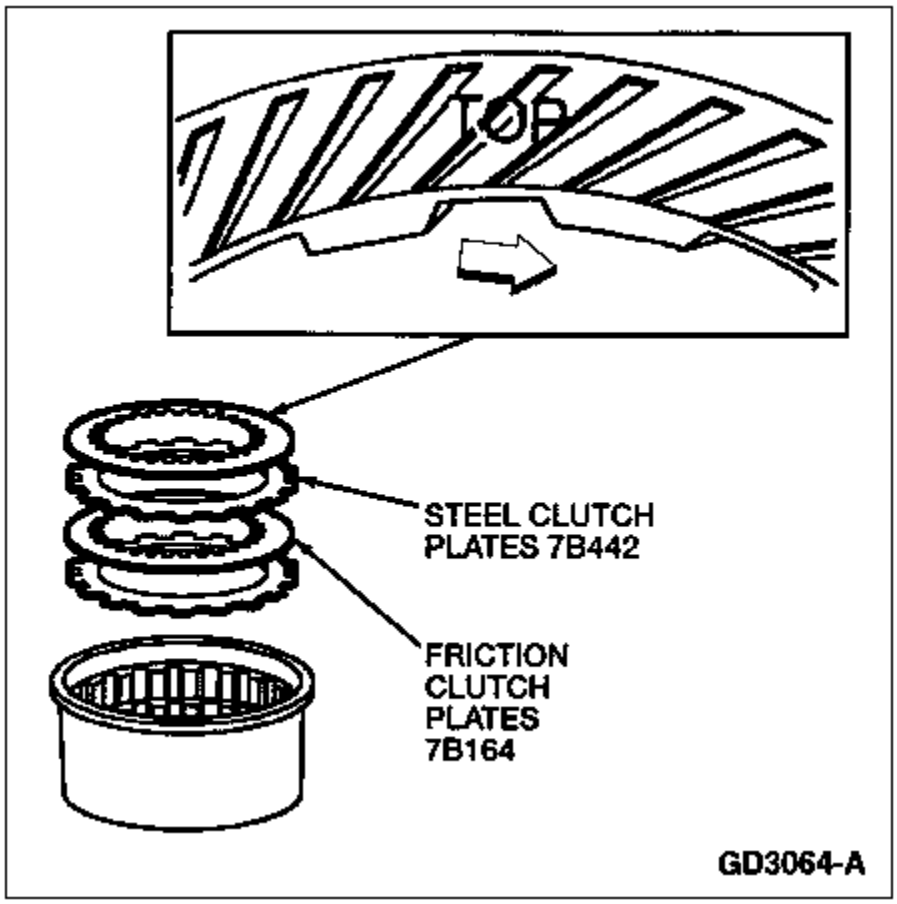
    CAUTION: If new clutch plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

    NOTE: When installing friction plates, the word "TOP" should face up. If reusing plates,

tomsn048@gmail.com

grooves must be installed clockwise.

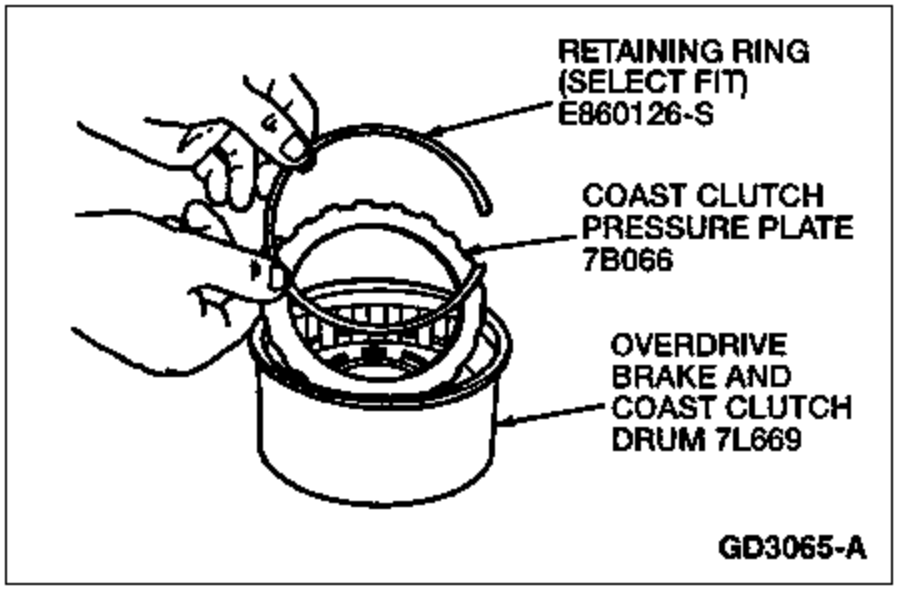
Install the two steel clutch plates and two friction clutch plates in alternating order, starting with a steel plate first.



14. **CAUTION: The retaining ring is select fit.**

Install the coast clutch pressure plate. Install the original retaining ring on top of the clutch pressure plate.

tomsn048@gmail.com

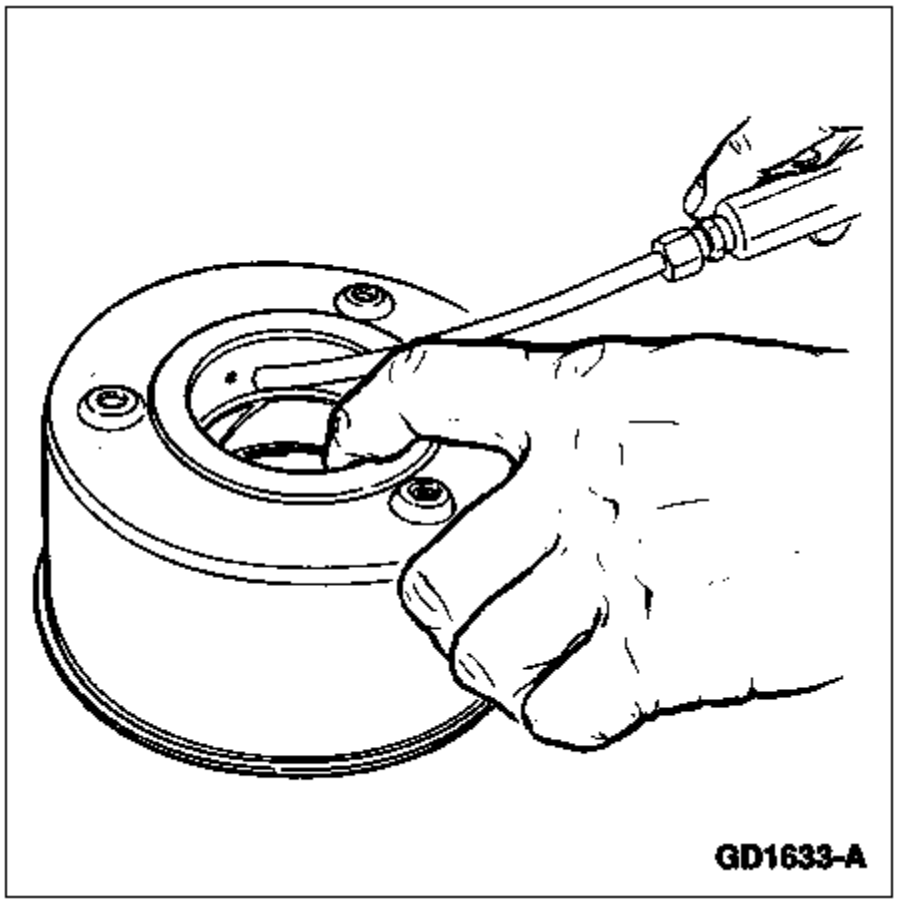


15. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE DRUM IS FACING DOWN AS SHOWN.**

    NOTE: The coast clutch piston must apply with air pressure and release when the air is removed.

    Air check the assembly. Apply air to one hole on the inside diameter of the front brake and coast clutch drum while blocking the other hole with a finger.

tomsn048@gmail.com



16. Check the free play of the clutch pack. Push down on the clutch pack. Use a feeler gauge to check the gap between the retaining ring and the pressure plate. Specification: 1.3 to 2.0mm (.051 to .079 inch).

    If the reading is not within specification, remove the retaining ring and check the thickness. Replace it with a ring that will correct free play. Verify with a feeler gauge.

tomsn048@gmail.com

tomsn048@gmail.com

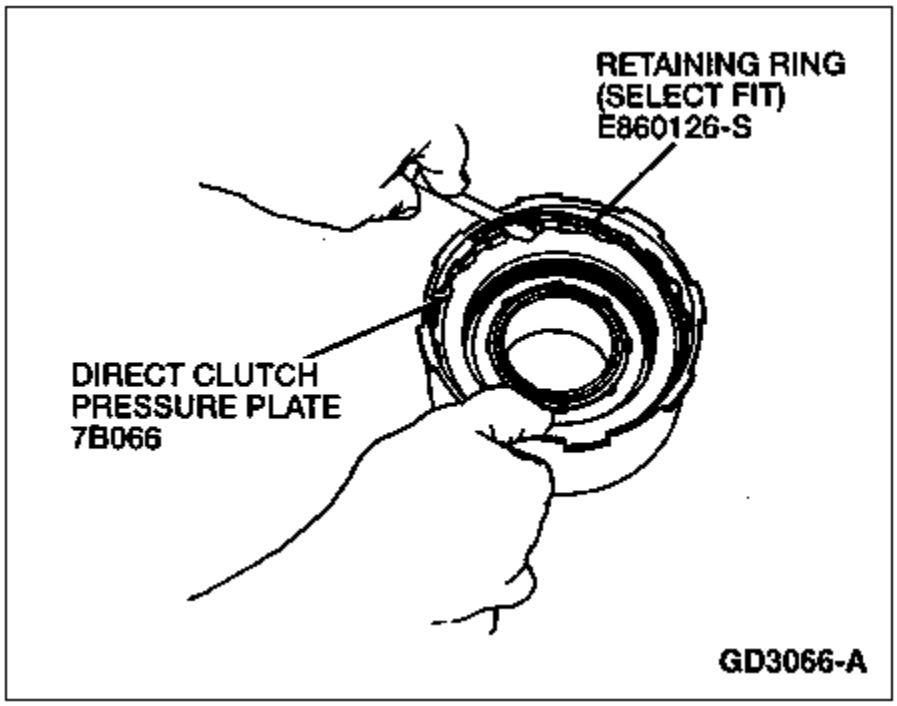
10	7D404	Direct Clutch Piston Inner Seal Ring
11	7D044	Intermediate Brake and Direct Clutch Drum Assembly

Disassembly

1. **CAUTION: The retaining ring is a select fit ring. See assembly procedure if the ring or clutch pack is replaced.**

   Remove the retaining ring and direct clutch pressure plate.

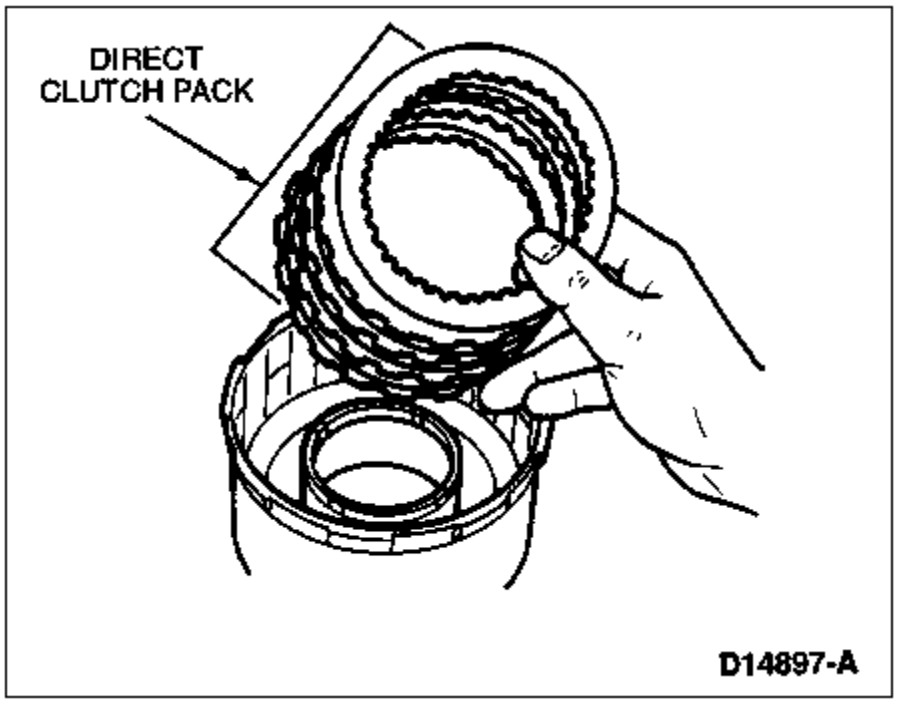


2. **CAUTION: Friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should face up.**

   CAUTION: If new clutch plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   Remove the direct clutch pack. Inspect for wear, damage or overheating. Replace the steel or friction plates as necessary.

tomsn048@gmail.com

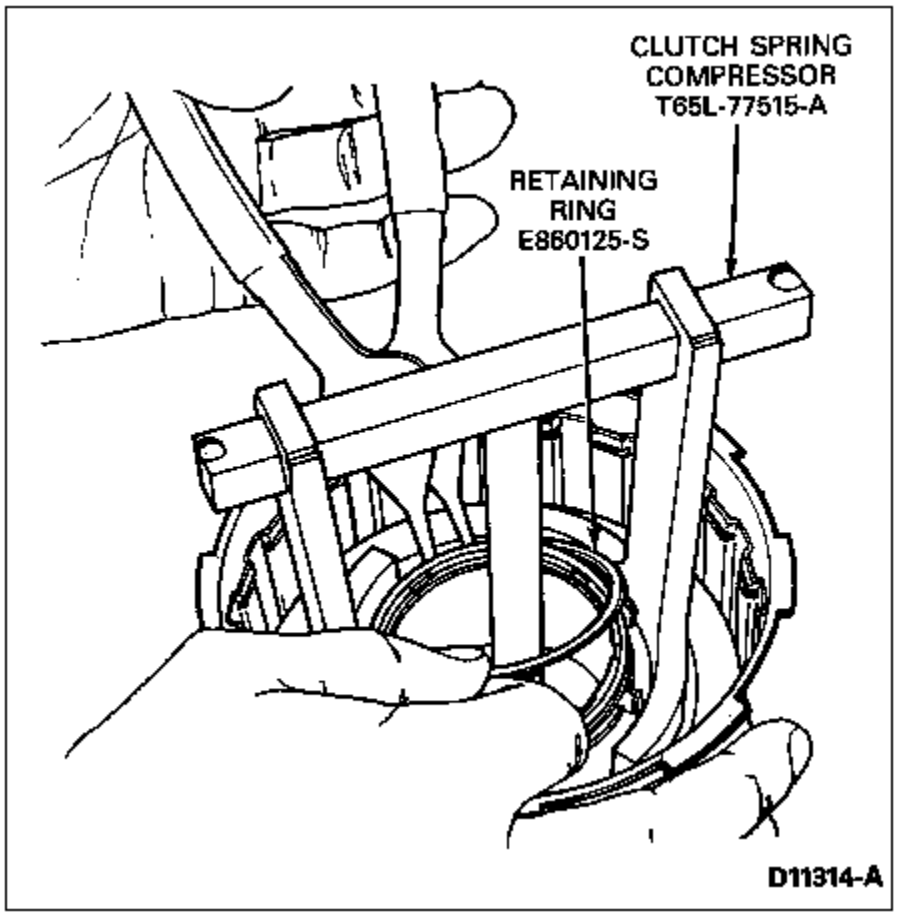


3. **WARNING: AFTER REMOVING THE RETAINING RING, USE CARE WHEN RELEASING THE PRESSURE ON THE SPRINGS.**

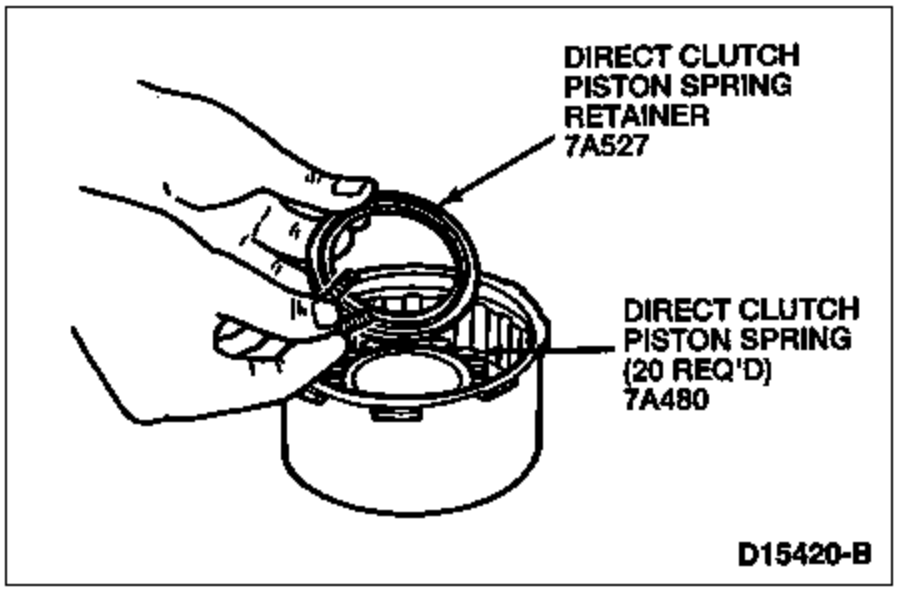
   CAUTION: Do not fully compress the clutch spring compressor or damage to the spring retainer may occur.

   Compress the direct clutch piston springs with Clutch Spring Compressor T65L-77515-A. Remove the retaining ring. Remove the tool.

tomsn048@gmail.com



4. Remove the direct clutch piston spring retainer and 20 direct clutch piston springs.

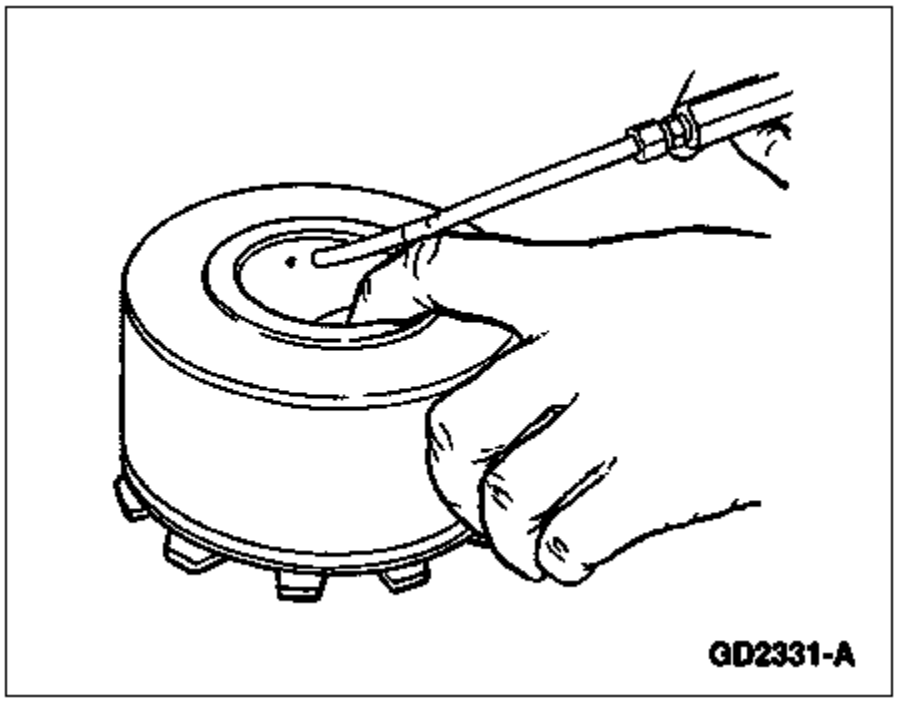


5. **WARNING: DO NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING**

tomsn048@gmail.com

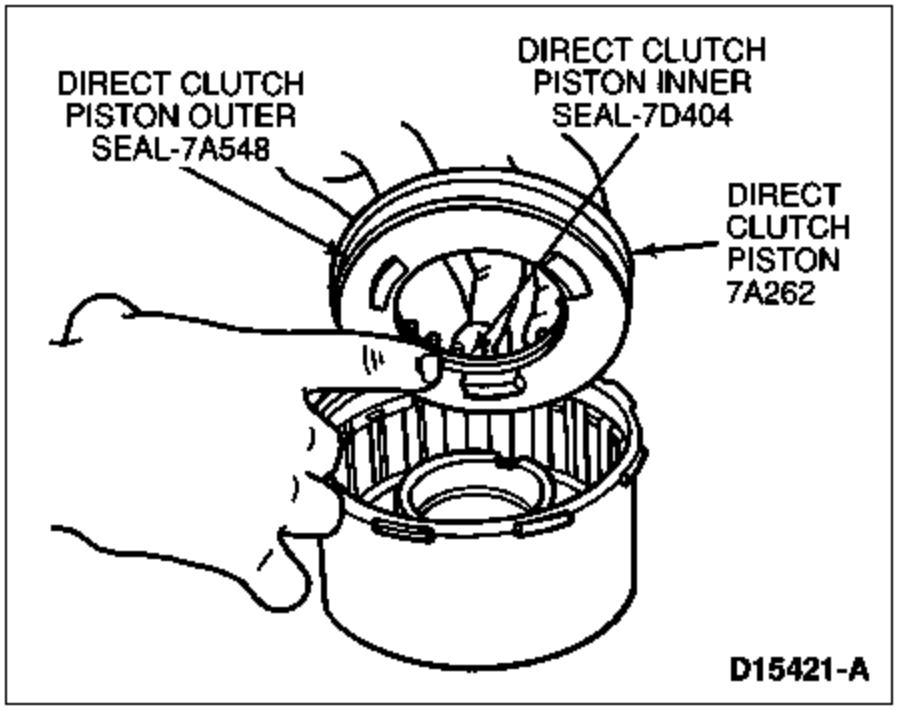
COMPRESSED AIR. MAKE SURE DRUM IS FACING DOWN AS SHOWN.

Remove the direct clutch piston using compressed air. Apply air pressure to one hole on the inside diameter of the intermediate brake and direct clutch drum while blocking the other hole with a finger.



6. Remove the direct clutch piston inner and outer seals. Clean and replace as necessary.

tomsn048@gmail.com

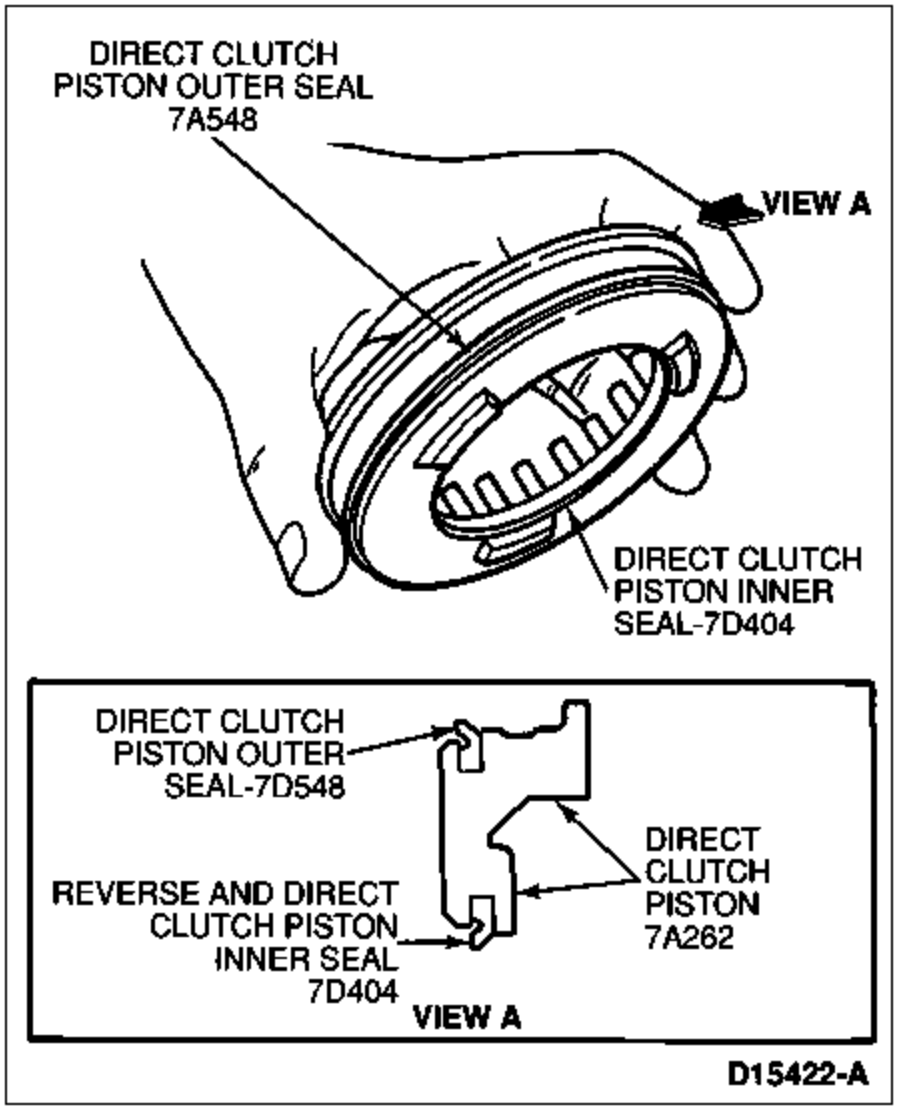


Assembly

1. **CAUTION: The lip seals must be positioned as shown. Care must be taken to prevent rollover of the lip seal.**

   Install new direct clutch piston inner and outer seals on the direct clutch piston.

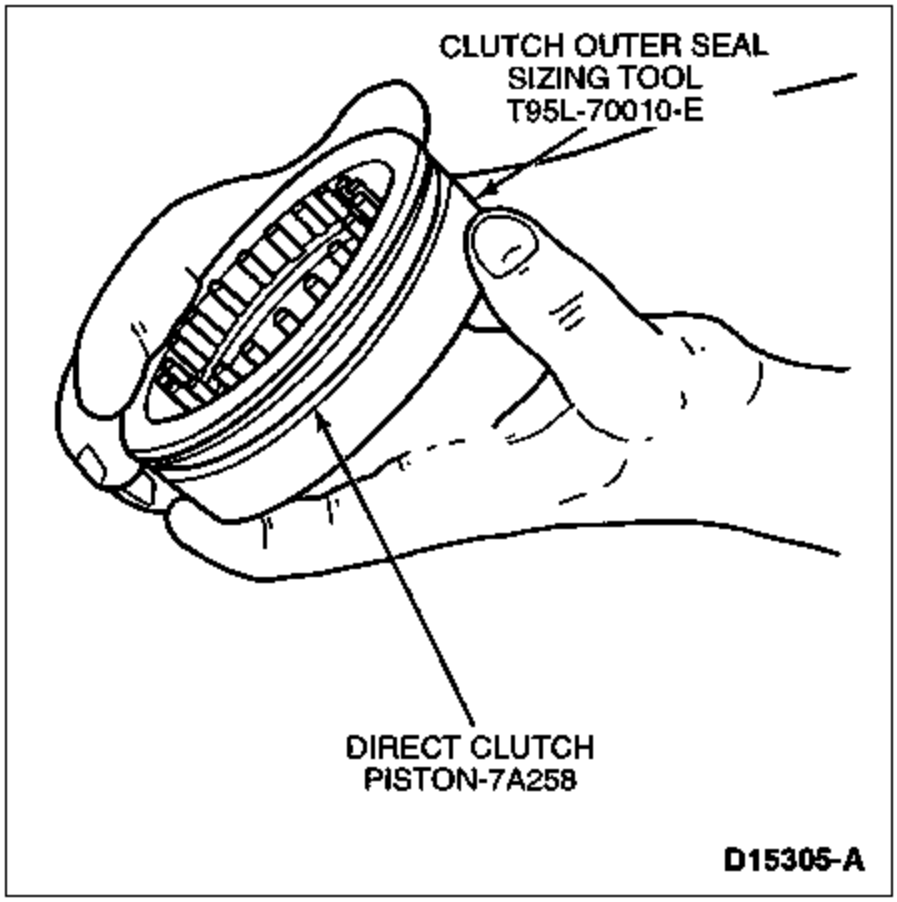
tomsn048@gmail.com



2. **CAUTION: Lubricate the direct clutch piston inner and outer seals with MERCON V® XT-5-QM transmission fluid.**

   Carefully press the direct clutch piston into Direct Clutch Outer Seal Sizing Tool T95L-70010-E.

tomsn048@gmail.com



3. Inspect the drum band surface, bushing and thrust surfaces for scores. Minor scores may be removed with a crocus cloth. Badly scored parts must be replaced.

4. Inspect the clutch piston bore and the piston and the piston inner and outer bearing surfaces for scores.

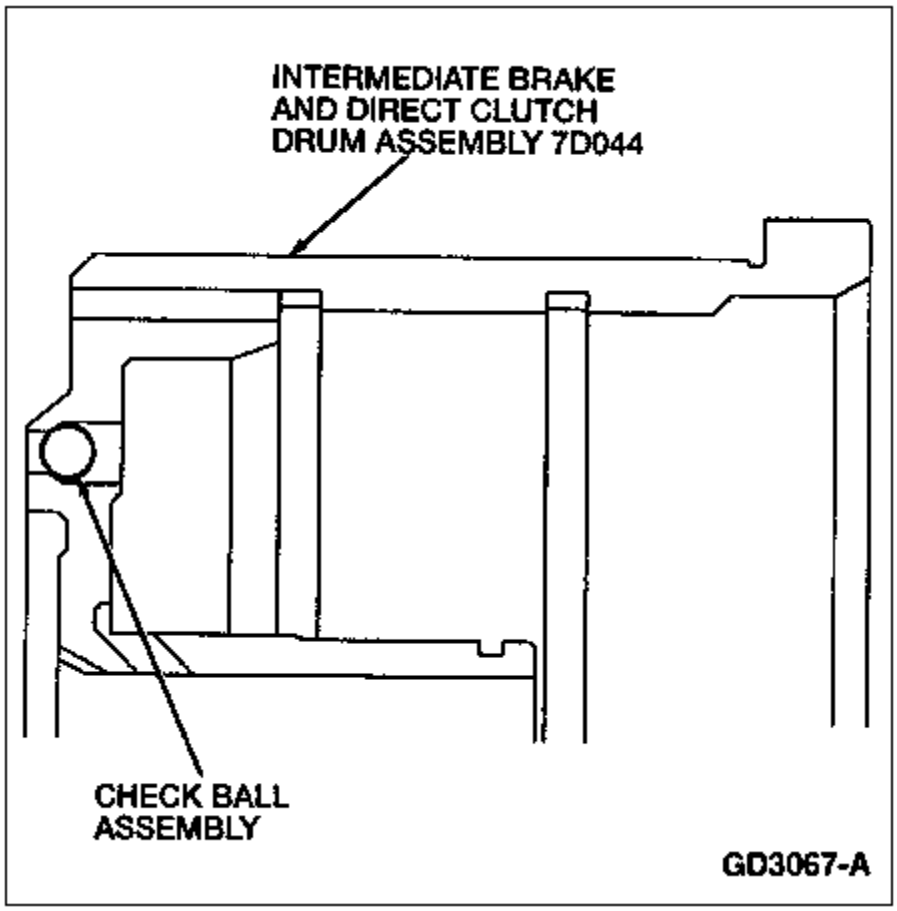
5. Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.

6. Inspect the clutch plates for wear, scoring and fit on the clutch hub serrations. Replace all plates that are badly scored, worn or do not fit freely in the hub serrations.

7. Inspect the direct clutch pressure plate for scores on the clutch plate bearing surface. Check the clutch release springs for distortion.

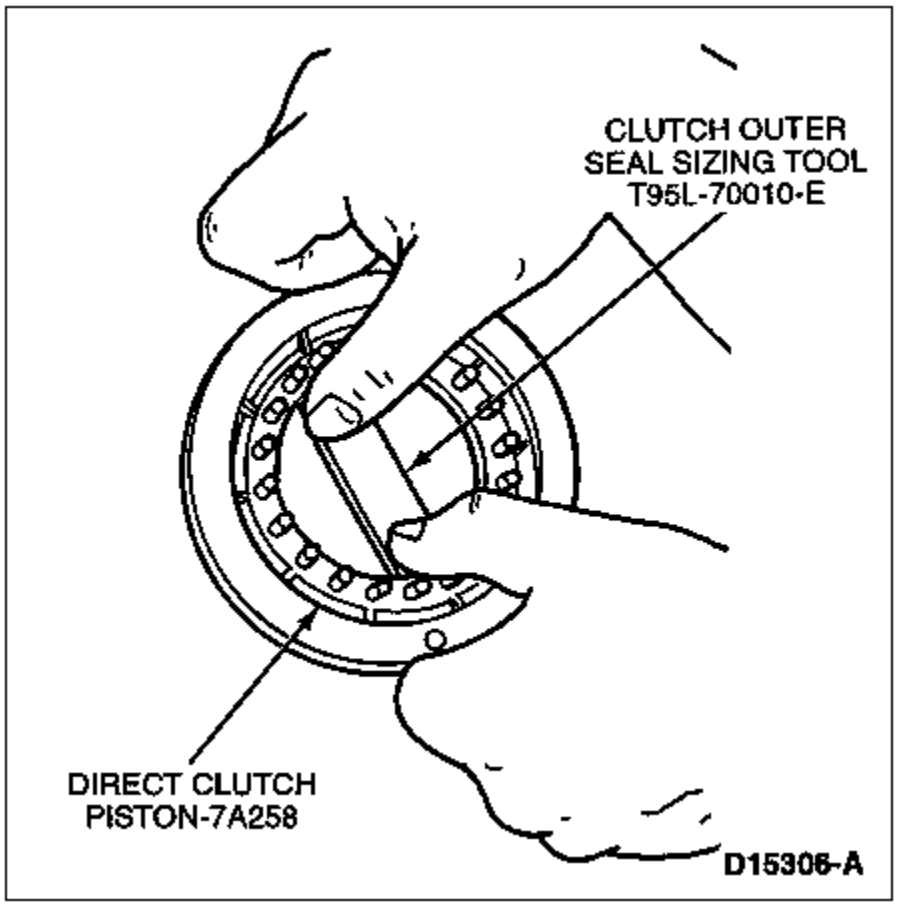
8. Make sure the check ball is free and clear of debris prior to installing piston. The check ball is located in the intermediate brake and direct clutch drum assembly.

tomsn048@gmail.com



9. Carefully remove the direct clutch piston from Direct Clutch Outer Seal Sizing Tool T95L-70010-E.

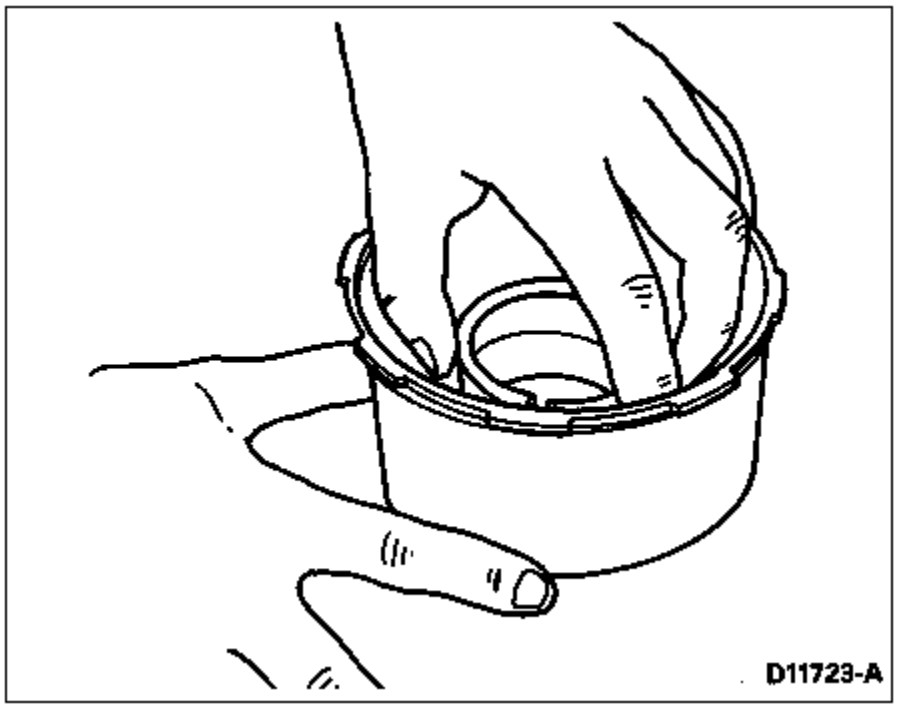
tomsn048@gmail.com



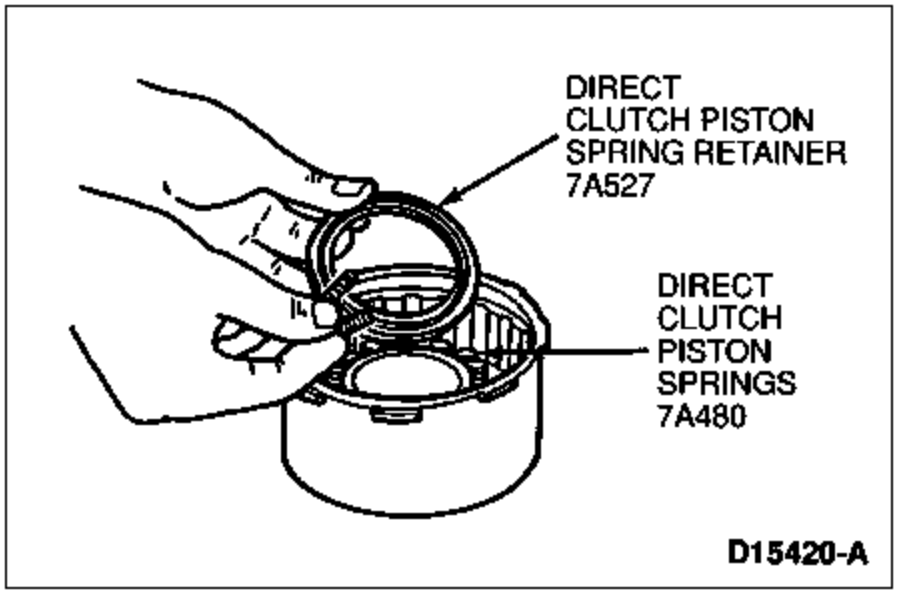
10. **CAUTION: Care must be taken to prevent damage to the seals during installation.**

Carefully install the clutch piston into the intermediate brake and direct clutch drum.

tomsn048@gmail.com



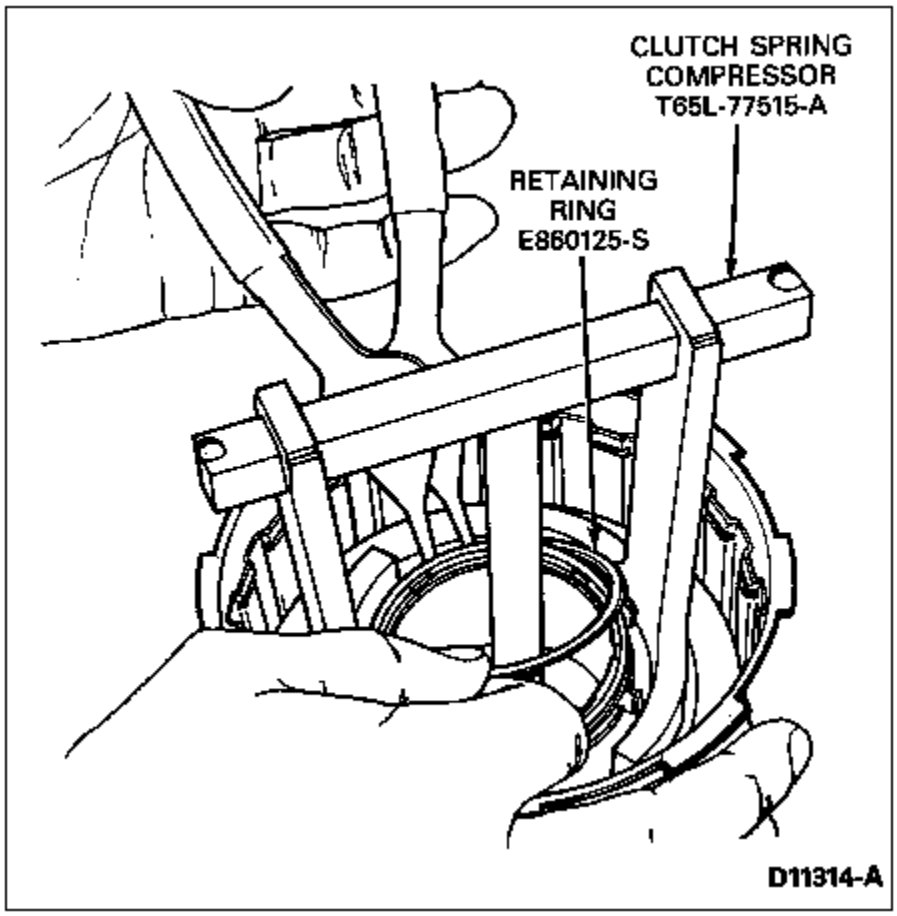
11. Install the direct clutch piston spring retainer and 20 direct clutch piston springs.



12. **CAUTION: Do not fully compress the clutch spring compressor damage to the spring retainer may occur.**

Compress the direct clutch piston springs with Clutch Spring Compressor T65L-77515-A. Install the retaining ring. Remove the tool.

tomsn048@gmail.com

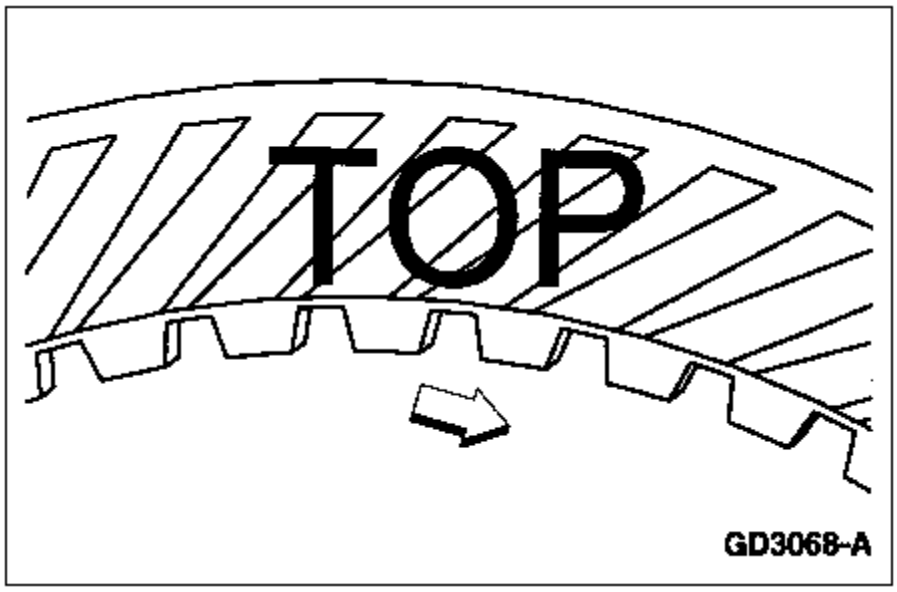


13. **CAUTION: Friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should be face up.**

CAUTION: The number of plates is model dependent. See Specifications at the end of this section. If new plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

When installing friction plates, the word "TOP" should face up. If reusing plates, grooves must be installed clockwise.

tomsn048@gmail.com

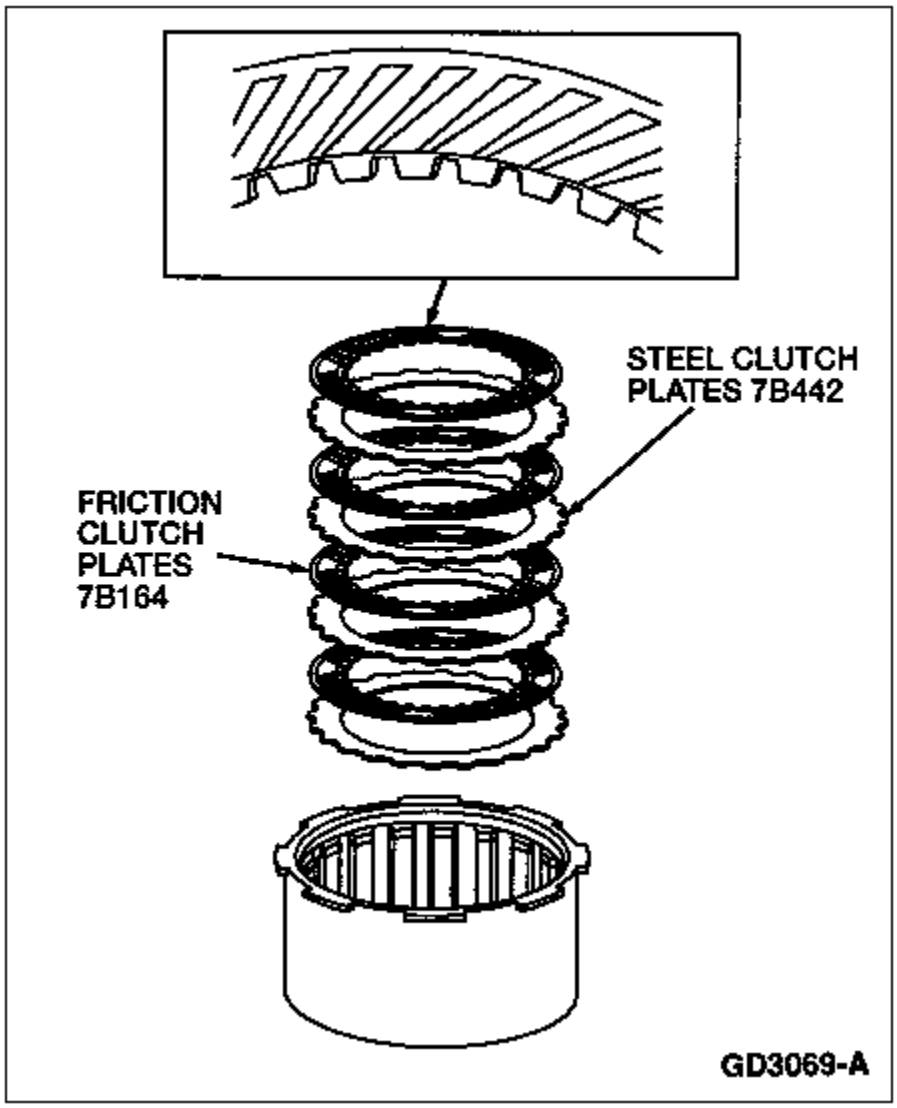


Install the steel clutch plates and friction clutch plates in alternating order, starting with a steel plate and finishing with a friction plate.

CLUTCH PACK

Engine	Steel	Friction
4.0L-EFI	4	4
4.0L-SOHC	5	5

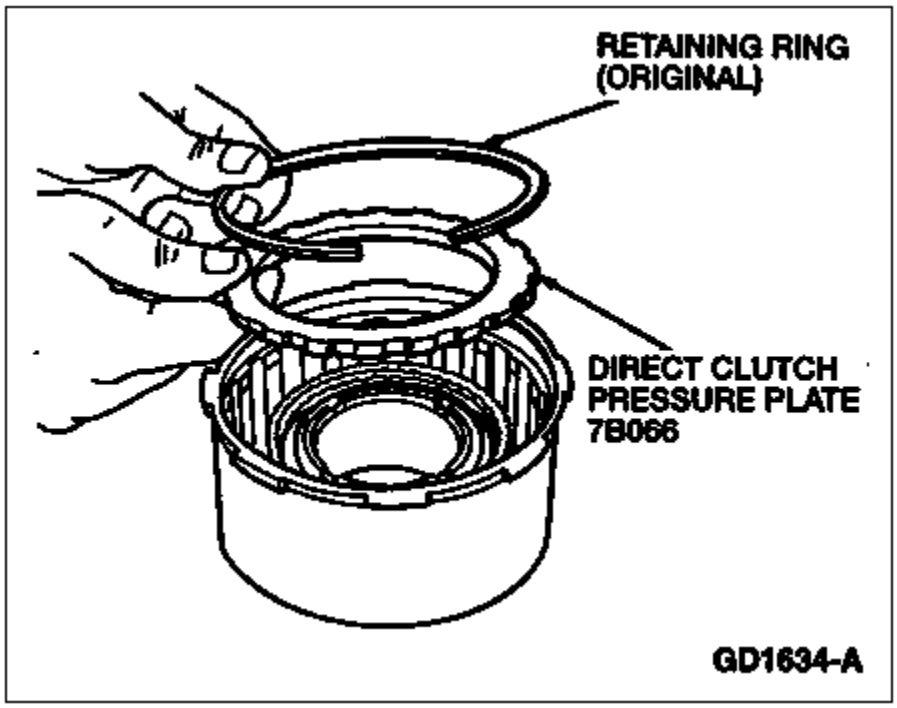
tomsn048@gmail.com



14. **CAUTION: The retaining ring is a select fit.**

Install the direct clutch pressure plate and original retaining ring on the clutch stack.

tomsn048@gmail.com

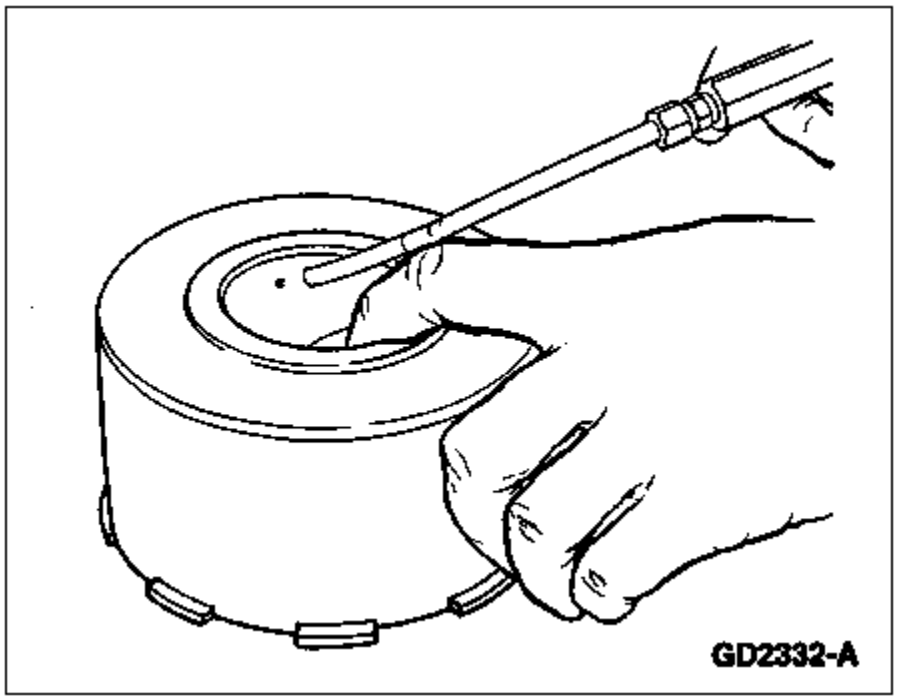


15. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE THE DRUM IS FACING DOWN AS SHOWN.**

    NOTE: The direct clutch piston must apply with air pressure and release when the air is removed.

    Air check the assembly. Apply air to one hole on the inside diameter of the intermediate brake and direct clutch drum while blocking the other hole with a finger.

tomsn048@gmail.com



16. Push down on the clutch pack. Use a feeler gauge to check the gap between the retaining ring and the clutch pressure plate. Specification: 1.3 to 2.0mm (0.051 to 0.079 inch).

    If the reading is not within specification, remove the retaining ring and check thickness. Replace with a ring that will correct free play, and verify with a feeler gauge.

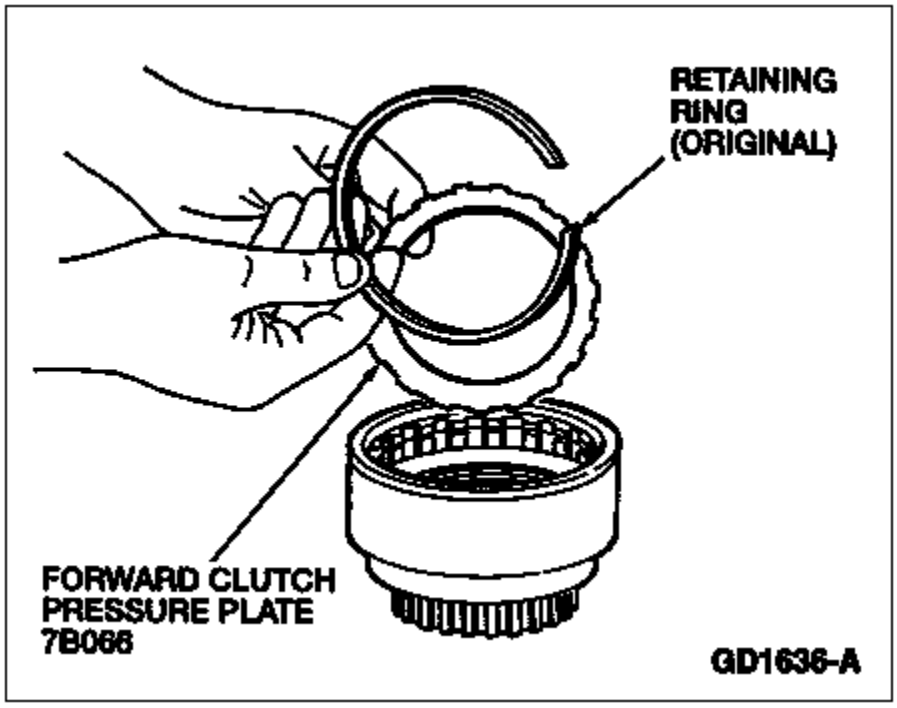
11	7A548	Forward Clutch Piston Inner Seal Ring
12	7A360	Forward Clutch Cylinder Assembly
13	7M153	No. 5 Forward Clutch Cylinder Thrust Bearing

Disassembly

1. **CAUTION: The retaining ring is a select fit ring. See assembly procedure if the retaining ring or clutch pack is replaced.**

   CAUTION: If new plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   Remove the retaining ring and forward clutch pressure plate.

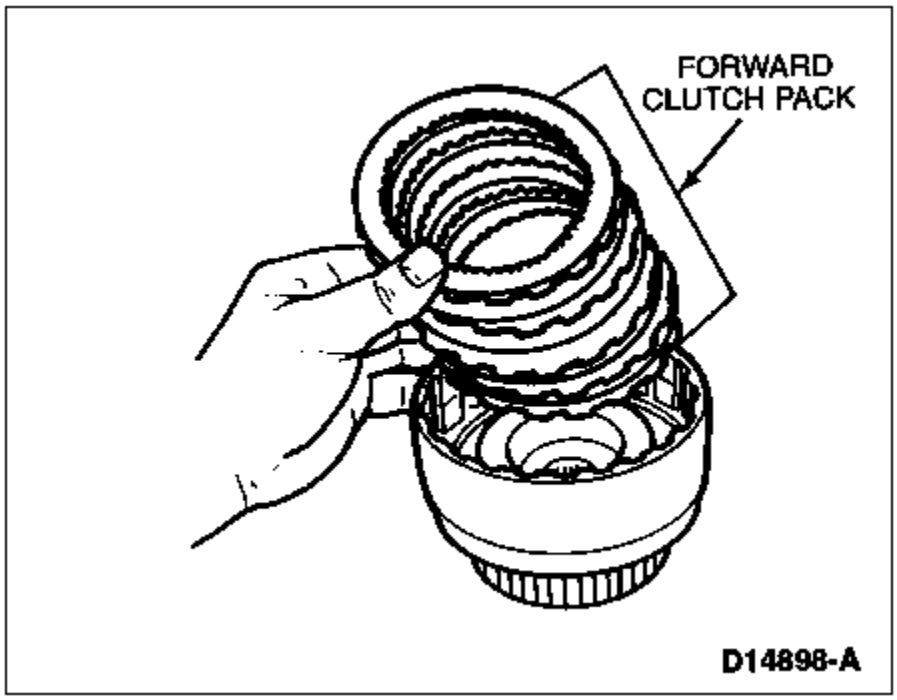


2. **CAUTION: Friction plates are directional and must be installed with grooves counterclockwise (I.D. to O.D.). The word "TOP" should face up.**

   NOTE: The number of clutch plates is engine dependent.

tomsn048@gmail.com

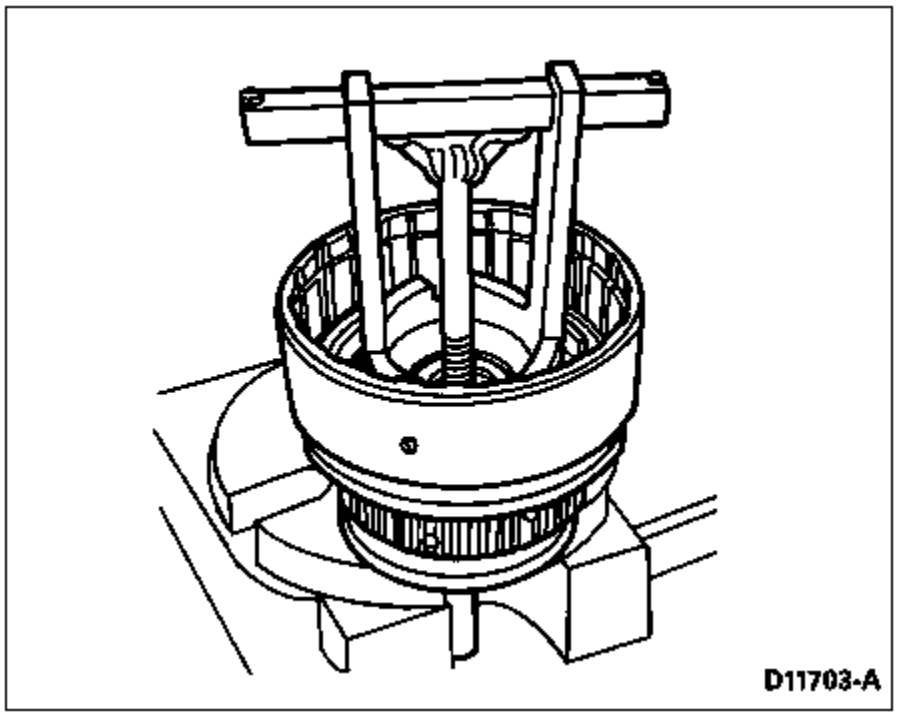
Remove the forward clutch pack. Inspect for wear, damage or overheating. Replace as necessary.



3. **CAUTION: Do not fully compress the clutch spring compressor or damage to the spring retainer may occur.**

   Compress the forward clutch piston springs with Clutch Spring Compressor T65L-77515-A. Remove the retaining ring.

tomsn048@gmail.com



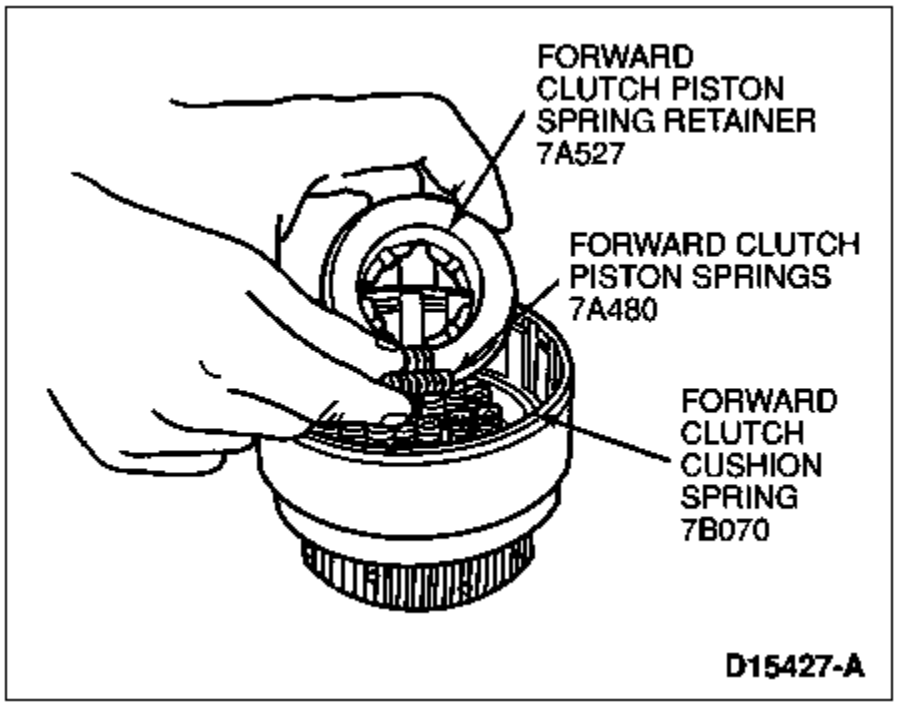
4. **WARNING: CAREFULLY RELEASE THE TOOL PRESSURE ON THE FORWARD CLUTCH PISTON SPRINGS AND REMOVE THE TOOL.**

   Remove the clutch spring compressor from the forward clutch cylinder.

5. **CAUTION: The forward clutch cushion spring is model dependent.**

   Remove the forward clutch piston spring retainer and 15 forward clutch piston springs. Remove the rubber forward clutch cushion spring. Replace as necessary.

tomsn048@gmail.com

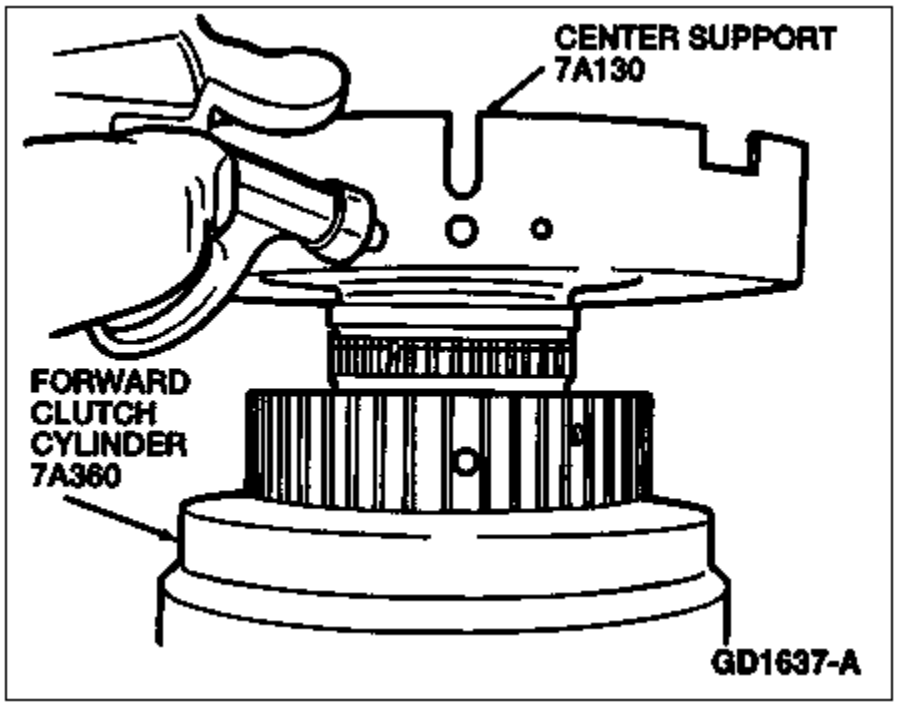


6. **WARNING: AIR PRESSURE MUST NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE THE CYLINDER IS FACING DOWN AS SHOWN.**

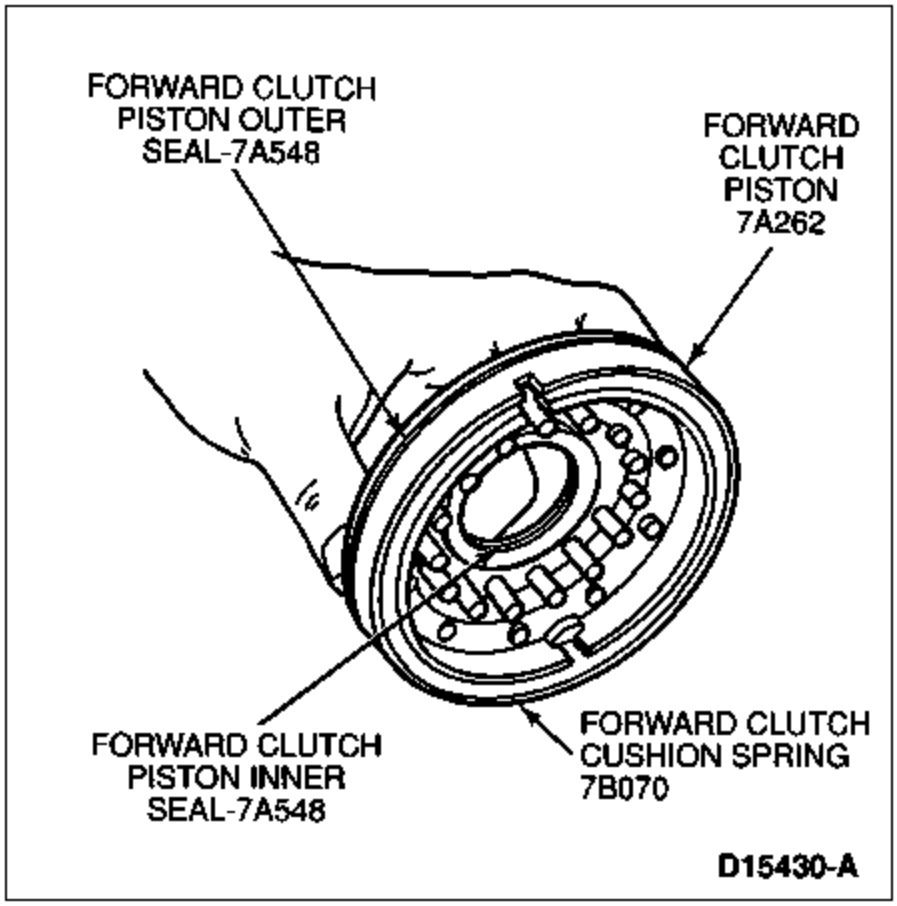
   NOTE: This is the middle-sized port.

   Use the center support to remove the forward clutch piston. Install the center support on the forward clutch cylinder. Apply air pressure to the far left port in the center support as shown.

tomsn048@gmail.com



7. Remove the forward clutch piston inner and outer seals. Clean and replace as necessary.



tomsn048@gmail.com

8. Inspect the forward clutch cylinder thrust surfaces, piston bore and clutch plate serration for scores or burrs. Minor scores or burrs may be removed with a crocus cloth. Replace the forward clutch cylinder if it is badly scored or damaged.

9. Check the fluid passages in the forward clutch cylinder for obstructions. Clean out all passages. Inspect the forward clutch piston for scores and replace if necessary. Inspect the piston check ball for freedom of movement and proper seating.

10. Check the clutch release springs for distortion and cracks. Replace the springs if they are distorted or cracked.

11. Inspect the friction clutch plates, steel clutch plates and clutch pressure plate for worn or scored bearing surface. Replace all parts that are deeply scored.

12. Check clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that does not slide freely on the serrations or that is not flat.

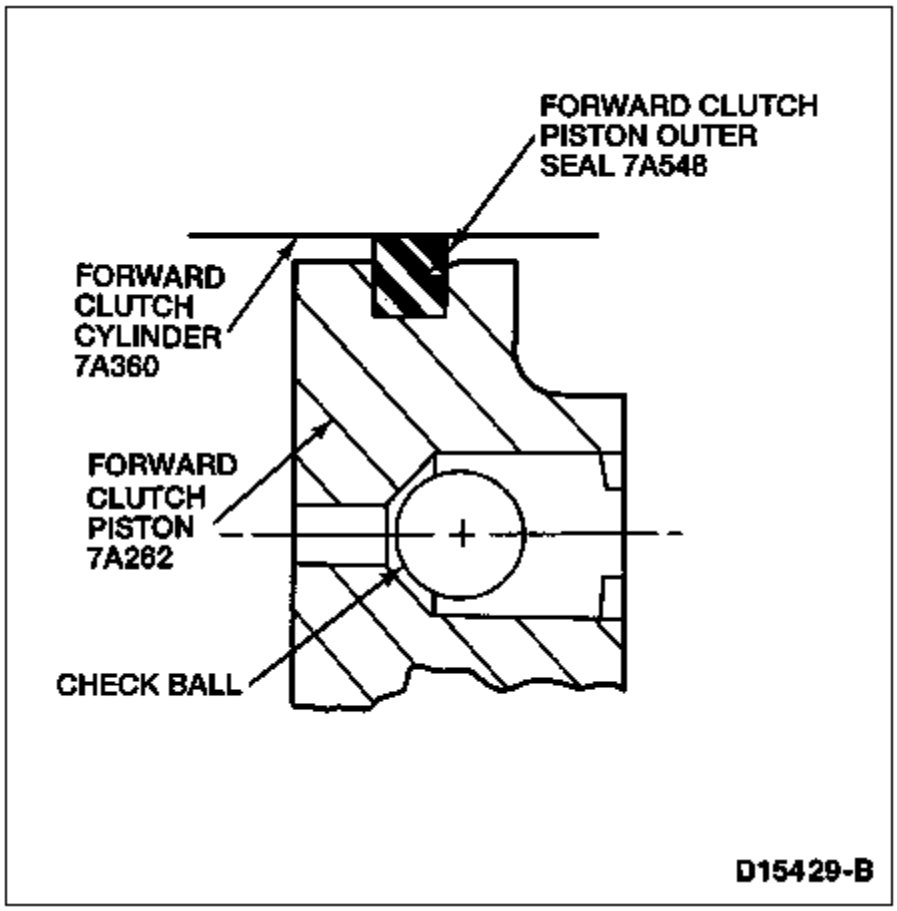
13. Check clutch hub thrust surfaces for scores and clutch hub splines for wear.

14. **NOTE: The check ball is located in the piston.**

    Make sure the check ball is free and clear of debris prior to installing the forward clutch piston.

15. Inspect bearing and seal rings for damage.

tomsn048@gmail.com

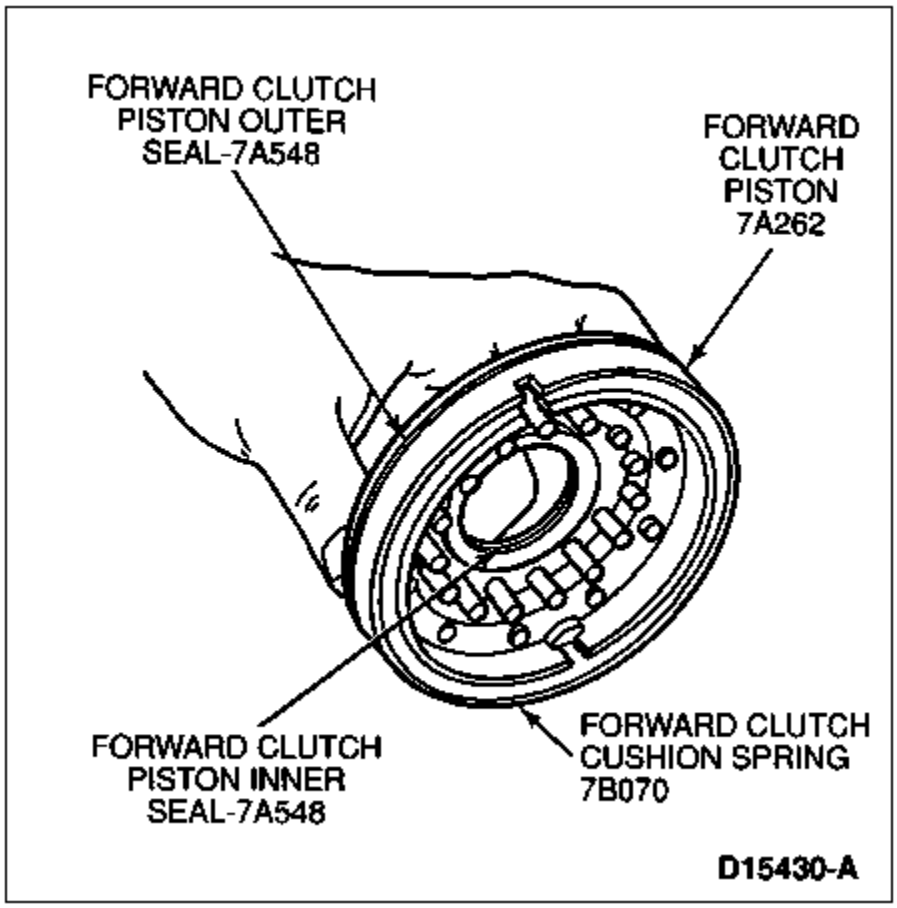


Assembly

1. **CAUTION: If there is evidence of clutch plate burning, replace the forward clutch cushion spring.**

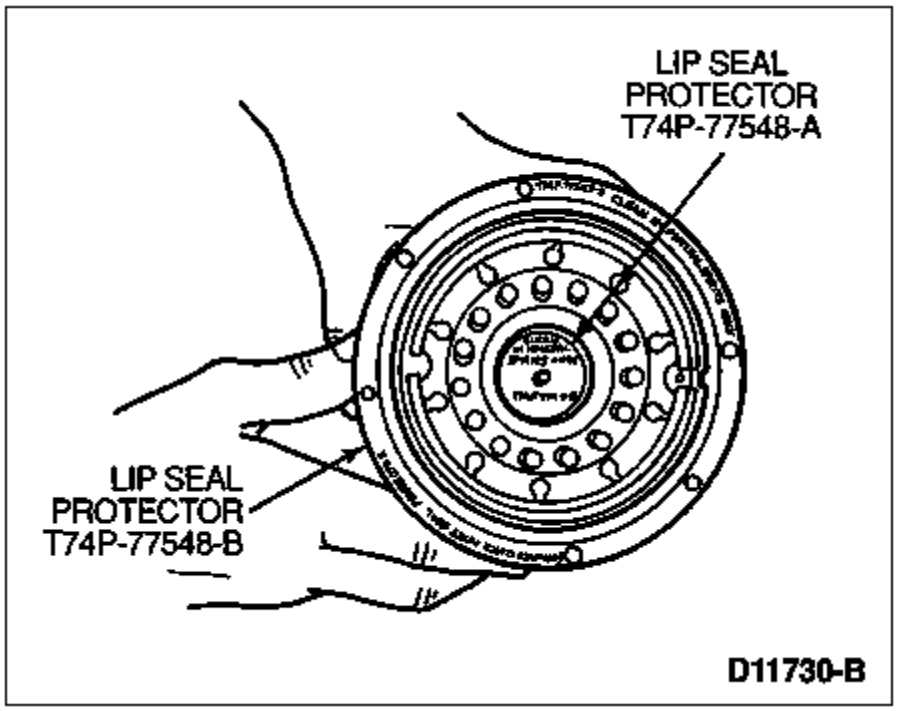
   Install new forward clutch piston inner and outer seals on the forward clutch piston. Install the forward clutch cushion spring.

tomsn048@gmail.com



2. To prevent damage to the forward clutch piston outer seal, install Lip Seal Protector T74P-77548-B. To prevent damage to the forward clutch piston inner seal install Lip Seal Protector T74P-77548-A into forward clutch cylinder.

tomsn048@gmail.com



3. **CAUTION: Care must be taken to prevent damage to the seals.**

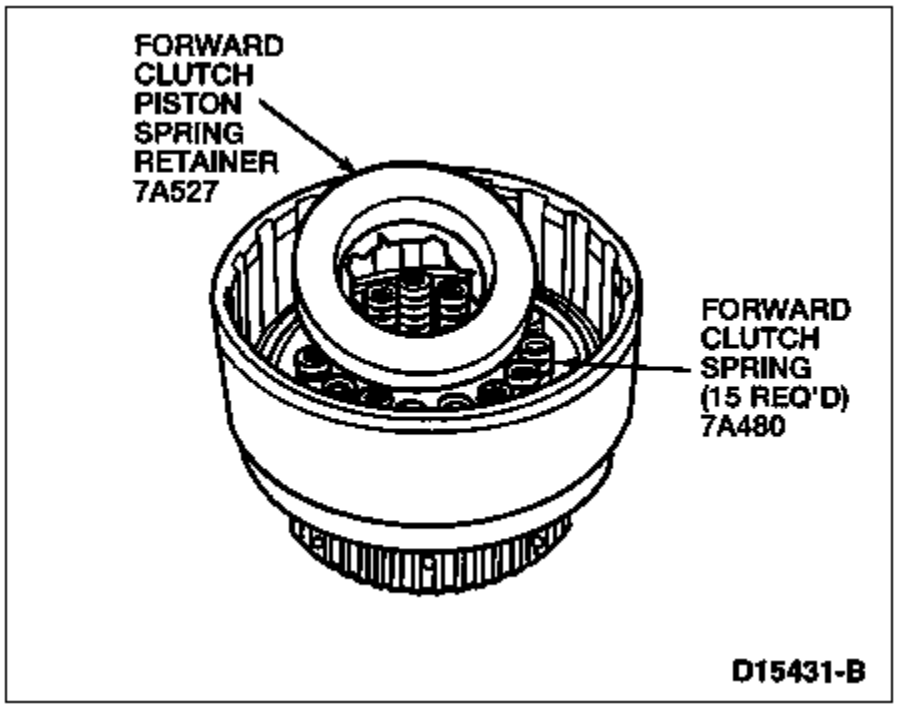
   NOTE: Apply petroleum jelly to the inner and outer seals.

   Carefully install the forward clutch piston into the forward clutch cylinder.

4. Carefully remove Lip Seal Protector T74P-77548-A and Lip Seal Protector T74P-77548-B from the forward clutch cylinder.

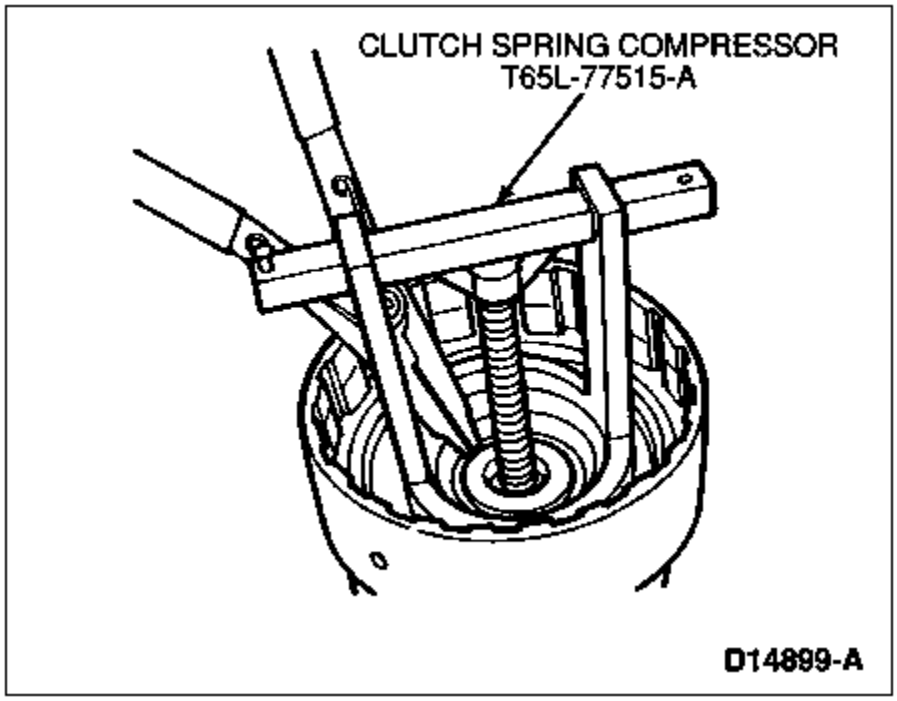
5. Install the 15 forward clutch piston springs and forward clutch piston spring retainer.

tomsn048@gmail.com



6. **CAUTION: Do not fully compress the clutch spring compressor or damage to the forward clutch piston spring retainer may occur.**

   Compress the clutch piston springs with Clutch Spring Compressor T65L-77515-A and install the retaining ring. Release the load on the forward clutch piston springs and remove the tool.



tomsn048@gmail.com

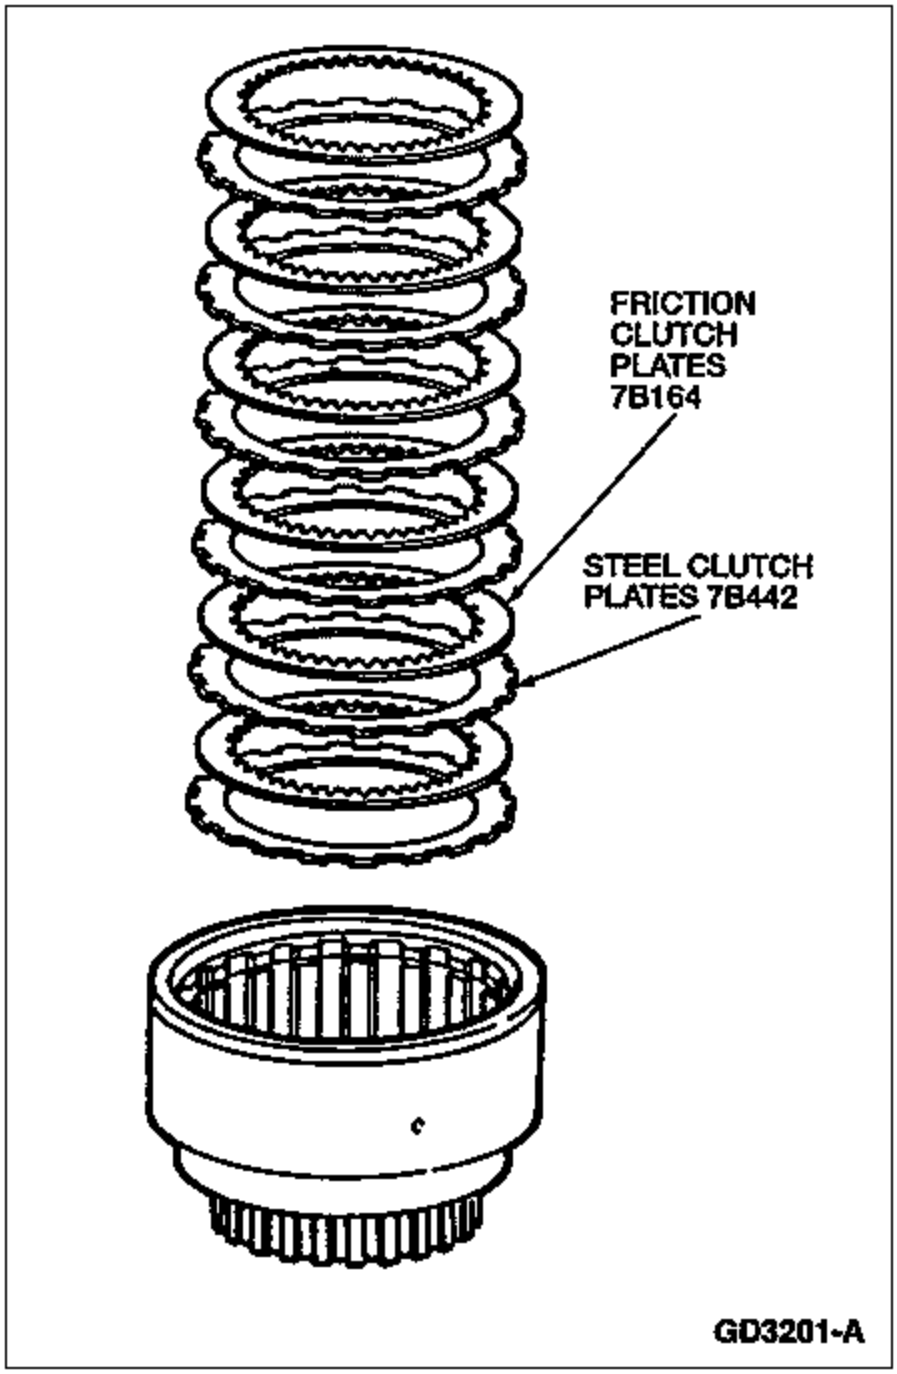
7. **CAUTION: Friction plates are directional and must be installed with groove counterclockwise (I.D. to O.D.). The word "TOP" should face up.**

   CAUTION: If new plates are being used, they should be soaked in clean transmission fluid for at least 30 minutes before assembly.

   When installing friction plates, the word "TOP" should face up. If reusing plates, grooves must be installed counterclockwise.

   Install the steel clutch plates and friction clutch plates in alternating order, starting with a steel plate and finishing with a friction plate.

tomsn048@gmail.com



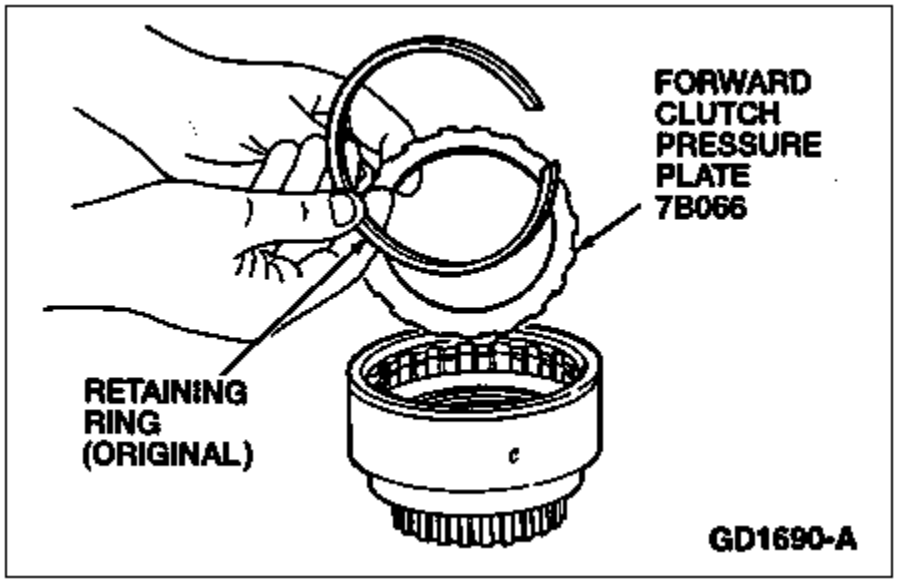
CLUTCH PACK

Engine	Steel	Friction
4.0L-EFI	6	6
4.0L-SOHC	6	6

8. **CAUTION: The retaining ring is a select fit.**

tomsn048@gmail.com

Install the forward clutch pressure plate on the clutch pack. Install the original retaining ring.

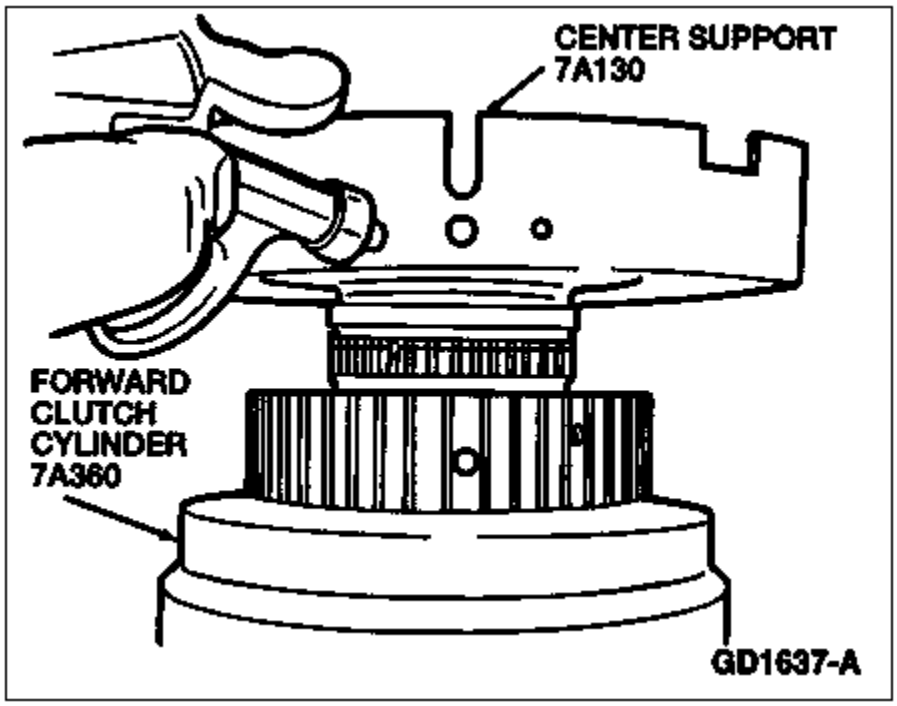


9. **WARNING: DO NOT EXCEED 138 KPA (20 PSI). WEAR SAFETY GLASSES WHEN USING COMPRESSED AIR. MAKE SURE THE DRUM IS FACING DOWN AS SHOWN.**

   NOTE: The forward clutch piston must apply with air pressure and release when the air is removed.

   Install the center support on the forward clutch cylinder. Apply air pressure to the far left port in the center support as shown.

tomsn048@gmail.com



10. Push down on the clutch pack. Use a feeler gauge to check the gap between the retaining ring and the clutch pressure plate. Specification: 1.4 to 2.1mm (.055 to .083 inch). If the reading is not within specifications, remove the retaining ring and check the thickness. Replace the retaining ring with one that will provide correct free play. Verify free play with a feeler gauge.

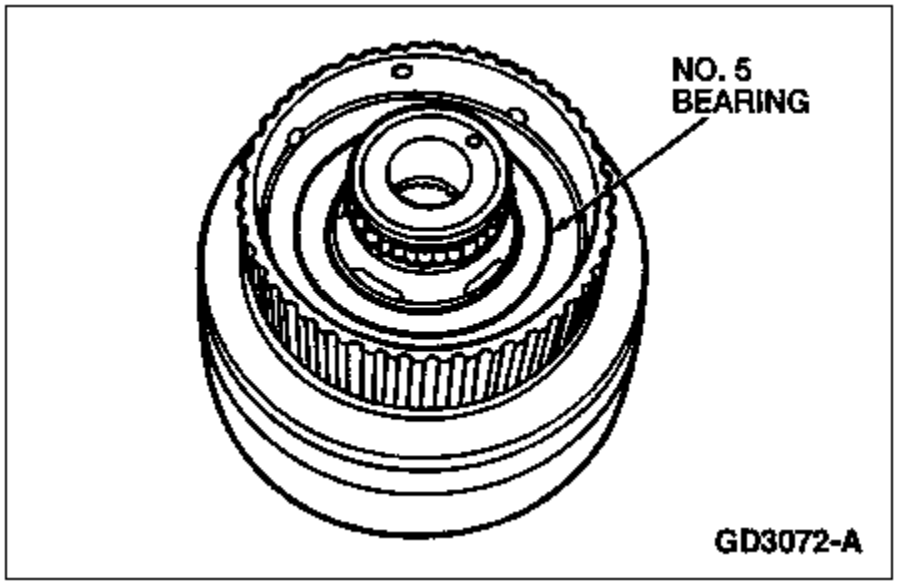
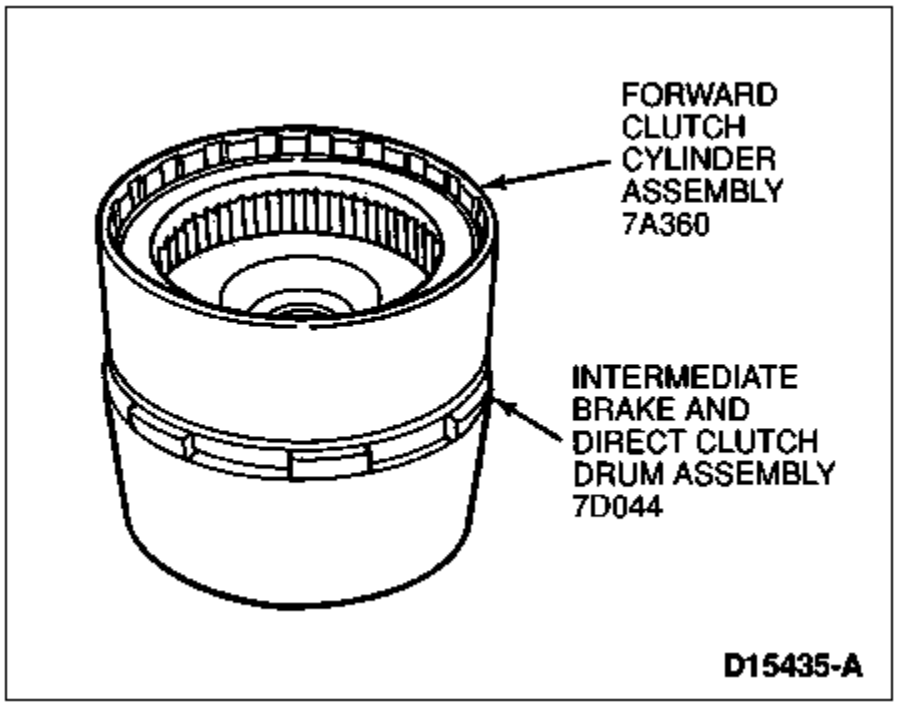
5	7D090	No. 6B Forward Clutch Thrust Washer
6	7D392	Forward Ring Gear
7	7F374	No. 7 Forward Planetary Thrust Bearing Assembly
8	7A398	Forward Planetary Assembly
9	7D064	Input Shell
10	7D063	Forward Sun Gear Assembly

1. Install the No. 5 forward clutch cylinder thrust bearing on the forward clutch cylinder assembly. Use petroleum jelly to hold the washer in place.

tomsn048@gmail.com

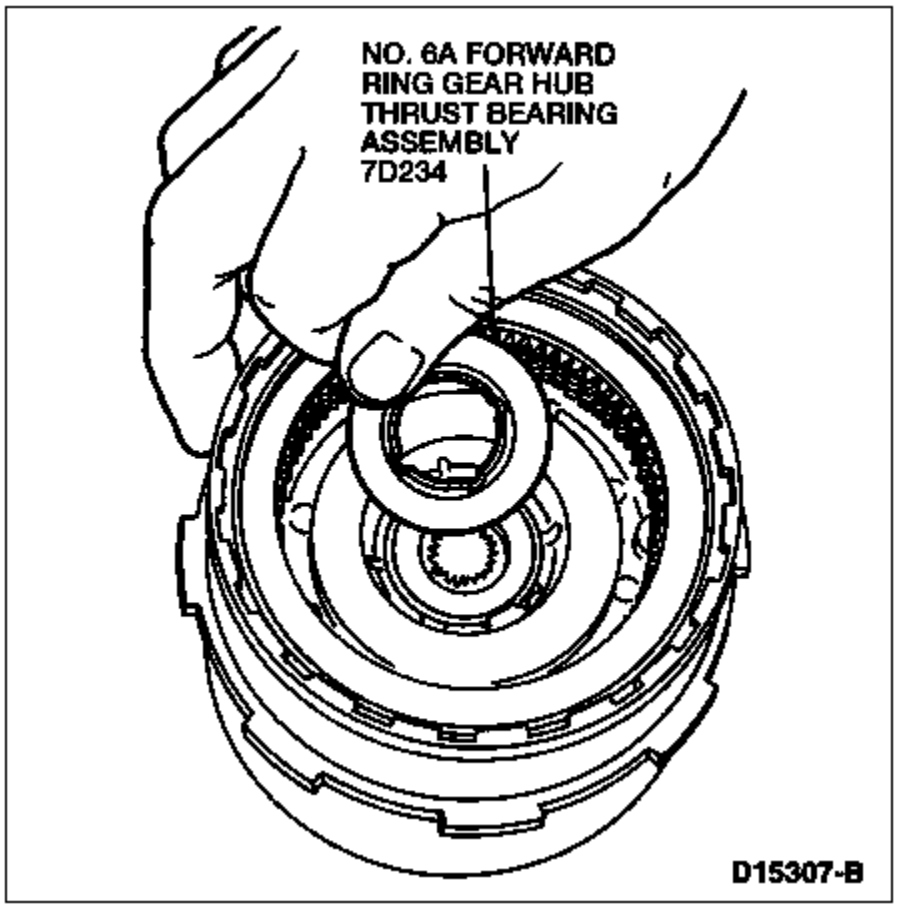


2. Install the forward clutch cylinder assembly into the intermediate brake and direct clutch drum assembly as shown.



3. Install the No. 6A forward ring gear hub thrust bearing into the forward clutch cylinder with the tabs facing up as shown.

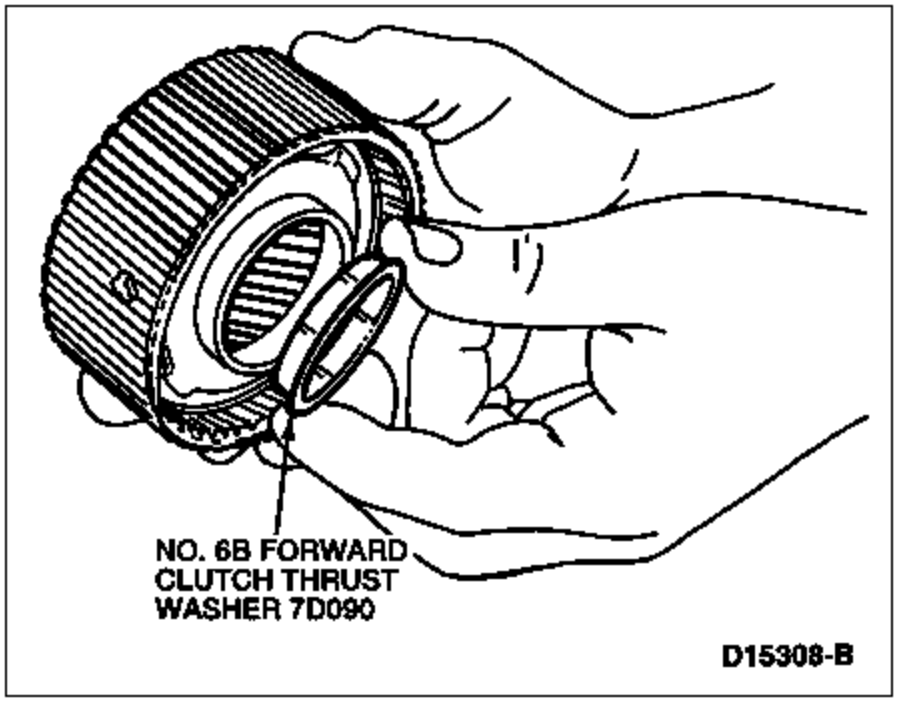
tomsn048@gmail.com



4. **NOTE: Use petroleum jelly to hold the washer in place.**

   Install the No. 6B forward clutch thrust washer into the forward ring gear hub.

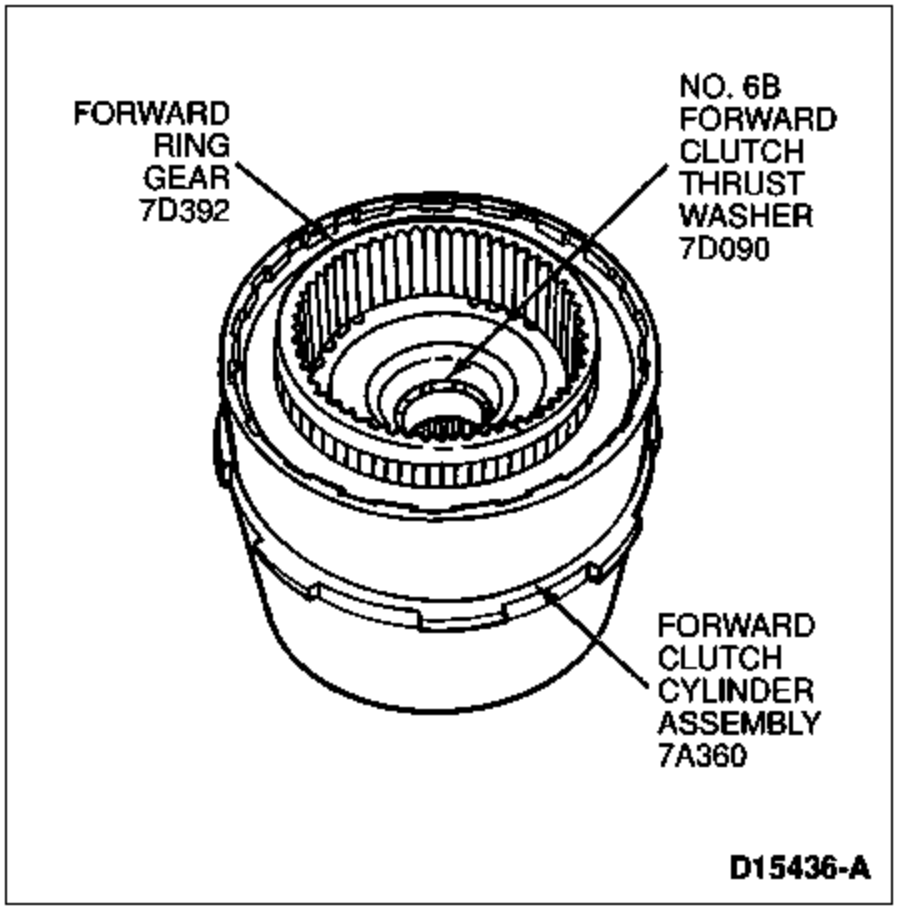
tomsn048@gmail.com



5. **NOTE: Make sure the No. 6A bearing and No. 6B forward clutch thrust washer assembly are inside the forward ring gear.**

   Install the forward ring gear and forward clutch thrust washer into the forward clutch cylinder assembly as shown.

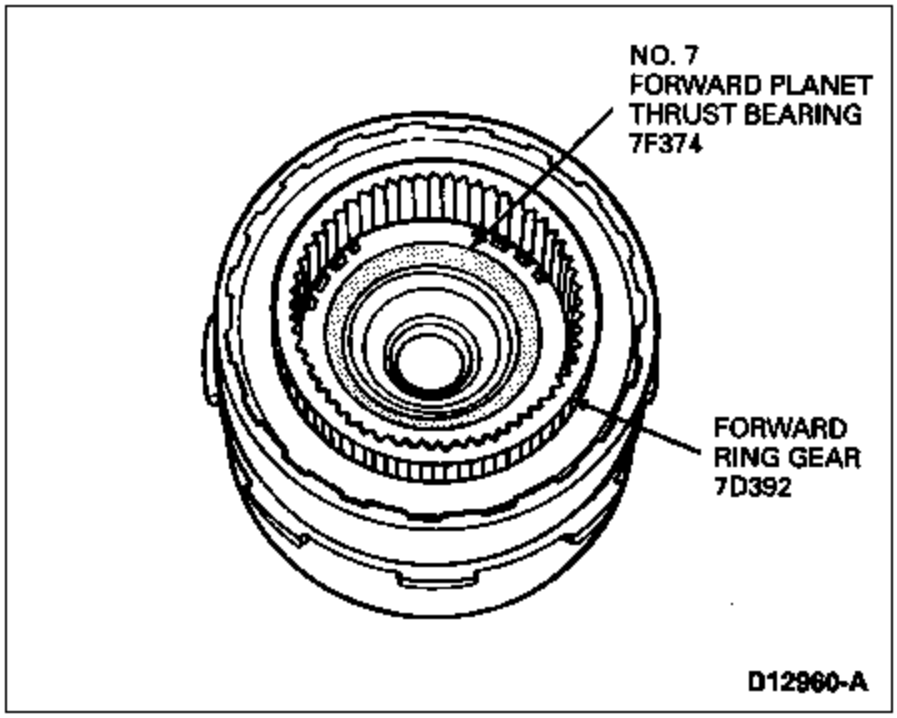
tomsn048@gmail.com



6. **CAUTION: Black oxidized color of thrust bearing must face up toward planetary assembly.**

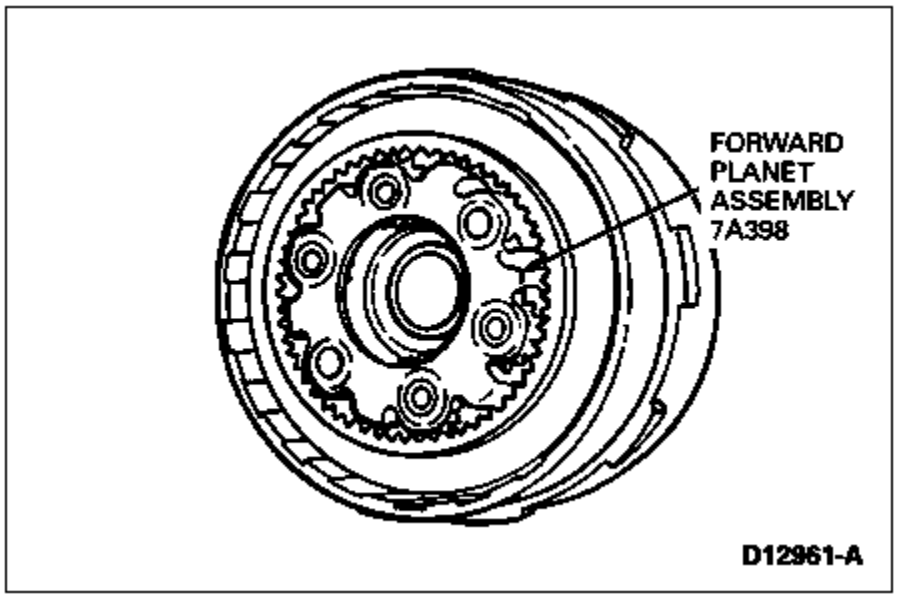
   Install the No. 7 forward planetary thrust bearing into the forward ring gear as shown.

tomsn048@gmail.com



7. **NOTE: All service replacements are 6 pinion only.**

   Install the forward planetary assembly into the forward ring gear as shown.

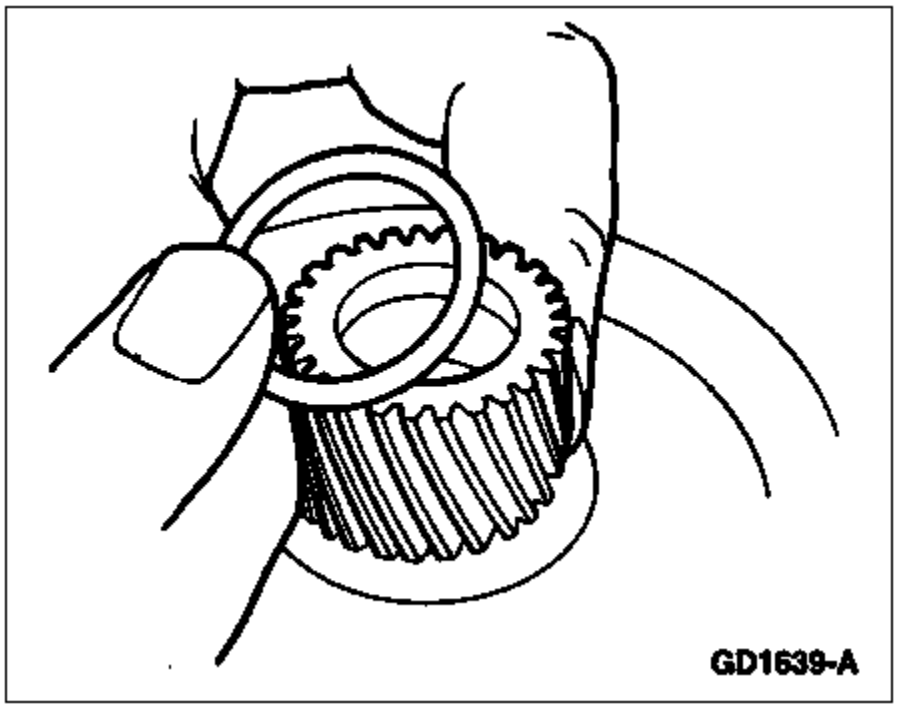


8. **NOTE: If sun gear, retaining rings or input shell require service; perform steps a-e.**

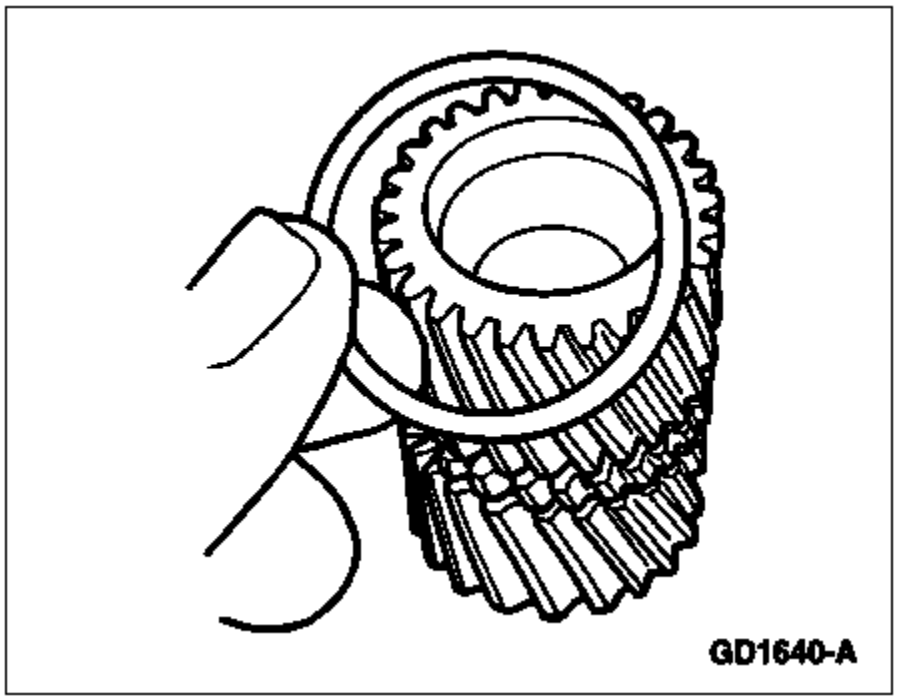
   Inspect the drum gear, bushing and washer for scoring, wear or damage. Replace as required.

   a. Remove rear retaining ring and sun gear from input shell.

tomsn048@gmail.com

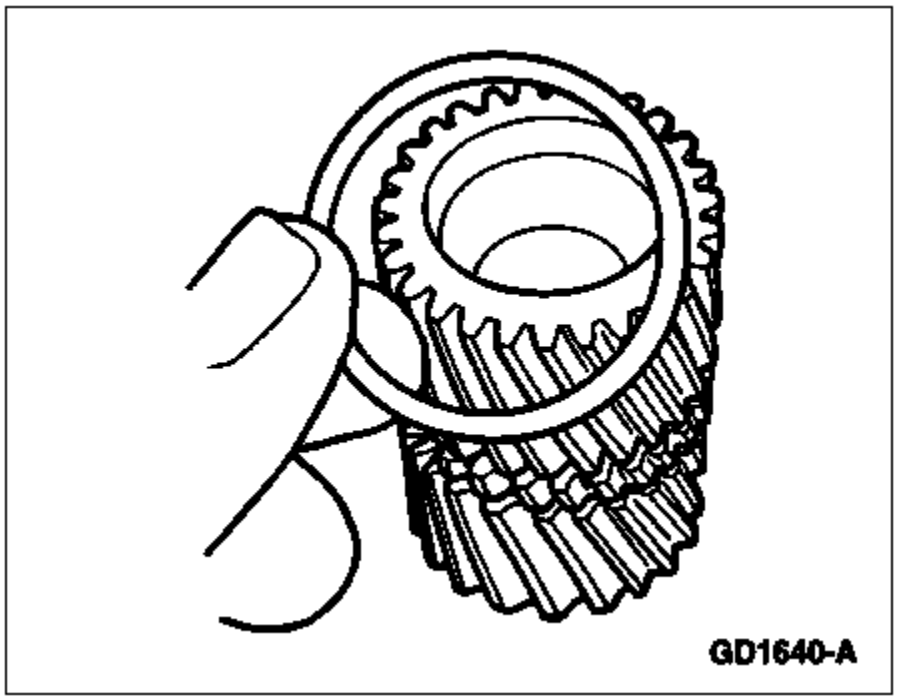


b. Remove front retaining ring from sun gear.

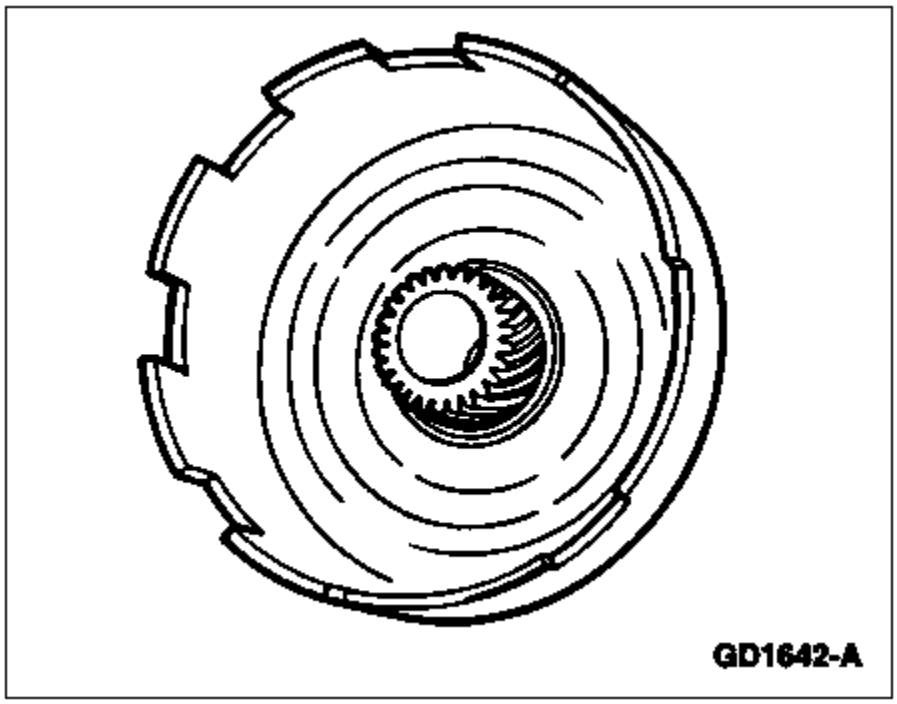


c. Install new retaining ring onto sun gear.

tomsn048@gmail.com

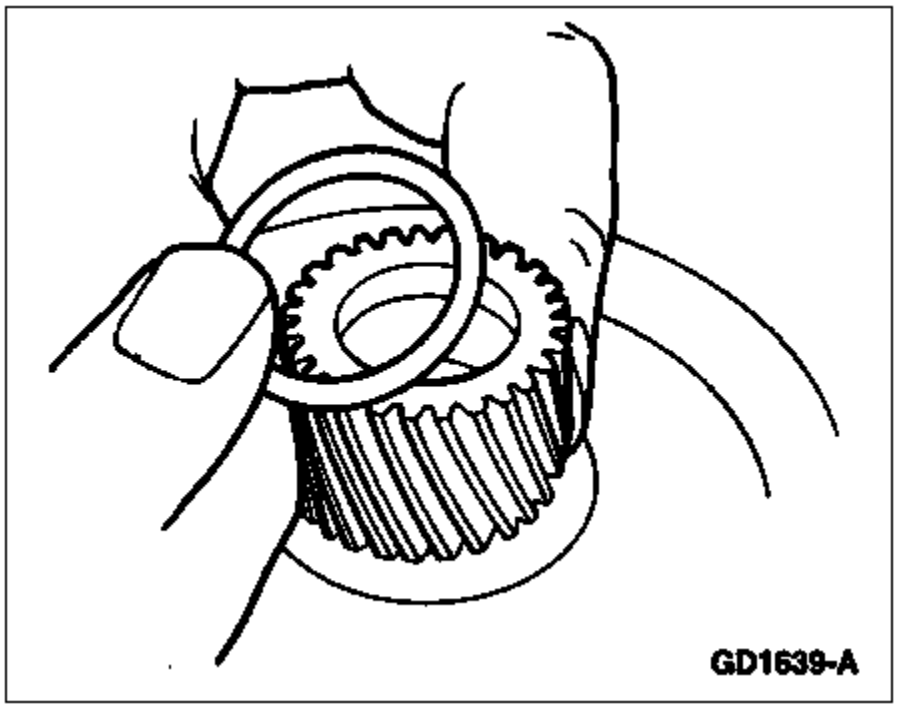


d. Install forward sun gear into input shell.



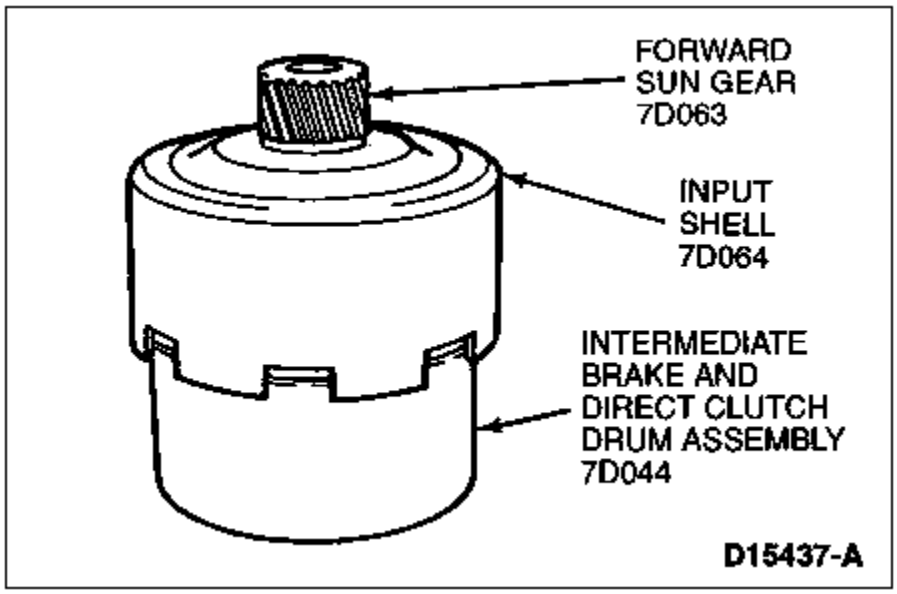
e. Install new rear retaining ring onto sun gear.

tomsn048@gmail.com



9. **NOTE: Make sure the forward sun gear aligns with the forward planetary assembly. Make sure the input shell aligns with the intermediate brake and direct clutch drum assembly as shown.**

   Install the input shell with forward sun gear assembly as shown.

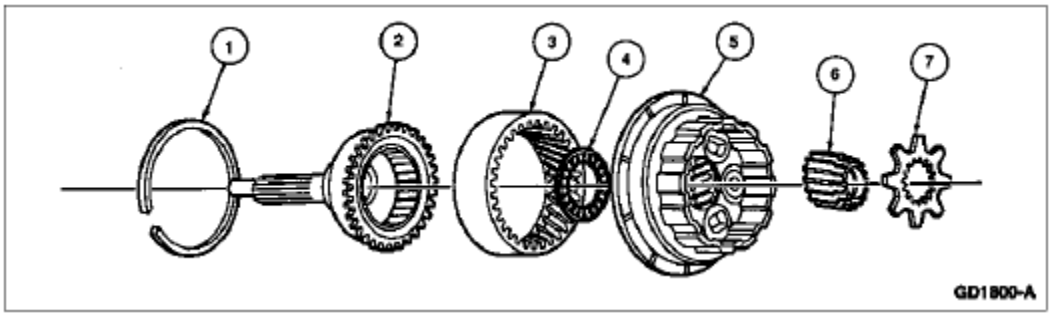


tomsn048@gmail.com

tomsn048@gmail.com

Overdrive Planetary and One-Way Clutch Assembly

Overdrive Planetary and One-Way Clutch Assembly

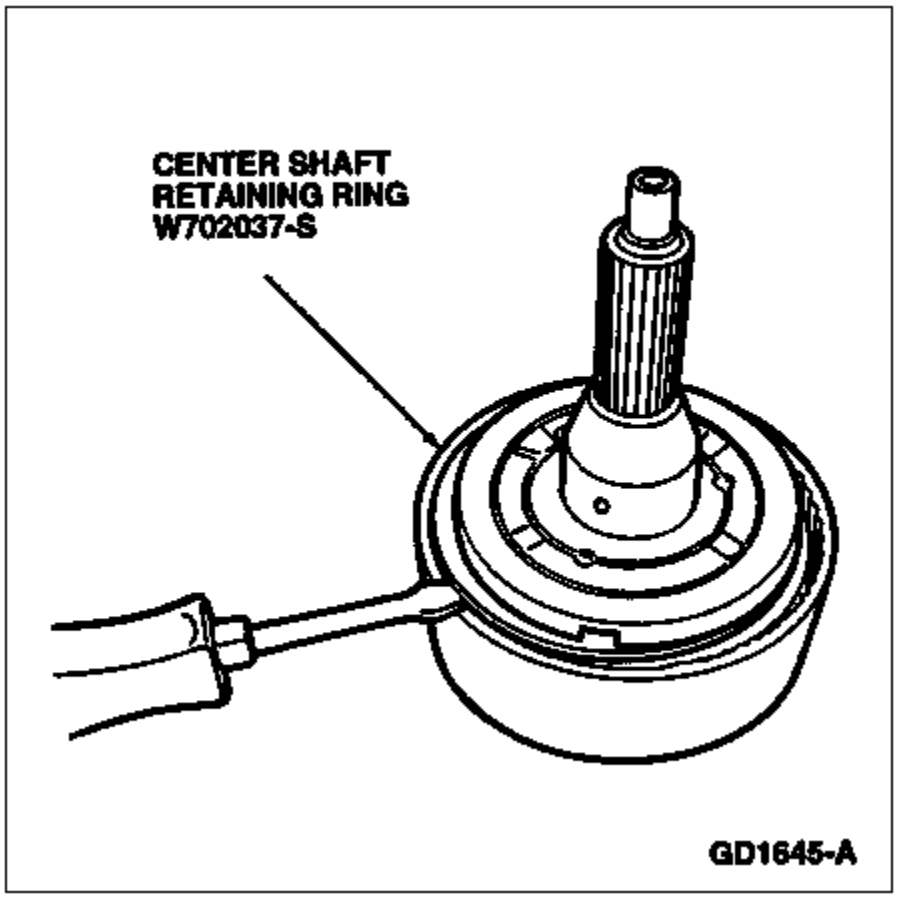


Item	Part Number	Description
1	W702037-S	Retaining Ring
2	7A658	Center Shaft Assembly
3	7653	Front Ring Gear
4	7L495	No. 2 Front Planetary Thrust Bearing
5	7B446	Front Planetary Gear Carrier Assembly
6	7D063	Front Sun Gear Assembly
7	7660	Coast Clutch Adapter

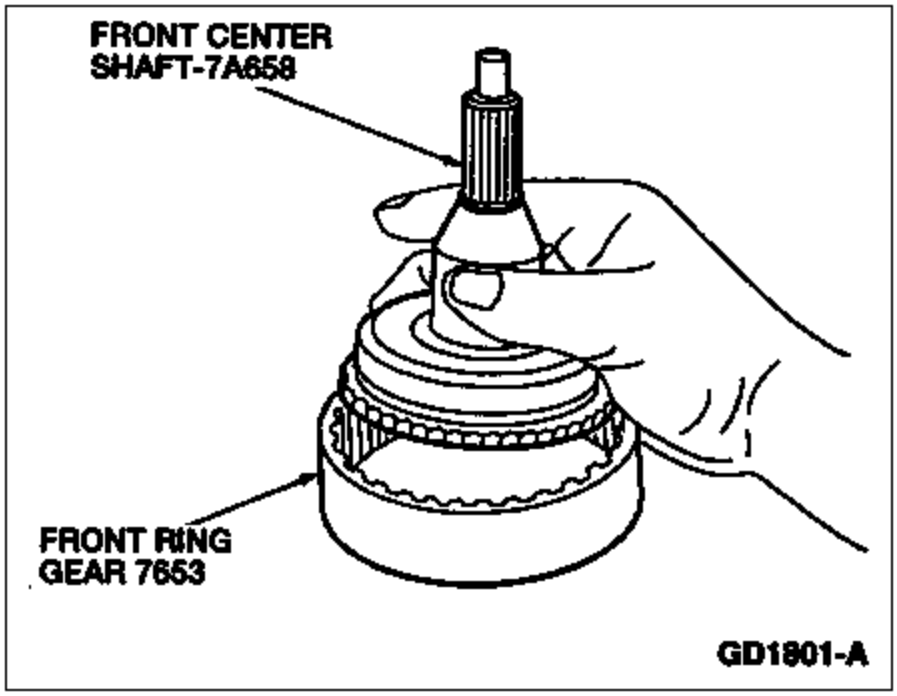
Disassembly

1. Remove the center shaft retaining ring from the front ring gear.

tomsn048@gmail.com



2. Remove the center shaft from the front ring gear.



tomsn048@gmail.com

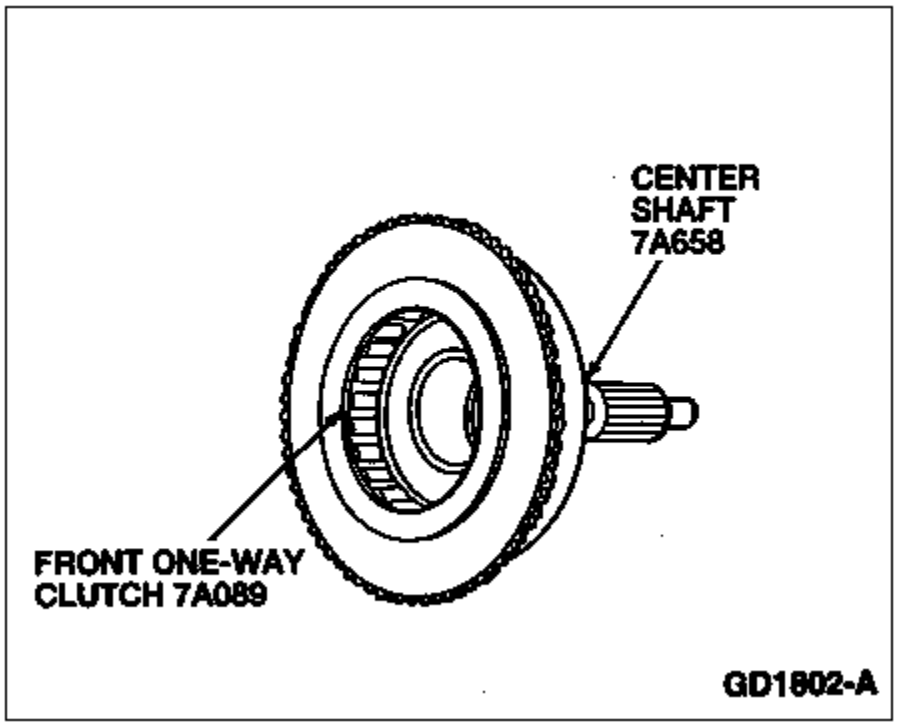
3. **CAUTION: Do not remove the front one-way clutch. Damage to the clutch may occur if it is removed.**

   NOTE: The front one-way clutch is serviced with the front center shaft.

   Clean and inspect the front one-way clutch and front center shaft assembly. Check for cracks in the roller cage and wear on the roller clutch. Inspect the press fit of the one-way roller clutch to the overdrive center shaft.

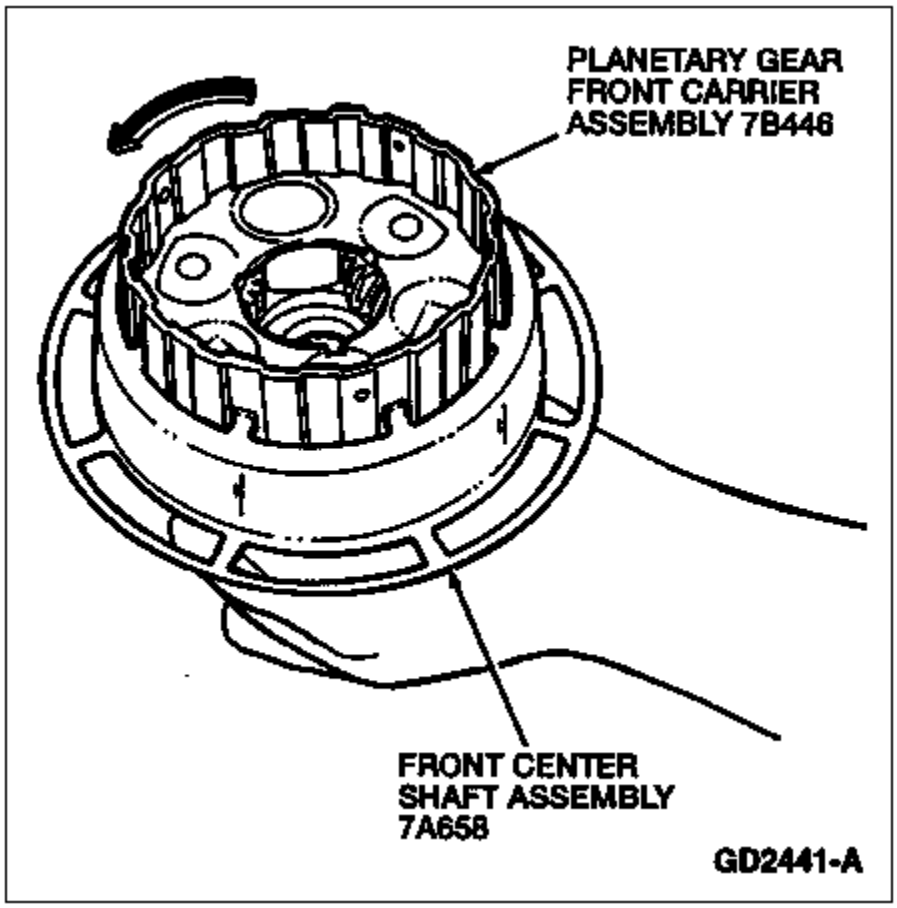
   Inspect the rollers and springs for excessive wear or damage.

   Inspect the spring and roller cage for bent or damaged spring retainers.



4. Temporarily insert the front planetary gear carrier assembly into the one-way clutch rollers for verification of the one-way clutch. The planetary must rotate counterclockwise and hold clockwise as shown. Remove the front planetary gear carrier assembly.

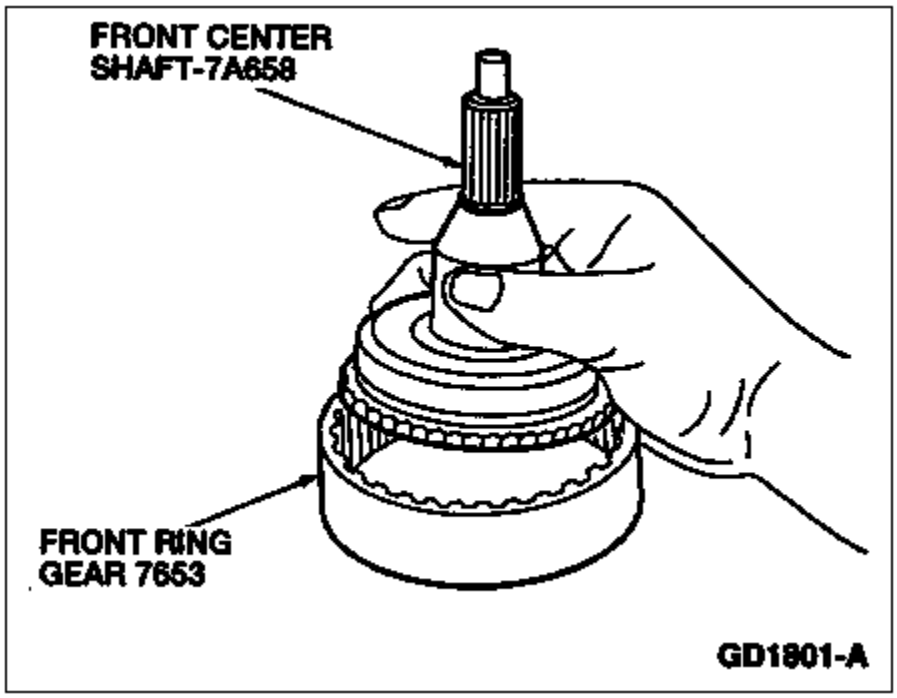
tomsn048@gmail.com



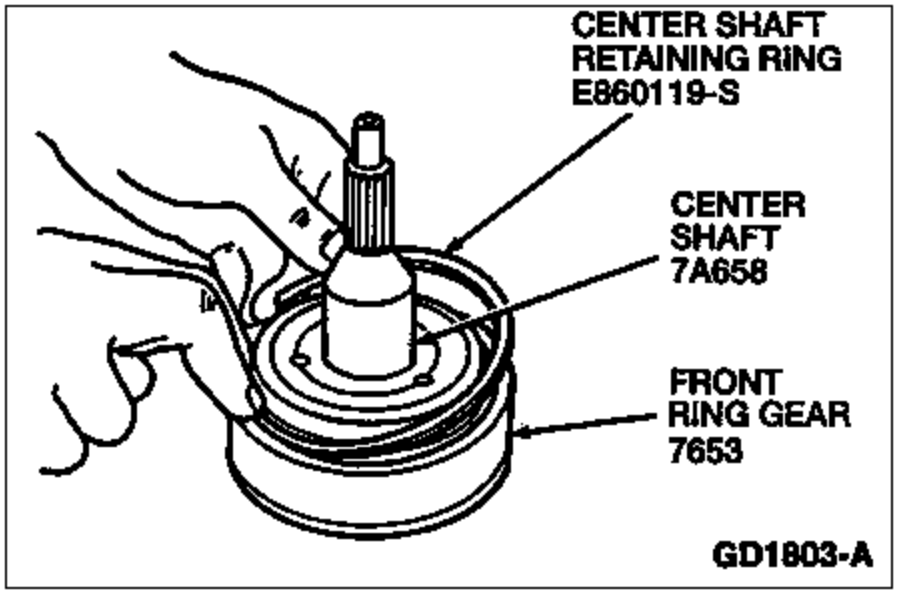
Assembly

1. Install the center shaft and front one-way clutch into the front ring gear.

tomsn048@gmail.com



2. Install the center shaft retaining ring.



3. **CAUTION: Planetarys must be replaced. Do not restake.**

   NOTE: Individual parts of the planetary carriers are not serviceable.

   Check the pins and shafts in the planetary assemblies for loose fit and/or complete disengagement. Use a new planetary assembly if either condition exists. Before installing a planetary assembly, the shaft retaining pins should be checked for adequate staking.

tomsn048@gmail.com

Inspect the pinion gears for damaged or excessively worn teeth.

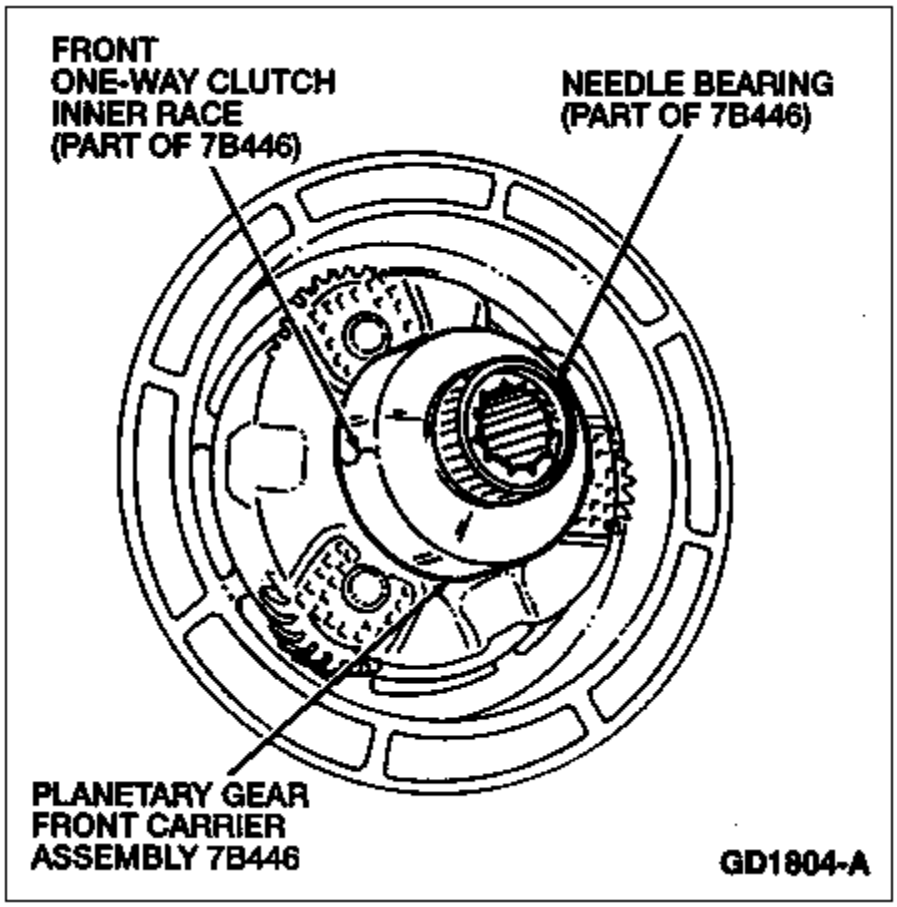
Check for free rotation of the pinion gears.

Inspect the overdrive one-way clutch inner race for scoring.

Check pinion bearing and gears.

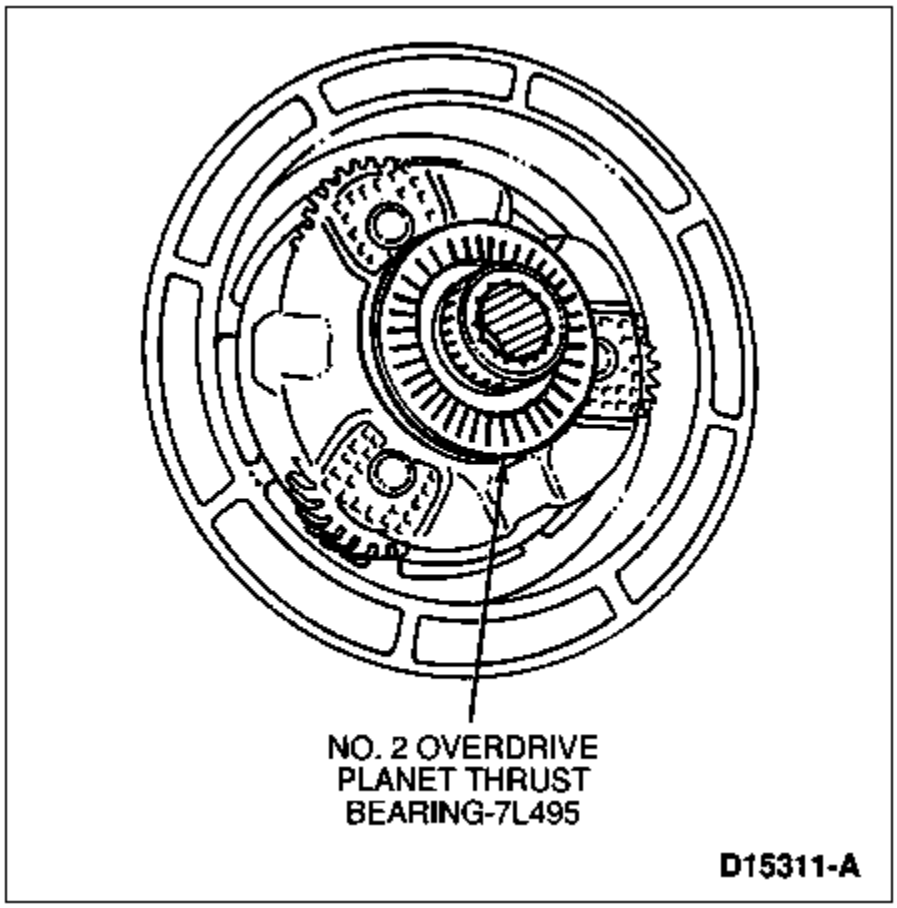
Inspect the inner and outer races for scored or damaged surface areas where the rollers contact the races.

Inspect the needle bearing on the nose of the front planetary gear carrier assembly.



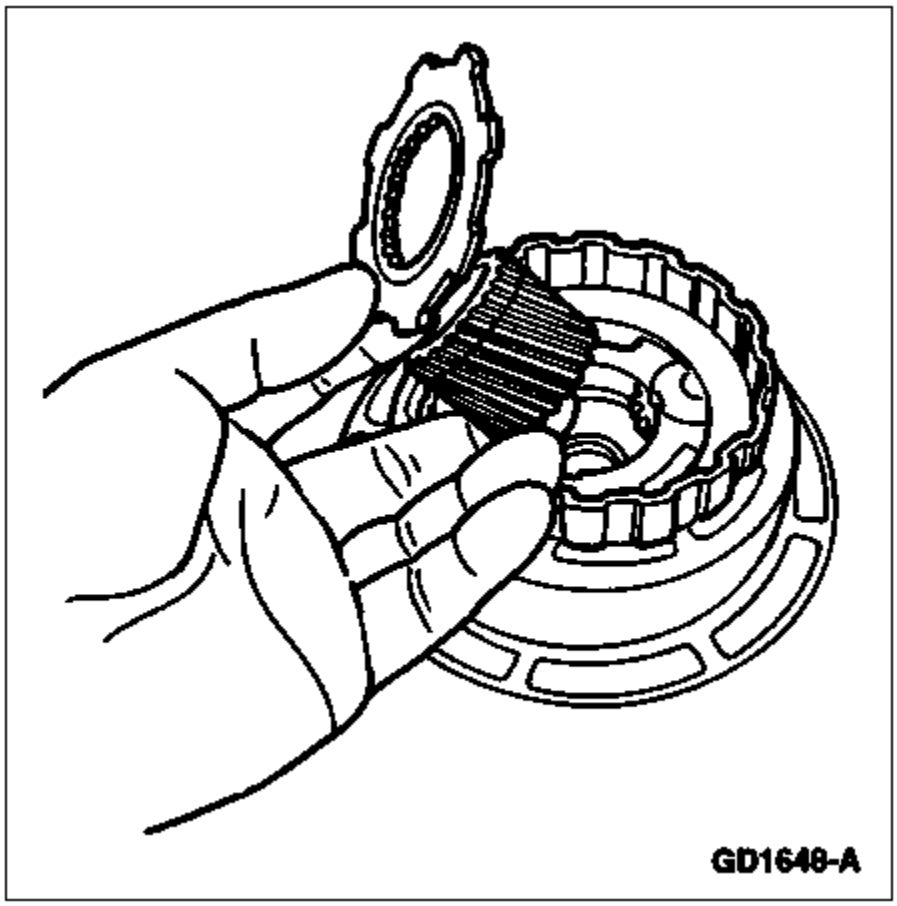
4. Remove and inspect the No. 2 planetary thrust bearing.

tomsn048@gmail.com



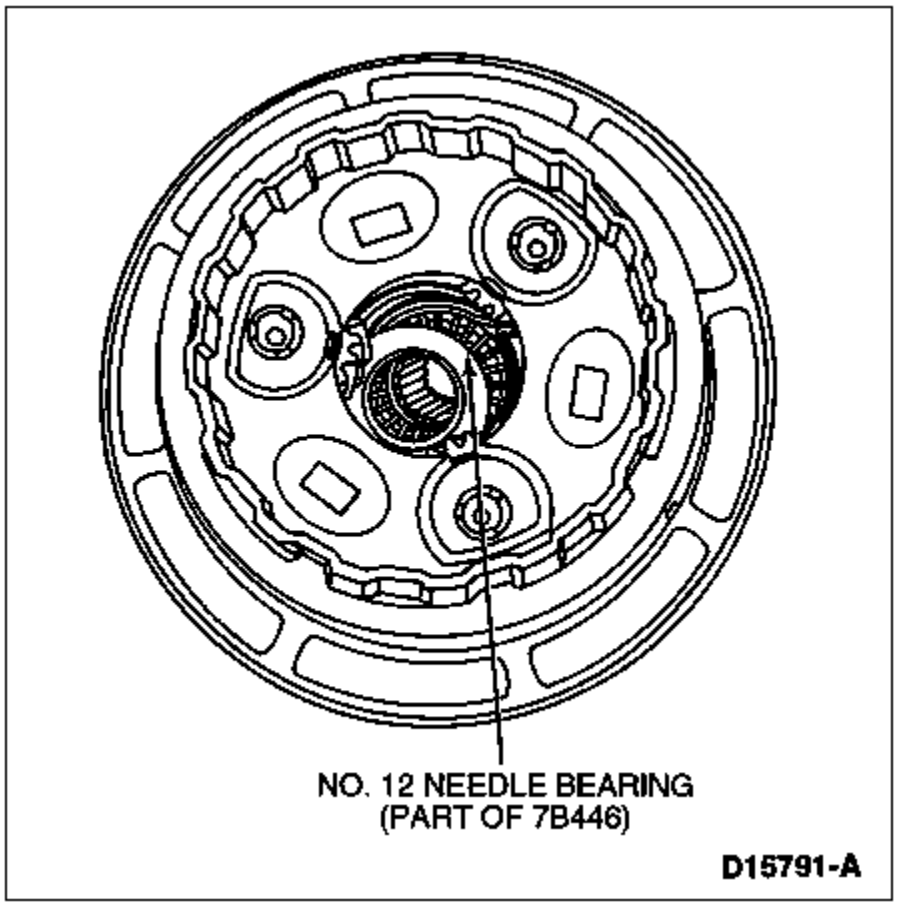
5. Remove coast clutch to front carrier adapter and front sun gear.

tomsn048@gmail.com



6. Inspect the No. 12 needle bearing inside the front planetary gear carrier.

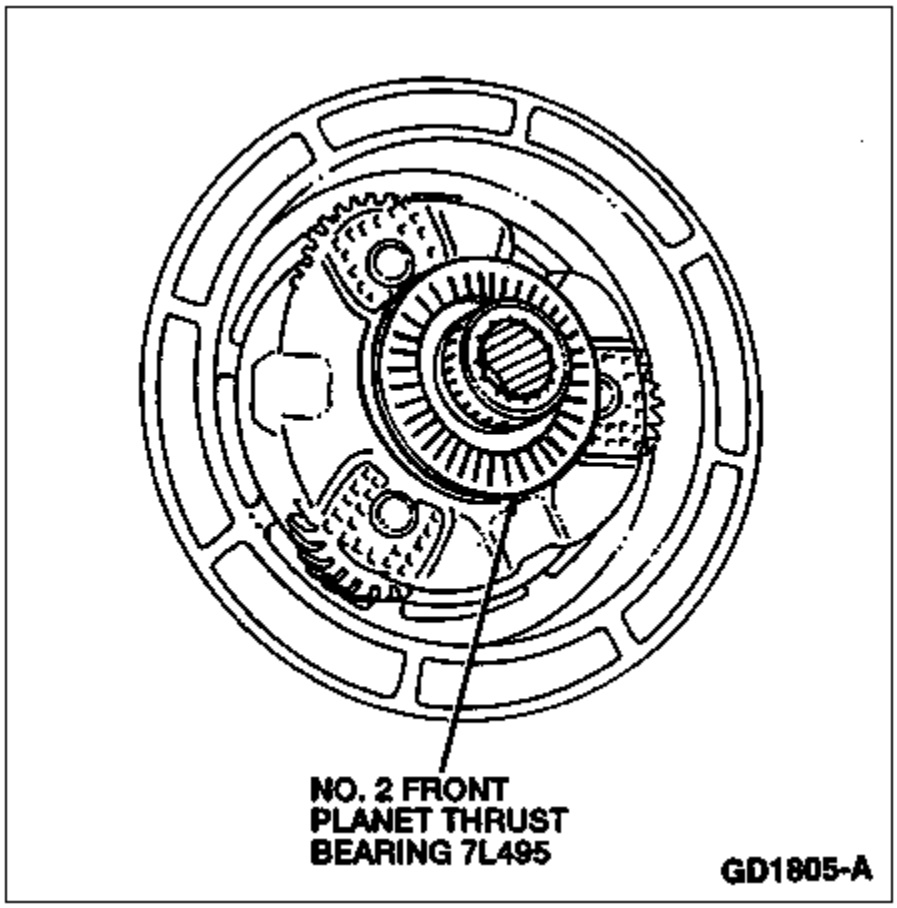
tomsn048@gmail.com



7. **NOTE: Use petroleum jelly to hold the No. 2 front planetary thrust bearing in place.**

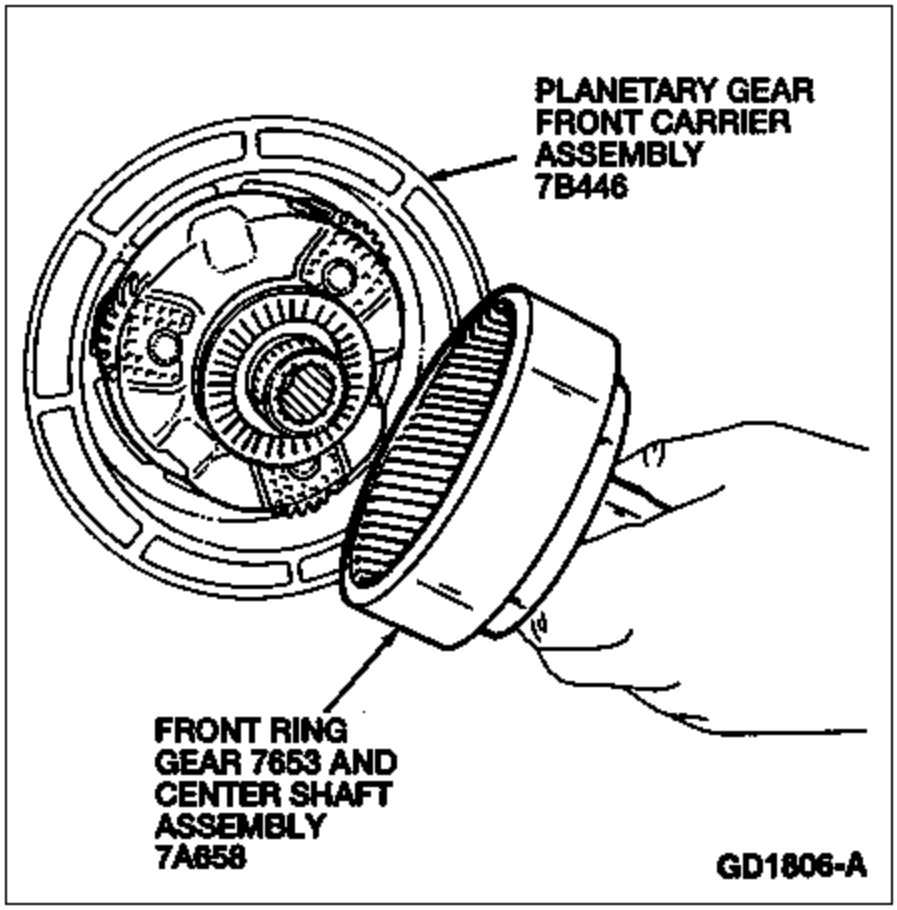
   Install the No. 2 front planetary thrust bearing between the front center shaft face and the front planetary gear carrier assembly.

tomsn048@gmail.com



8. Install the front planetary gear carrier into the center shaft and front ring gear.

tomsn048@gmail.com

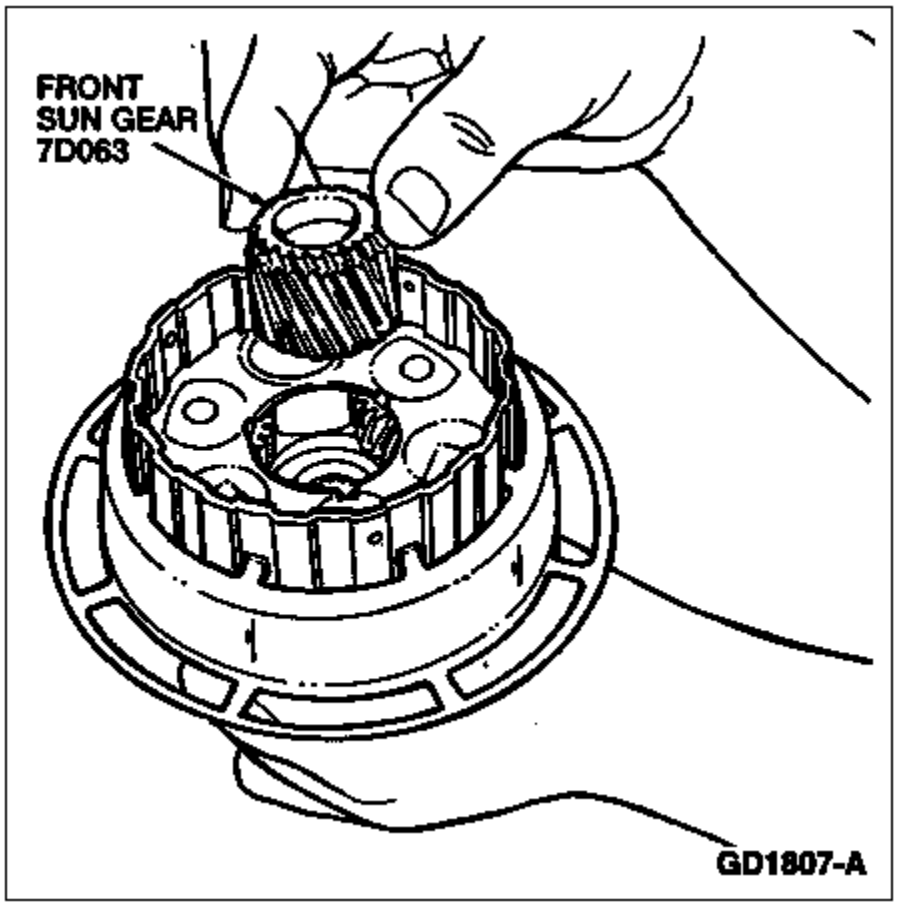


9. **CAUTION: Use care not to bend or damage the exciter wheel.**

   CAUTION: Before installing the front sun gear into the front planetary gear carrier, make sure the No. 12 sun gear thrust bearing race is aligned with the needle bearing inside the front planetary gear carrier. The front sun gear will not seat properly if the No.12 sun gear thrust bearing race is not aligned in the center of the front sun gear.

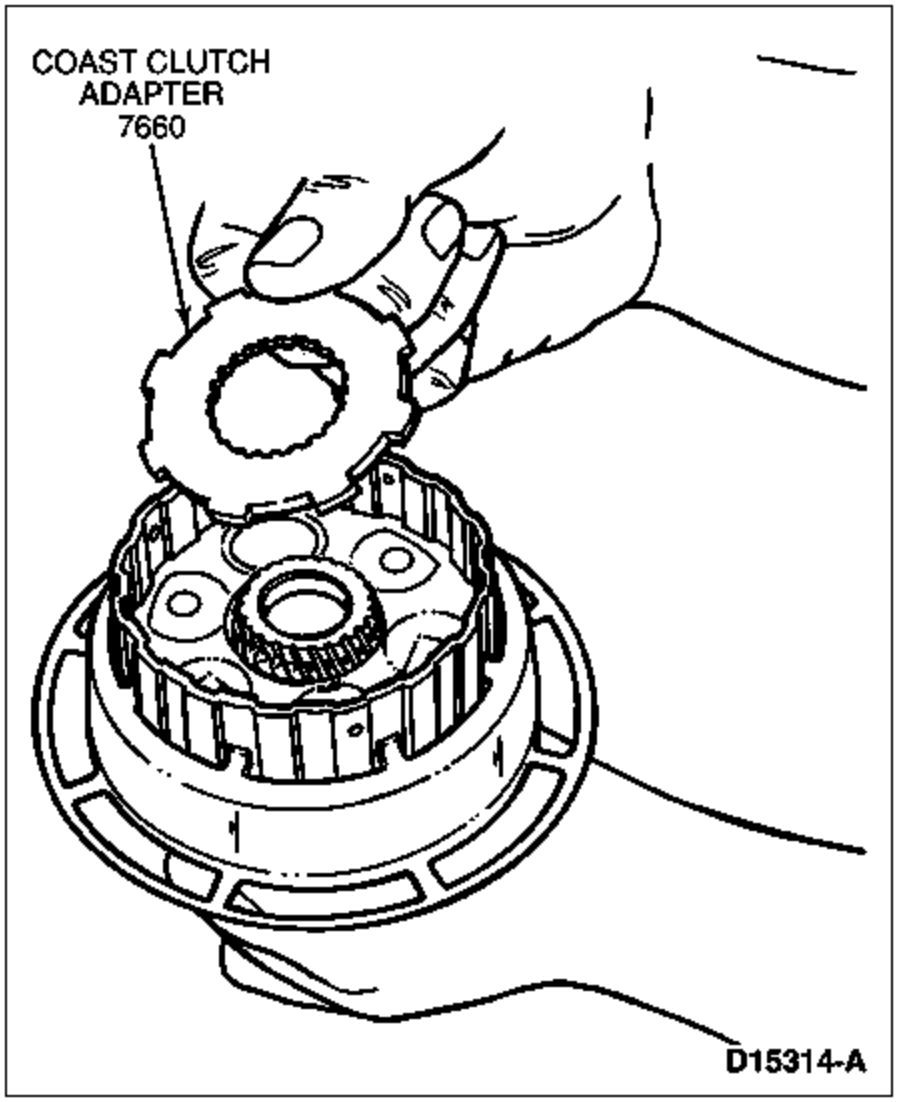
   Install the front sun gear into the front planetary gear carrier.

tomsn048@gmail.com



10. Install the coast clutch adapter on the front sun gear.

tomsn048@gmail.com

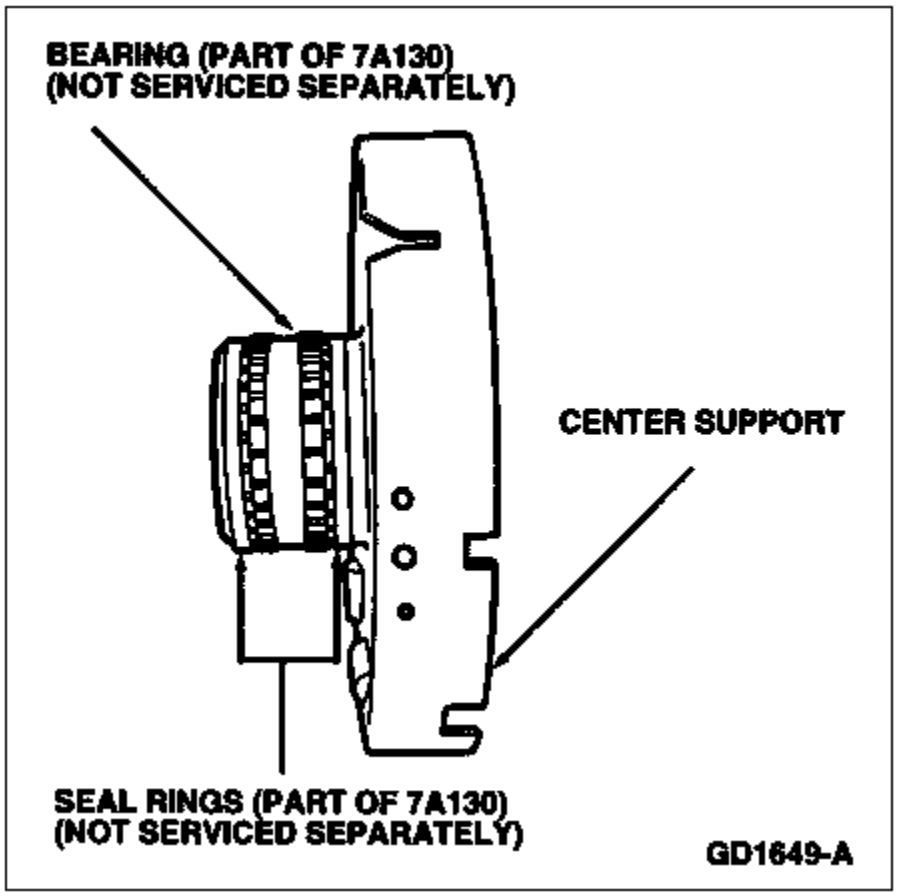


tomsn048@gmail.com

tomsn048@gmail.com

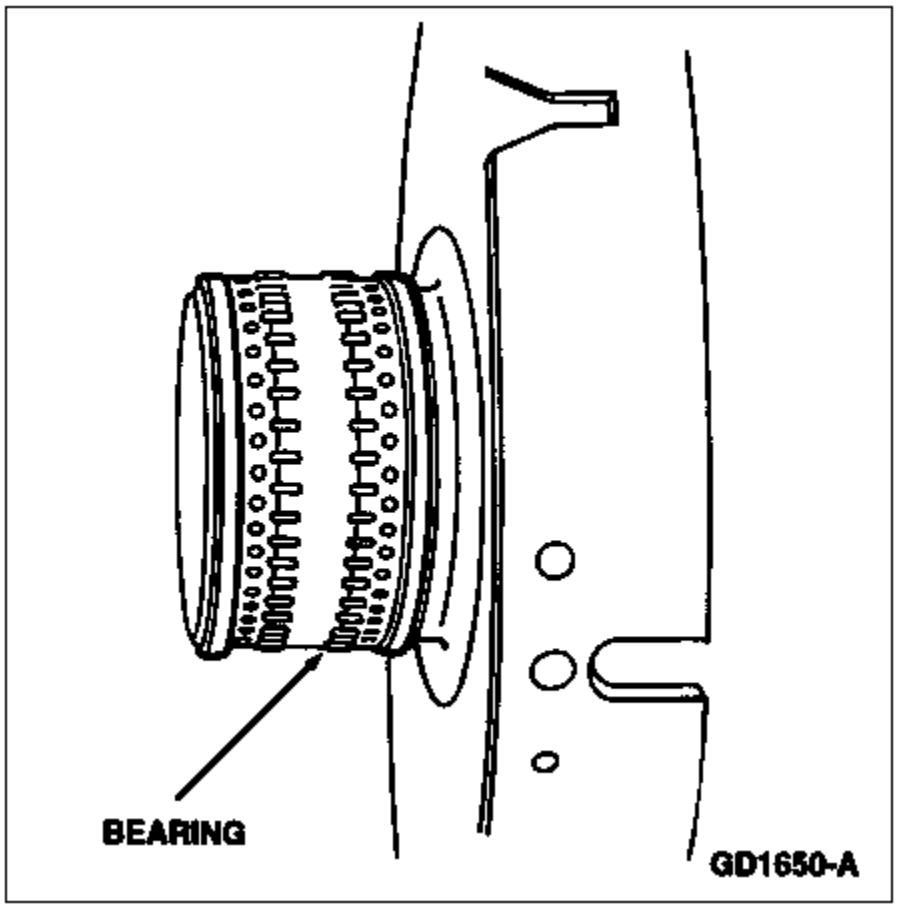
Center Support

Inspection

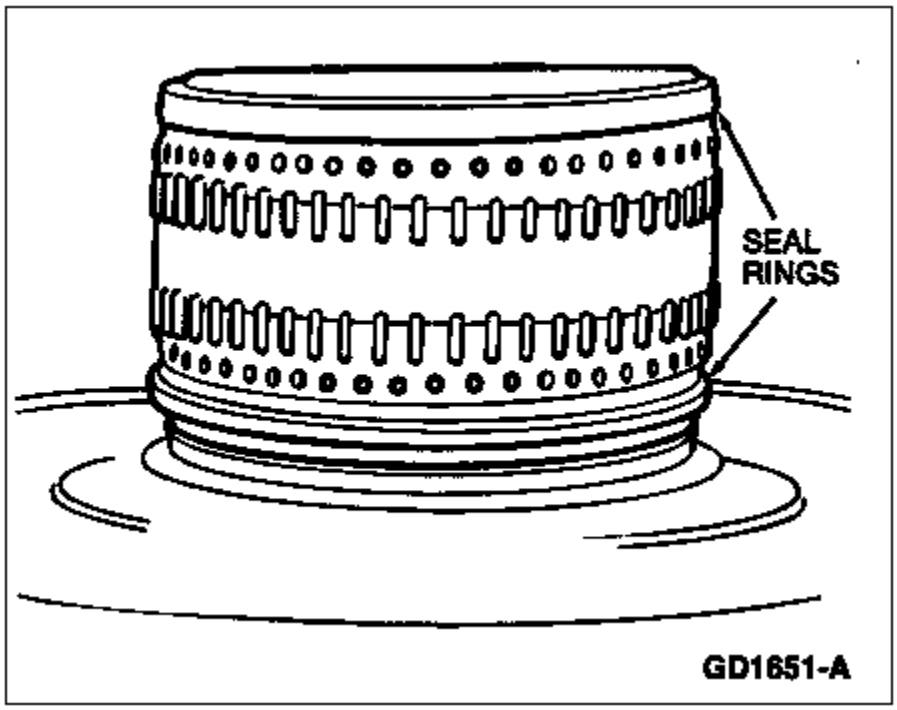


1. Inspect center support for damage. If damaged, replace center support assembly.

tomsn048@gmail.com

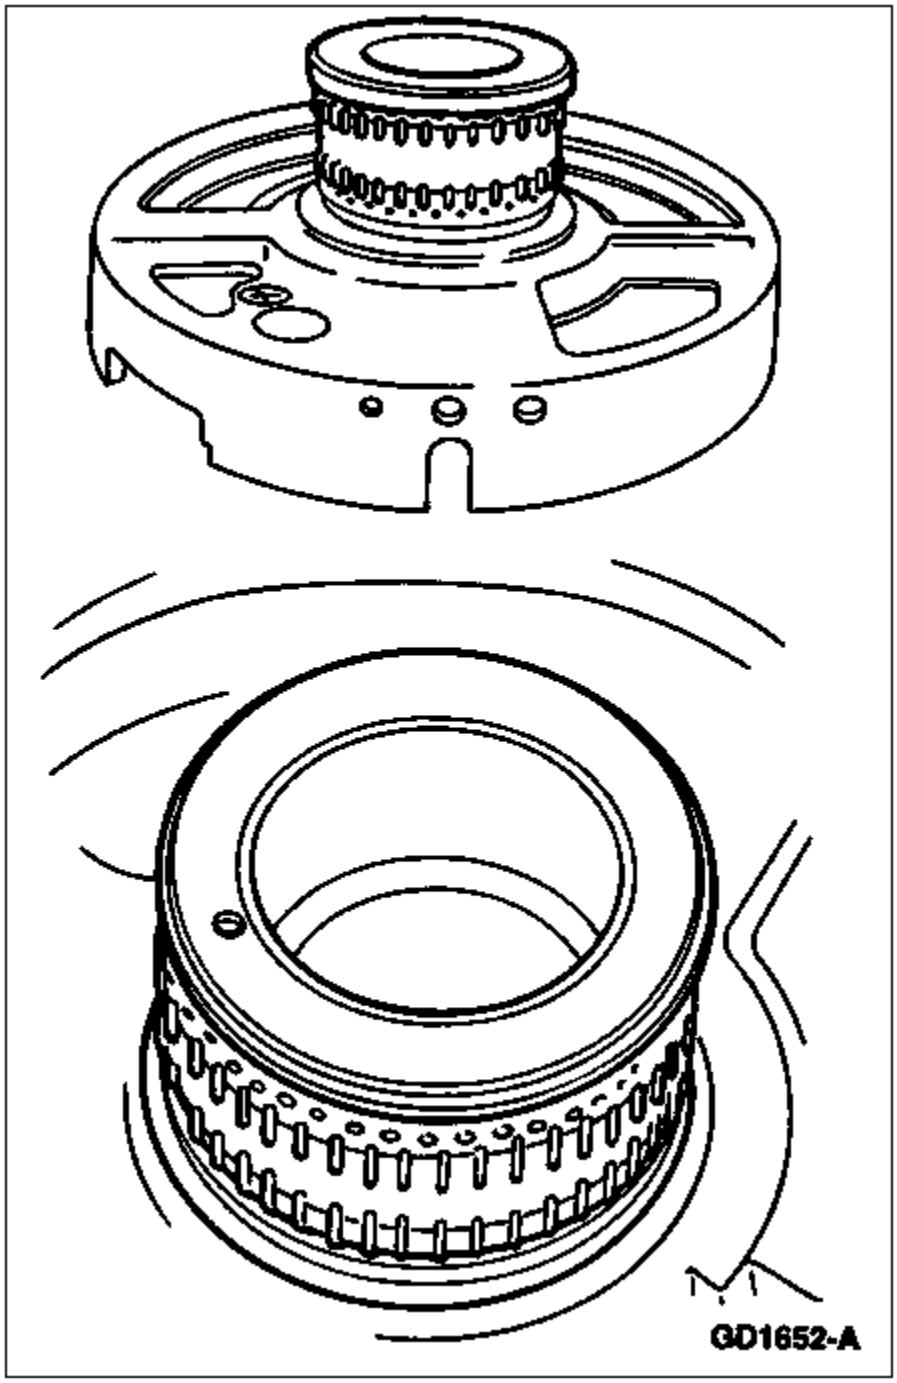


2. Inspect seal rings for damage. If damaged, replace center support.



tomsn048@gmail.com

3. Inspect thrust surface for wear, scoring or damage. Inspect forward clutch sealing surface for scoring or damage. Inspect hydraulic passages for damage or restrictions.



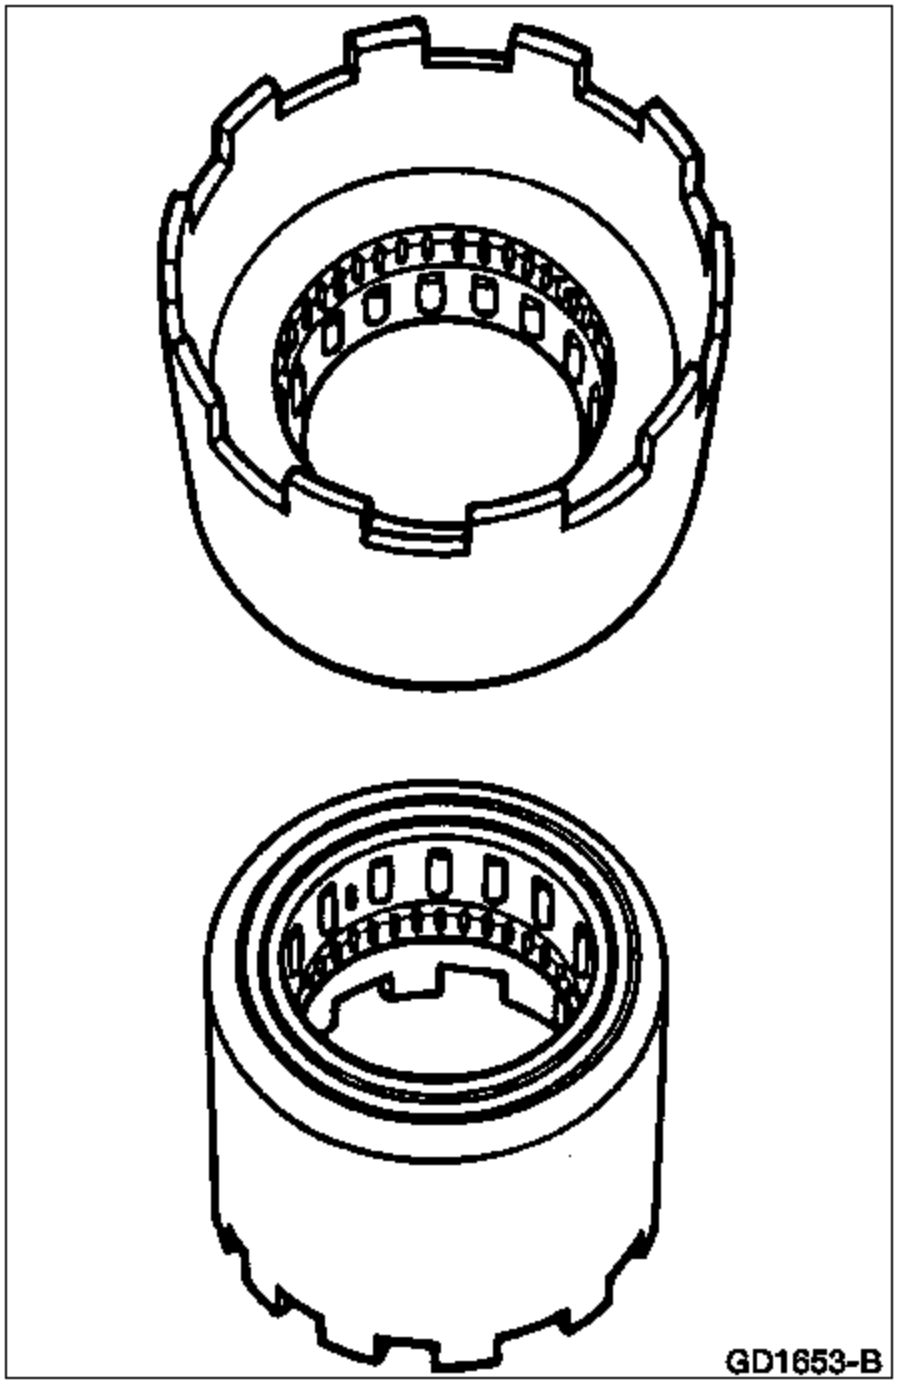
tomsn048@gmail.com

tomsn048@gmail.com

Low/Reverse Brake Drum

Low/Reverse Brake Drum Assembly

tomsn048@gmail.com

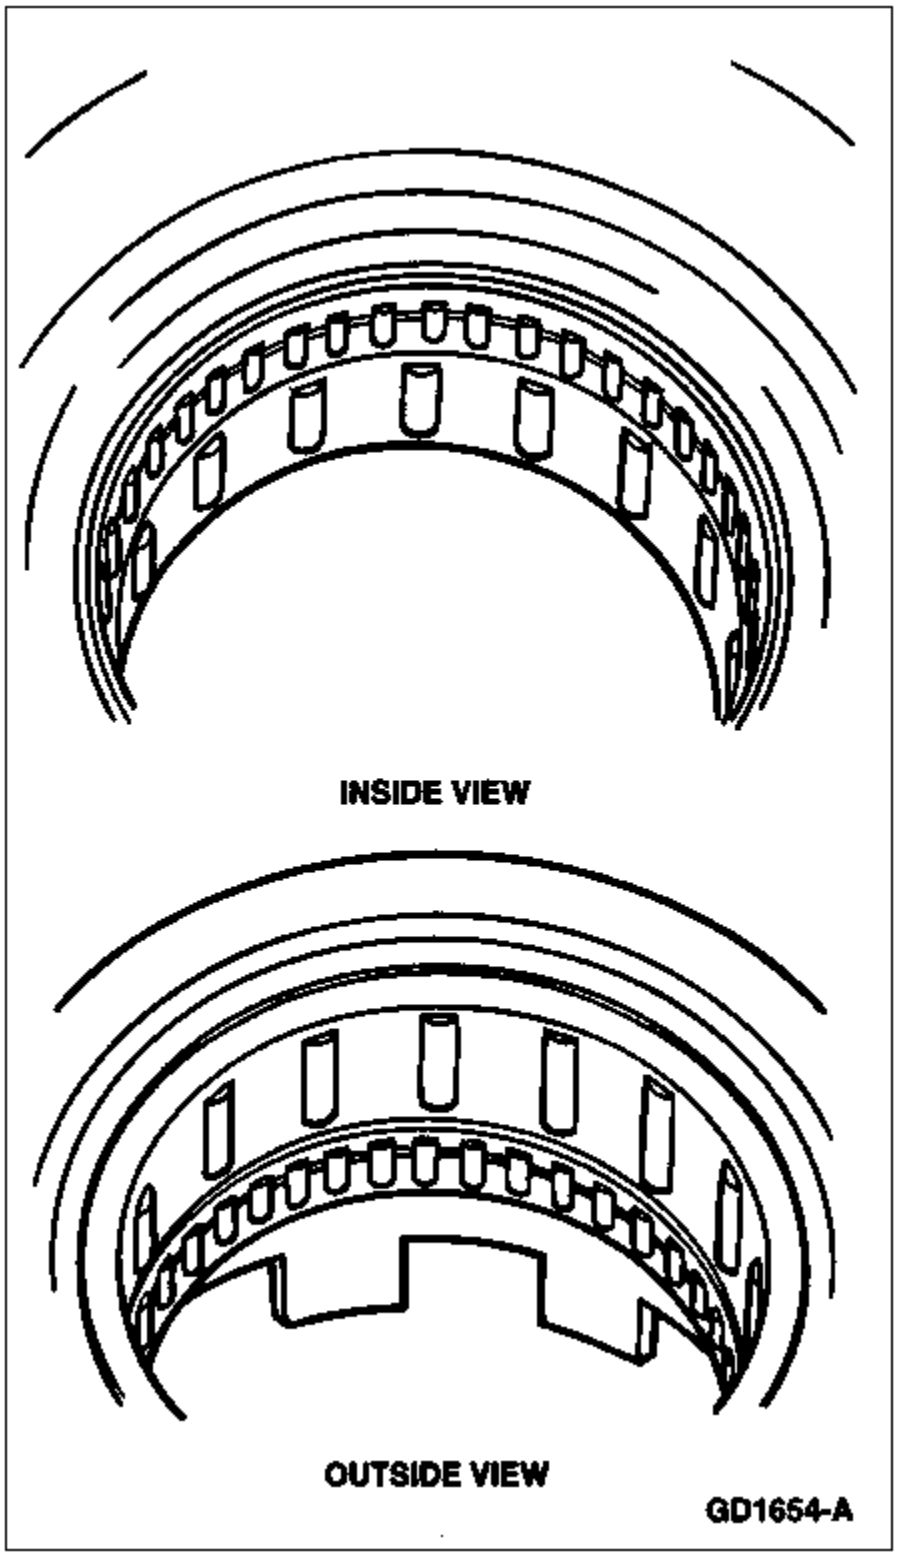


Inspection

1. **NOTE: The rear one-way clutch is part of the reverse drum assembly.**

   Inspect rollers, sprags, and low/reverse drum for damage. If damaged, replace drum assembly.

tomsn048@gmail.com

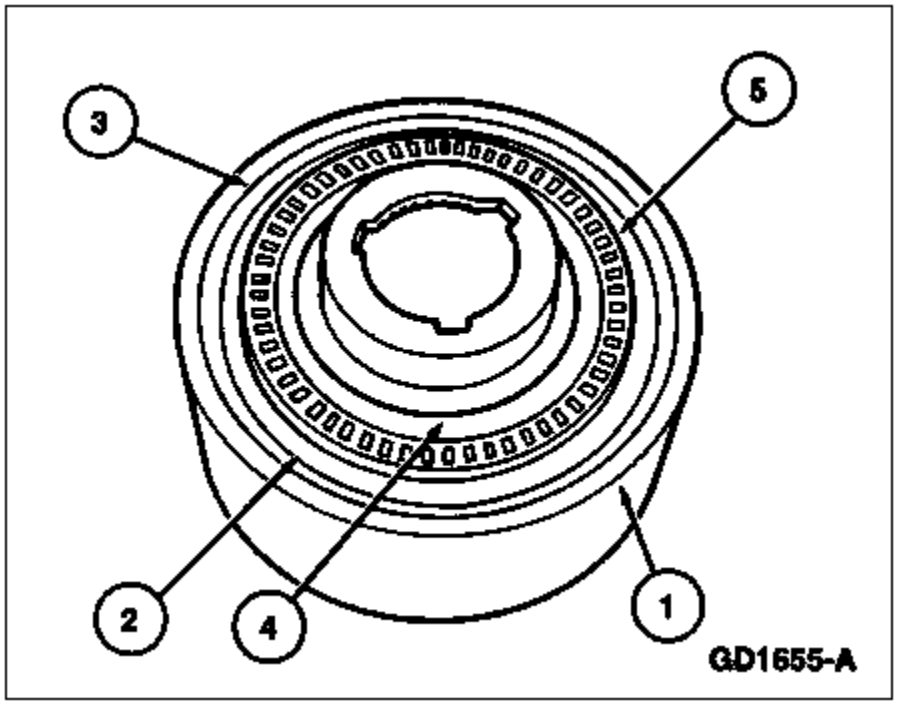


tomsn048@gmail.com

tomsn048@gmail.com

Output Shaft Ring Gear and Hub Assembly

Output Shaft Ring Gear and Hub Assembly



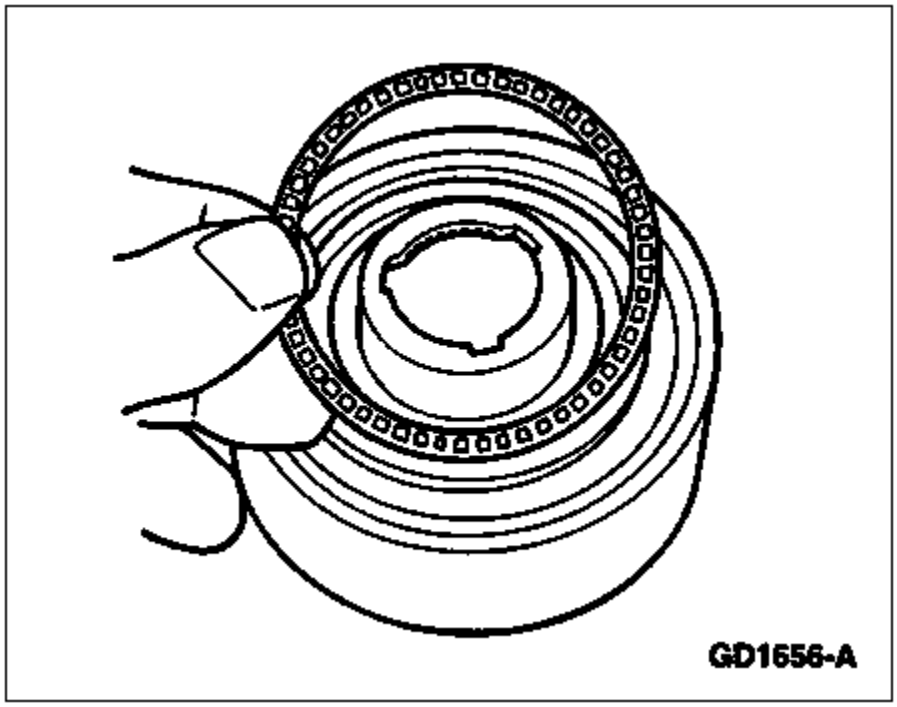
Item	Part Number	Description
1	7A153	Output Shaft Ring Gear
2	7D164	Output Shaft Hub
3	E860122-S	Retaining Ring
4	7M150	No. 10A Bearing Race Assembly
5	7M150	No. 10B Needle Bearing

Disassembly

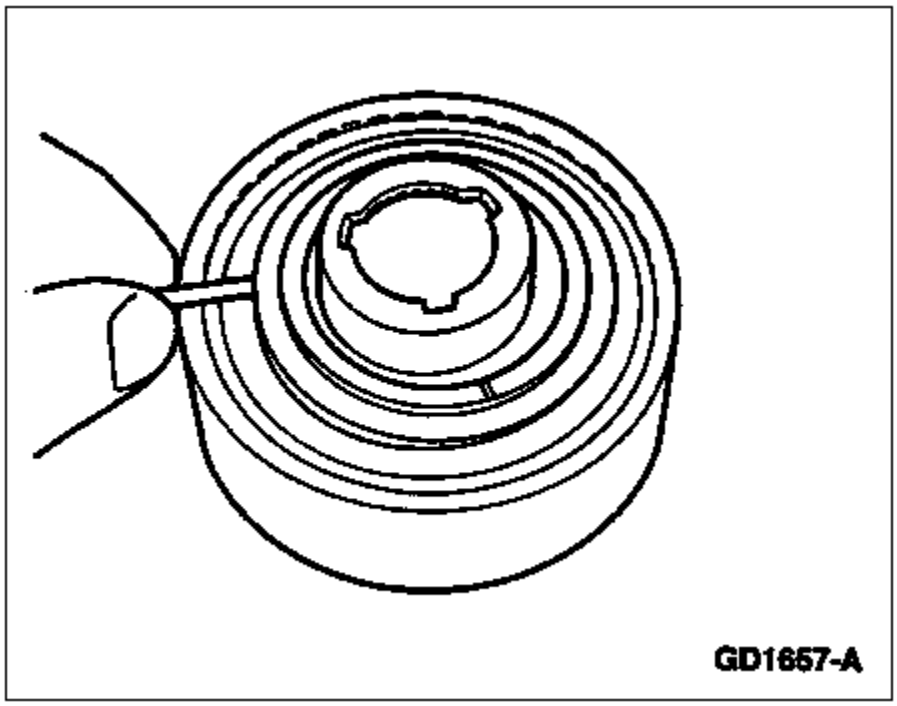
1. Inspect the ring gear, hub, No.10B needle bearing and No. 10A bearing race assembly for damage. If service is required, use the following procedures.

2. Remove No. 10B needle bearing, if not already removed.

tomsn048@gmail.com

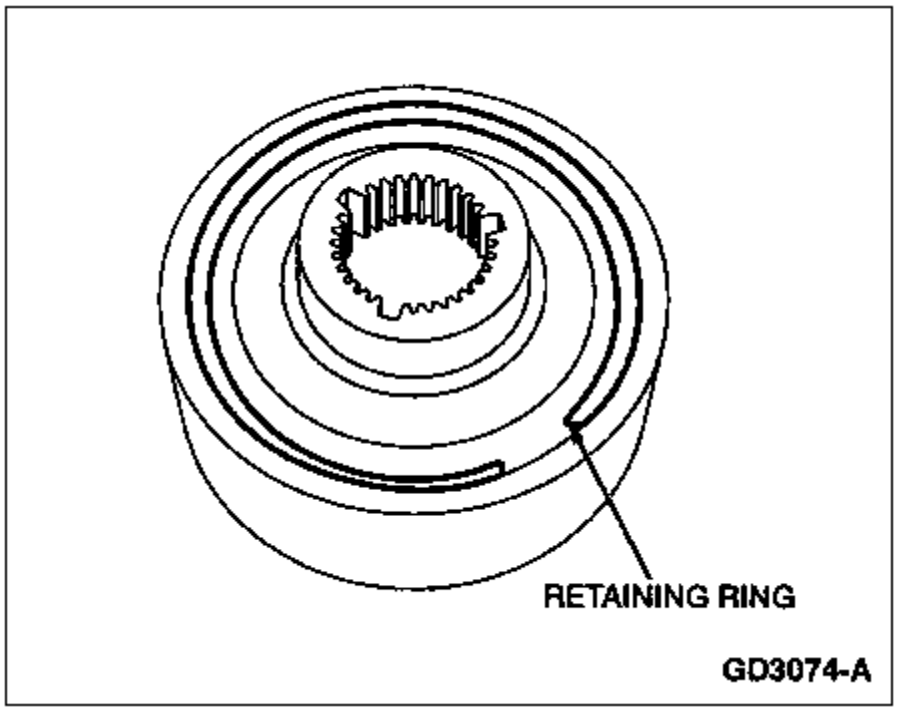


3. Remove No. 10A bearing race assembly.



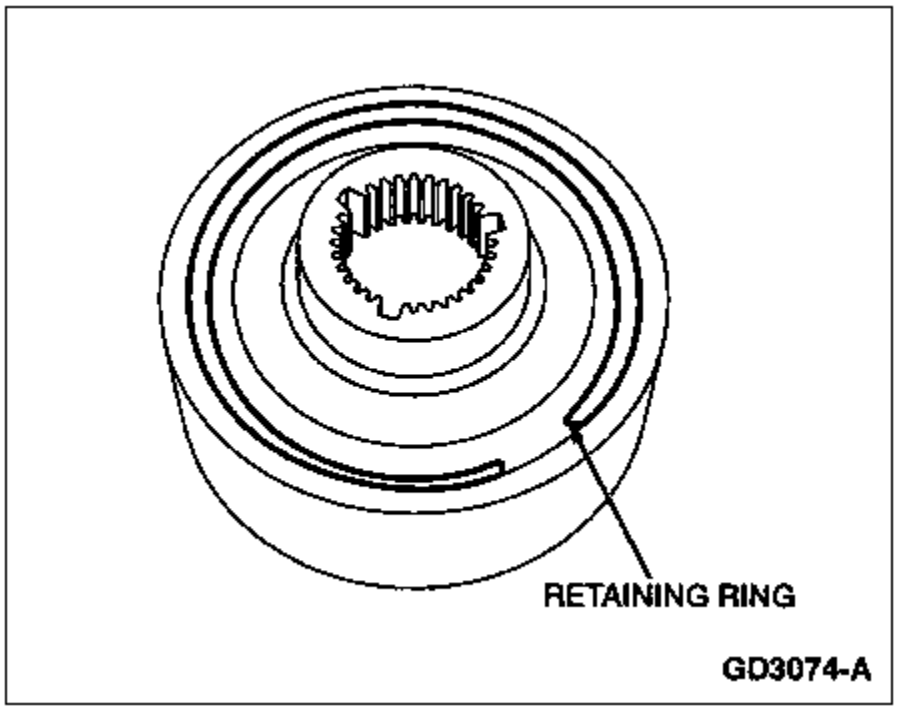
4. Separate ring gear from hub by removing retaining ring.

tomsn048@gmail.com



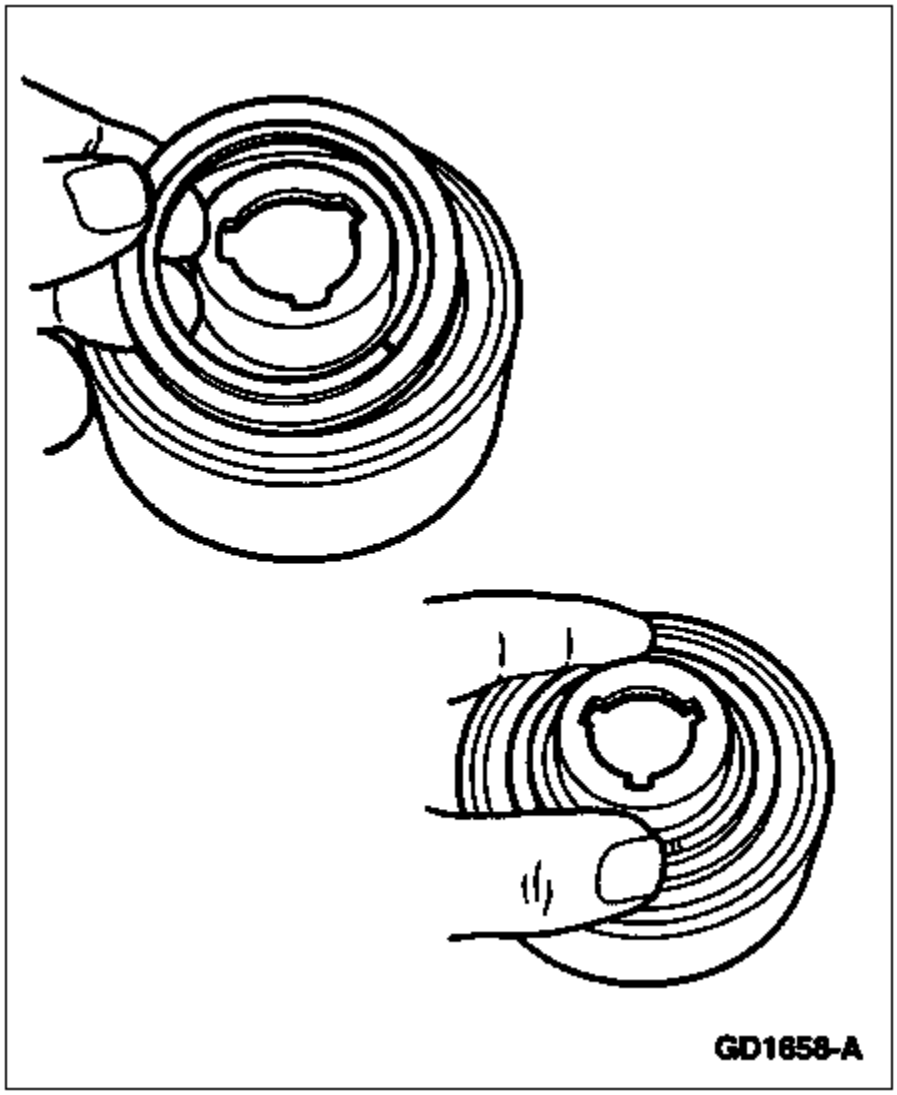
Assembly

1. Install output shaft hub into ring gear. Install retaining ring.



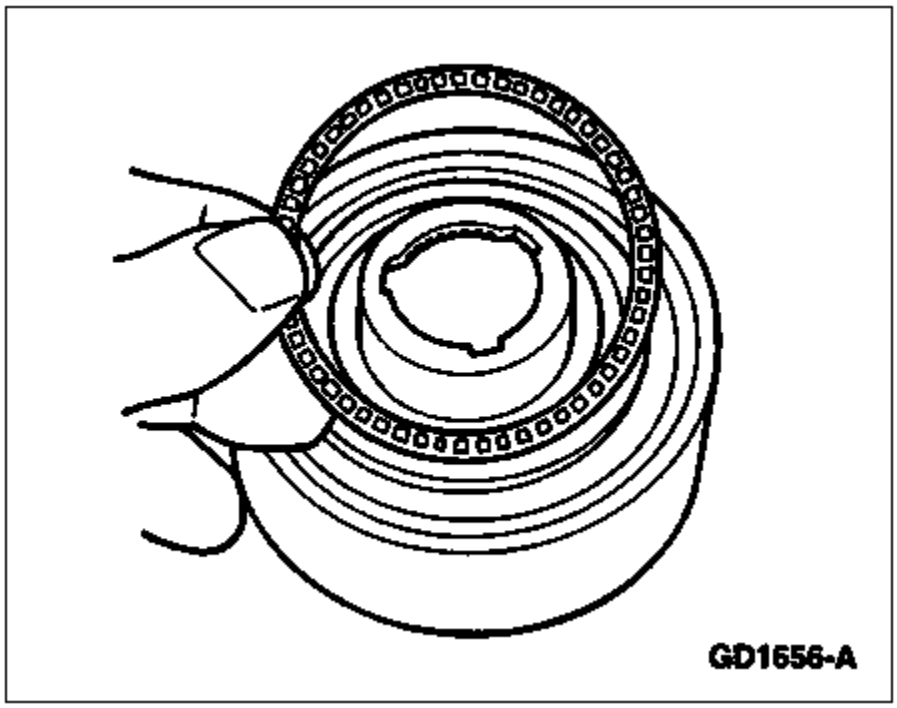
2. Install No. 10A bearing race assembly onto outshaft hub. Press on - snap fit.

tomsn048@gmail.com



3. Using petroleum jelly, install No. 10B needle bearing onto output shaft ring gear and hub assembly.

tomsn048@gmail.com



tomsn048@gmail.com

Torque Converter Service Procedures

Cleaning/Inspection

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the torque converter. These contaminates are a major cause of recurring transmission troubles and MUST be removed from the system before the transmission is put back into the vehicle.

Whenever a transmission has been disassembled to replace worn or damaged parts, or because the valve body sticks repeatedly from foreign material, the torque converter MUST be cleaned using a mechanical agitated cleaner, such as Rotunda Torque Converter/Transmission Oil Cooler Cleaner 014-00028 or equivalent.

Torque Converter Flushing

NOTE: Mineral spirits used to clean the torque converter must be fresh, non-chlorinated and non-halogenated.

Following the instructions included with the Torque Converter/Transmission Oil Cooler Cleaner 014-00028, flush out the converter.

After flushing the torque converter, follow these steps:

- Thoroughly drain the remaining solvent through the impeller hub.
- Add 1.9L (2.0 quarts) of clean MERCON V® XT-5-QM Automatic Transmission Fluid into fluid filler tube.
- Agitate the solution inside the torque converter by hand.
- Thoroughly drain the torque converter through the impeller hub.

Torque Converter Leak Check

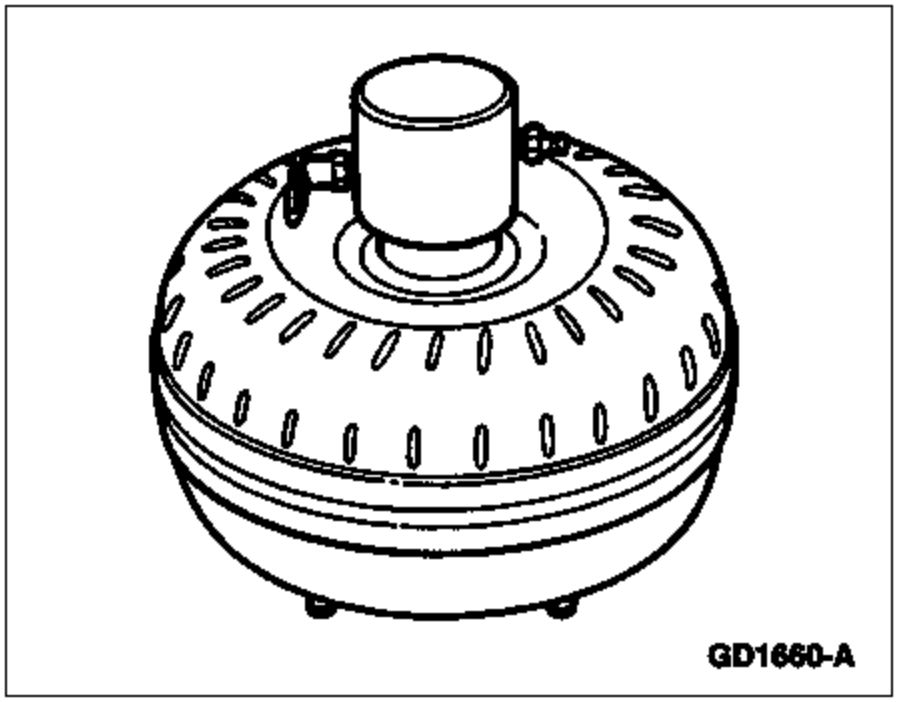
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Torque Converter Leak Check Tool and Gasket	014-R1075

1. Clean the outside surface at the torque converter.

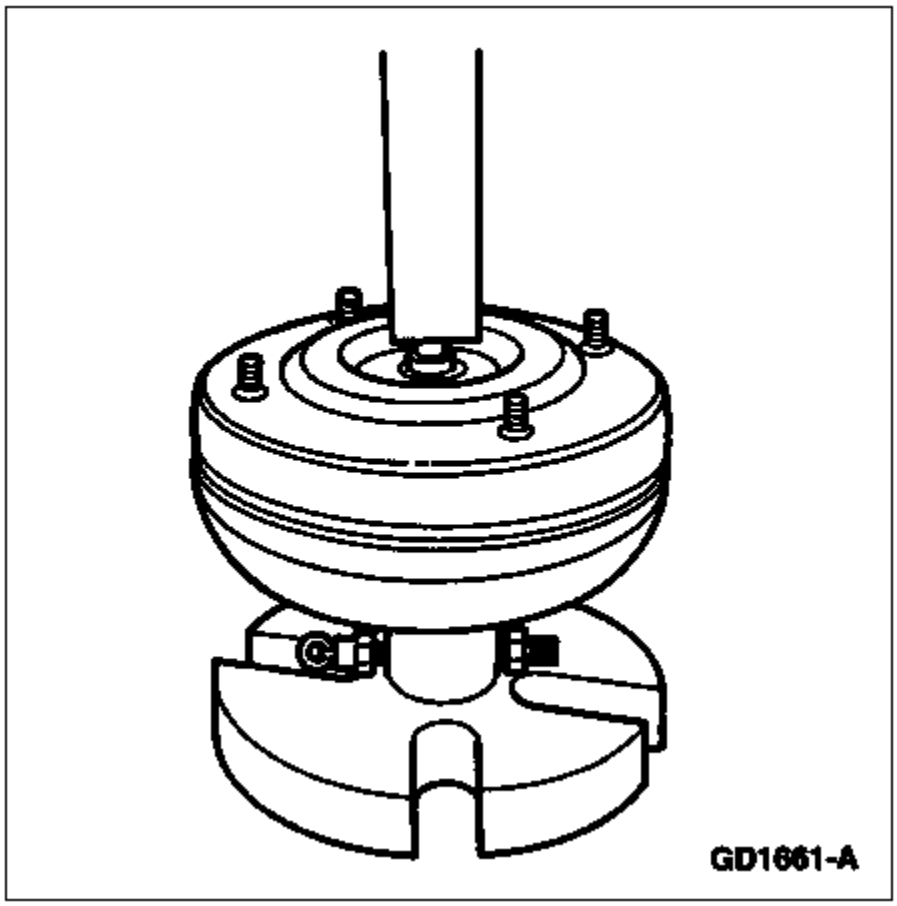
2. Install Torque Converter Leak Check Tool and Gasket 014-R1075 into converter hub.

tomsn048@gmail.com



3. Install torque converter with installed Torque Converter Leak Check Tool and Gasket 014-R1075 into press.

tomsn048@gmail.com



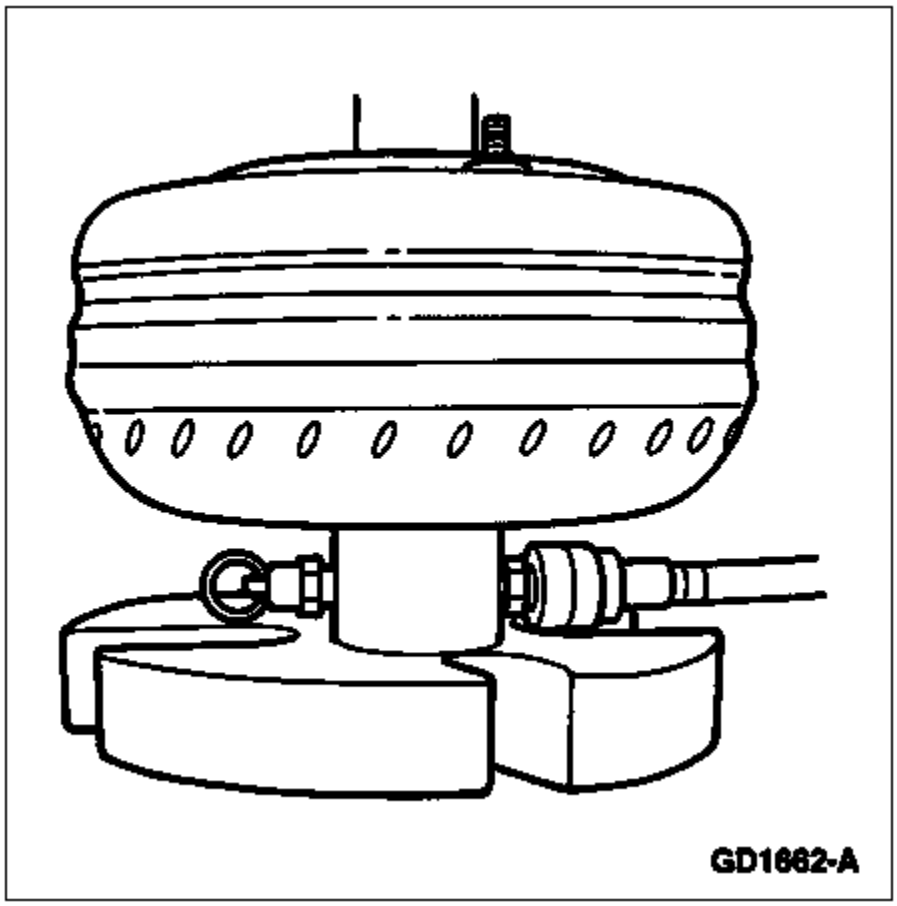
4. **WARNING: ALWAYS FOLLOW PROPER SAFETY PROCEDURES WHILE USING PRESS.**

   Secure press. Apply enough force from press to seal tool into torque converter.

5. **NOTE: Use clean dry shop air.**

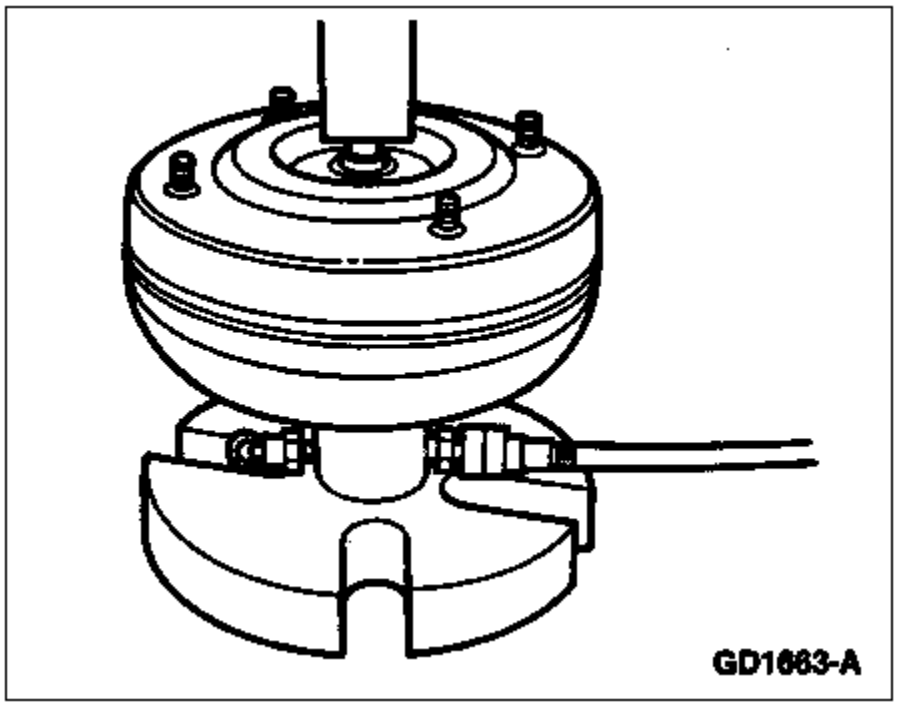
   Apply air pressure 80 psi (MAX) to valve on Torque Converter Leak Check Tool and Gasket 014-R1075.

tomsn048@gmail.com



6. With air pressure applied to valve, inspect for leaks at studs, seams and pilot hub. A soap bubble solution may be applied around those areas to aid in diagnosis. If leaks are present, replace converter.

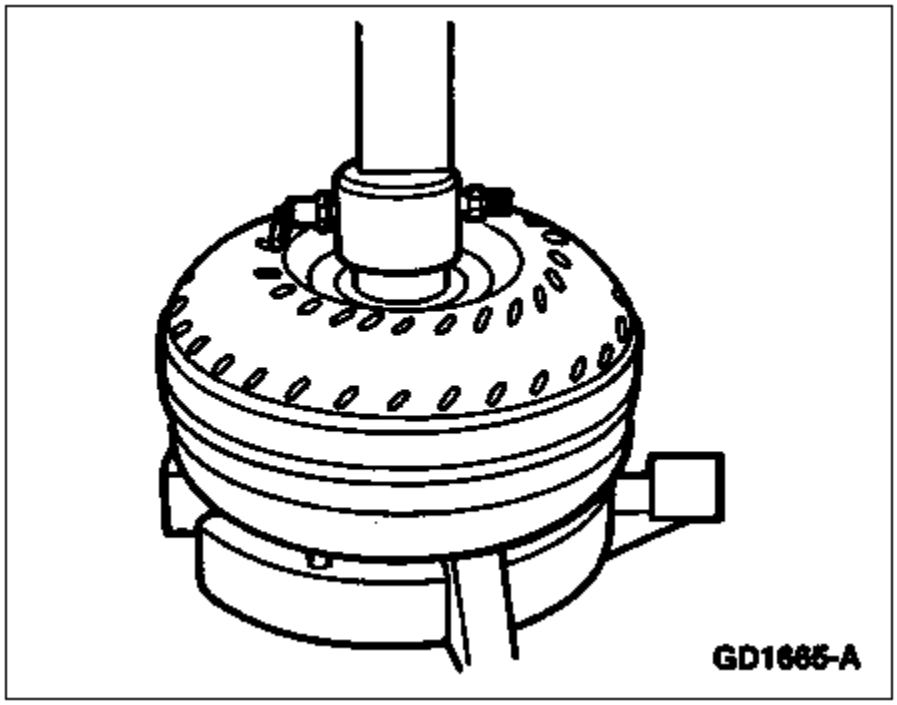
tomsn048@gmail.com



7. Release pressure and then slowly release press. Remove air hose.

tomsn048@gmail.com

8. Rotate torque converter and tool then reinstall into press with tool up.



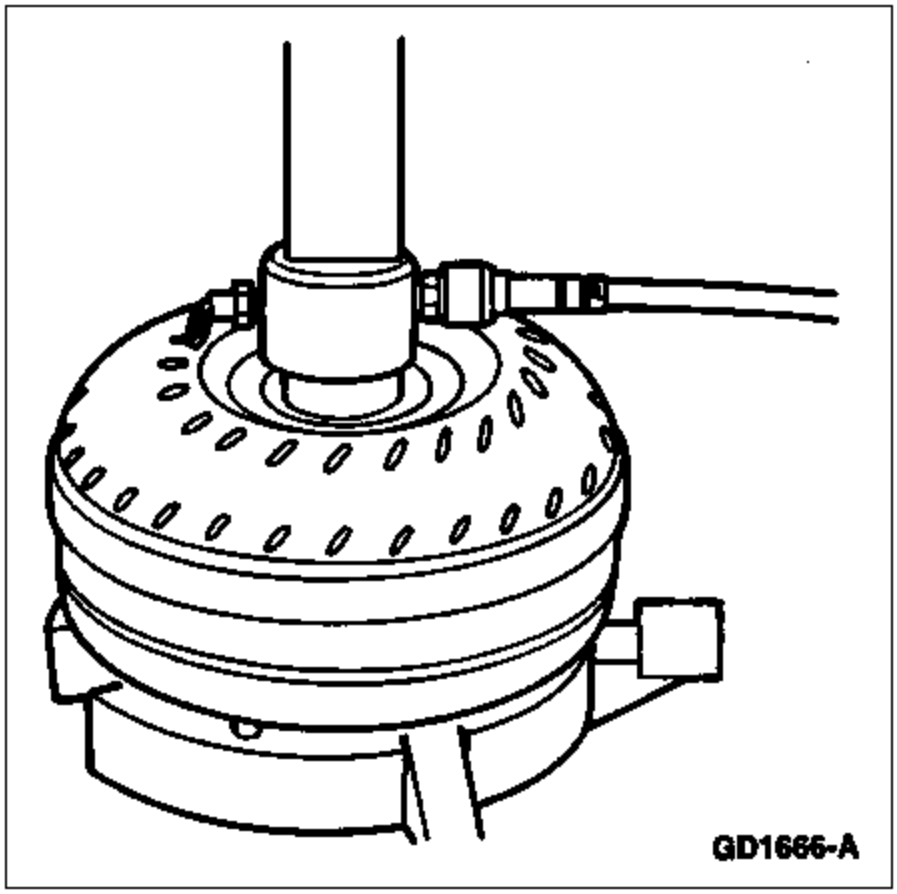
9. **WARNING: ALWAYS FOLLOW PROPER SAFETY PROCEDURES WHILE USING PRESS.**

   Secure press. Apply enough force from press to seal tool into torque converter.

10. **NOTE: Use clean dry shop air.**

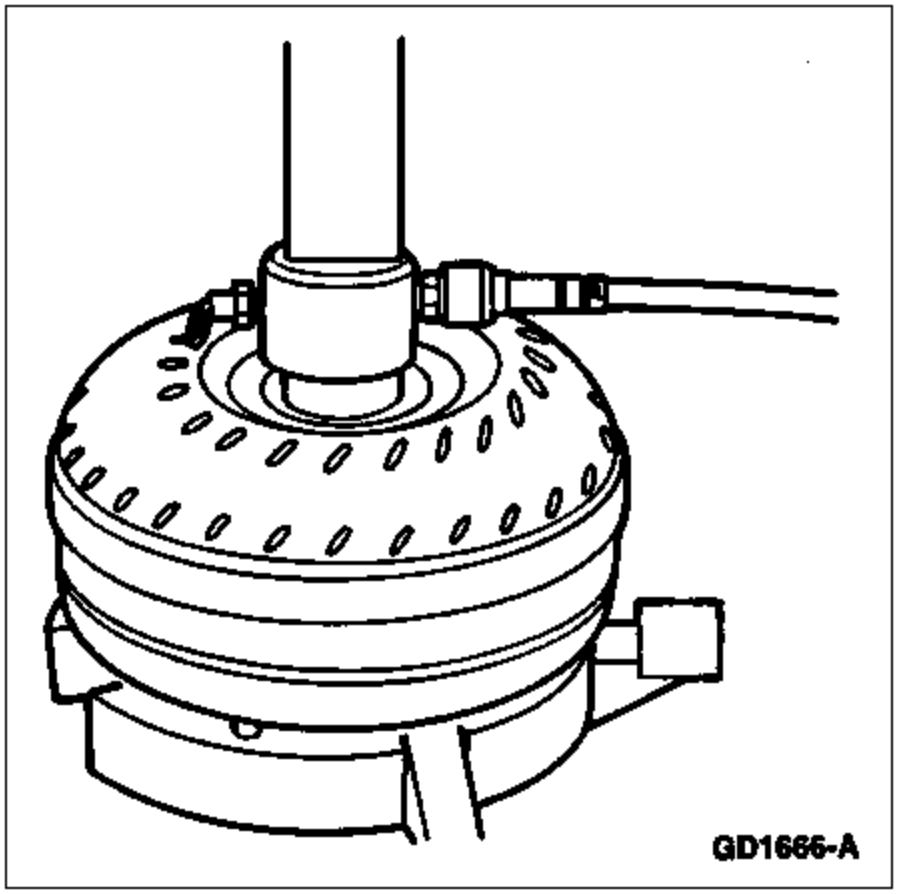
    Apply air pressure 80 psi (MAX) to valve on leak check tool.

tomsn048@gmail.com



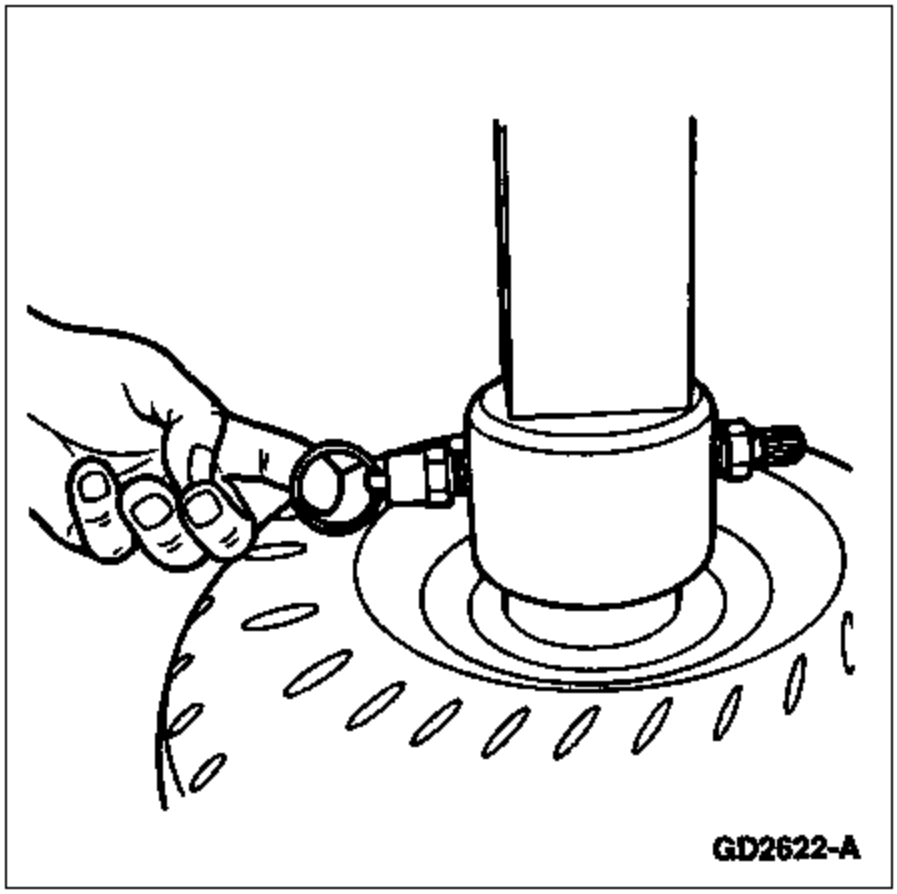
11. With air pressure applied to valve, inspect for leaks at converter hub, seams and studs. A soap bubble solution may be applied around those areas to aid in diagnosis. If leaks are present, replace converter.

tomsn048@gmail.com



12. Remove air hose. Release pressure and then slowly release press. Remove converter. Remove tool.

tomsn048@gmail.com



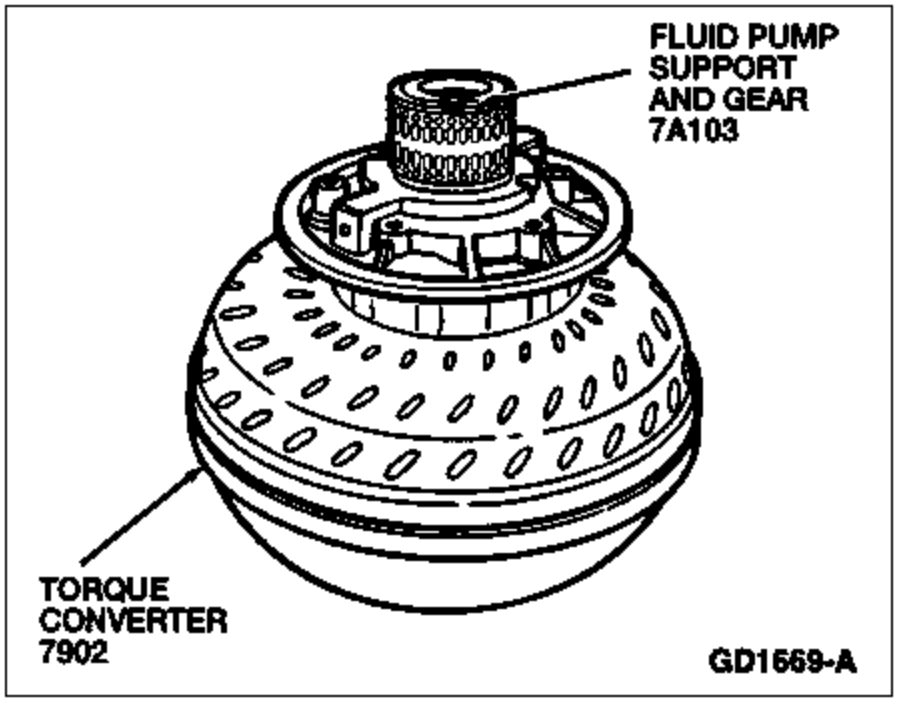
Stator to Impeller Interference Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
End Play Checking Tool	T80L-7902-A

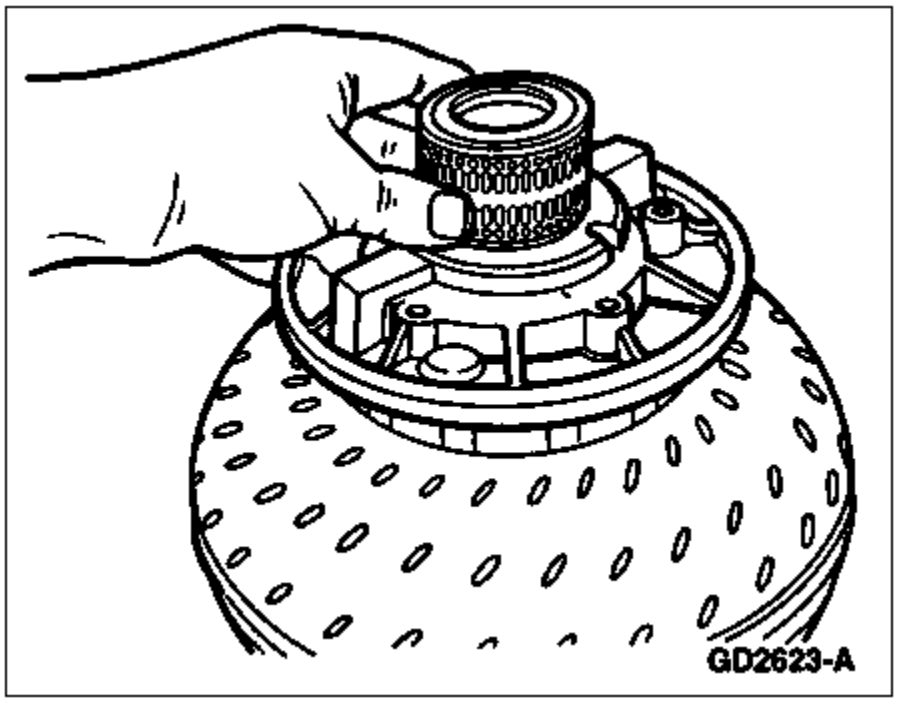
1. Install the fluid pump support into torque converter. Engage the splines of the one-way clutch inner race with the mating splines of the stator support.

tomsn048@gmail.com



2. Rotate the torque converter both clockwise and counterclockwise. The fluid pump support should rotate freely without any signs of interference or scraping within the torque converter.

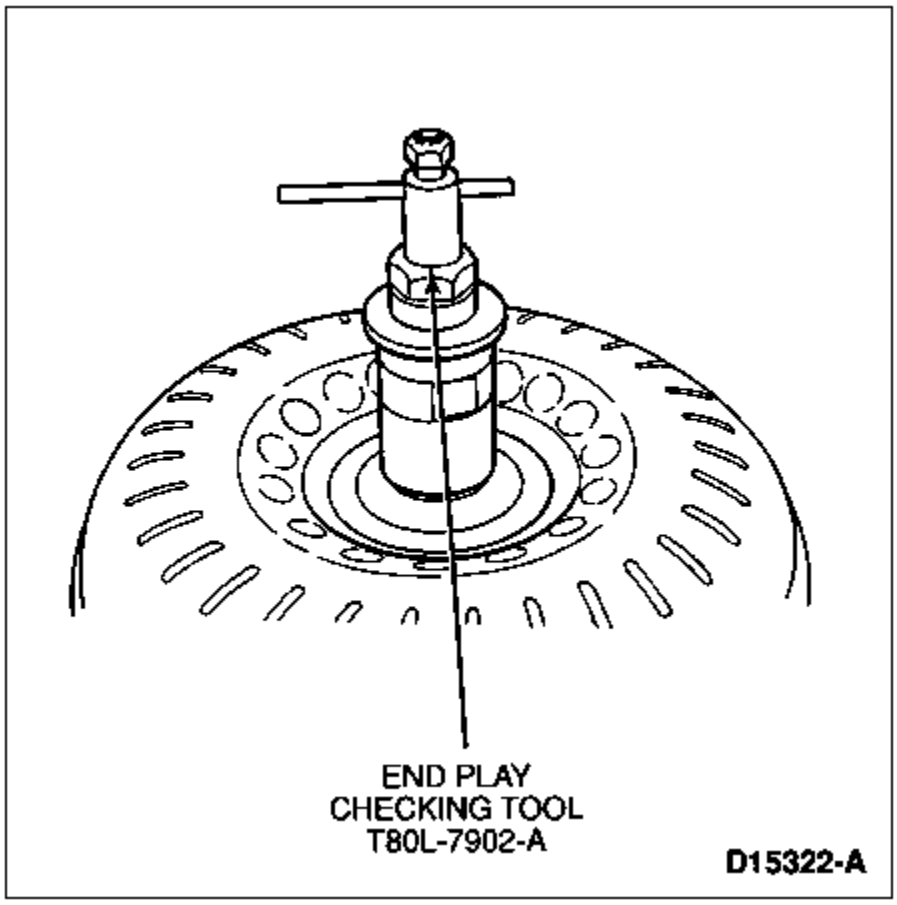
   If there is an indication of scraping, the trailing edges of the stator blades may be interfering with the leading edges of the impeller blades. In such cases, replace the torque converter.



tomsn048@gmail.com

Torque Converter End Play Check

1. Install End Play Checking Tool T80L-7902-A into the converter turbine hub until it bottoms.

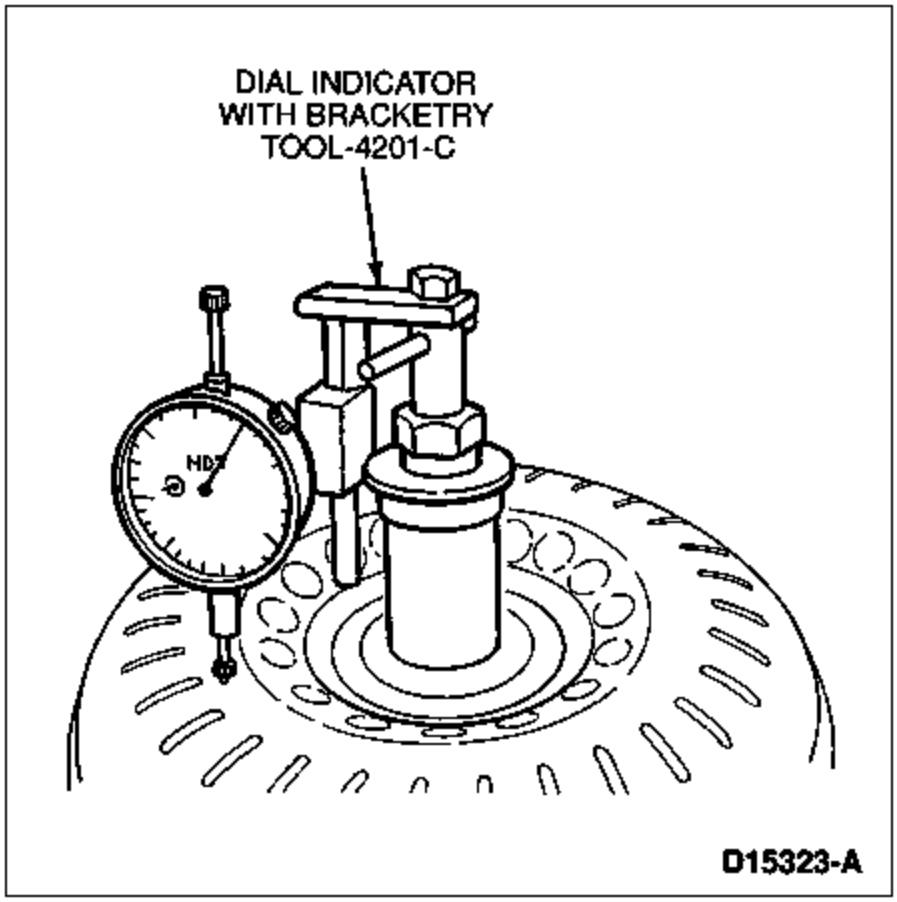


2. Expand the sleeve in the turbine spline by tightening the threaded inner post until the tool is securely locked in the spline.

tomsn048@gmail.com

3. Attach Dial Indicator with Bracketry TOOL-4201-C or equivalent to End Play Checking Tool T80L-7902-A. Position the indicator button on the converter impeller housing and set the dial face to zero (0).

tomsn048@gmail.com



4. Lift the tool upwards as far as it will go and note the indicator reading. The indicator reading is the total end play which the turbine and stator share. Replace the torque converter if the total end play exceeds the specifications.

CONVERTER END PLAY

New or Rebuilt Converter		Used Converter	
mm	Inch	mm	Inch
0.58 Max.	0.023 Max.	1.27 Max.	0.050 Max.

5. Loosen the threaded inner post to remove the tool from the torque converter (7902).

tomsn048@gmail.com

tomsn048@gmail.com

Transmission

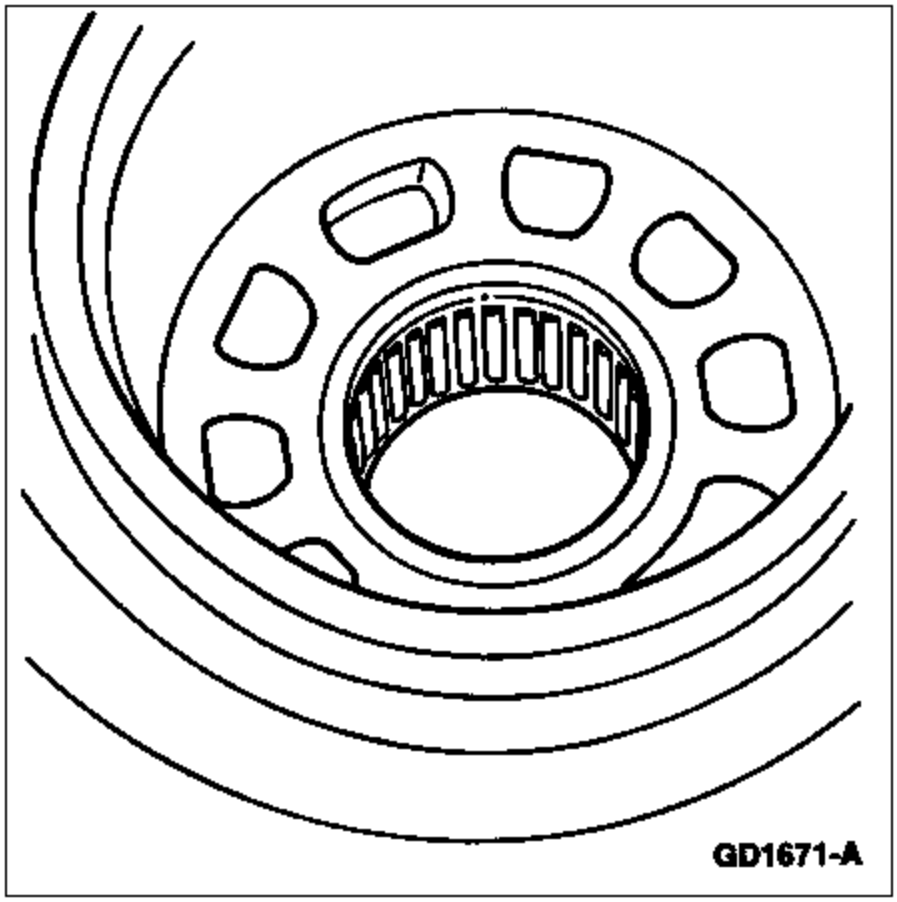
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bench-Mounted Holding Fixture	T57L-500-B
Shift Lever Seal Replacer	T74P-77498-A
Gauge Bar	T93T-77003-AH
Front Pump Alignment Set	T74P-77103-X
Band Adjustment Torque Wrench Set	T71P-77370-A
Servo Rod Selecting Gauge	T74P-77190-A
Extension Housing Bushing Replacer	T77L-7697-F
Extension Housing Seal Replacer	T74P-77052-A
Digital TR Sensor Alignment Tool	T97L-70010-A
Drive Handle	T80T-4000-W
Case Bearing Installation Tool	T97T-77110-A
Bearing Cup Puller	T77F-1102-A
Impact Slide Hammer	T50T-100-A
Turbine Shaft Speed Sensor Gauge	T95L-70010-F
Valve Body Guide Pin (.235)	T95L-70010-B
Valve Body Guide Pin (.248)	T95L-70010-C
Torque Converter Handles	T81P-7902-C
Servo Cover Compressor	T95L-77028A
Converter Guide Pins	T95L-7902A

1. Inspect the case for cracks and stripped threads. Inspect the gasket surfaces and mating surfaces for burrs. Check the vent for obstructions and check all fluid passages for obstructions and leakage.

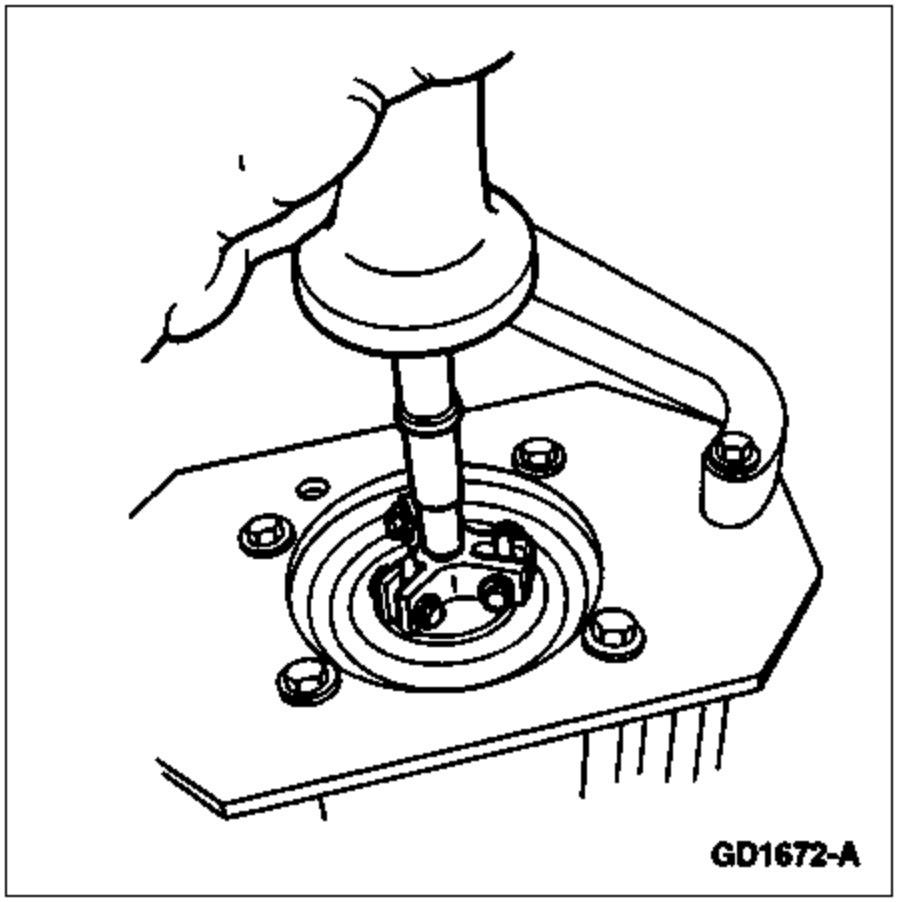
2. Inspect case bearing for damage. If damaged, replace bearing. Refer to steps a-d.

tomsn048@gmail.com

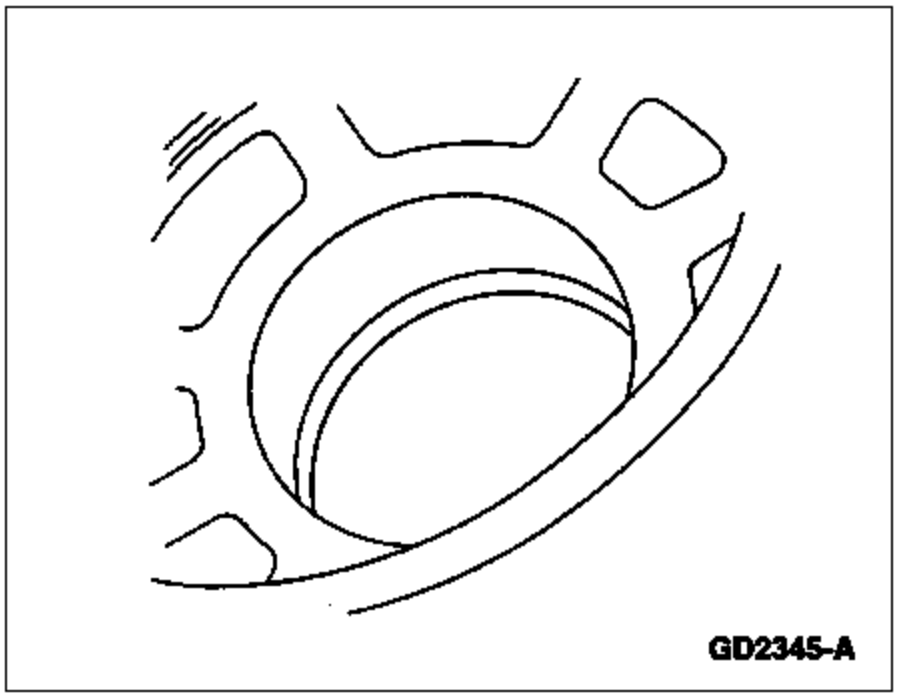


a. Install Bearing Cup Puller T77F-1102-A with Impact Slide Hammer T50T-100-A onto case bearing. Remove bearing.

tomsn048@gmail.com



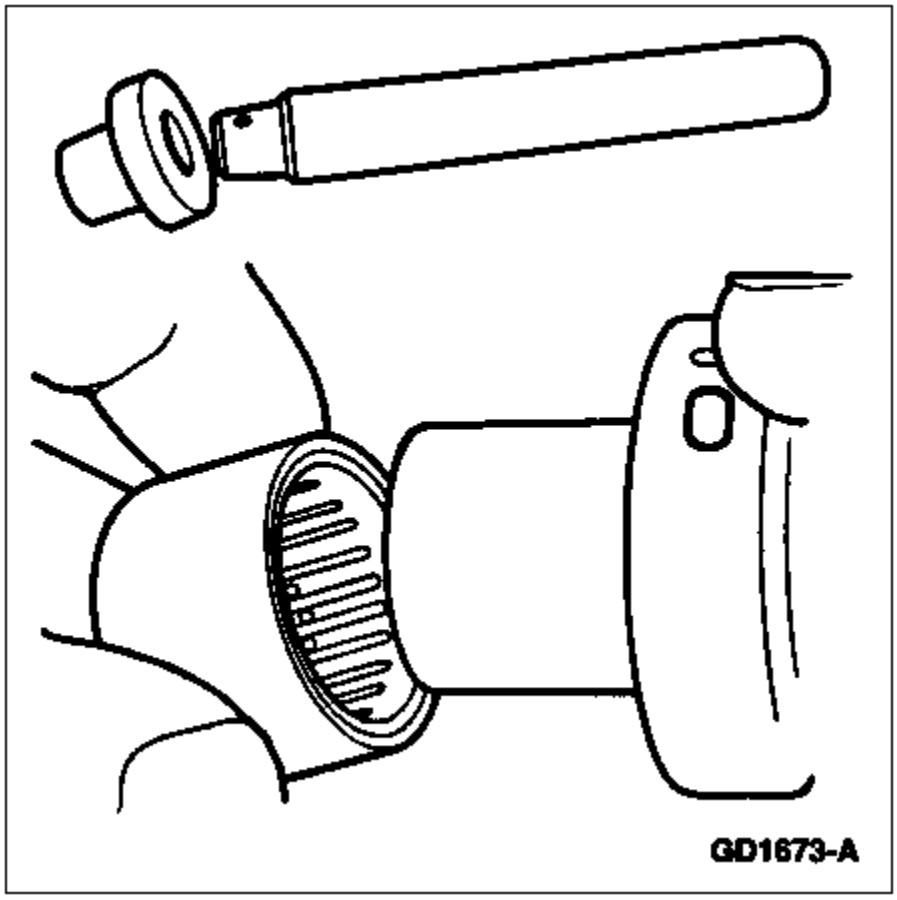
b. Inspect case bore for nicks and burrs. Remove with oil stone prior to installation of new bearing.



c. Install Drive Handle T80T-4000-W into Case Bearing Installation Tool T97T-77110-A. Install

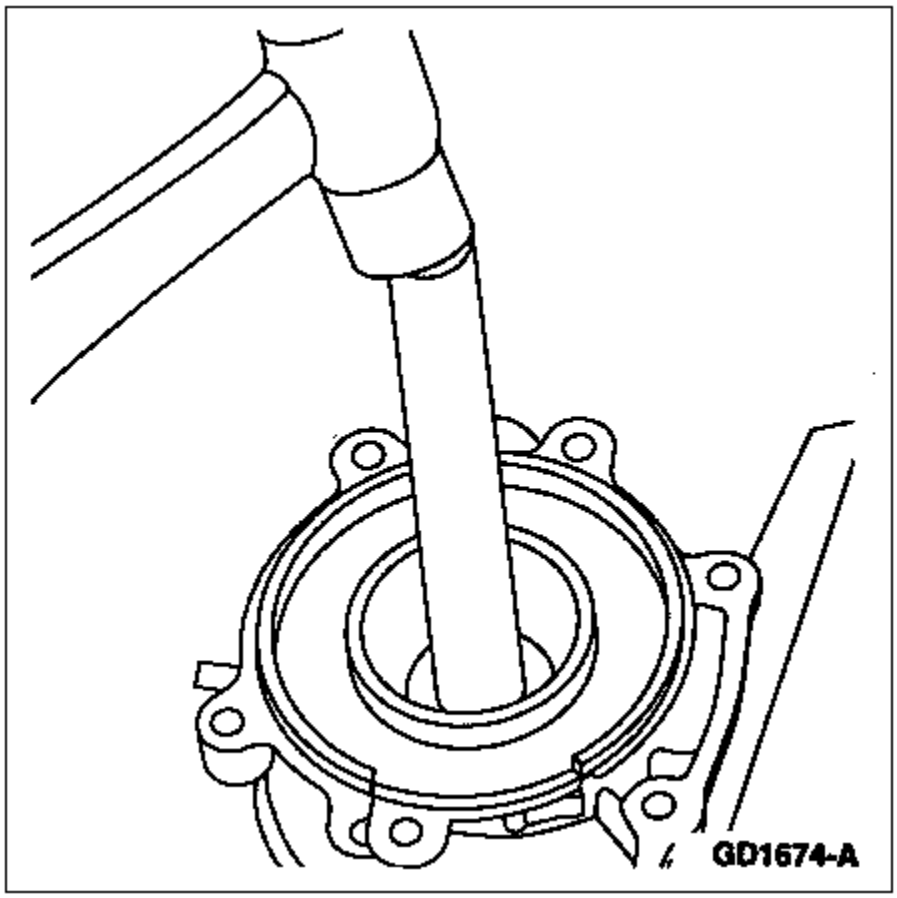
tomsn048@gmail.com

new bearing on Case Bearing Installation Tool T97T-77110-A. Make sure bearing seal ring is facing Drive Handle T80T-4000-W.



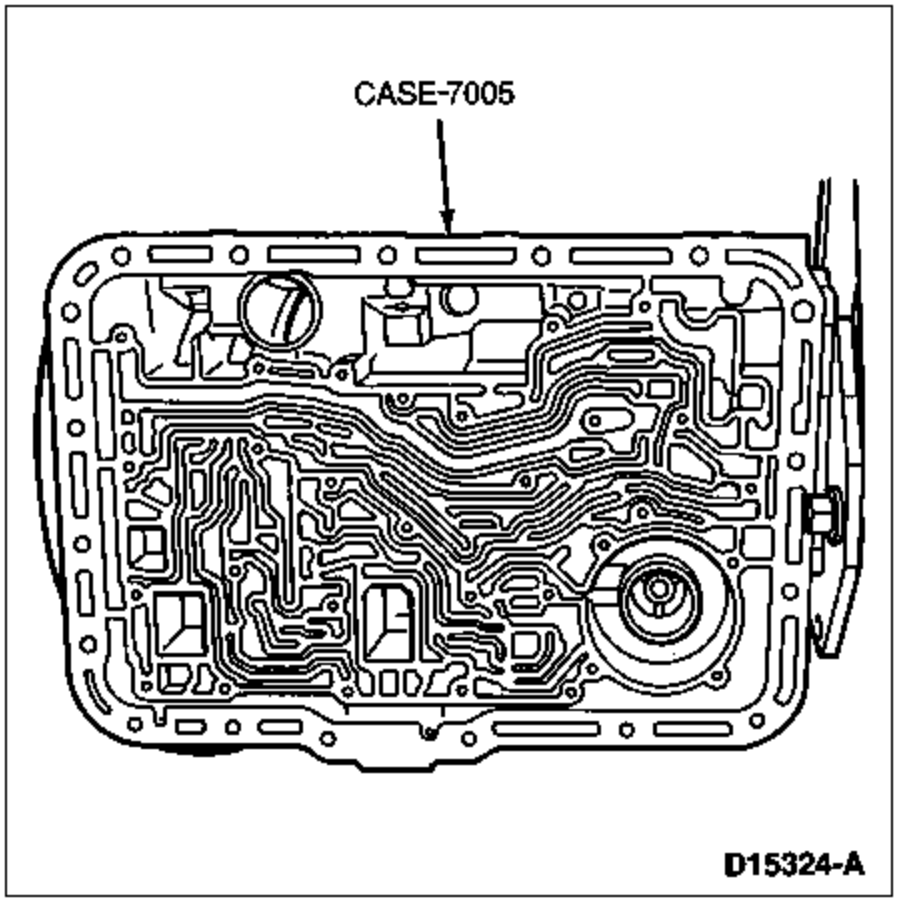
d. Using a hammer, tap bearing into place with Case Bearing Installation Tool T97T-77110-A.

tomsn048@gmail.com

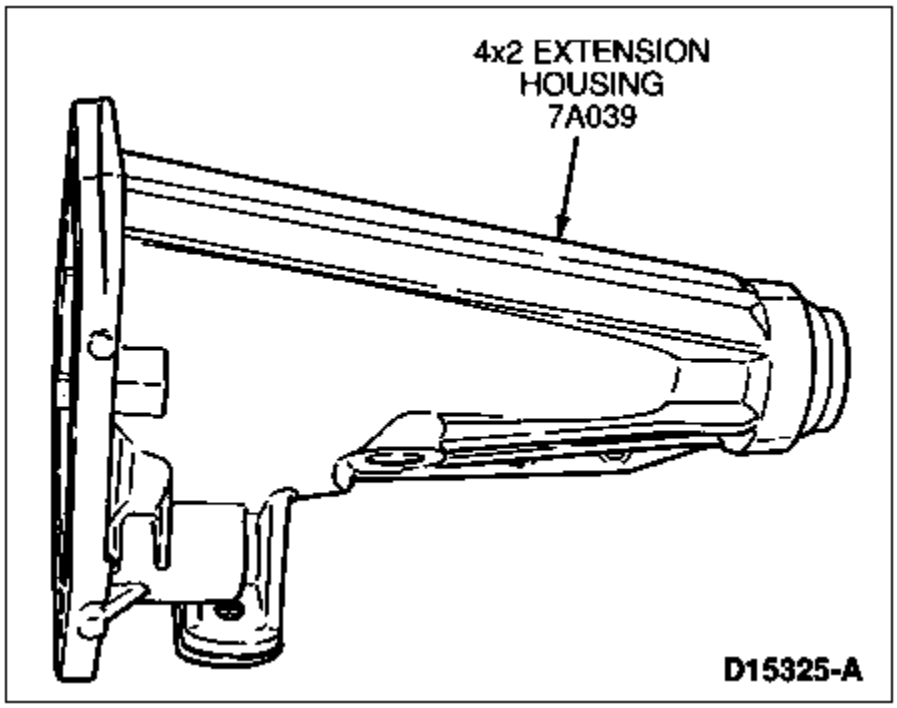


3. Check all parking linkage for wear or damage.
4. Inspect all case threads for damage.

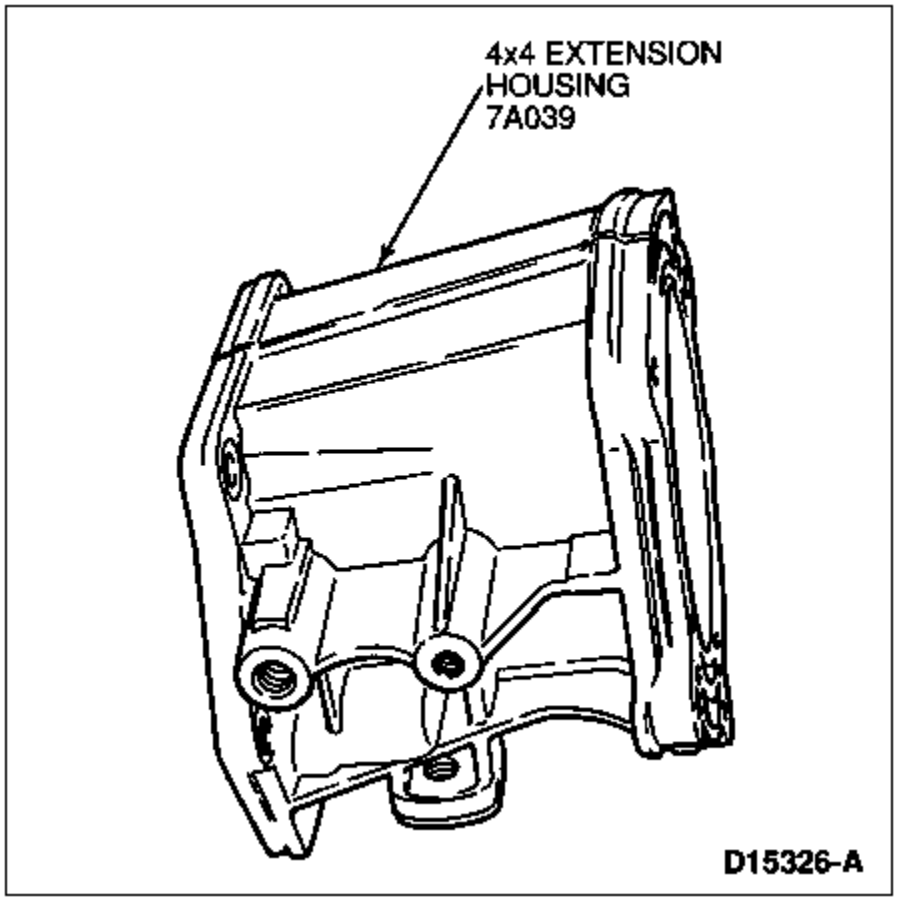
tomsn048@gmail.com



5. Inspect the extension housing for cracks. Inspect the gasket surfaces for burrs or warpage.



tomsn048@gmail.com



6. Inspect the bushing for scores or wear. Replace if required.

7. Inspect the rear seal for hardness, cracks or wear. If the seal shows wear or deterioration, replace the seal.

8. Inspect the seal counterbore and remove all burrs and scores with a crocus cloth.

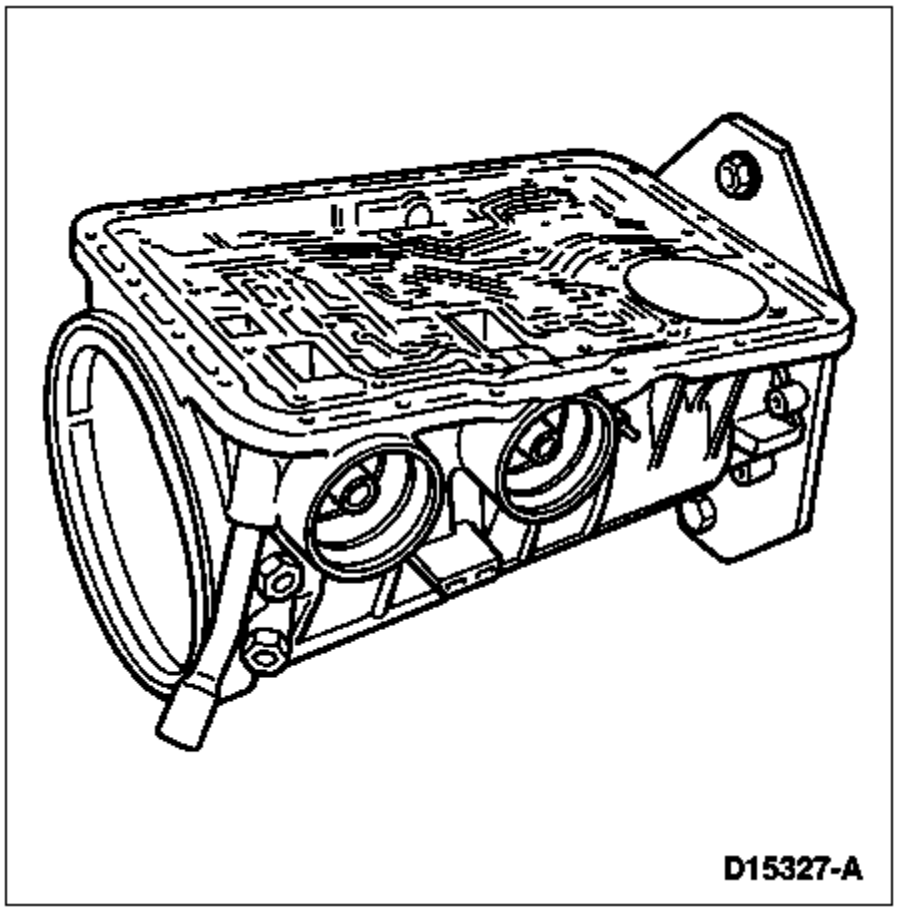
9. **NOTE: Bench-Mounted Holding Fixture T57L-500-B should still be attached to the adapter plate. If it is not, reattach the fixture arm at this time.**

   Reattach the adapter plate to the extension housing face using four M10 x 30 mm screws.

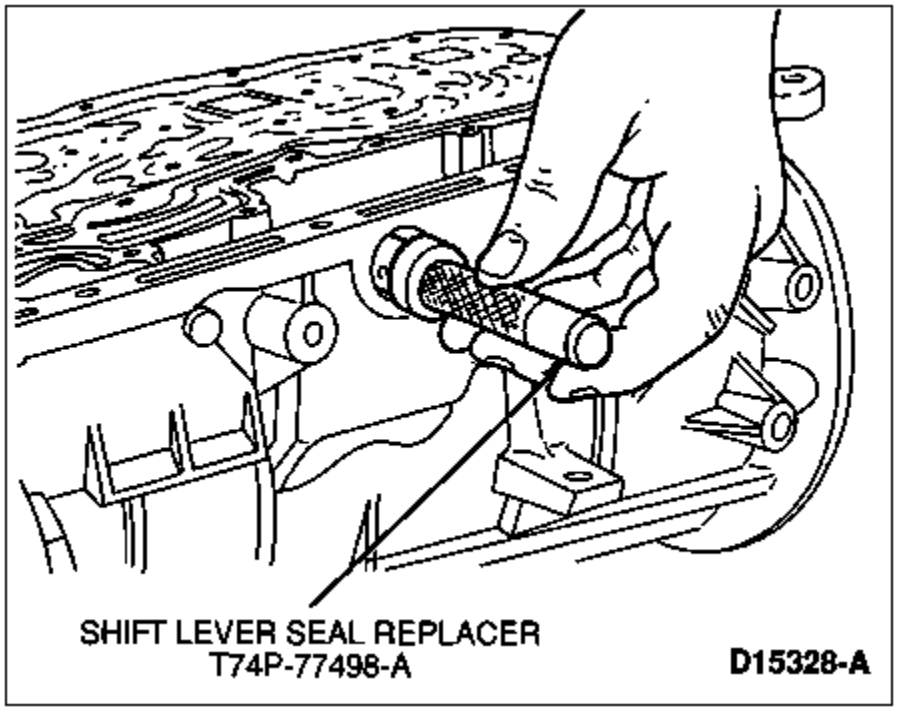
10. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Install the transmission case in the Bench-Mounted Holding Fixture T57L-500-B and rotate so the transmission fluid pan rail is facing up.

tomsn048@gmail.com

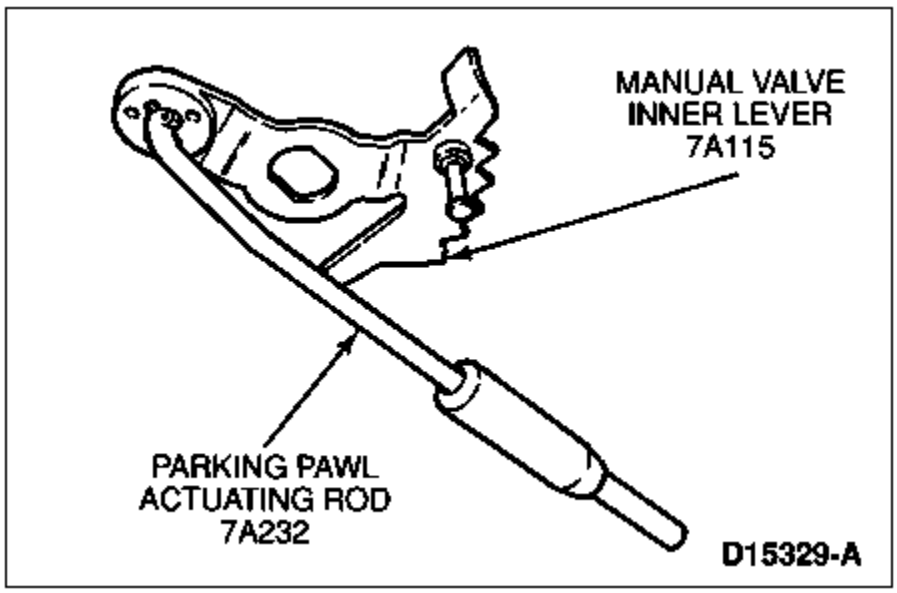


11. Lubricate and install the main control lever seal using Shift Lever Seal Replacer T74P-77498-A.



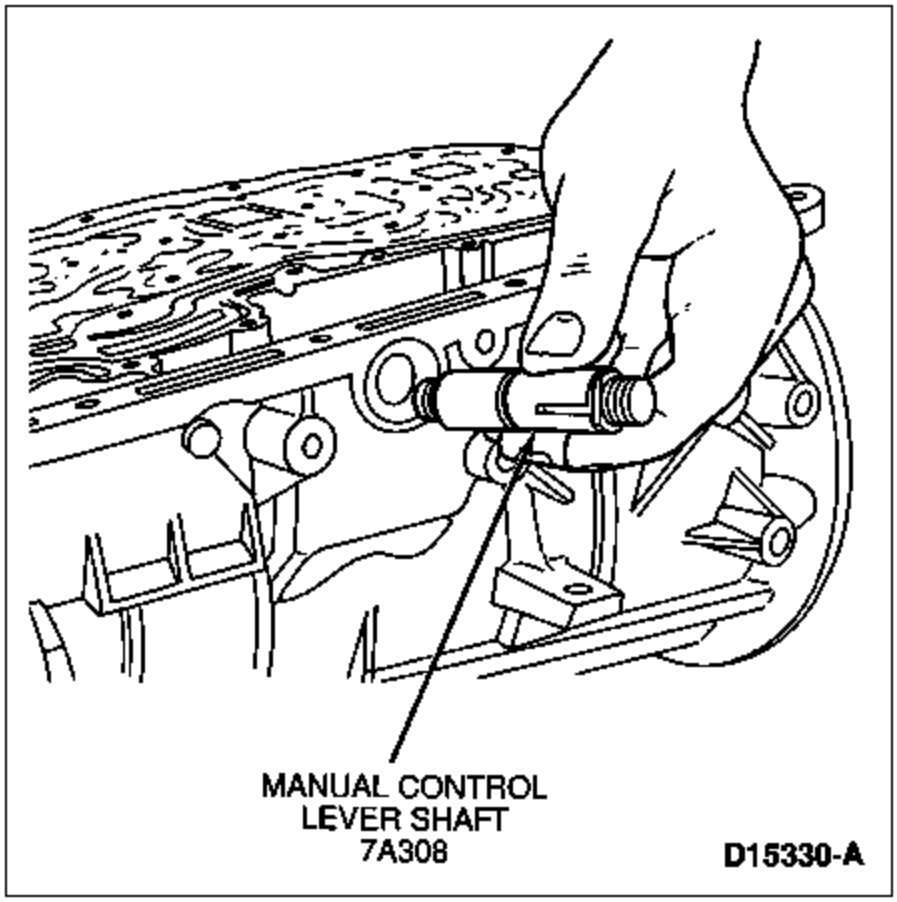
tomsn048@gmail.com

12. Assemble the manual valve inner lever and parking pawl actuating rod as shown.



13. Install the manual control lever shaft into the case.

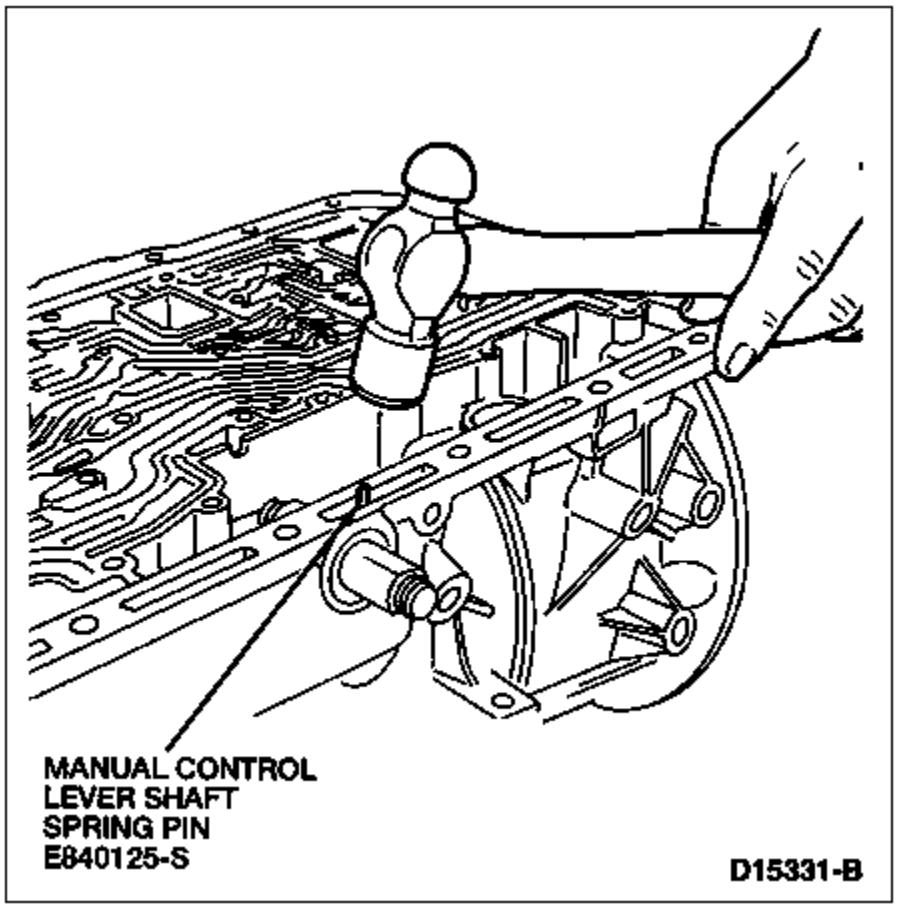
tomsn048@gmail.com



14. **CAUTION: Use care not to damage the fluid pan rail surface when installing the retaining pin.**

    Align the manual control lever shaft with the manual control lever shaft retaining pin. Install the retaining pin.

tomsn048@gmail.com

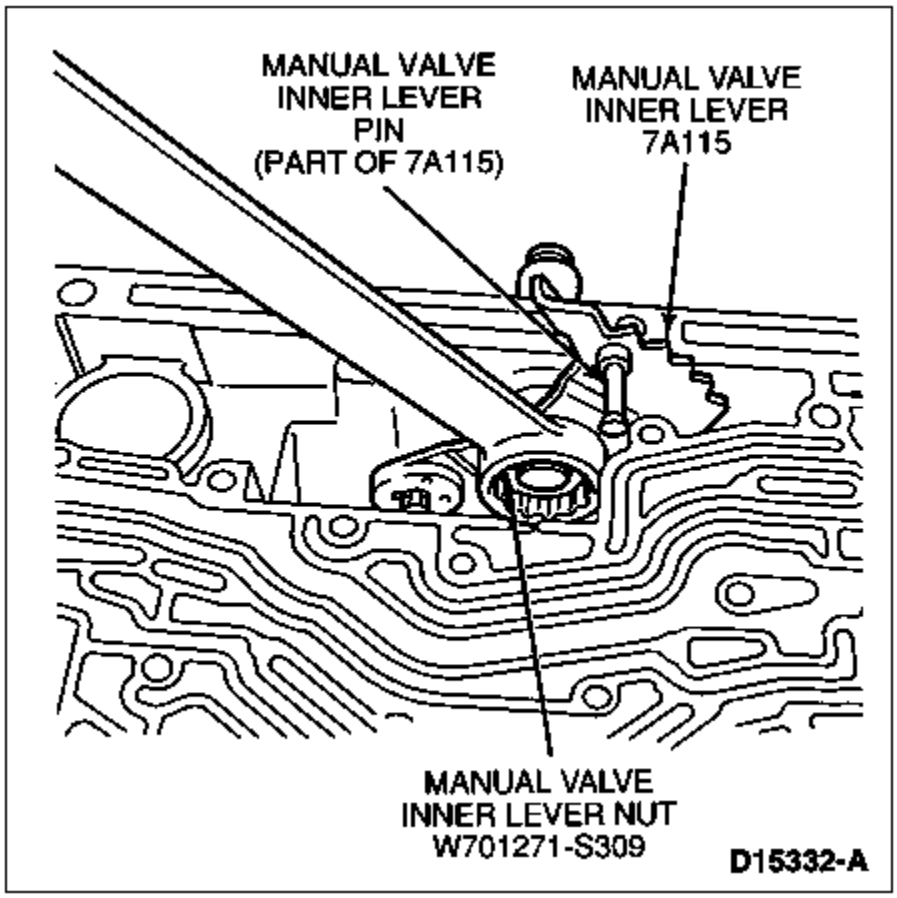


15. Install the manual valve inner lever and parking pawl actuating rod into the case. Align the flats of the manual valve inner lever with the flats on the manual control lever shaft.

16. **CAUTION: To avoid damage, do not allow wrench to strike the manual valve inner lever pin.**

    Install manual valve inner lever nut and tighten to 41-54 Nm (30-40 lb-ft).

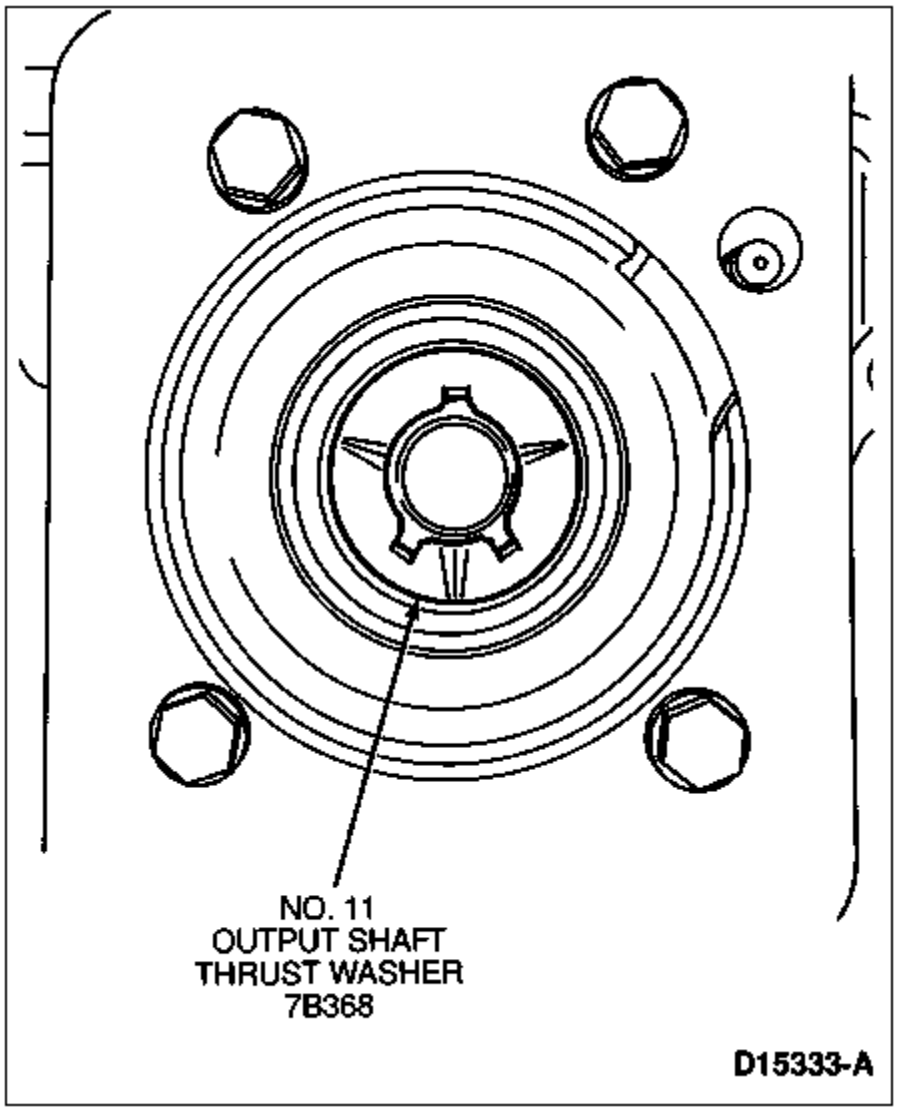
tomsn048@gmail.com



17. **CAUTION: The tabs on the No. 11 output shaft thrust washer point into the case. Ensure that the thrust washer is properly seated.**

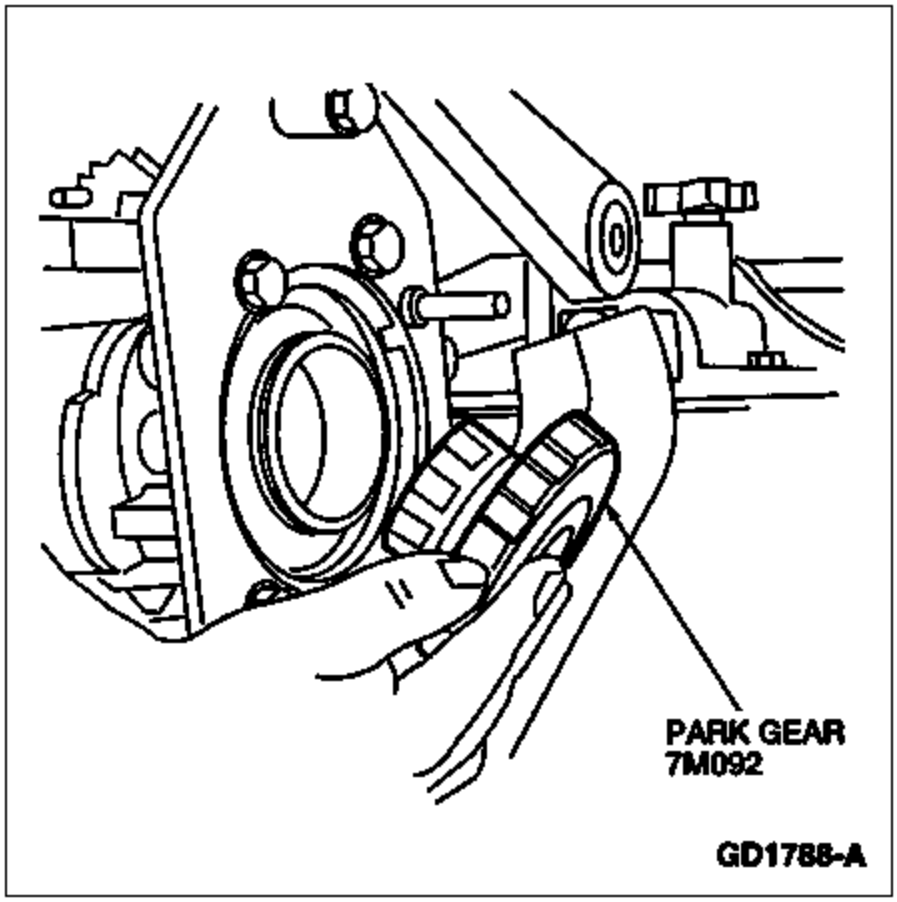
    Apply petroleum jelly to the No. 11 output shaft thrust washer and install into the rear of the case bore.

tomsn048@gmail.com

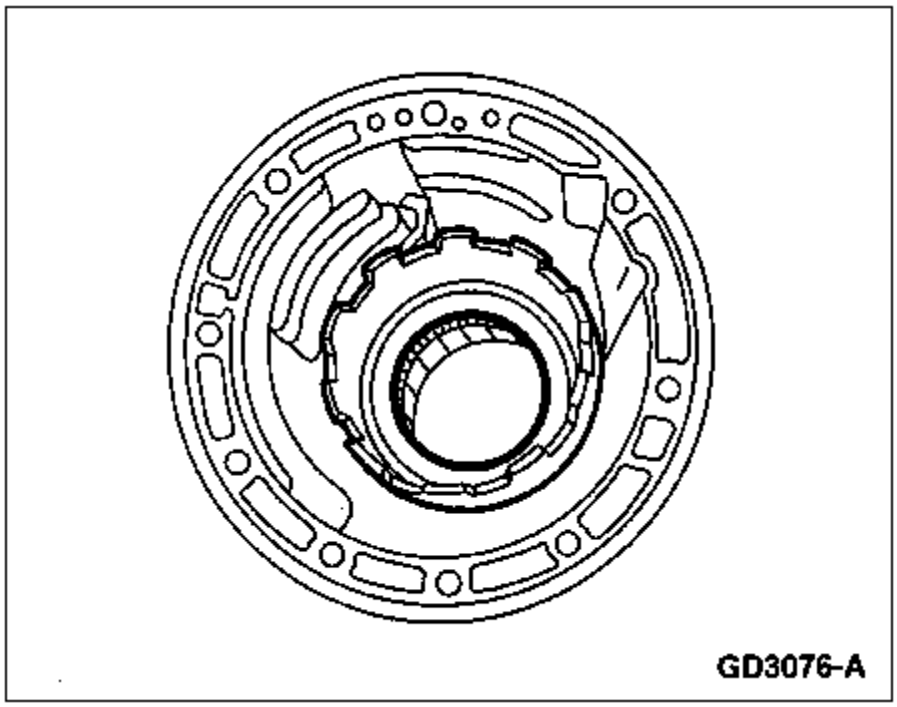


18. Install the park gear into the rear case bore.

tomsn048@gmail.com

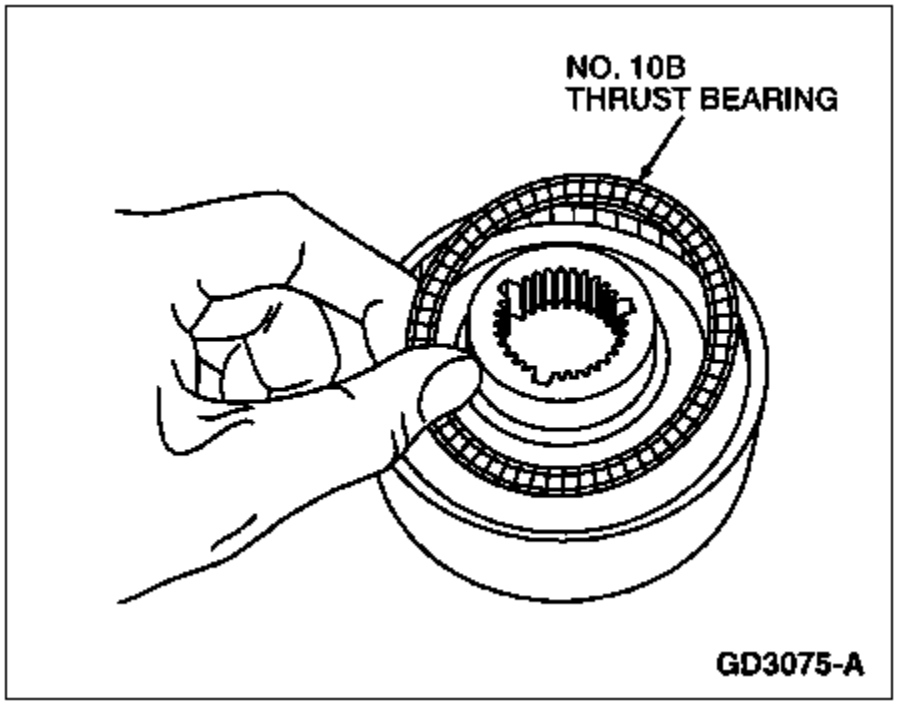


19. Rotating the reverse brake drum assembly clockwise, install into case.



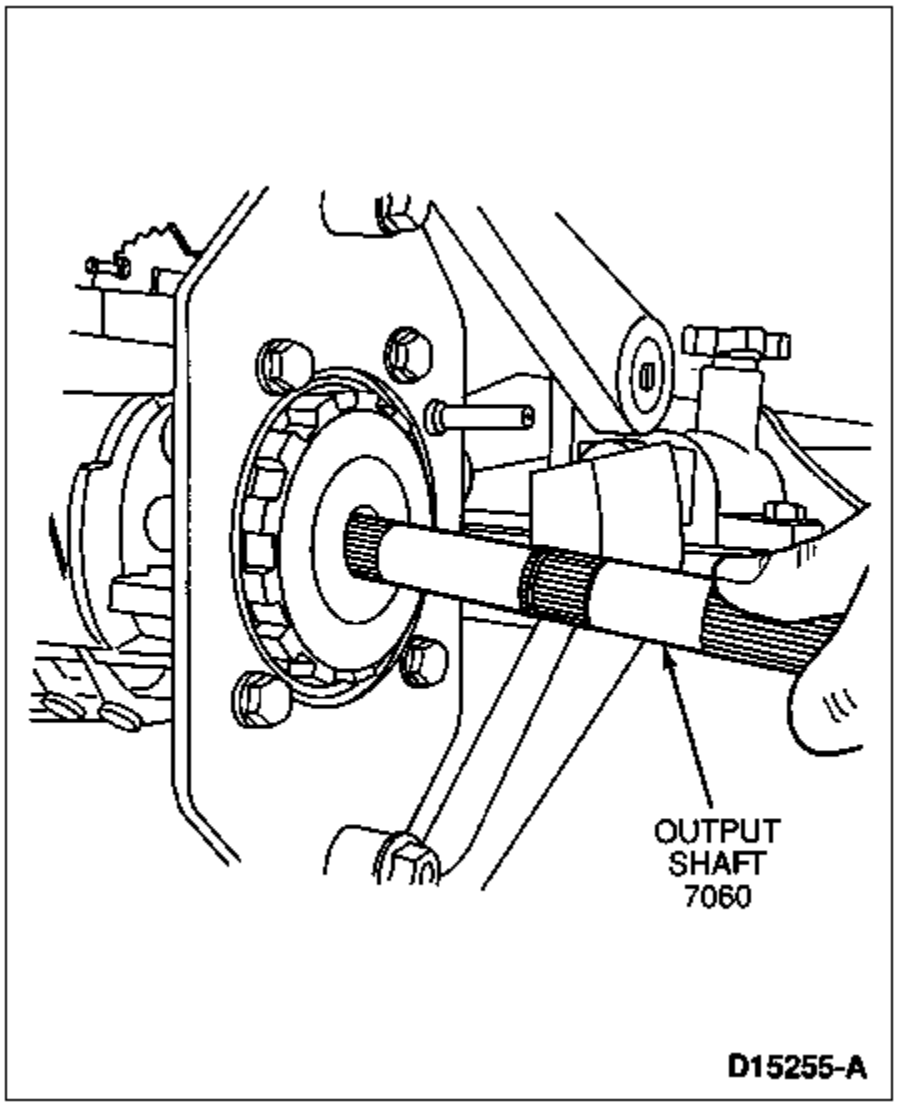
tomsn048@gmail.com

20. If not already installed, use petroleum jelly to install No. 10B thrust bearing onto output shaft ring gear and hub assembly.



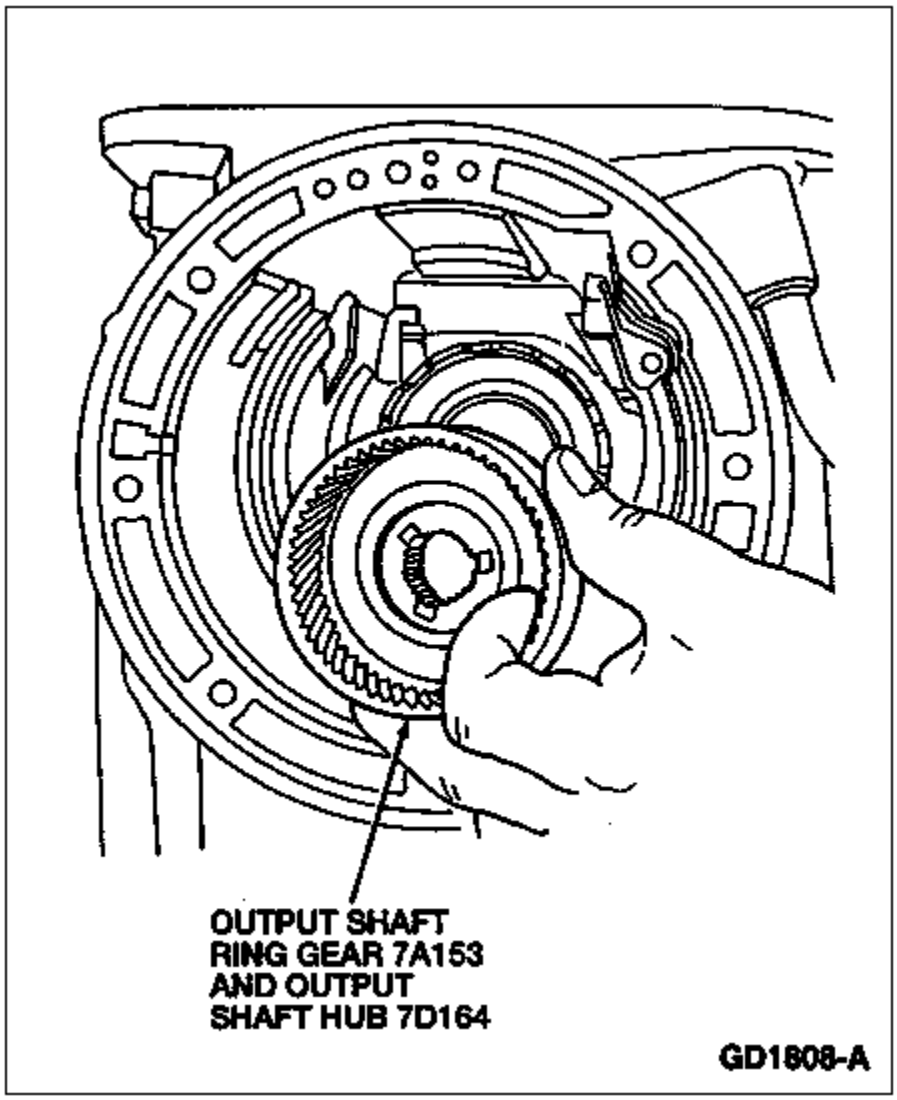
21. Install the output shaft through the output shaft park gear.

tomsn048@gmail.com



22. Install the output shaft ring gear and output shaft hub assembly.

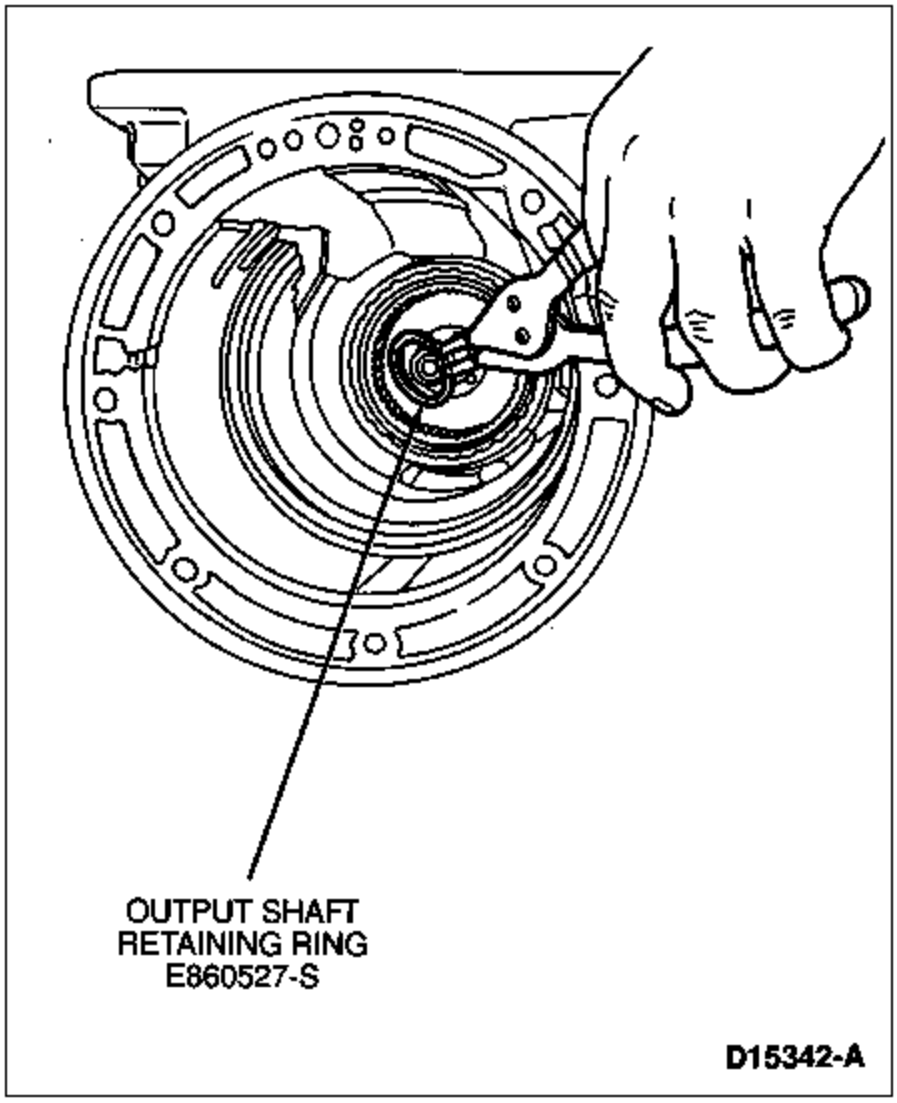
tomsn048@gmail.com



23. **CAUTION: Always use a new retaining ring.**

Install a new output shaft retaining ring in the output shaft retaining ring groove.

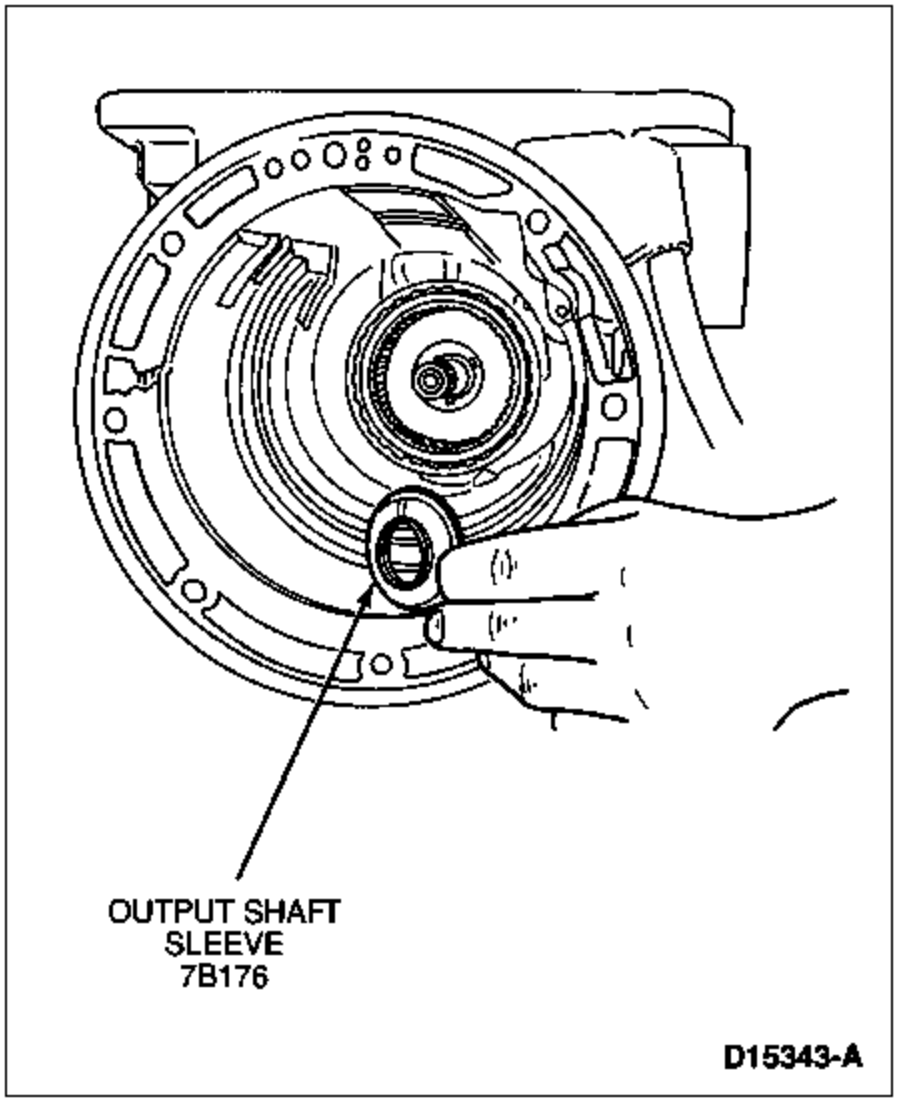
tomsn048@gmail.com



24. **NOTE: Use petroleum jelly to hold the sleeve in place.**

    Install the output shaft sleeve with cone facing up.

tomsn048@gmail.com

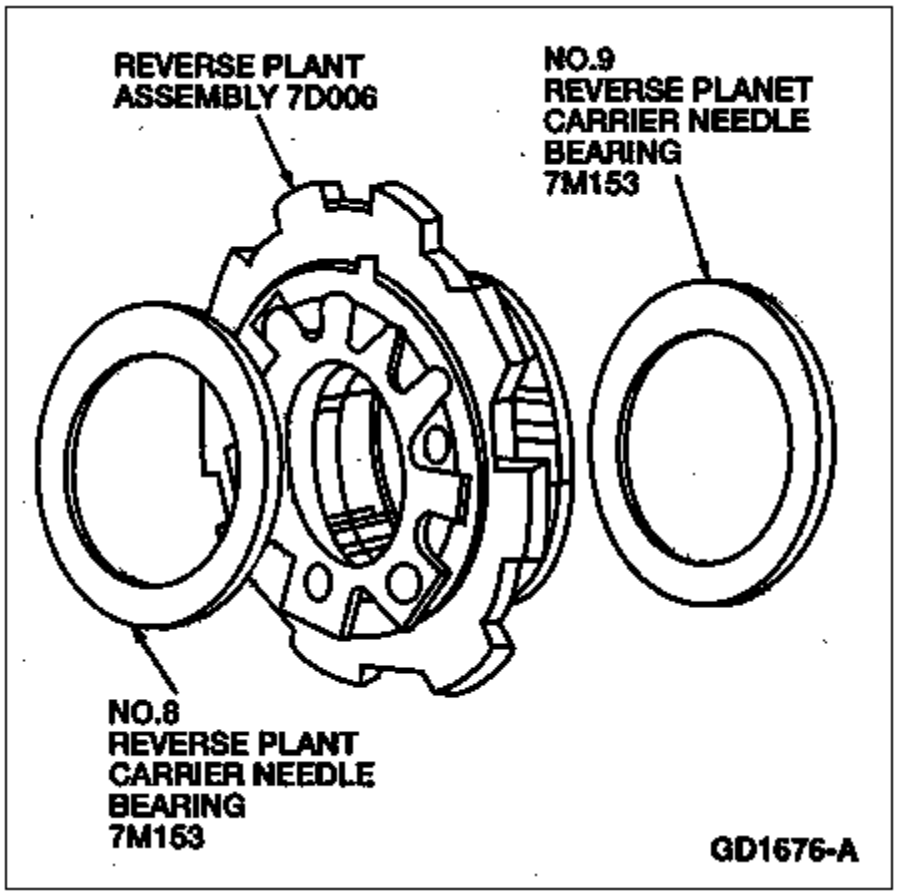


25. **NOTE: Use petroleum jelly to hold the needle bearings in place.**

    Position the No. 8 low/reverse planetary carrier needle bearing on the front face of the low/reverse planetary. Position the No. 9 low/reverse planetary carrier needle bearing on the rear face of the low/reverse planetary.

    No. 8 and 9 Low/Reverse Planetary Carrier Needle Bearing Position

tomsn048@gmail.com

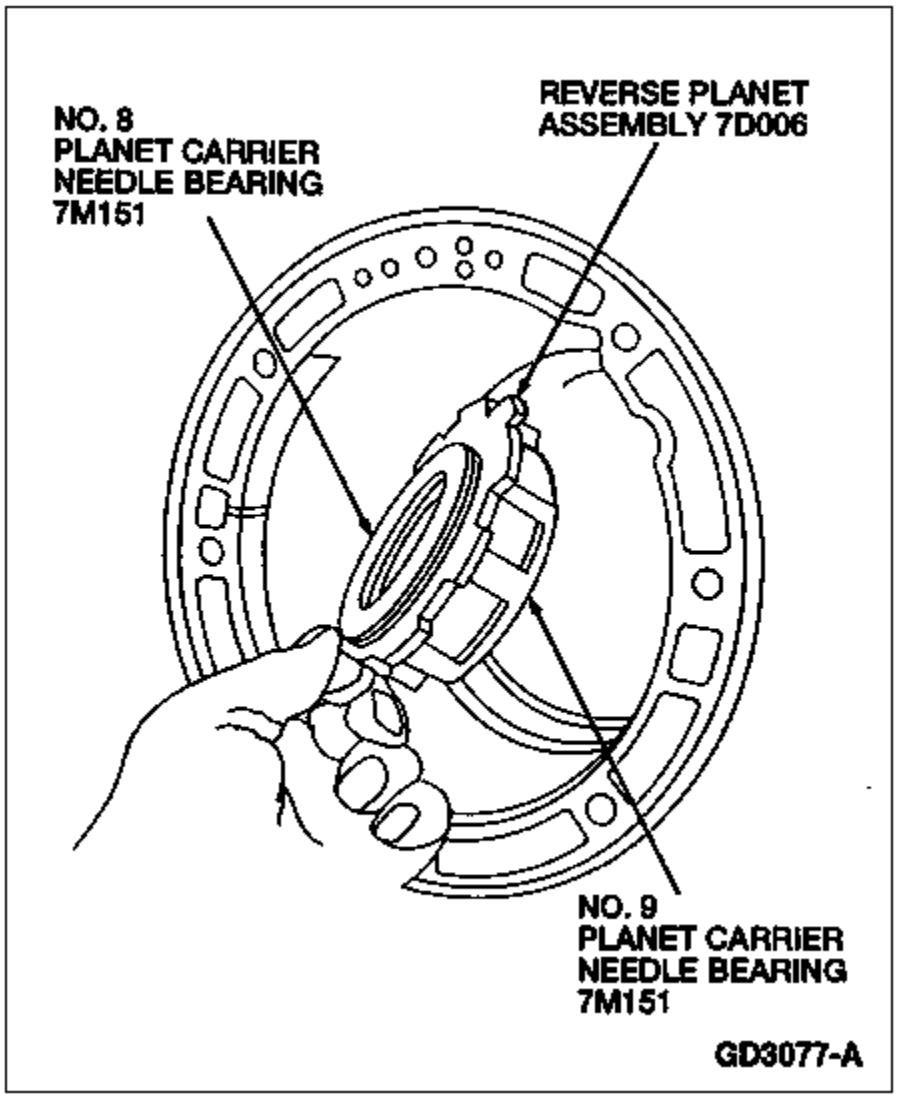


26. **CAUTION: Make sure the needle bearings stay in place.**

Install the low/reverse planetary assembly, with No. 8 and No. 9 low/reverse planetary carrier needle bearings, into the output shaft ring gear.

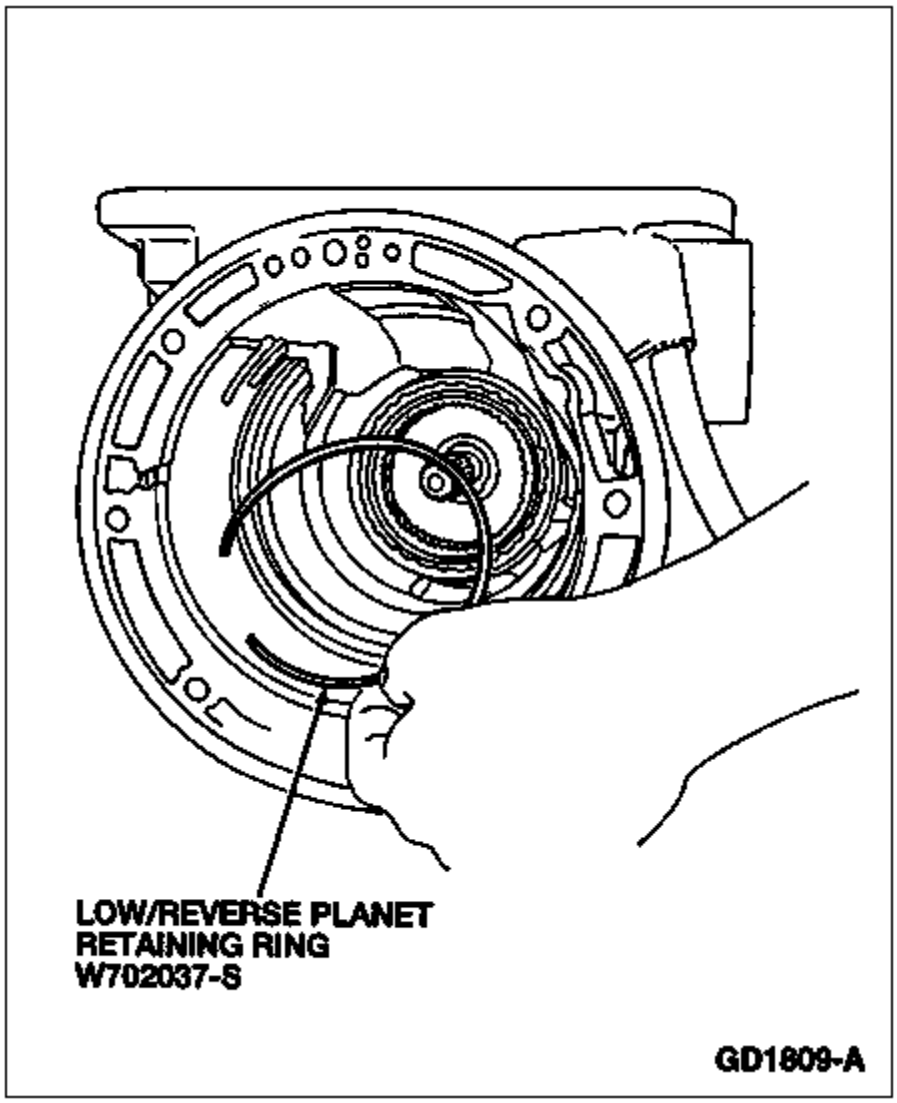
Reverse Planetary Assembly Installation

tomsn048@gmail.com



27. Pull the low/reverse brake drum forward and install the retaining ring into the low/reverse brake drum groove. This will hold the low/reverse planetary assembly in place.

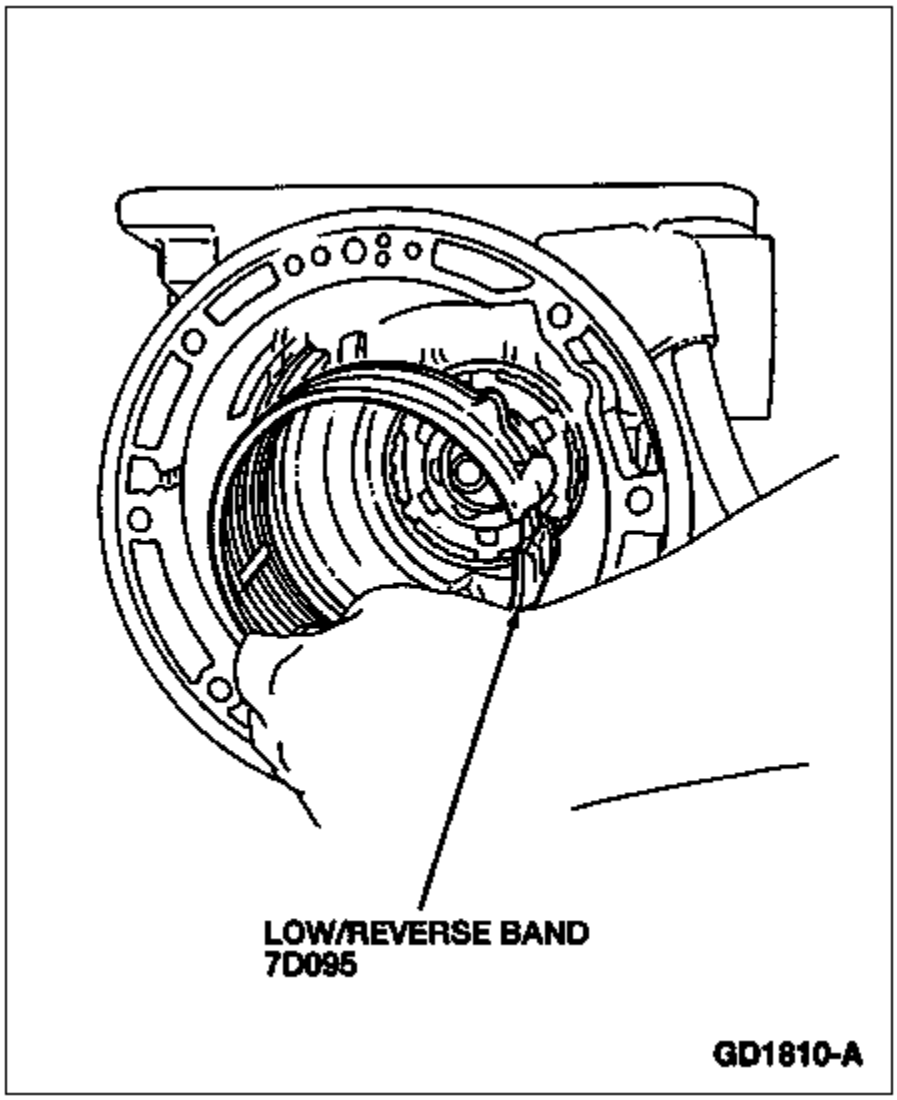
tomsn048@gmail.com



28. **CAUTION: Make sure band is resting on the two anchor pins in the case.**

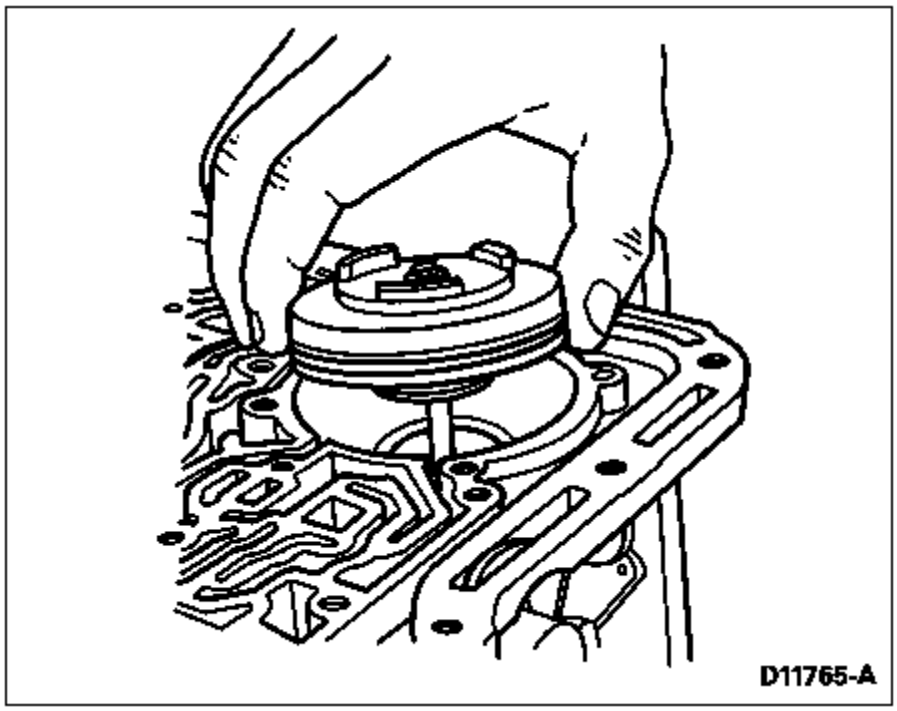
Install the low/reverse band over the low/reverse brake drum.

tomsn048@gmail.com

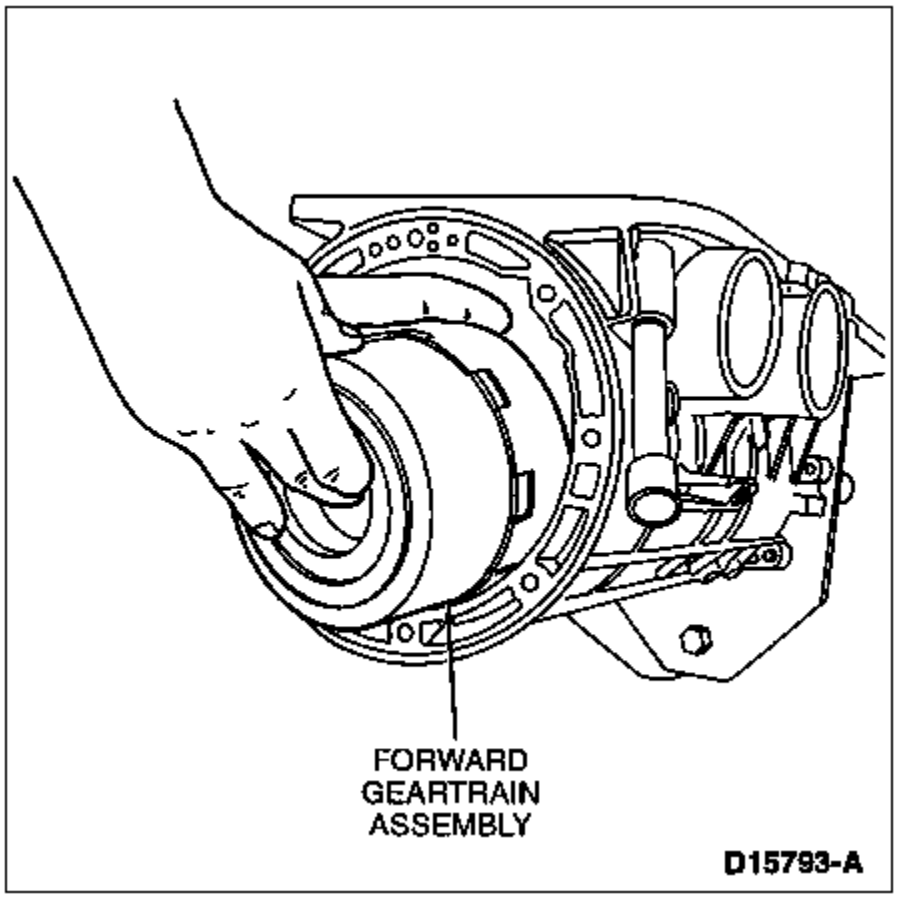


29. Install the low/reverse band servo piston and rod temporarily to hold the low/reverse clutch band in position.

tomsn048@gmail.com



30. Install the previously assembled forward geartrain assembly.

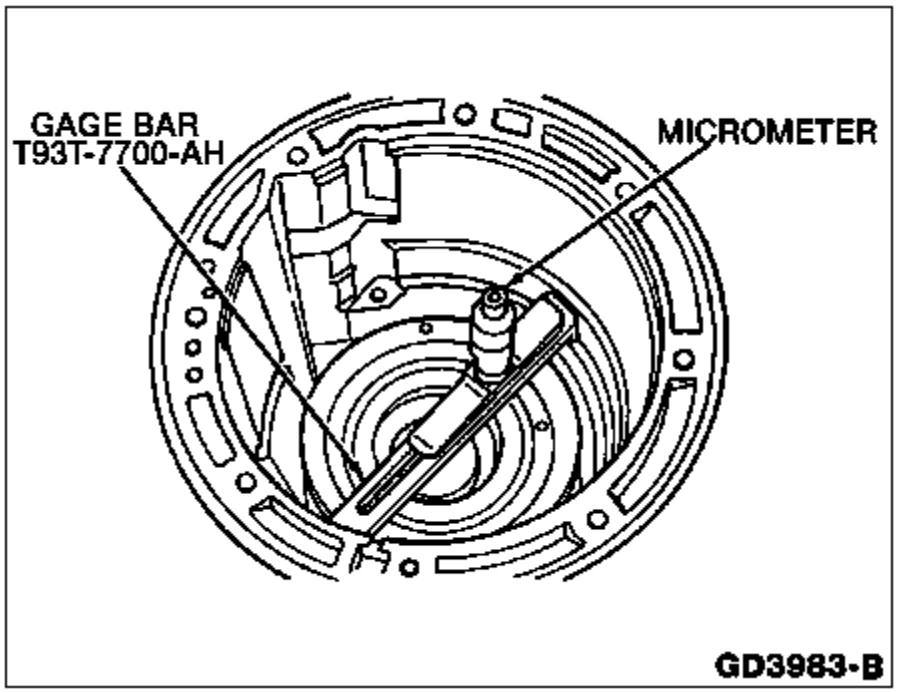


tomsn048@gmail.com

31. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

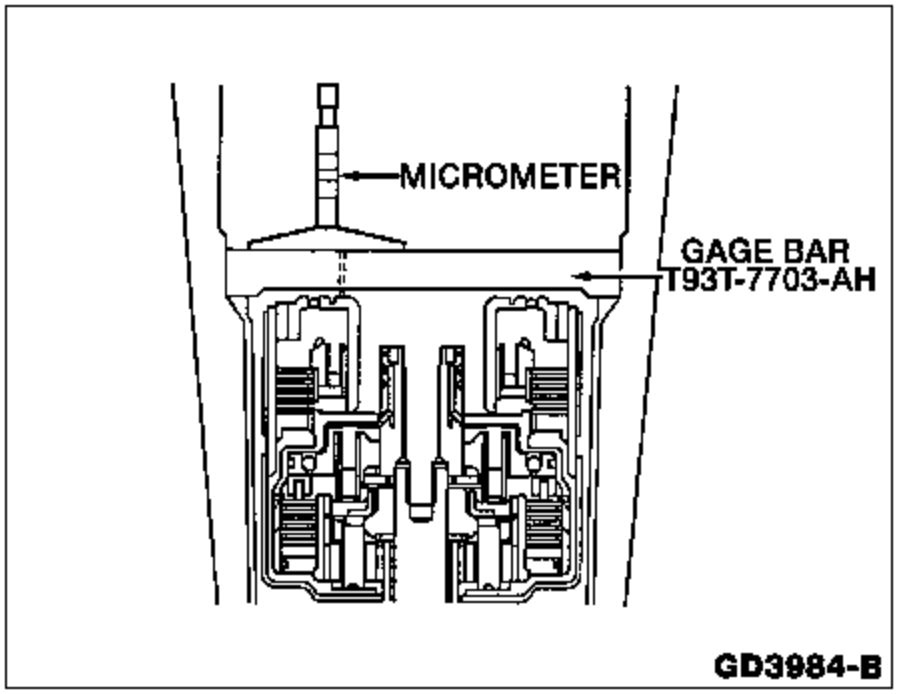
    Rotate the transmission assembly so that the converter housing gasket surface is facing up.

32. Place Gage Bar T93T-77003-AH on the case shoulder of the number four intermediate brake drum thrust surface. Set the mircometer on top of the gage bar as shown.

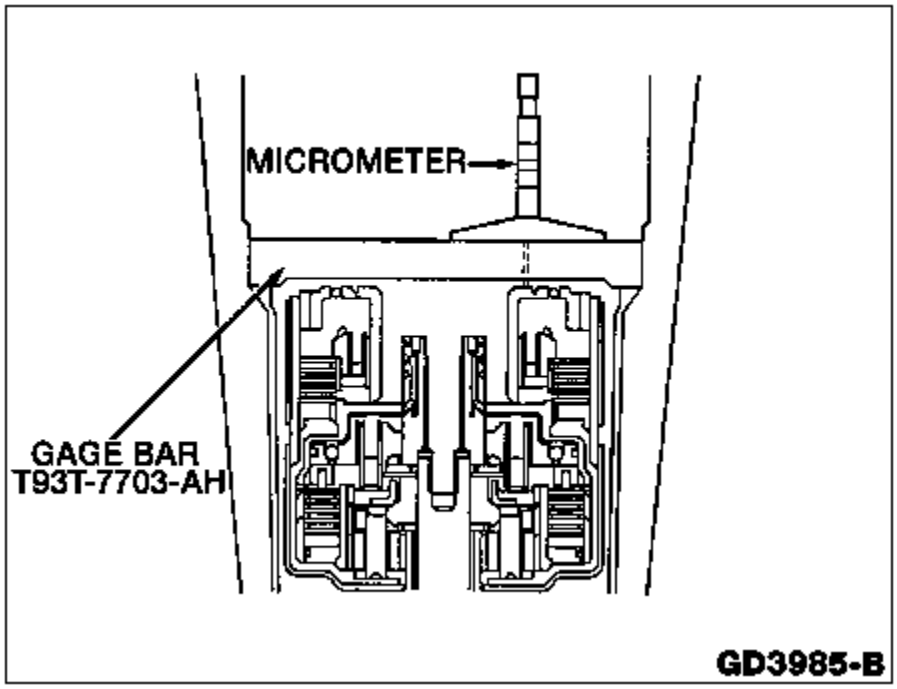


33. Extend the micrometer probe until it contacts the intermediate brake drum thrust bearing surface. Record the reading as dimension "A."

tomsn048@gmail.com



34. Place the micrometer on the opposite side and extend the mircometer probe until it contacts the intermediate brake drum thrust surface. Record the reading as dimension "B."

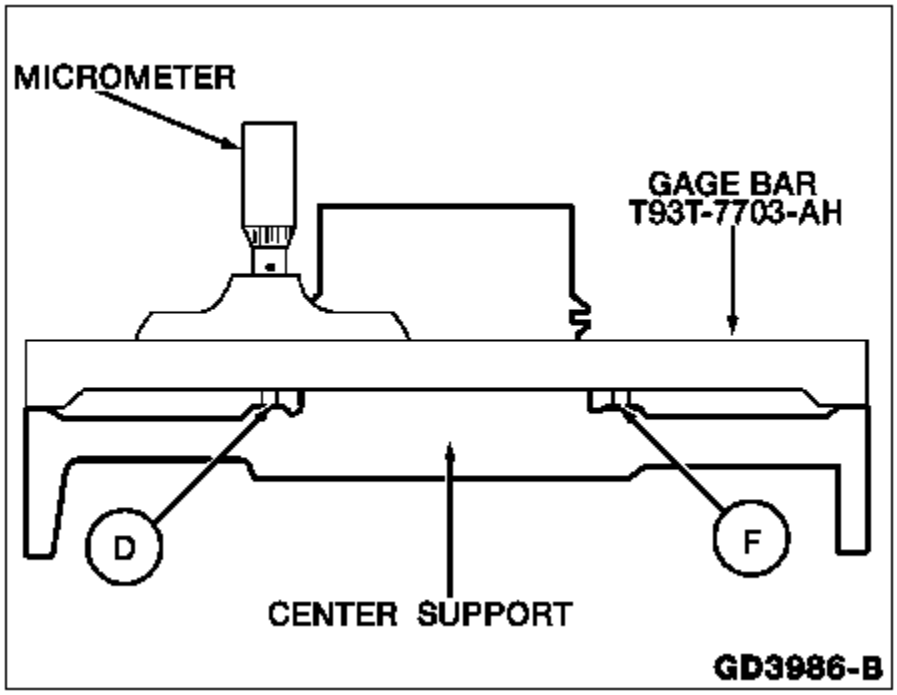


35. Add the dimensions "A" and "B," divide the total of "A" and "B" by two. Subtract the gage bar thickness (17.78 mm [0.700 in]). This is dimension "C."

36. Place Gage Bar T93T-77003-AH across the center support. Place micrometer on top of the gage bar as shown. Extend the micrometer probe until it contacts the center support thrust bearing surface.

tomsn048@gmail.com

Record the reading as dimension "D."



37. Place the micrometer on the opposite side of Gage Bar T93T-77003-AH and extend the micrometer until it contacts the center support thrust bearing surface. Record the dimension as "F."

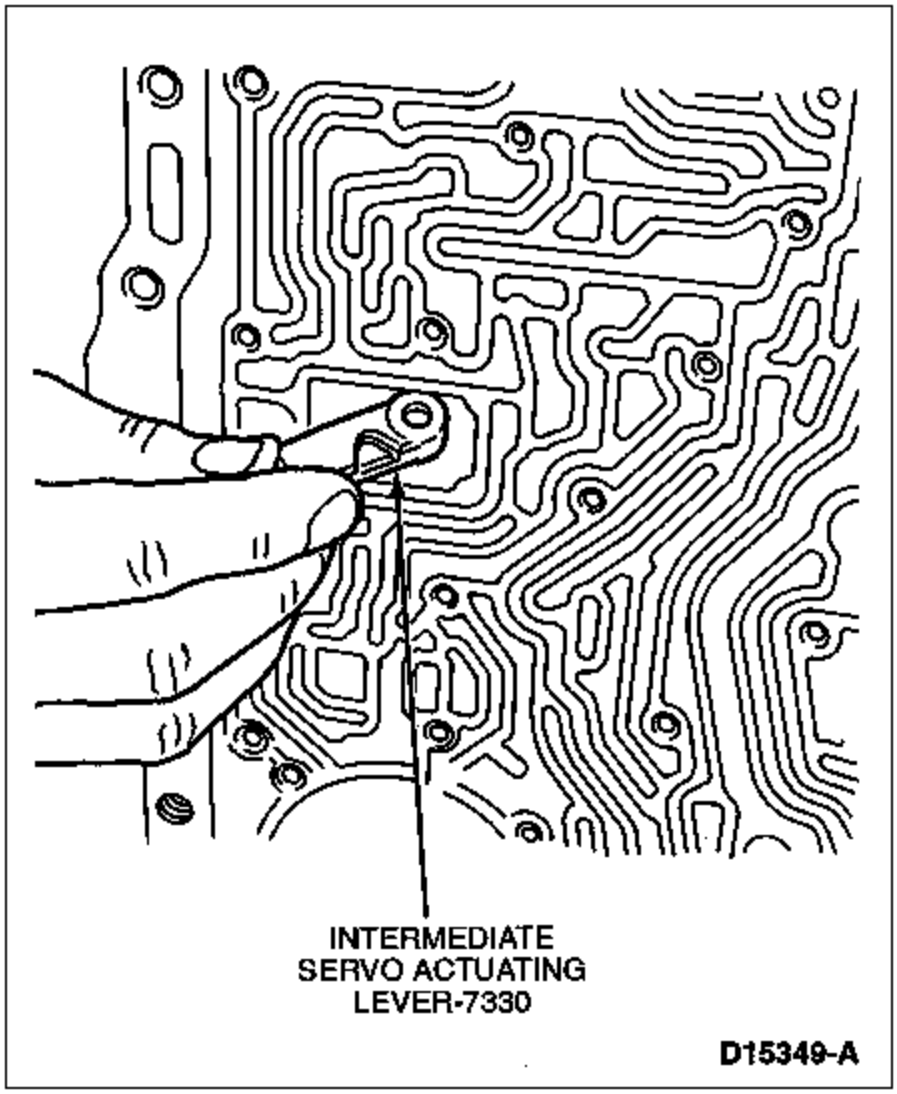
38. Add dimensions "D" and "F" and divide the total of "D" and "F" by two, then subtract the Gage Bar thickness (17.78 mm [0.700 in]). The resulting dimension is "G."

39. Add dimensions "G" and "C." This total is dimension "J." Use the chart below and dimension "J" to choose the proper number four thrust bearing. Reference end play is 0.21-0.51 mm (0.008-0.020 in).

Dimension "J"	Service Part Number	Bearing Thickness	Identification Notches
3.01-3.15 mm (0.119-0.124 in)	F77Z-7D014-GA	2.65-2.80 mm (0.104-0.110 in)	None
3.17-3.34 mm (0.125-0.132 in)	F77Z-7D014-HA	2.80-2.95 mm (0.110-0.116 in)	One
3.36-3.54 mm (0.133-0.140 in)	F77Z-7D014-KA	3.00-3.15 mm (0.1118-0.124 in)	Two
3.57-3.71 mm (0.141-0.147 in)	F77Z-7D014-LA	3.20-3.35 mm (0.126-0.132 in)	Three

40. Install the intermediate servo actuating lever as shown.

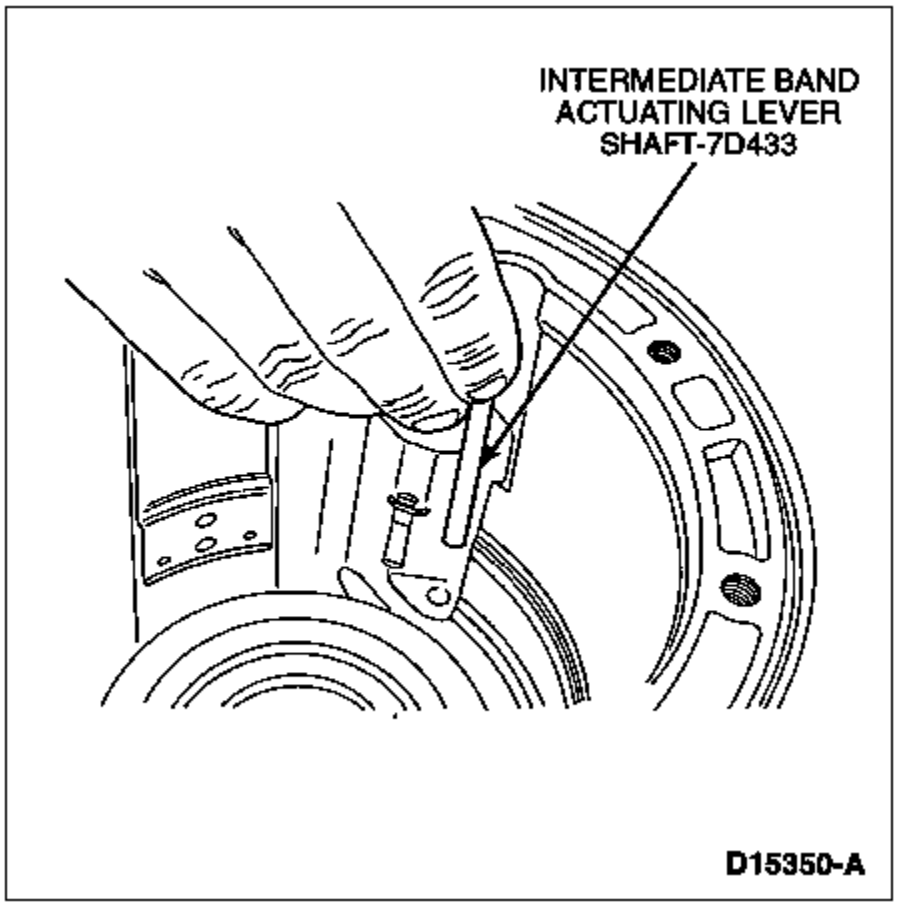
tomsn048@gmail.com



41. **NOTE: The intermediate band actuating lever shaft is shorter than the overdrive shaft.**

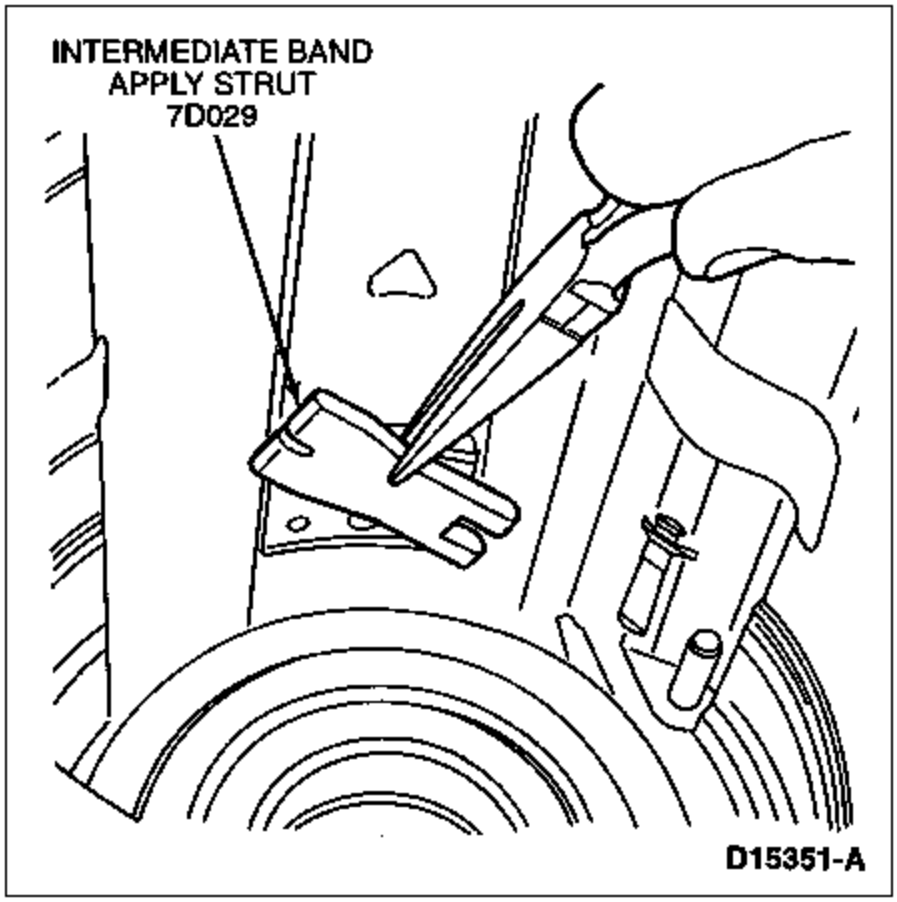
    Install the intermediate band actuating lever shaft through the intermediate servo lever.

tomsn048@gmail.com



42. Install the intermediate band apply strut on the intermediate servo lever.

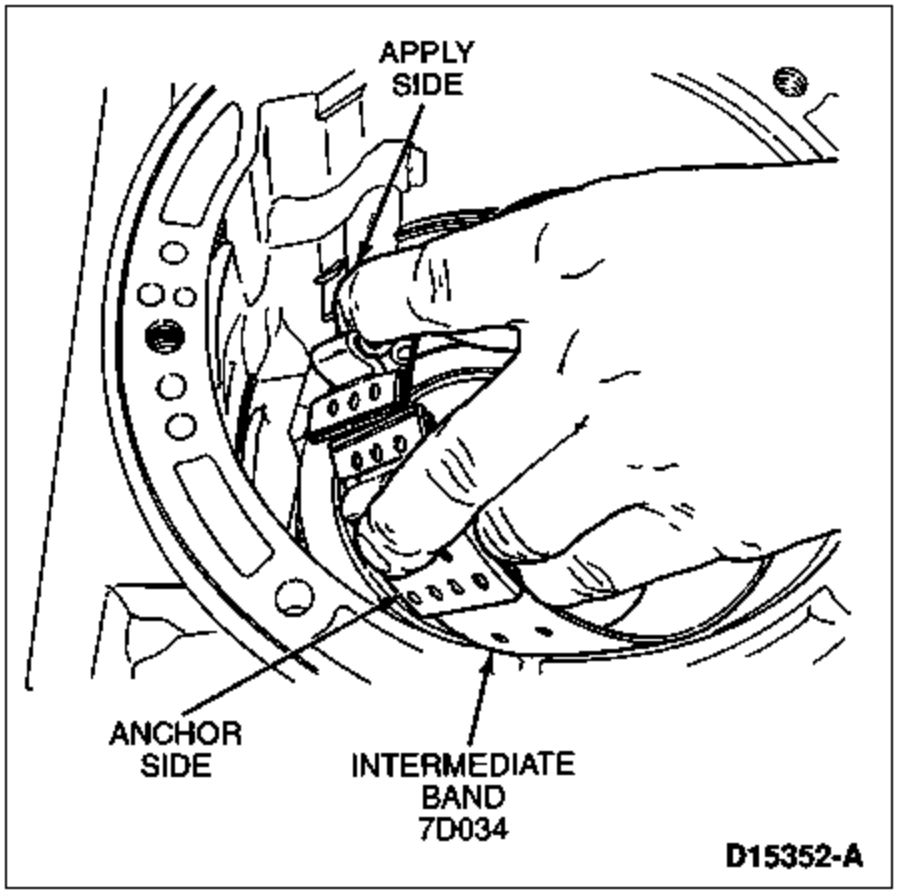
tomsn048@gmail.com



43. **NOTE: Make sure the apply strut is aligned with the band notch.**

    Install the intermediate band.

tomsn048@gmail.com

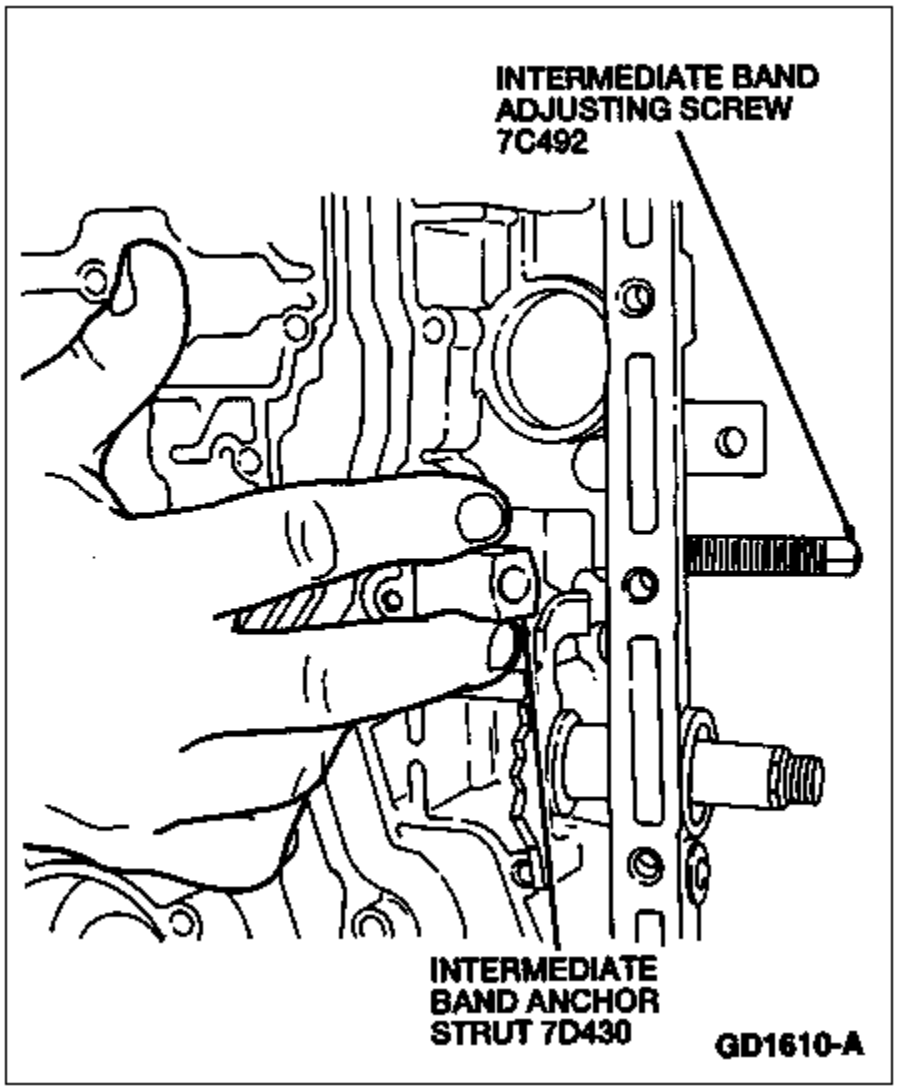


44. **NOTE: Use the intermediate band adjusting screw as a temporary alignment guide.**

    NOTE: The front and intermediate band anchor struts are the same.

    Install the intermediate band anchor strut and intermediate band adjusting screw.

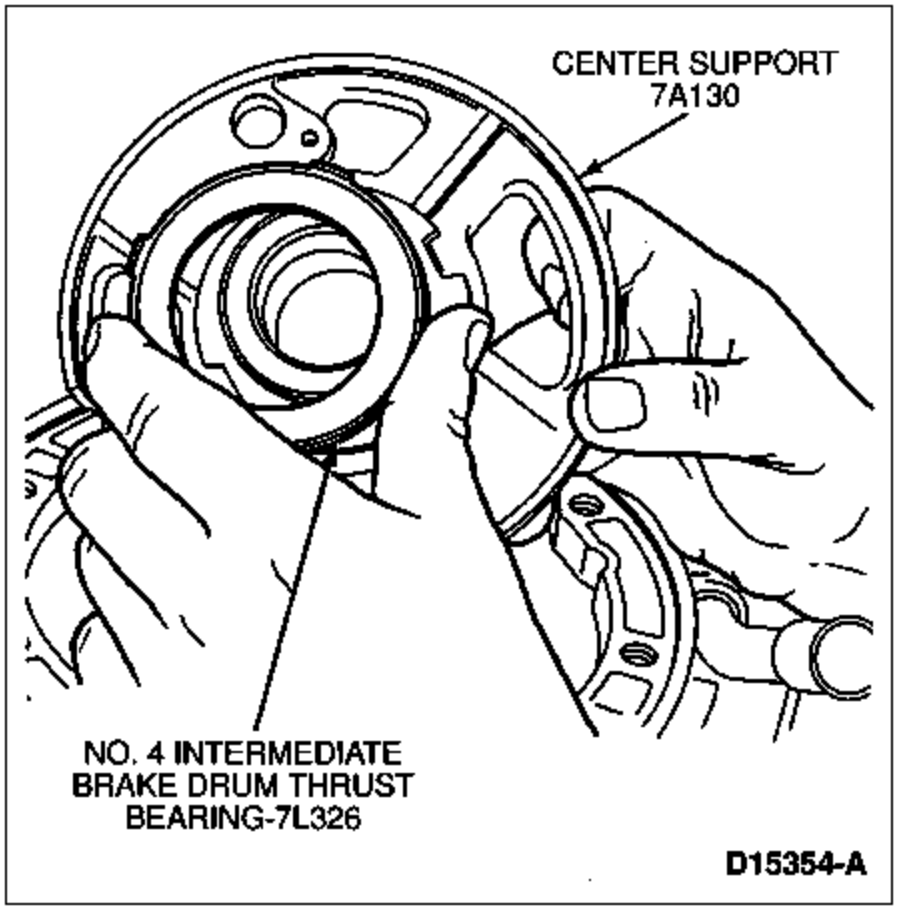
tomsn048@gmail.com



45. **NOTE: Use petroleum jelly to hold the No. 4 intermediate brake drum thrust bearing in place.**

Install the correctly selected No. 4 intermediate brake drum thrust bearing over the center support as shown.

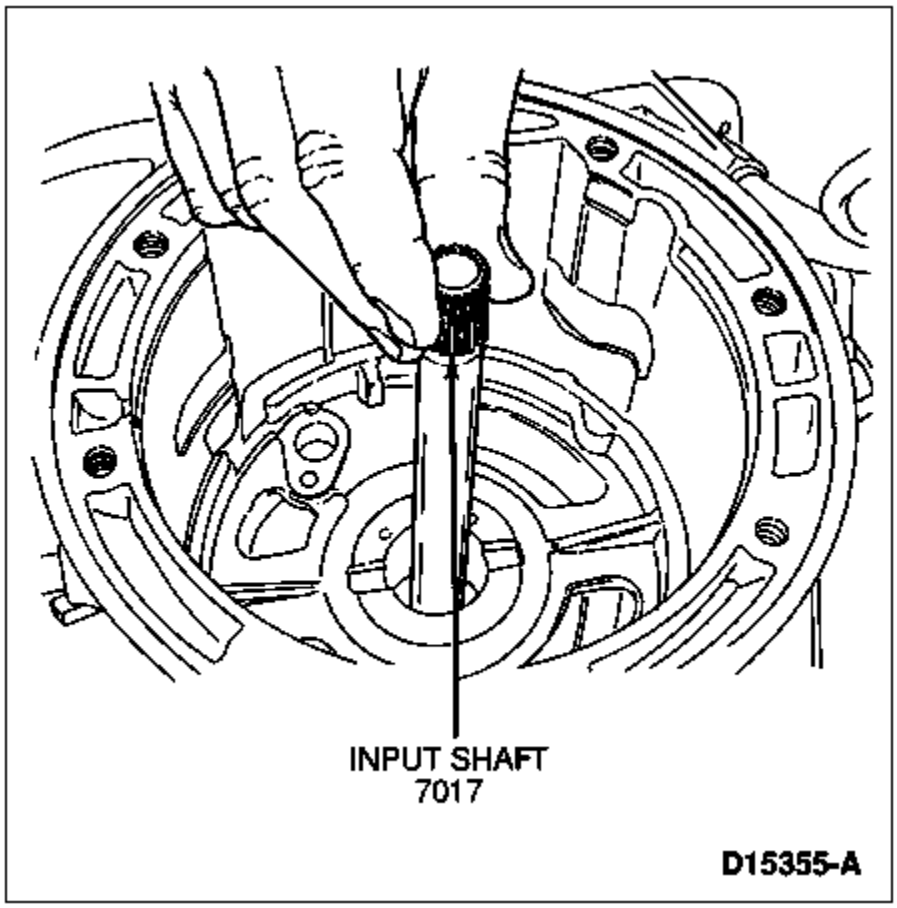
tomsn048@gmail.com



46. **CAUTION: Do not apply pressure to the rear planetary support while installing. Damage to the sealing rings may result. Make sure the rear planetary support is seated.**

Position the center support into the reverse clutch drum. Use the input shaft as an aid to seat the center support. Gently wiggle the input shaft from side to side until the center support is seated against the case shoulder. Remove the input shaft.

tomsn048@gmail.com

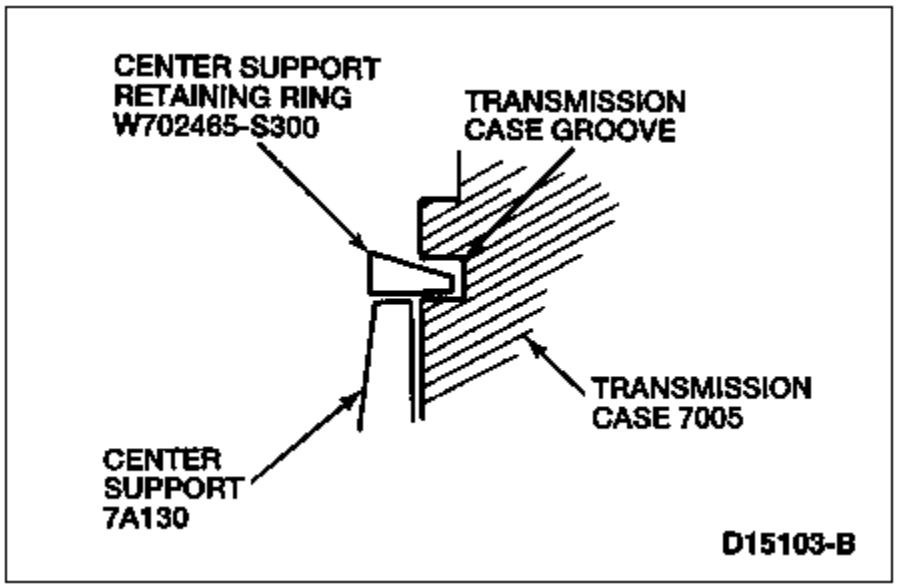


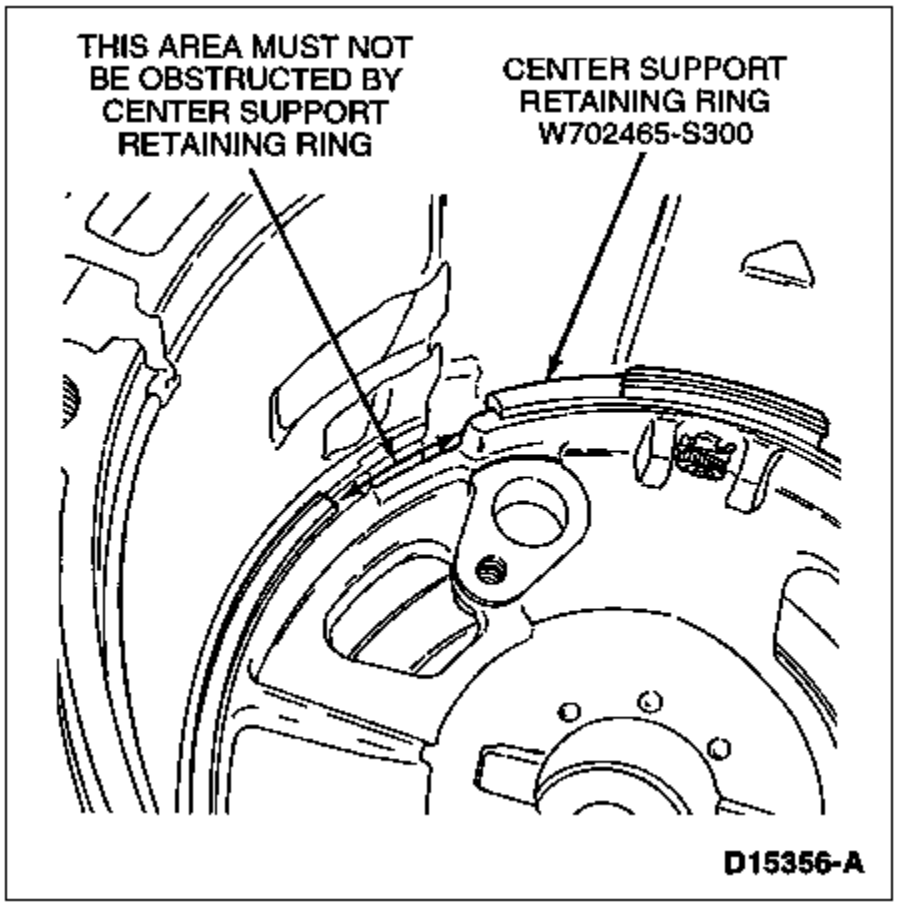
47. **CAUTION: Install the retaining ring in the transmission case groove with the tapered side facing up.**

CAUTION: The retaining ring must be installed so the notch opening is not obstructed by the center support retaining ring. This will prevent damage to the turbine shaft speed (TSS) sensor wires.

Install the center support retaining ring in the transmission case groove.

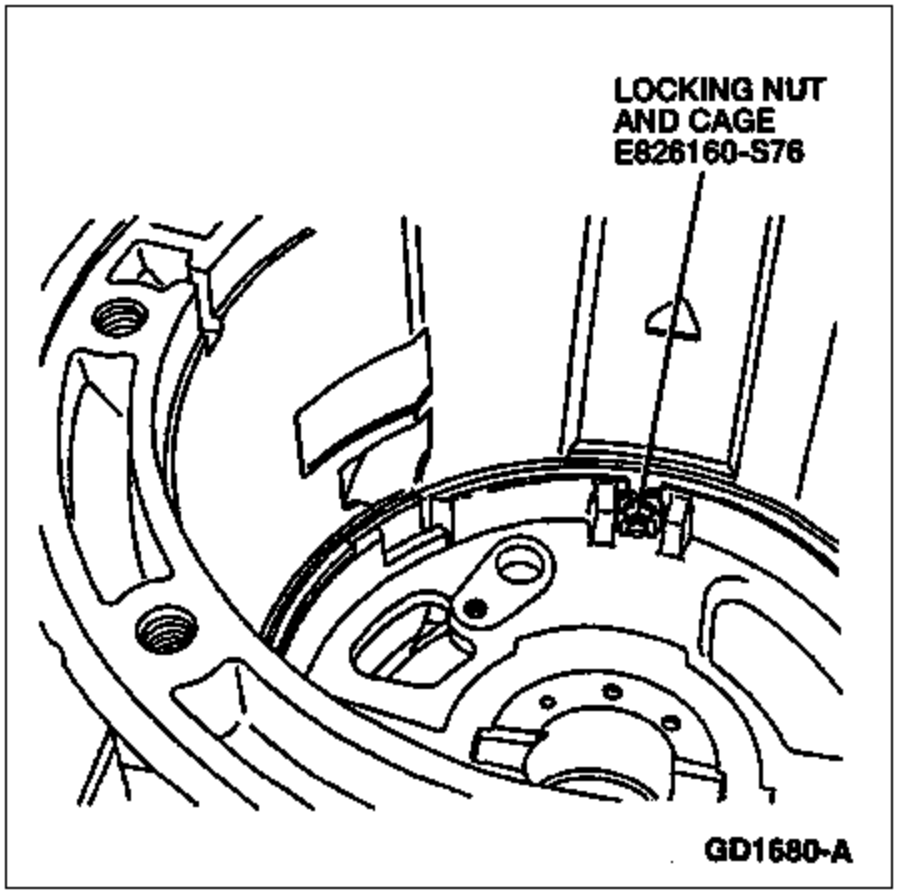
tomsn048@gmail.com





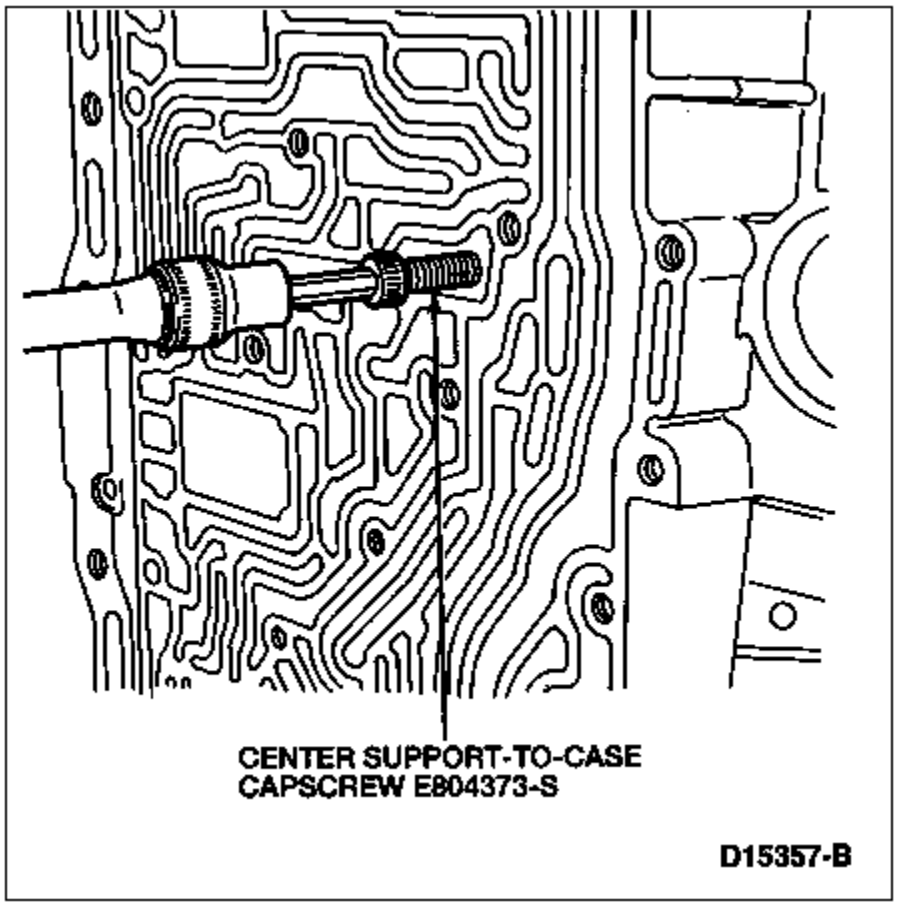
48. Ensure that the nut and cage assembly is in place.

tomsn048@gmail.com



49. Use a 5 mm Allen wrench to install the M6 x 20 mm center support-to-case capscrew into the nut and cage assembly as shown. Tighten the center support-to-case capscrew to 9-13 Nm (80-115 lb-in).

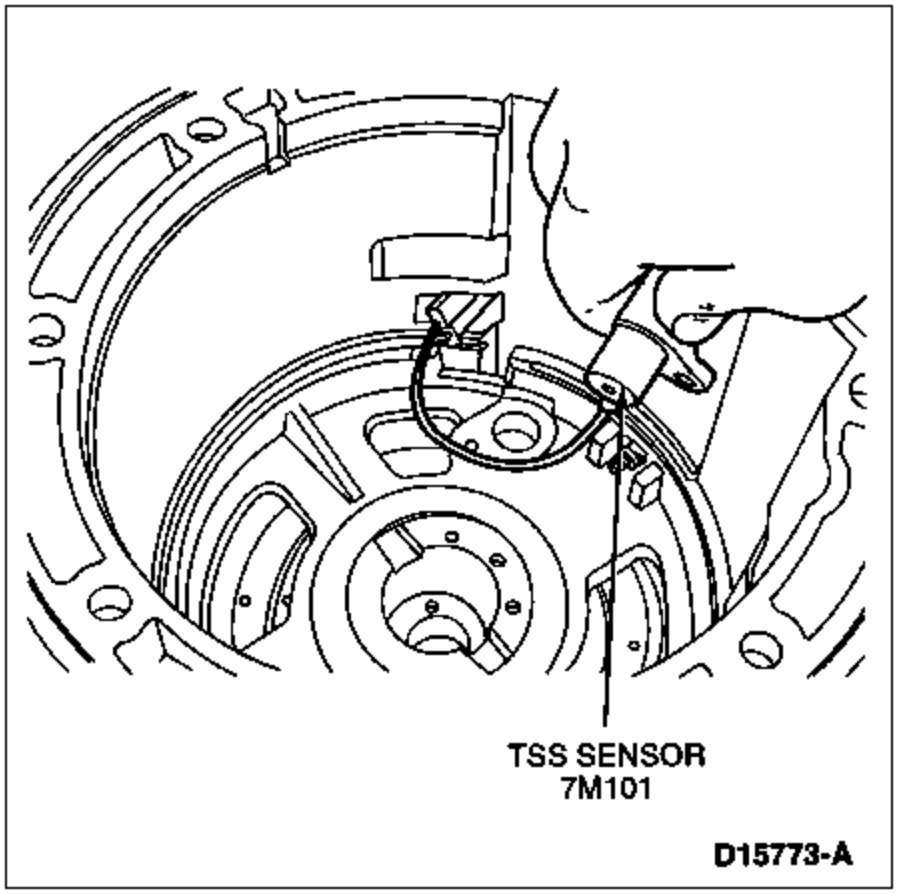
tomsn048@gmail.com



50. **CAUTION: Carefully route the turbine shaft speed (TSS) sensor connector and wiring harness through the opening in the case. Do not damage the wiring.**

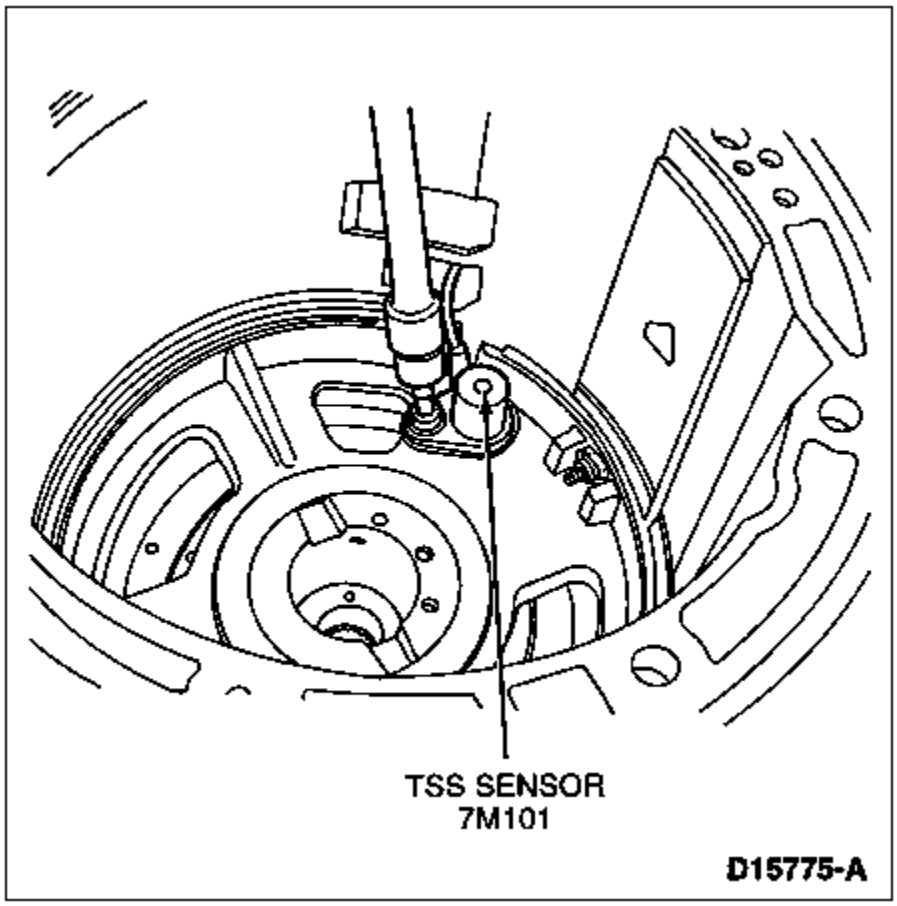
Route the TSS sensor connector and wiring harness through the opening in the case.

tomsn048@gmail.com



51. Install the turbine shaft speed (TSS) sensor on the center support. Use a T30 torx socket to install the TSS screw. Tighten the TSS sensor-to-center support screw to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com

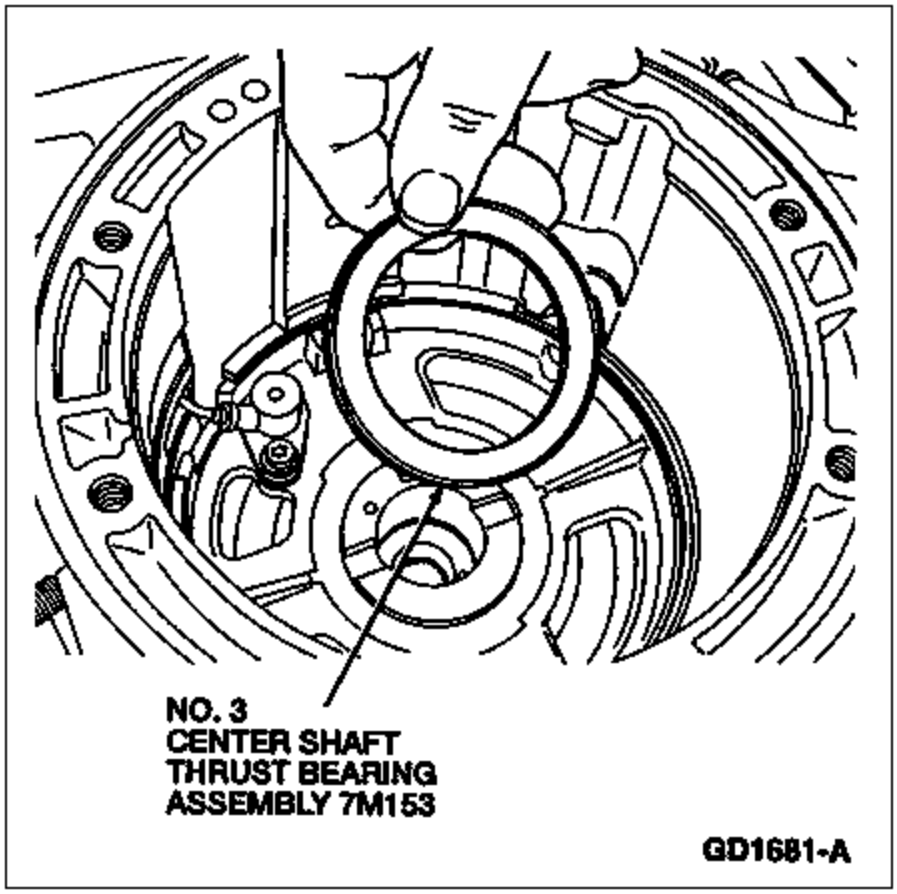


52. **CAUTION: Use only the No. 3 center shaft thrust bearing assembly.**

NOTE: No. 3 center shaft thrust bearing assembly has no notches on the outer race.

Install the No. 3 center shaft thrust bearing assembly.

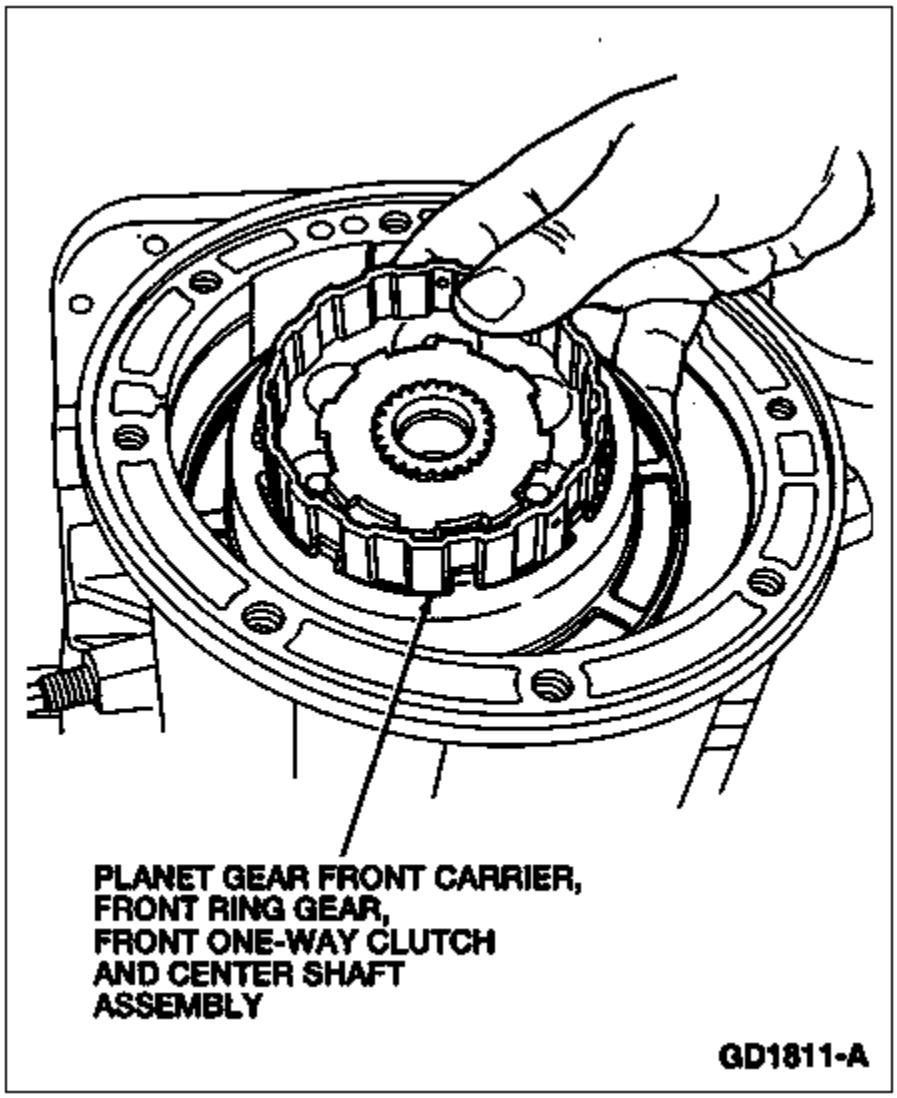
tomsn048@gmail.com



53. **CAUTION: Do not bend the trigger wheel.**

Install the planetary gear front carrier, front ring gear, front one-way clutch and center shaft assembly.

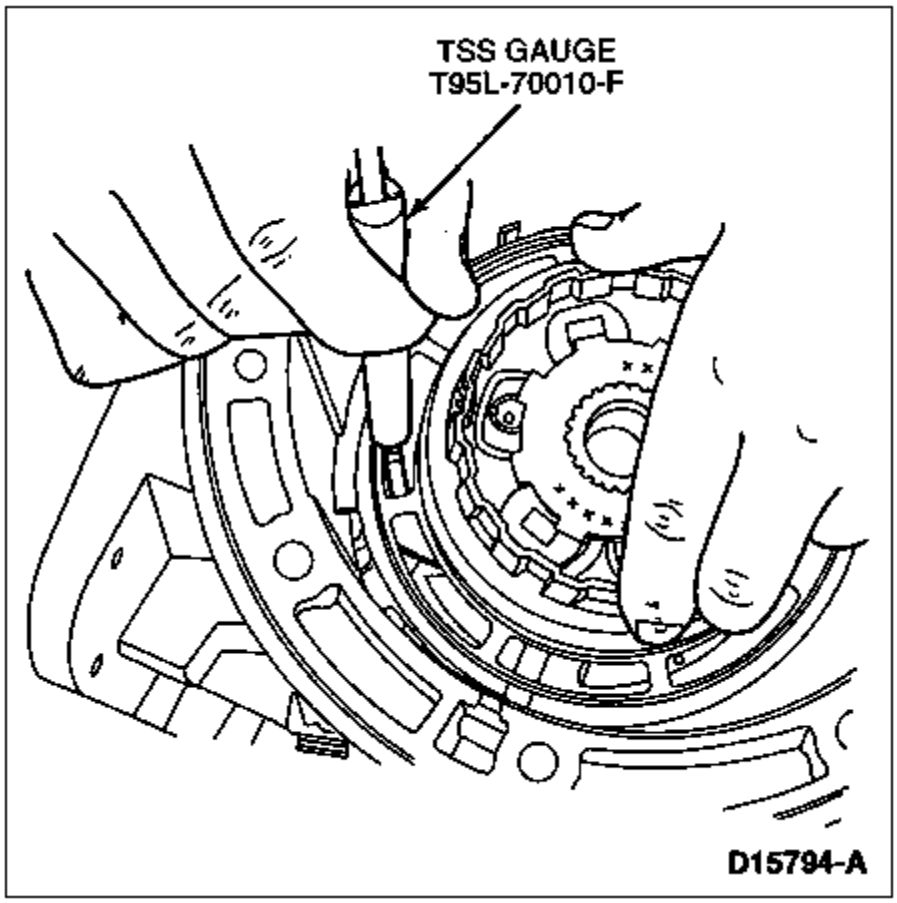
tomsn048@gmail.com



54. **NOTE: Perform TSS air gap clearance check . This step and the next two steps describe the procedures for checking the turbine shaft speed (TSS) sensor air gap clearance.**

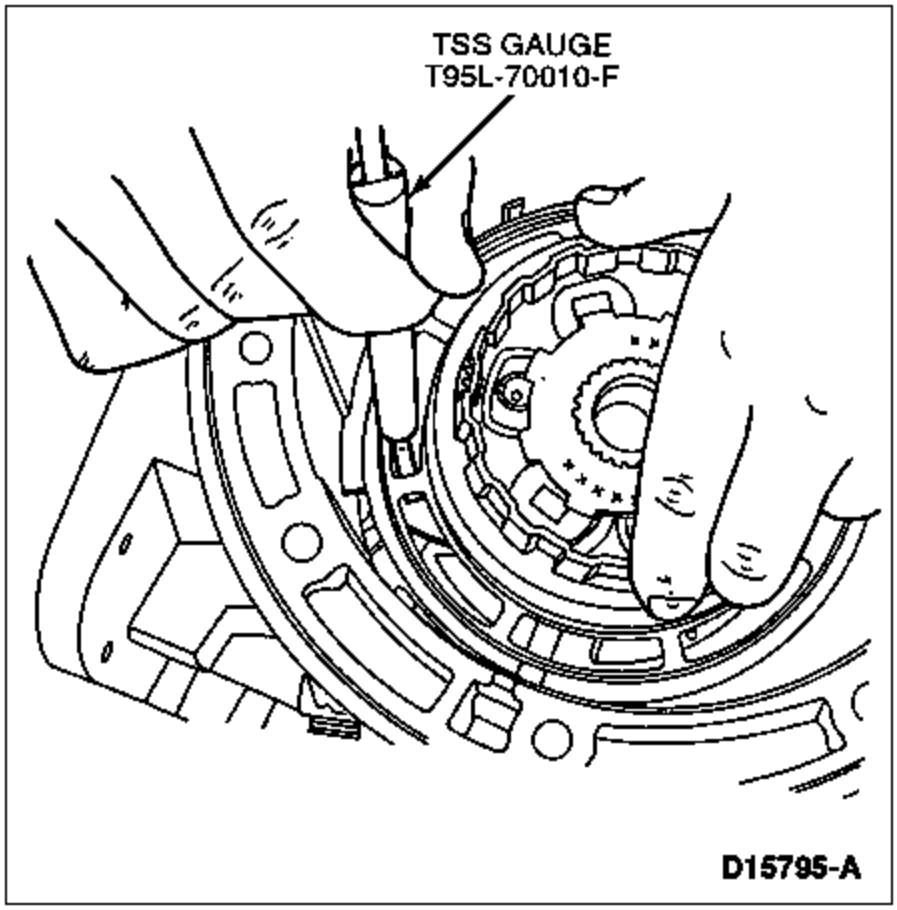
Place the thin blade of Turbine Shaft Speed Sensor Gauge T95L-70010-F over the turbine shaft speed (TSS) sensor as shown. Rotate the trigger wheel. The trigger wheel window should pass over the thin blade of the TSS gauge. If it doesn't, the planetary gear overdrive carrier and trigger wheel must be replaced.

tomsn048@gmail.com



55. Place the thick blade of Turbine Shaft Speed Sensor Gauge over the turbine shaft speed (TSS) sensor as shown. Rotate the trigger wheel. The trigger wheel window should not pass over the thick blade of the TSS gauge. If it does, the planetary gear overdrive carrier and trigger wheel must be replaced.

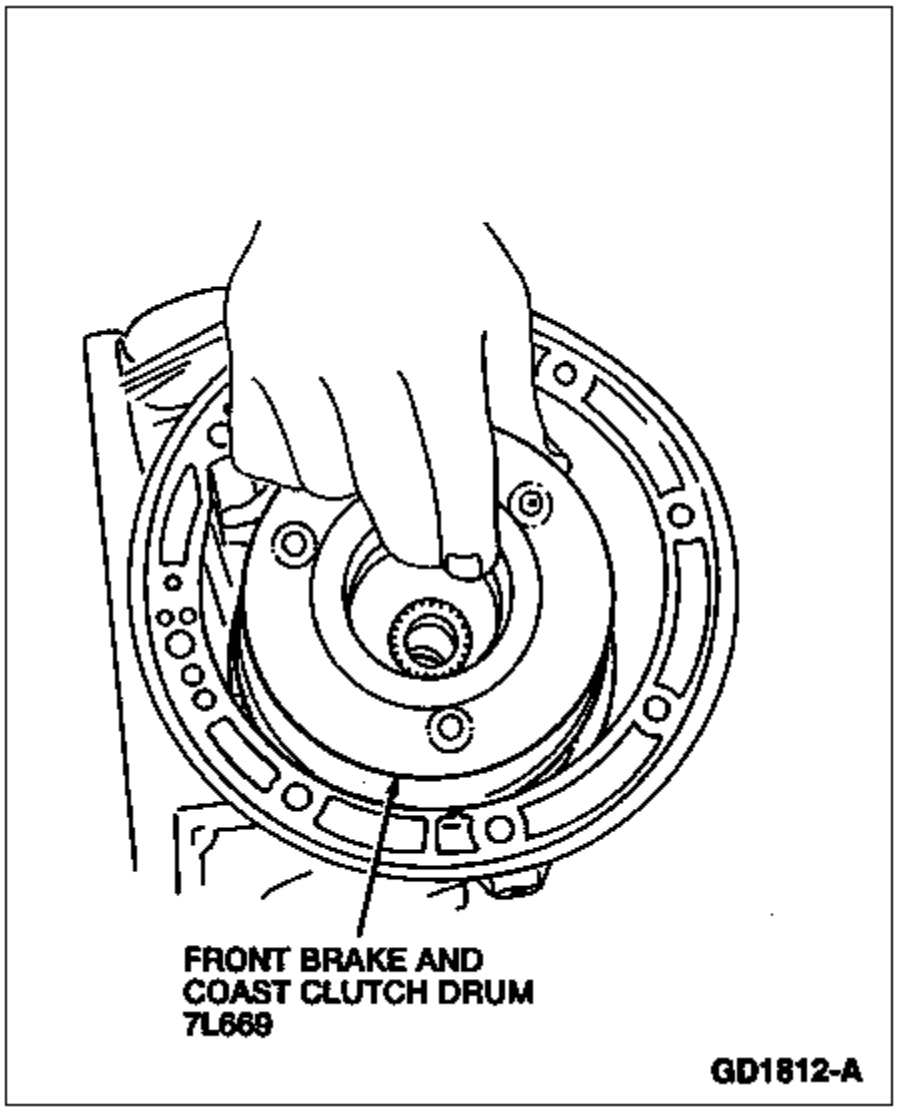
tomsn048@gmail.com



56. Repeat the previous two steps for the remaining trigger wheel windows.

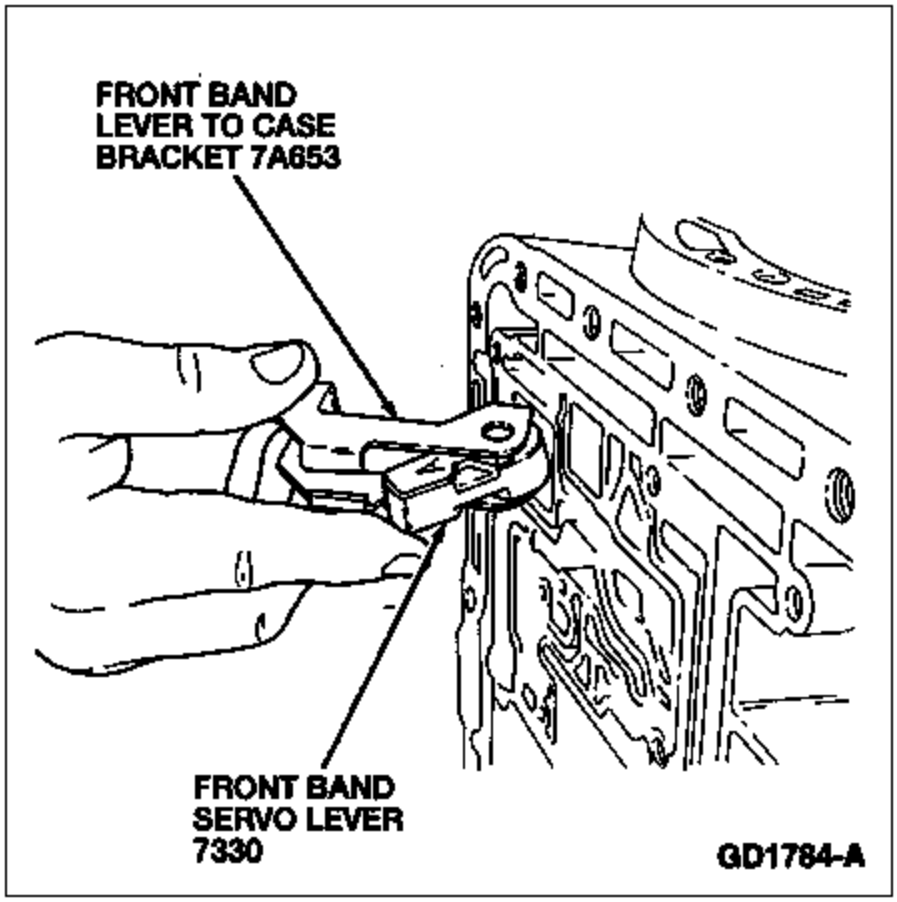
57. Align the clutch plates and front adapter gear and install the front brake and coast clutch drum assembly.

tomsn048@gmail.com



58. Install the front band lever-to-case bracket and front band servo lever as shown.

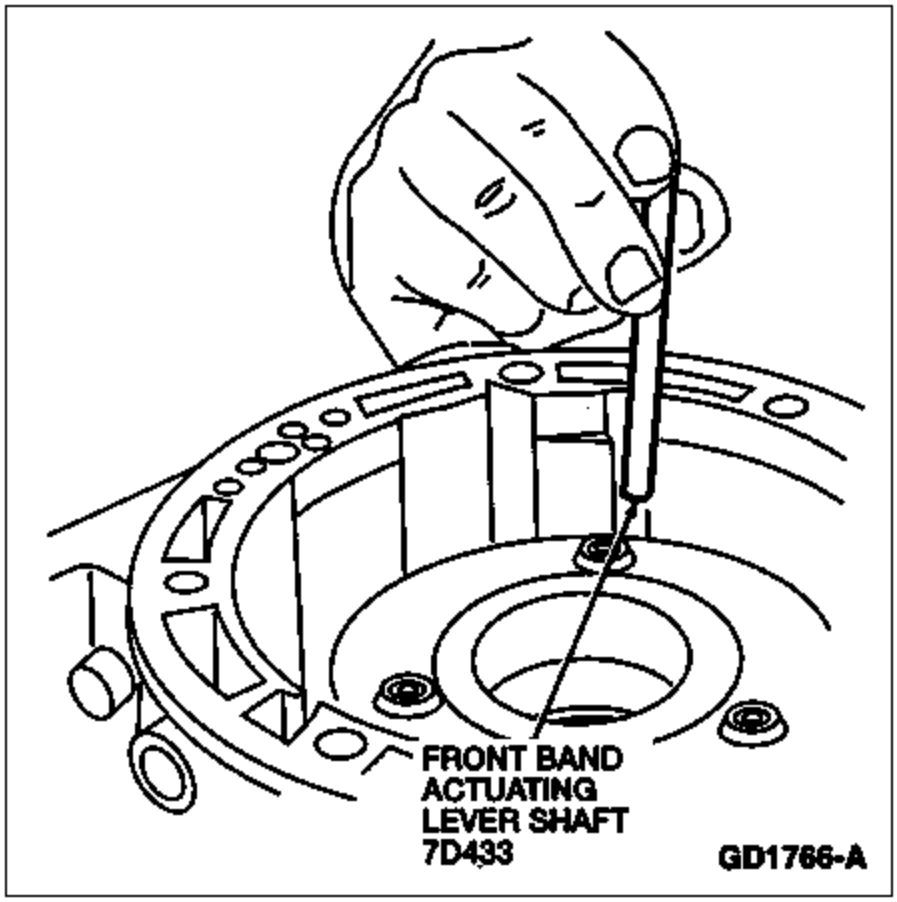
tomsn048@gmail.com



59. **NOTE: The front band actuating lever shaft is longer than the intermediate band actuating lever shaft.**

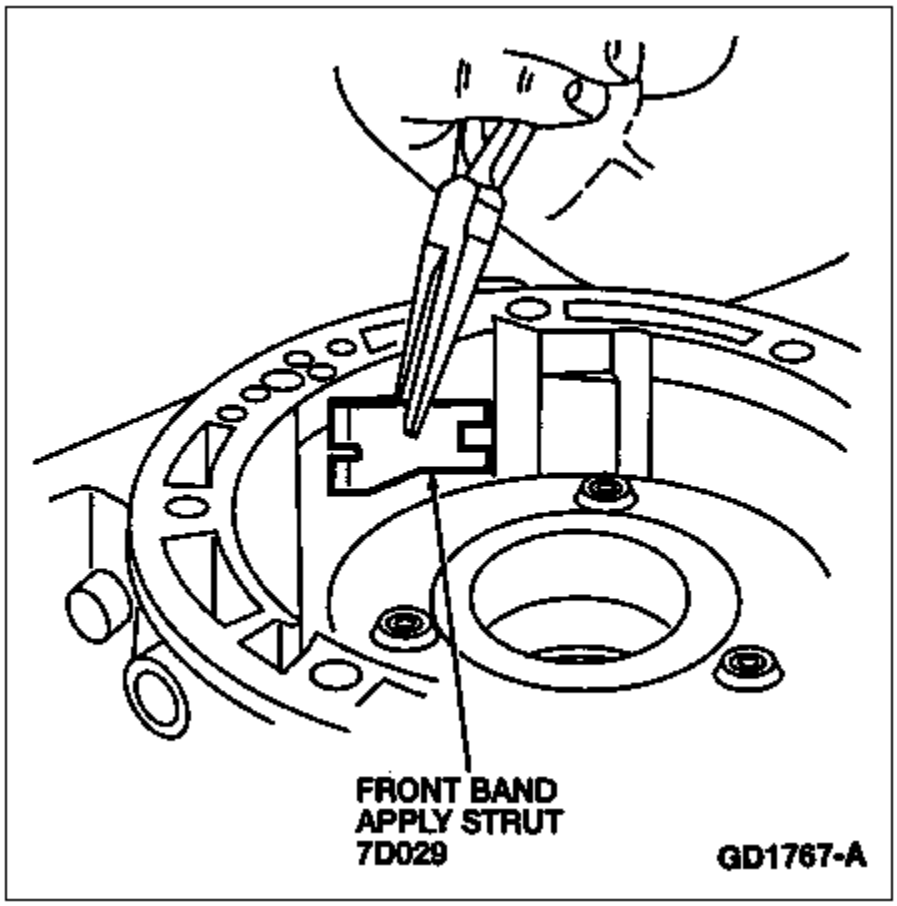
    Install the front band actuating lever shaft through the front band lever to case bracket and front band servo actuating lever.

tomsn048@gmail.com



60. Install the front band apply strut.

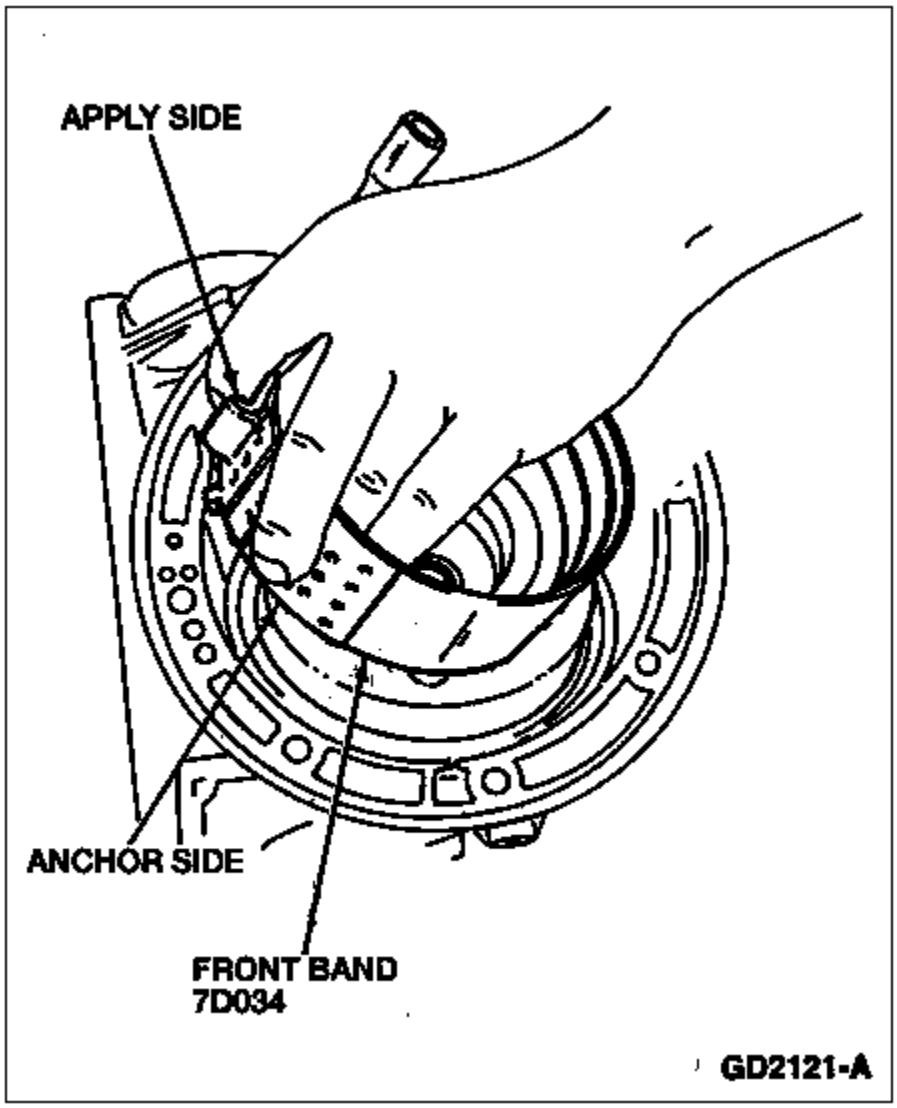
tomsn048@gmail.com



61. **NOTE: If the front band is reused, it must be installed in the same position as when removed.**

    Install the front band assembly over the front brake and coast clutch drum.

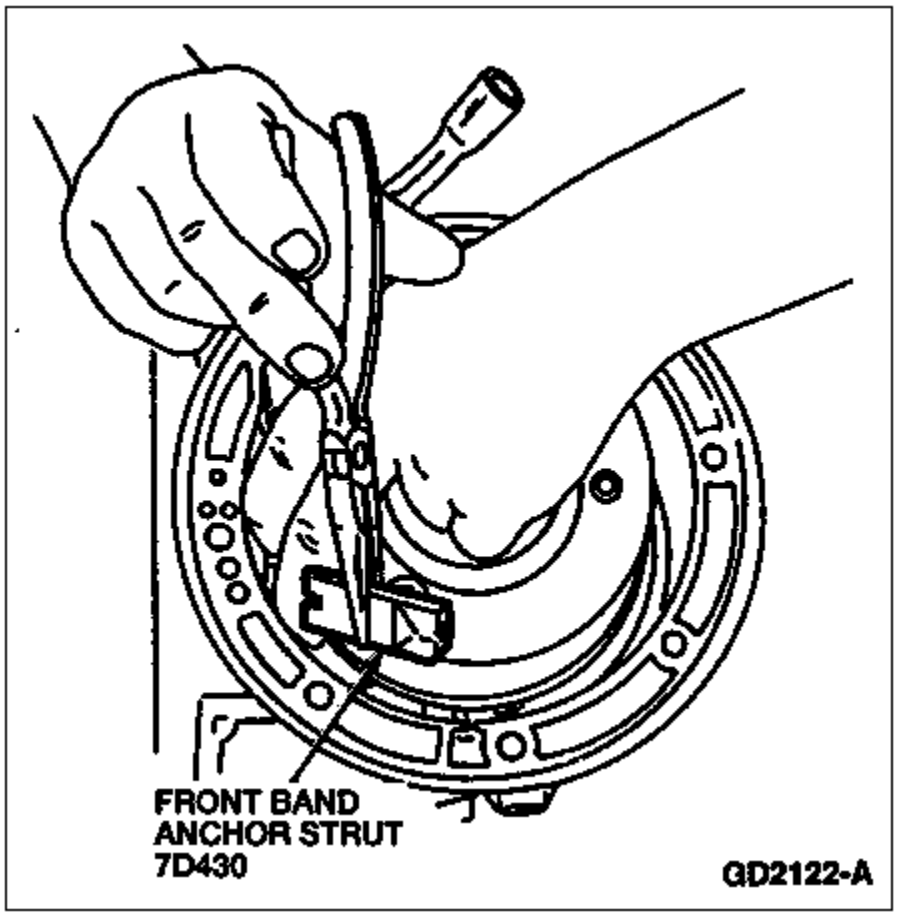
tomsn048@gmail.com



62. **NOTE: Use the band adjusting screw as a temporary alignment guide.**

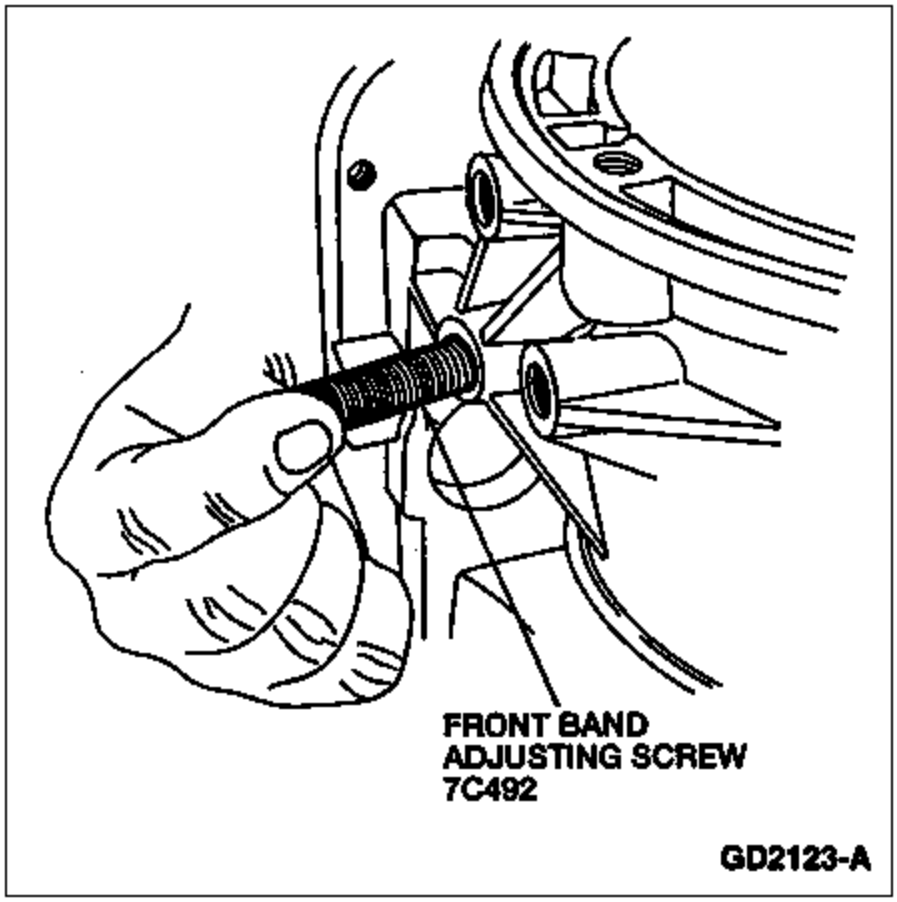
    Install the front band anchor strut.

tomsn048@gmail.com



63. Install the front band adjusting screw.

tomsn048@gmail.com

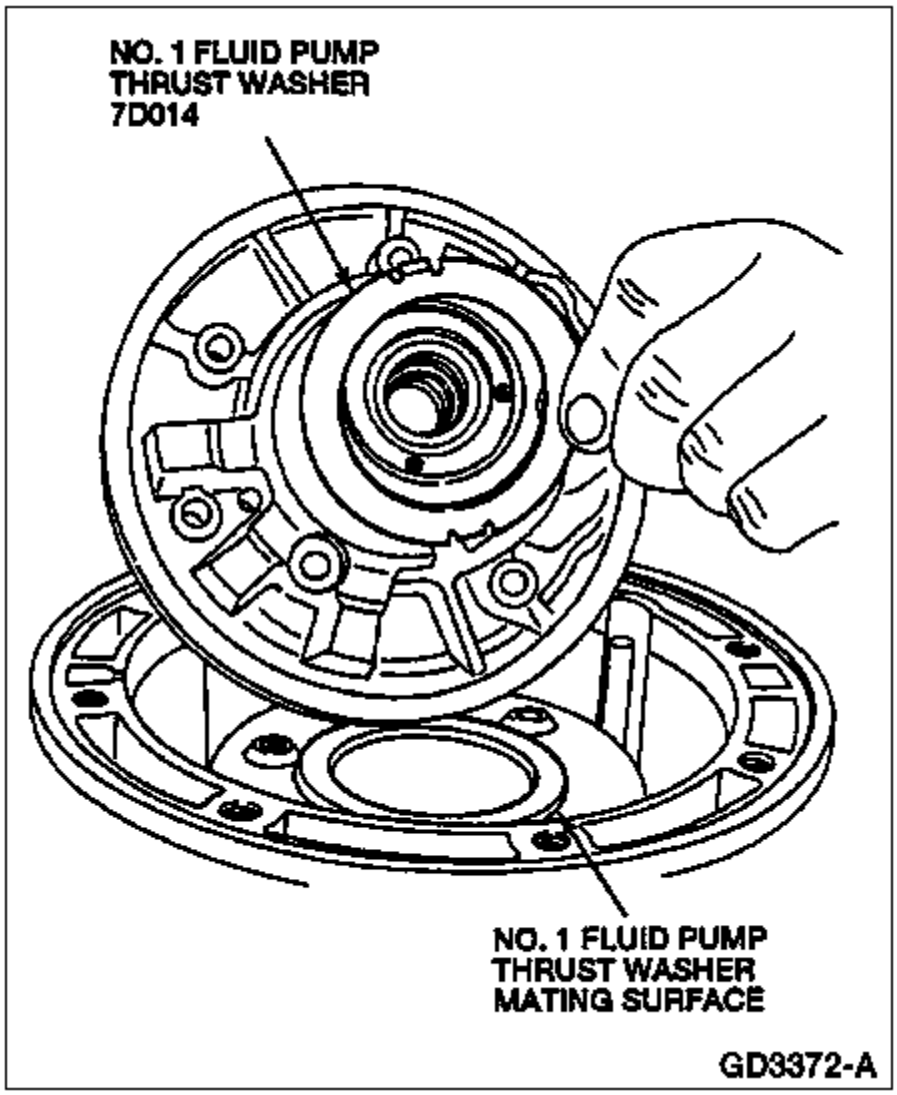


64. Perform the front end play check procedure as follows:

    a. **CAUTION: Be sure the pump body is seated against the washer and front brake and coast clutch drum. The pump body must be below the level of the case gasket surface.**

    Use petroleum jelly to hold any No. 1 fluid pump thrust washer on the rear of the pump. The washer tabs go into the pump face. Place the pump into position in the case.

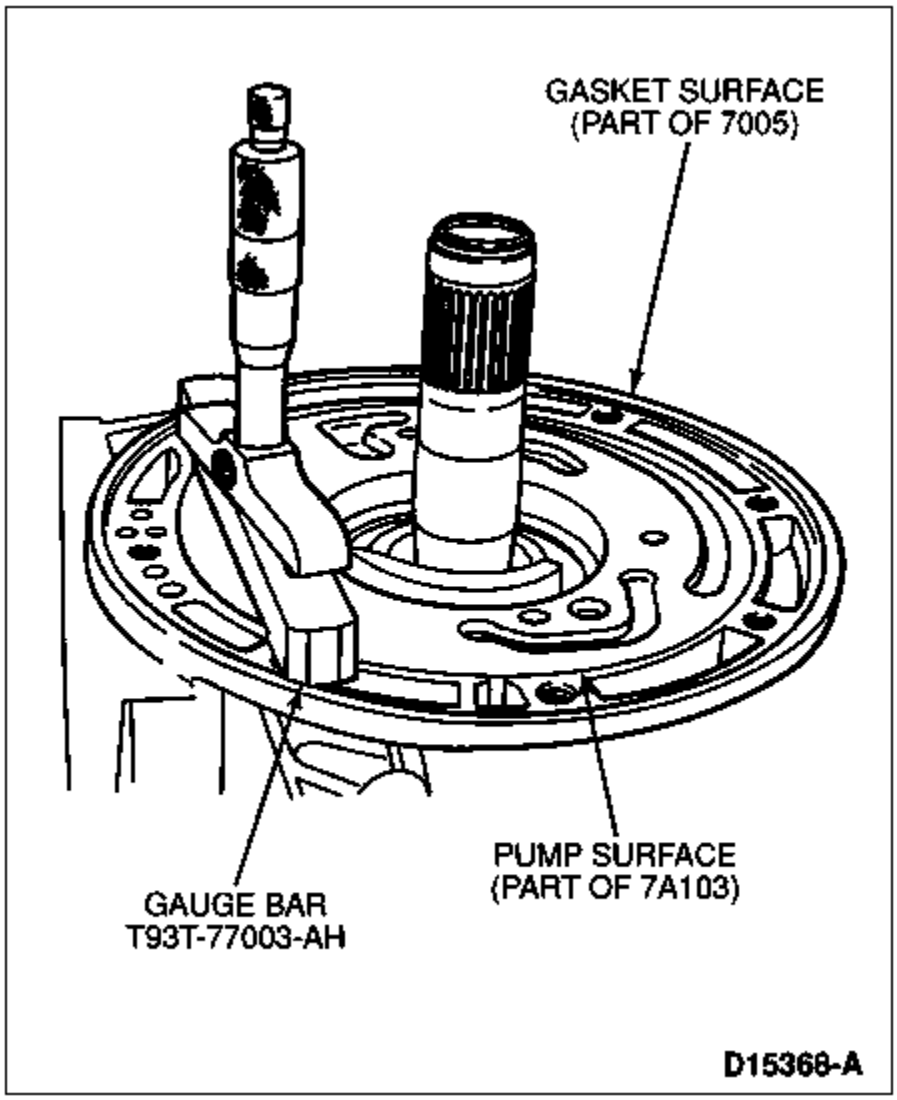
tomsn048@gmail.com



b. **CAUTION: The gauge bar must rest on the gasket surface.**

   Place Gauge Bar T93T-77003-AH across the case as shown.
c. Place a micrometer on the gauge bar and extend the probe until it contacts the pump surface.
d. Read the micrometer and subtract the thickness of the gauge bar (17.78 mm [0.700 inch]). Record this as dimension "A."
e. Move the gauge bar to the opposite side of the case.
f. Repeat Steps c and d and record this measurement as dimension "B."
g. Add dimensions "A" and "B" together and divide by 2. This is the front end clearance, dimension "C."

tomsn048@gmail.com



h. **CAUTION: If the average is below the specification, choose a thinner washer. If the average is above the specification, choose a thicker washer.**

NOTE: The front end play specification is 0.18-0.70 mm (0.007-0.028 in).

NOTE: The tabs on the washer go into the pump face.

Remove the pump and install the correct No. 1 thrust washer. Use petroleum jelly to hold the washer in place.

TRANSMISSION END CLEARANCE

Dimension "C"	Identification: Color	Service Part Number	Washer Thickness
Front No. 1 (All Engines) 0.18-0.70 mm (0.007-0.028 in.) Without Gasket	White Green Red Beige Black Yellow	97GT-7D014-TA 97GT-7D014-MA 97GT-7D014-NA 97GT-7D014-PA 97GT-7D014-RA 97GT-7D014-SA	1.55-1.60 mm (0.061-0.063 in.) 1.75-1.80 mm (0.069-0.071 in.) 1.85-1.90 mm (0.073-0.075 in.)

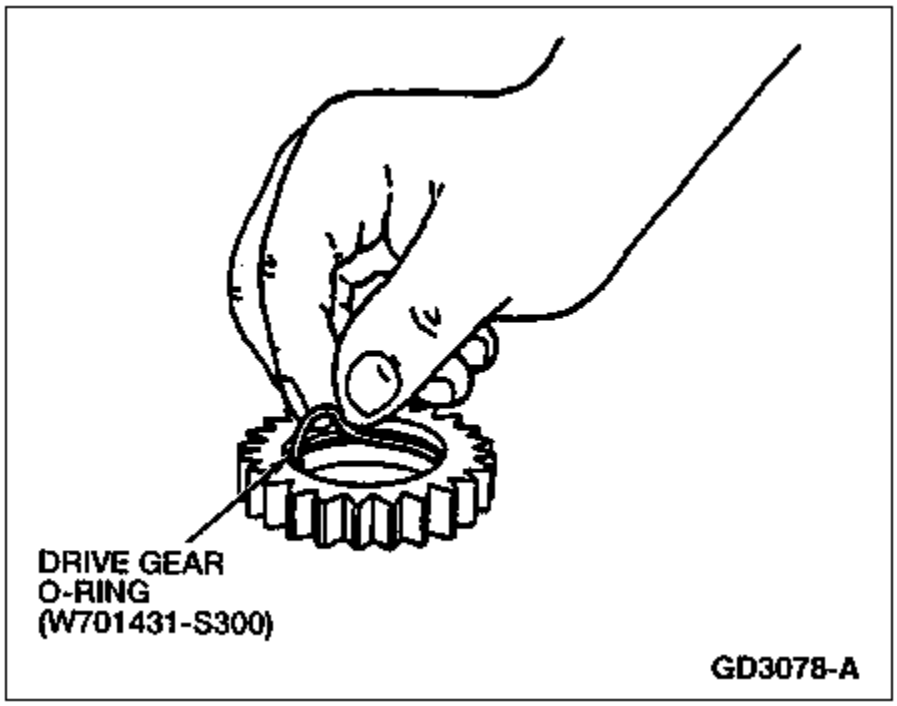
tomsn048@gmail.com

			1.95-2.00 mm (0.077-0.079 in.) 2.05-2.10 mm (0.081-0.083 in.) 2.15-2.20 mm (0.085-0.087 in.)

i. **NOTE: Front end clearance specification is 0.18-0.70mm (0.007-0.028 in).**

Verify front and clearance is correct, repeat steps a-g.

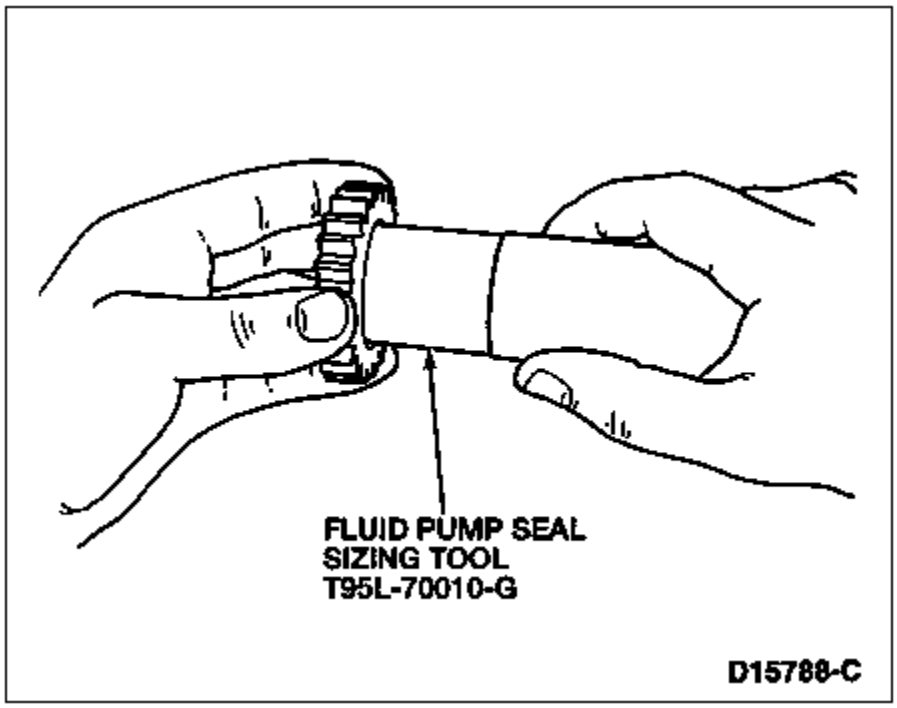
65. Install a new drive gear O-ring.



66. Lubricate Fluid Pump Seal Sizing Tool T95L-70010-G to seat drive gear O-ring.

67. Install Fluid Pump Seal Sizing Tool into pump drive gear to seat drive gear O-ring into groove.

tomsn048@gmail.com

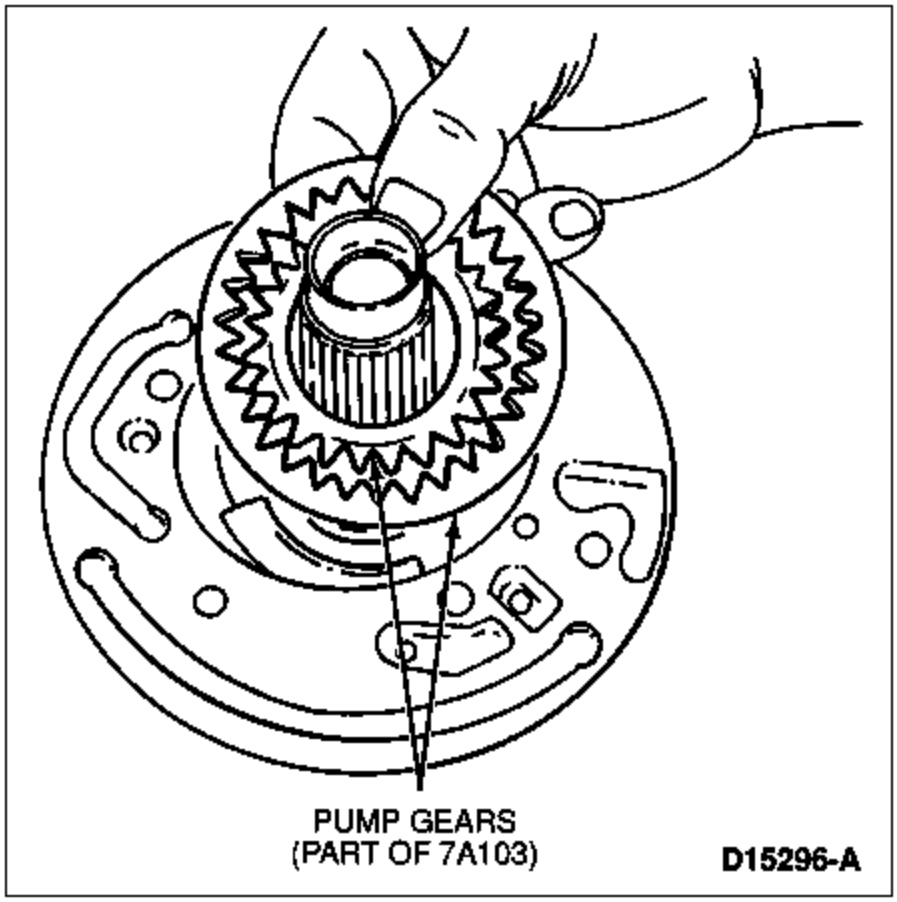


68. Remove Fluid Pump Seal Sizing Tool.

69. **CAUTION: The chamber on the inside edge of the small gear must be up when in the pump housing gear pocket. The dimple on the larger gear must be down when in the pump housing gear pocket.**

    Position the two pump gears into the pump housing. Apply a lubricant to the pump gears to prevent scoring at initial start-up.

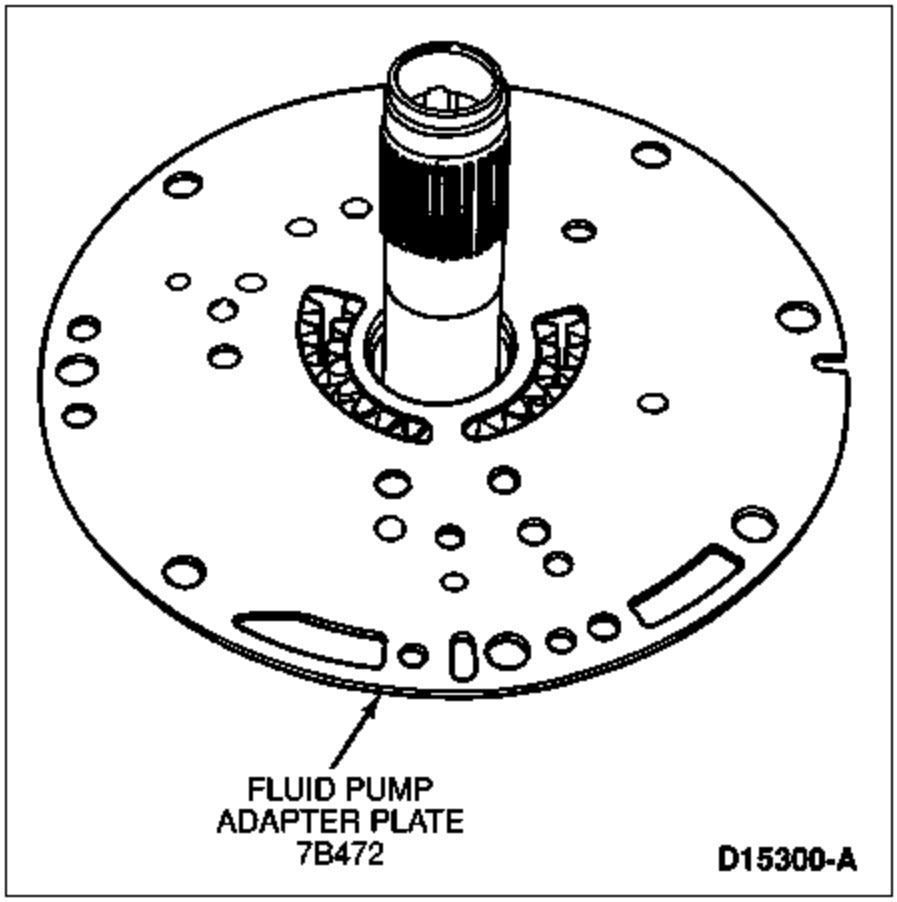
tomsn048@gmail.com



70. **CAUTION: Make sure the holes in the plate line up with the holes in the pump.**

Install the fluid pump adapter plate.

tomsn048@gmail.com

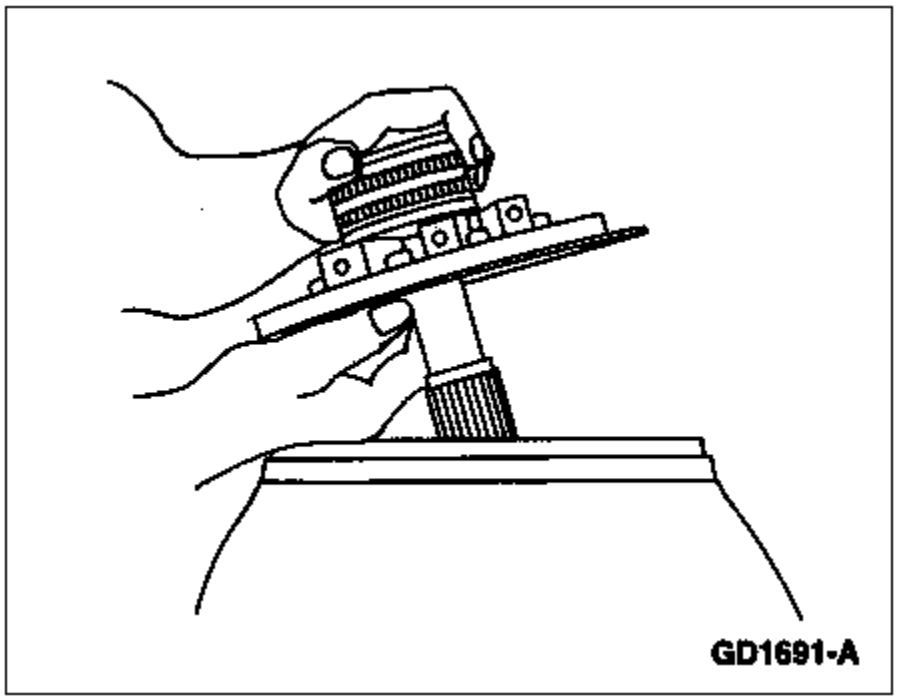


71. **CAUTION: Do not allow the pump gears to come out of the pump housing pocket.**

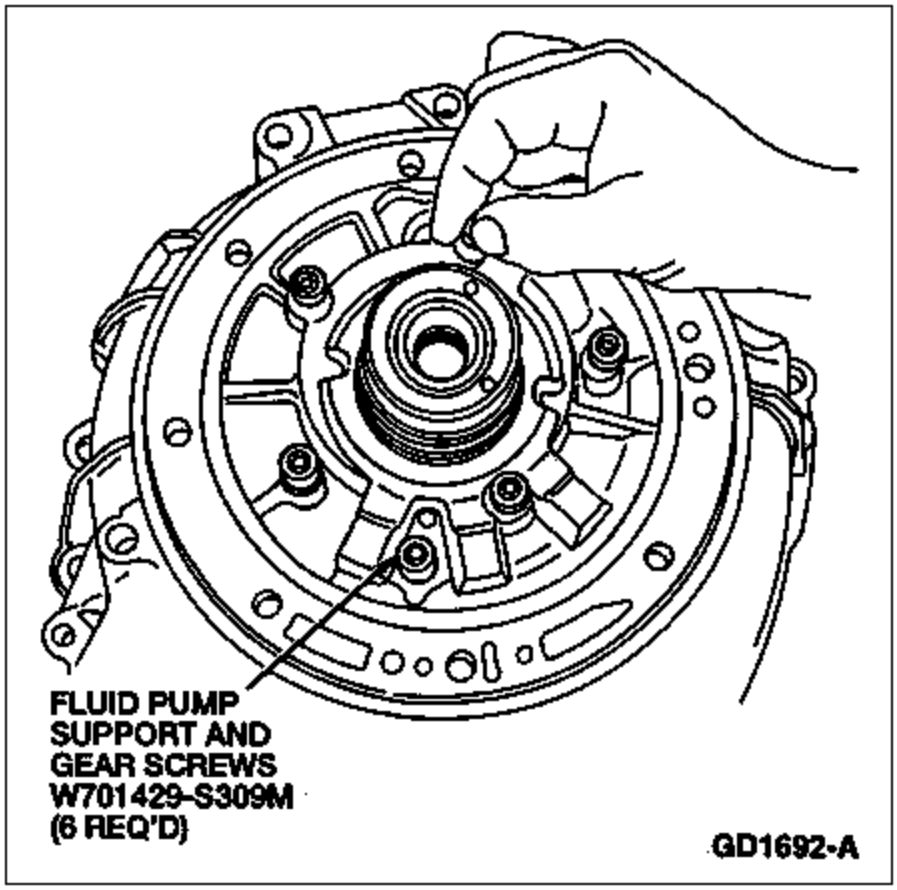
NOTE: The notch on the outside of the fluid pump adapter plate will be at the nine o'clock position, relative to the converter housing.

Turn the converter housing face down on the bench. Hold the fluid pump adapter plate against the front pump support and gear to keep the pump gears in place. Turn the pump and adapter plate over and place on the converter housing.

tomsn048@gmail.com



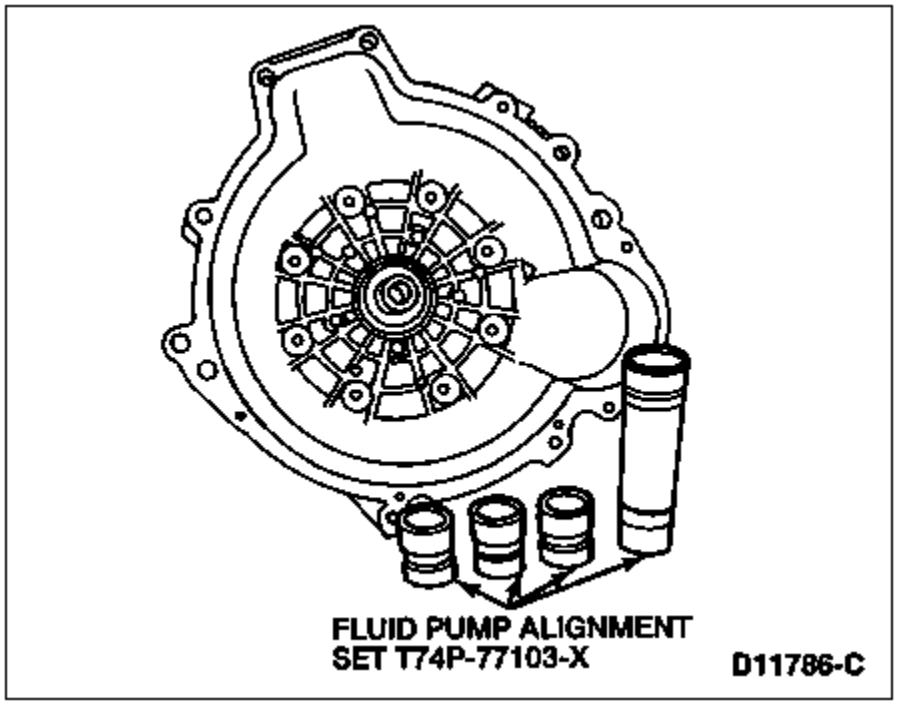
72. Install the six M8 x 35 mm Torx® head front pump support and gear screws fingertight only.



tomsn048@gmail.com

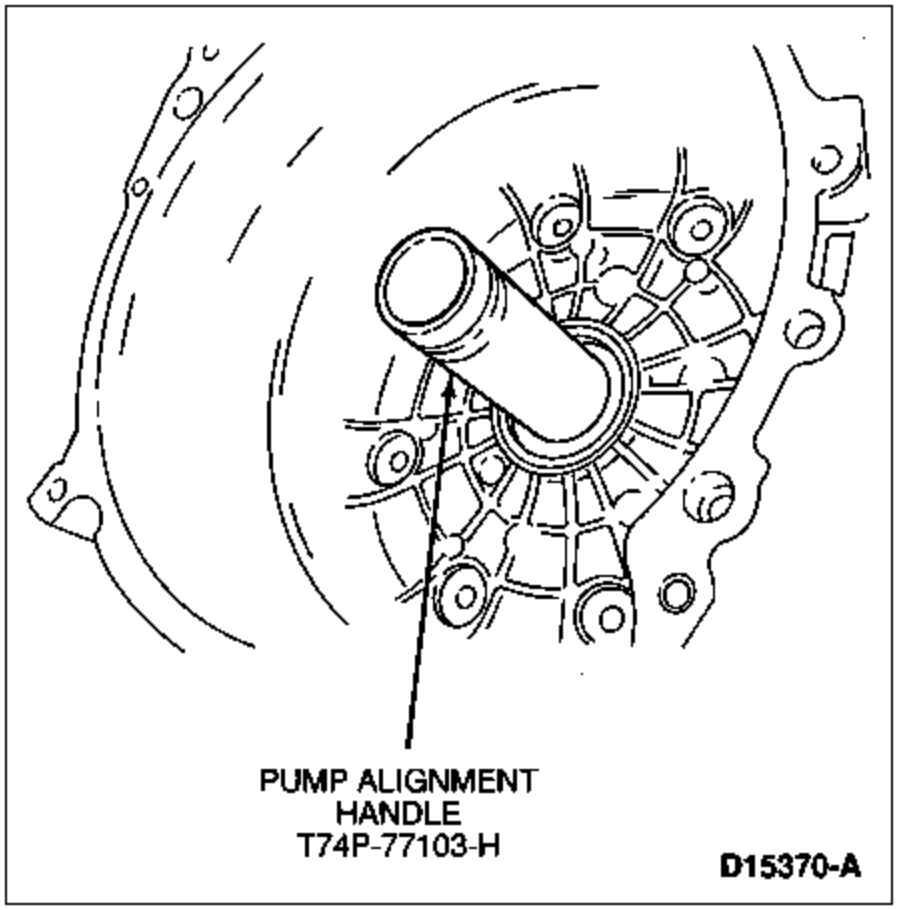
73. **CAUTION: Fluid Pump Alignment Set T74P-77103-X must be used to properly align the front pump support and gear to the fluid pump adapter plate. This will prevent seal leakage, gear noise, broken gears and bushing failure.**

    Select the gauge that will be the snuggest fit when placed over the fluid pump support and gear.



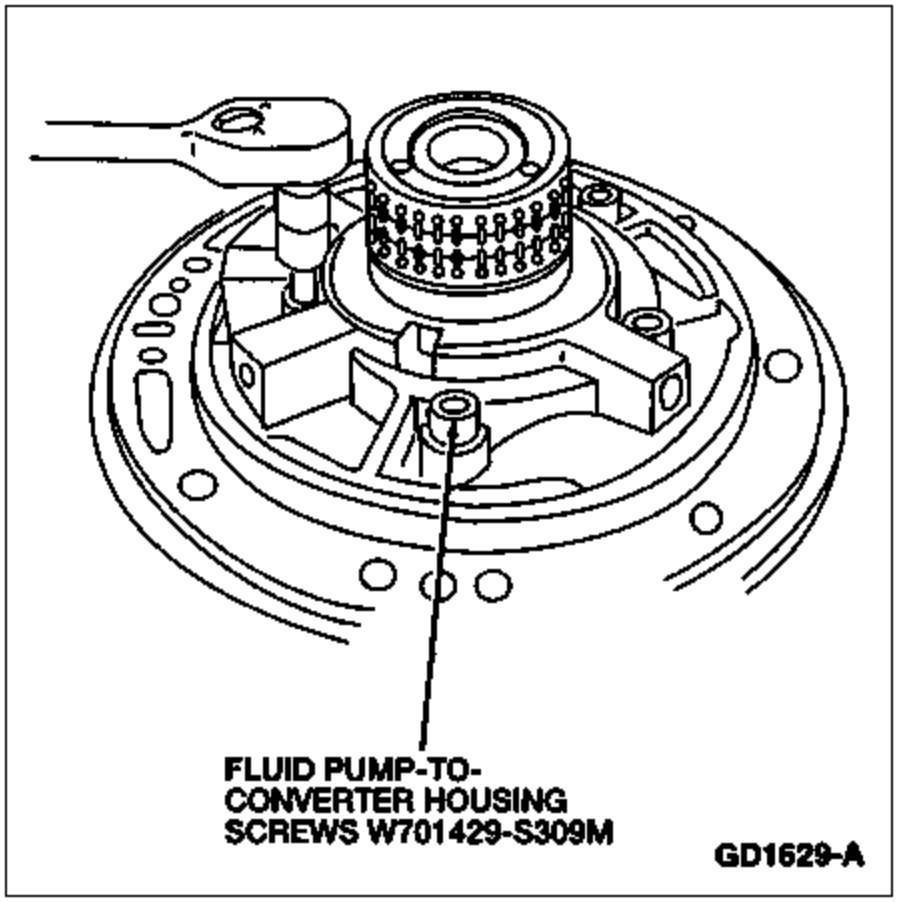
74. Thread the gauge into Pump Alignment Handle T74P-77103-H (Part of T74P-77103-X, Fluid Pump Alignment Set). Slide the tool over the front pump support and gear until it bottoms out in the pump gear pocket. This centers the pump to the converter housing.

tomsn048@gmail.com



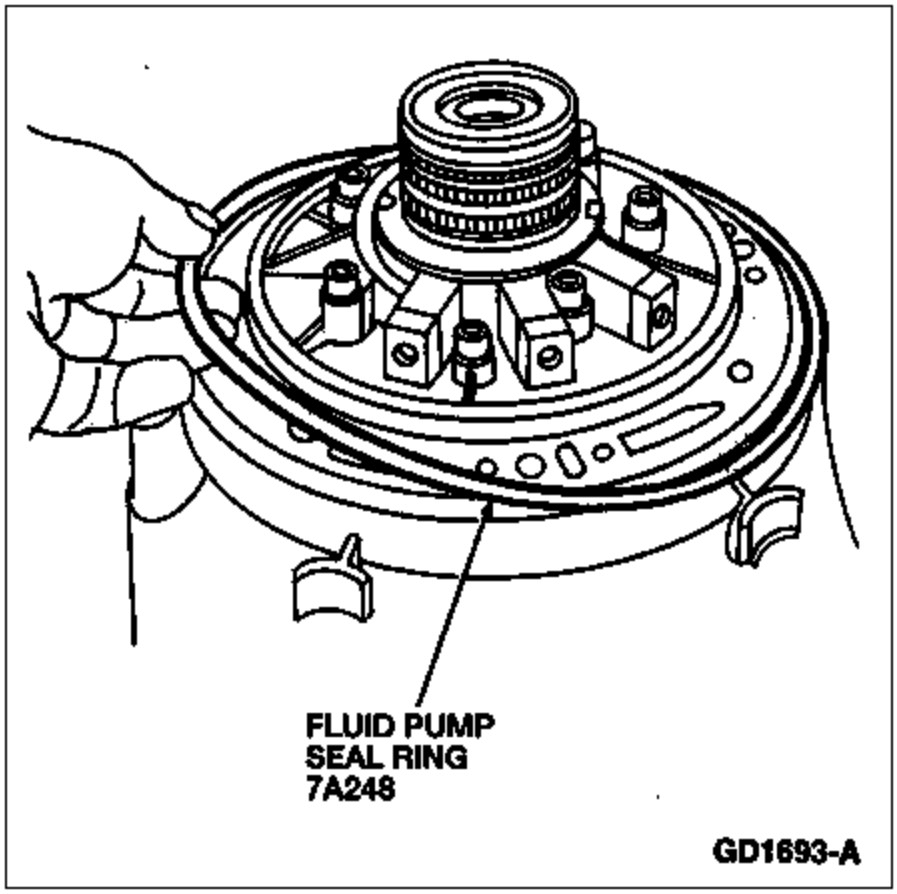
75. Use a Torx® 40 socket wrench to tighten the six M8 x 35 mm fluid pump support and gear-to-converter housing screws. Tighten the fluid pump support and gear-to-converter housing screws in a star pattern to 22-28 Nm (16-21 lb-ft). Remove the Pump Alignment Handle.

tomsn048@gmail.com



76. Install a new fluid pump seal ring.

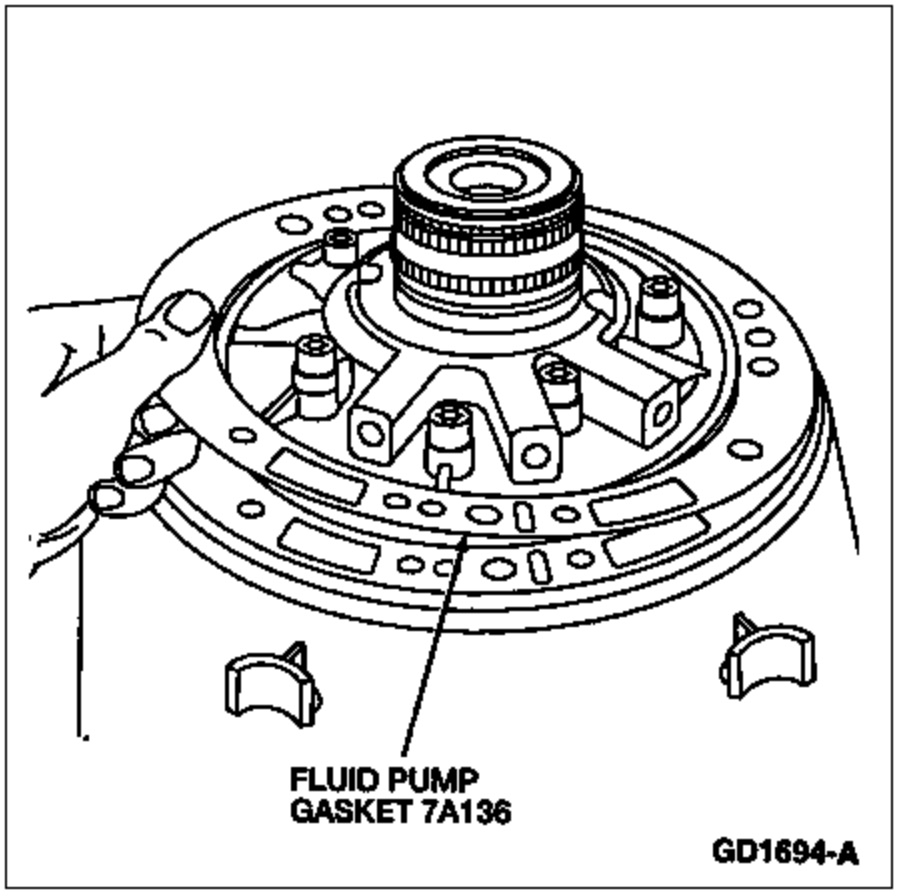
tomsn048@gmail.com



77. **NOTE: Make sure the fluid pump seal ring is installed on the converter housing and pump assembly.**

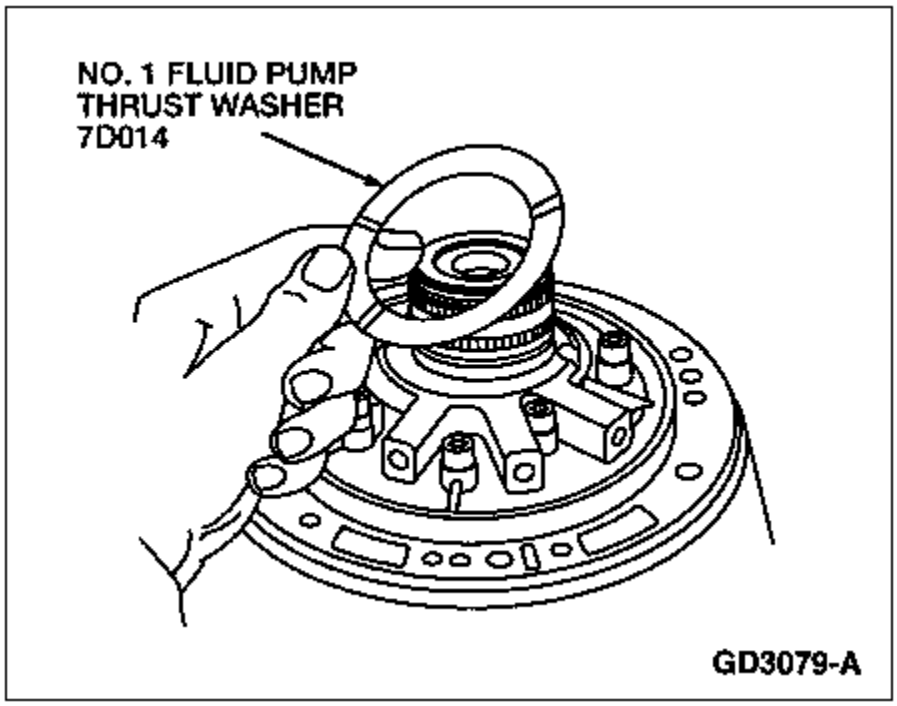
    Place a new fluid pump gasket on the fluid pump adapter plate as shown. Use petroleum jelly to hold the fluid pump gasket in place.

tomsn048@gmail.com



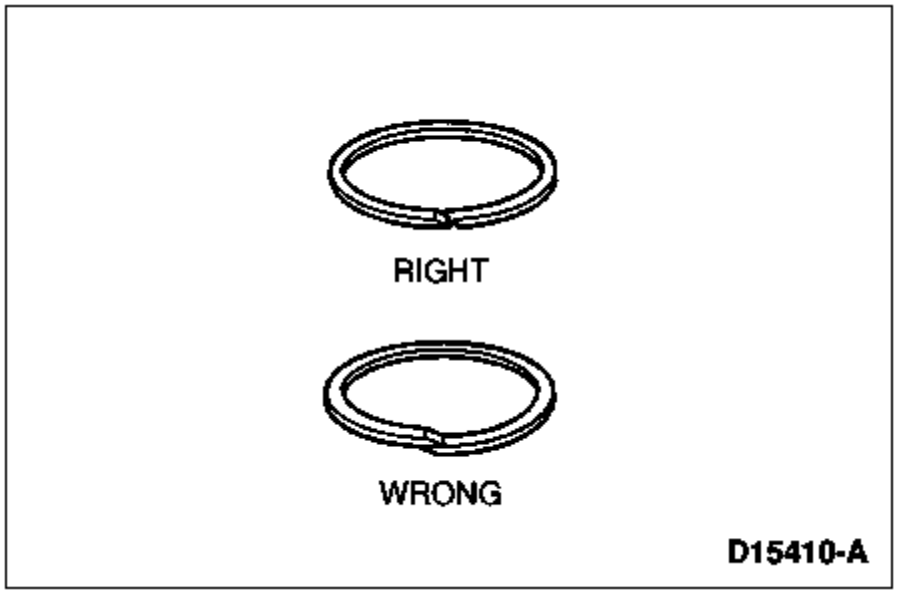
78. Install the correct No. 1 fluid pump thrust washer on the fluid pump support and gear. Use petroleum jelly to hold the washer in place.

tomsn048@gmail.com

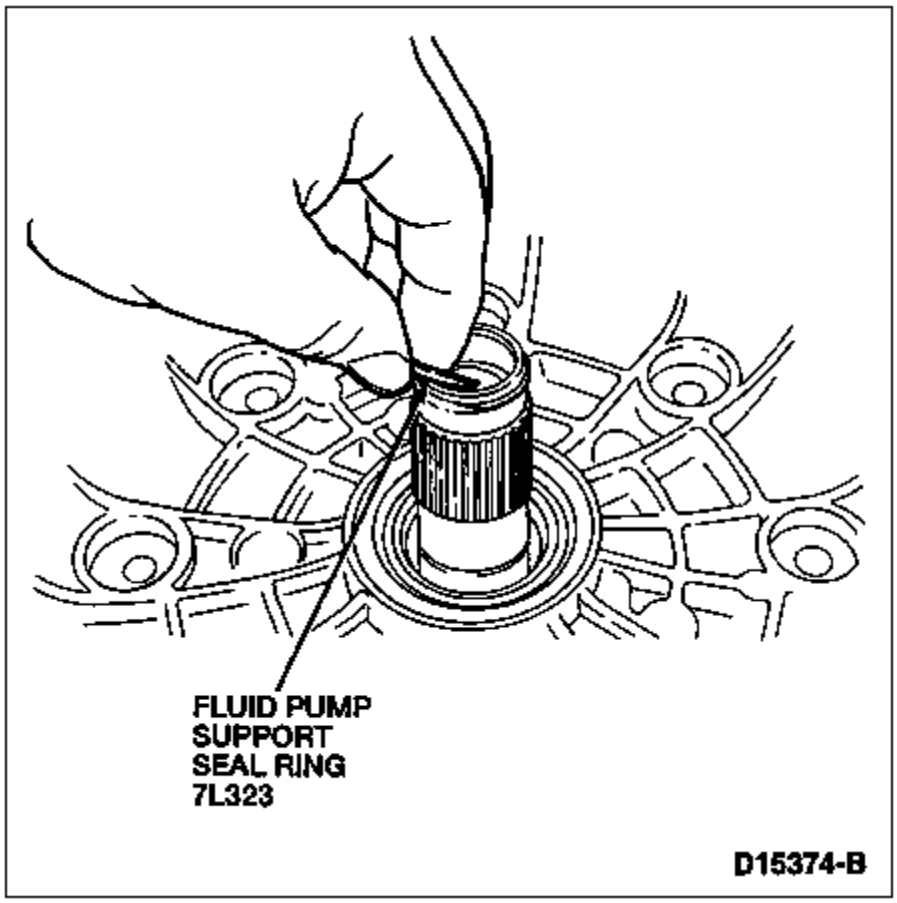


79. **NOTE: Verify correct seal installation. Be sure seal grooves are clean and free of burrs.**

Turn the converter housing over and install the front pump support seal ring.



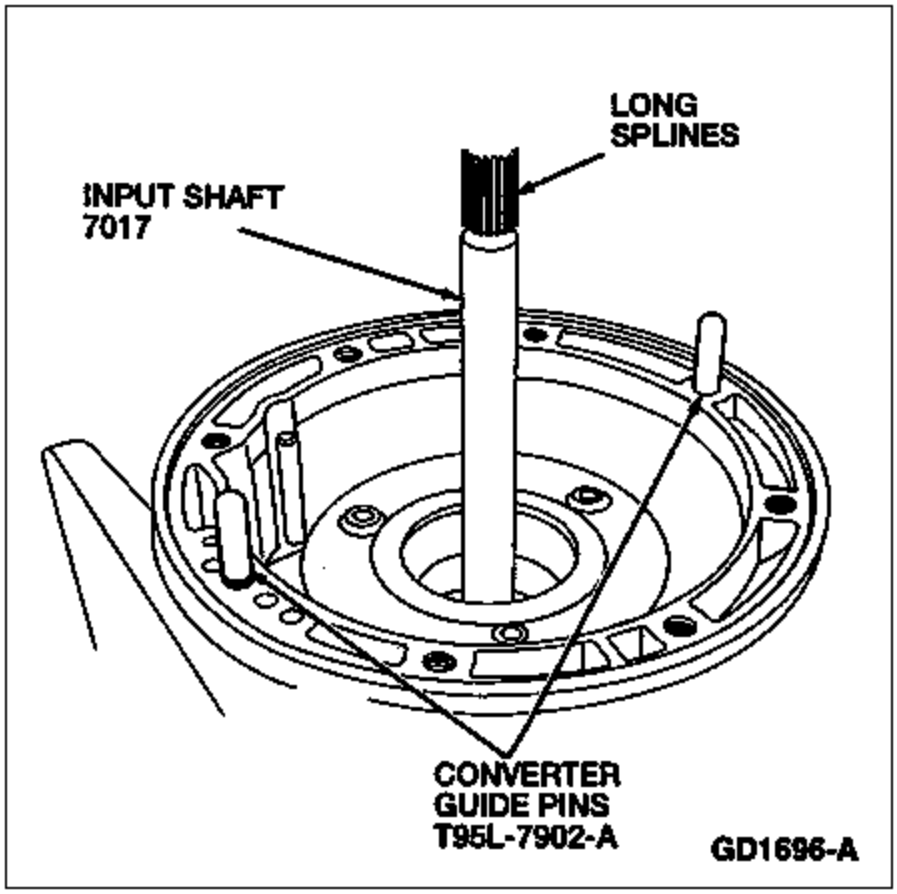
tomsn048@gmail.com



80. **NOTE: The splines on the input shaft are not the same length. The shorter splines go into the assembly.**

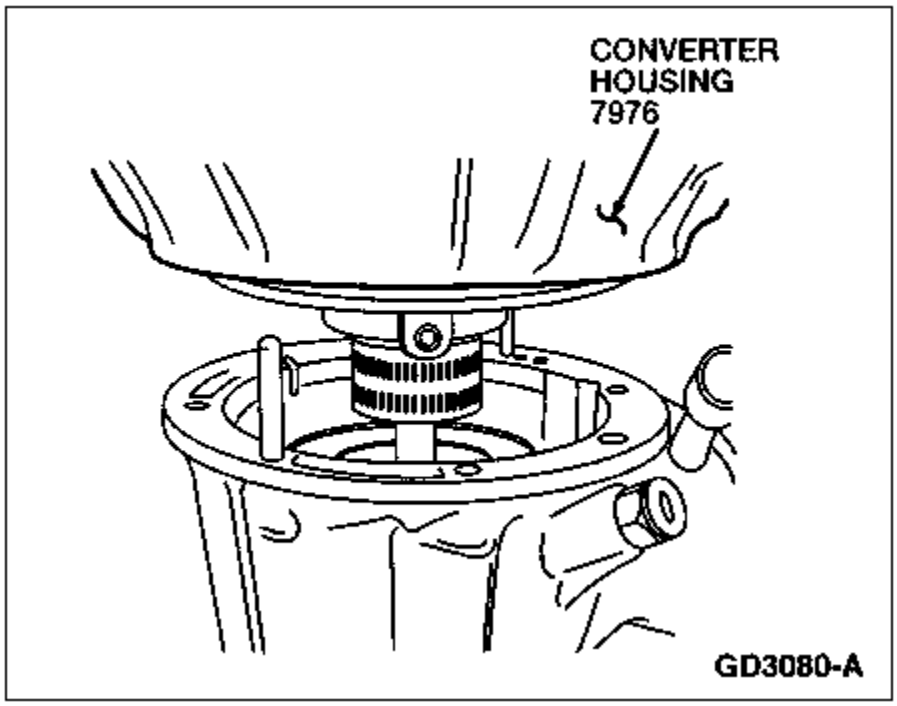
Install the input shaft as a guide for the converter housing and fluid pump support and gear assembly. Install the Converter Guide Pins T95L-7902-A as shown.

tomsn048@gmail.com



81. Install the converter housing and fluid pump support and gear assembly (with the fluid pump gasket) and the No. 1 fluid pump thrust washer to the case.

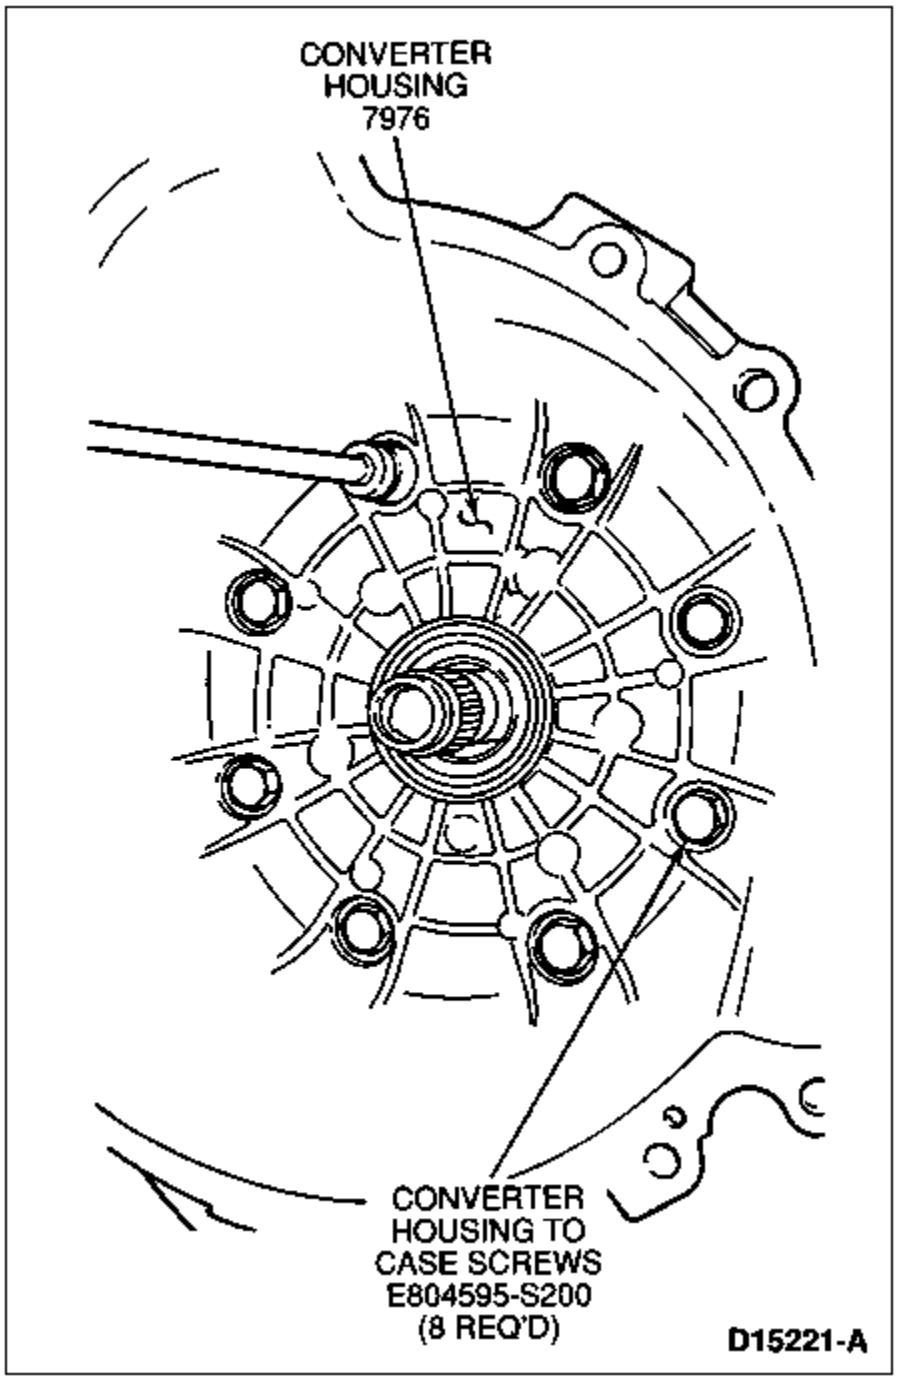
tomsn048@gmail.com



82. **NOTE: Lubricate O-rings on converter housing screws.**

Remove Converter Guide Pins and use a 17 mm socket wrench to install the eight new M10 x 33 mm converter housing-to-case screws. Tighten the converter housing-to-case screws in a star pattern to 36-52 Nm (27-39 lb-ft).

tomsn048@gmail.com



83. Remove the input shaft.

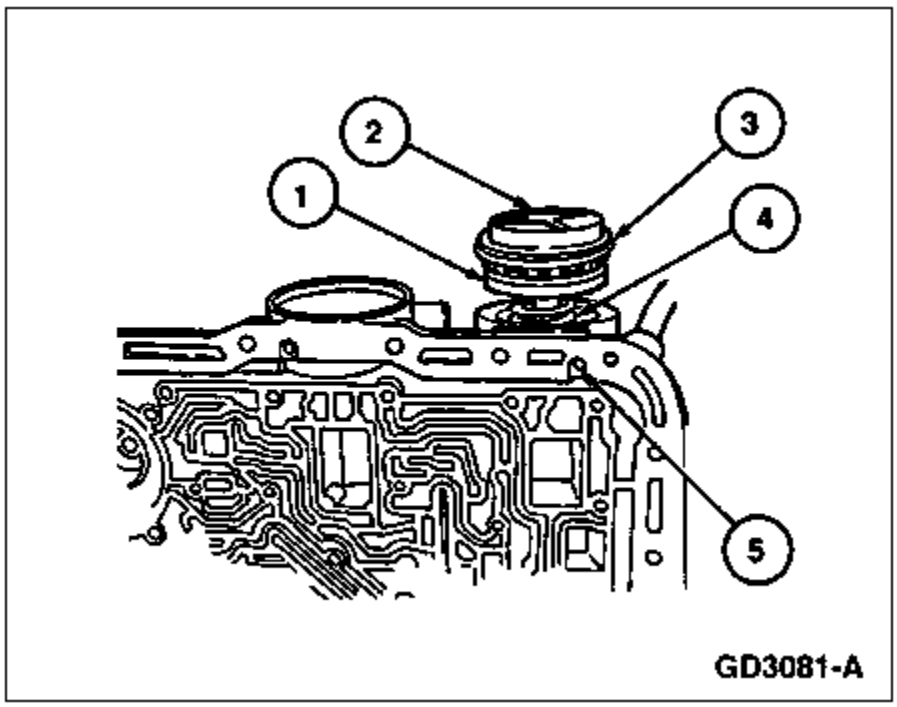
84. **WARNING: MAKE SURE THE LOCK PIN ON BENCH-MOUNTED HOLDING FIXTURE T57L-500-B IS SECURE.**

    Rotate the transmission assembly so the fluid pan rail is facing up.

85. **CAUTION: Do not damage the front servo cover to case O-ring during installation. Do not press the front servo cover and O-ring past the relief hole in the case. O-ring damage may occur.**

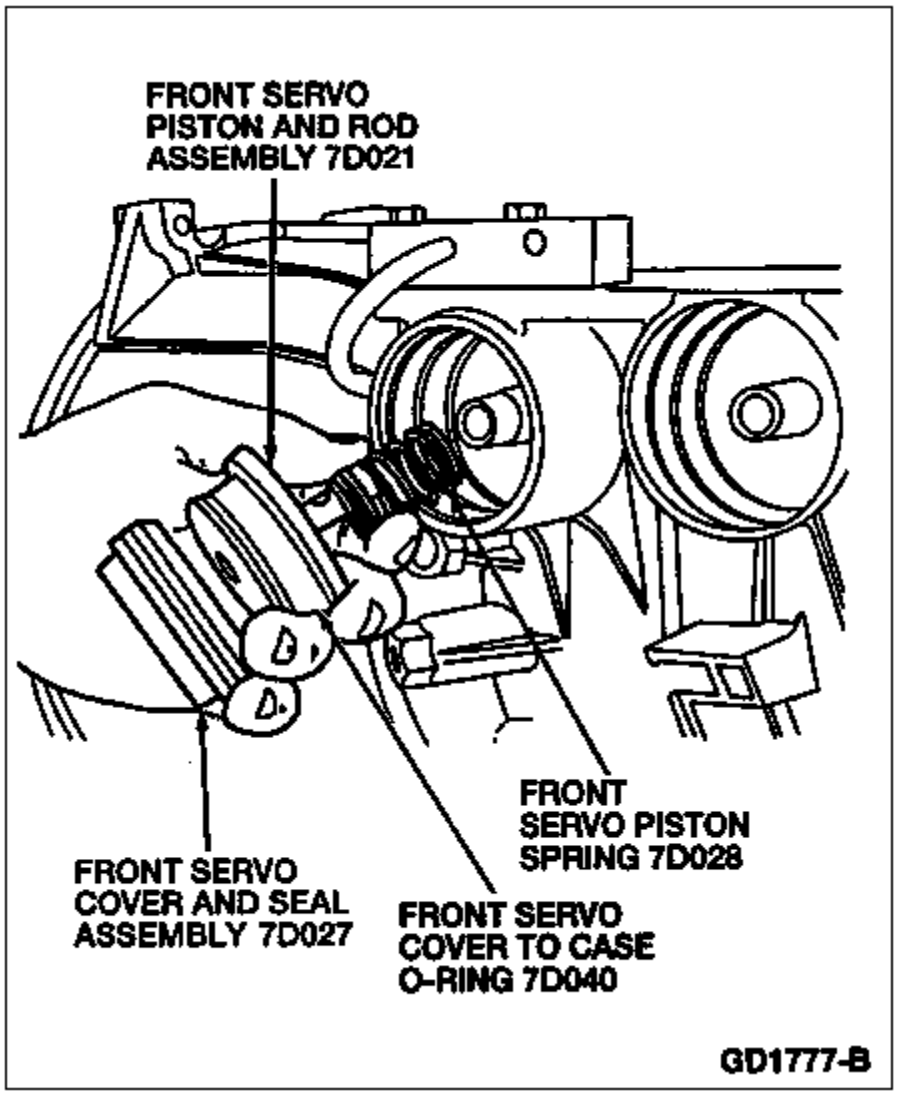
tomsn048@gmail.com

Install the front servo piston spring, servo piston and rod assembly, servo cover to case O-ring with servo cover.



Item	Part Number	Description
1	7D021	Front Servo Piston and Rod Assembly
2	7D027	Front Servo Cover and Seal Assembly
3	7D040	Front Servo O-Ring
4	7D028	Front Servo Piston Spring
5	—	Relief Hole (Part of 7005)

tomsn048@gmail.com

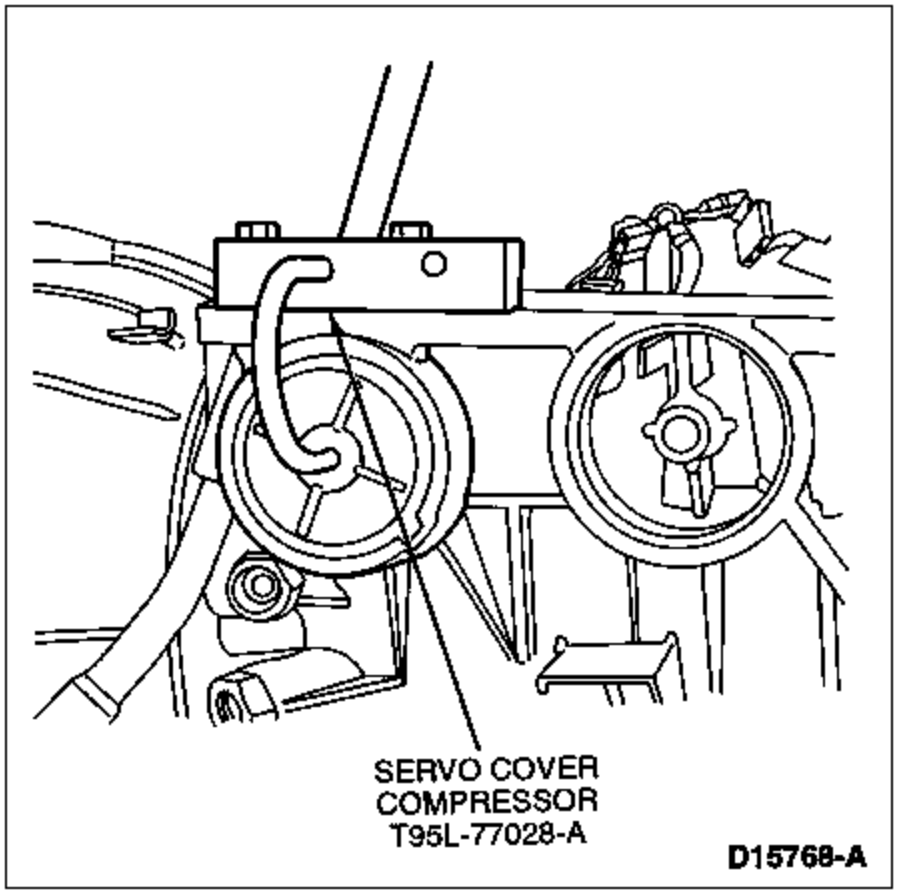


86. **NOTE: The J-hook must be in the appropriate hole for the servo being removed, and tool number should be facing up.**

    Install Servo Cover Compressor T95L-77028-A over the front servo cover at the fluid pan rail. Tighten the screws.

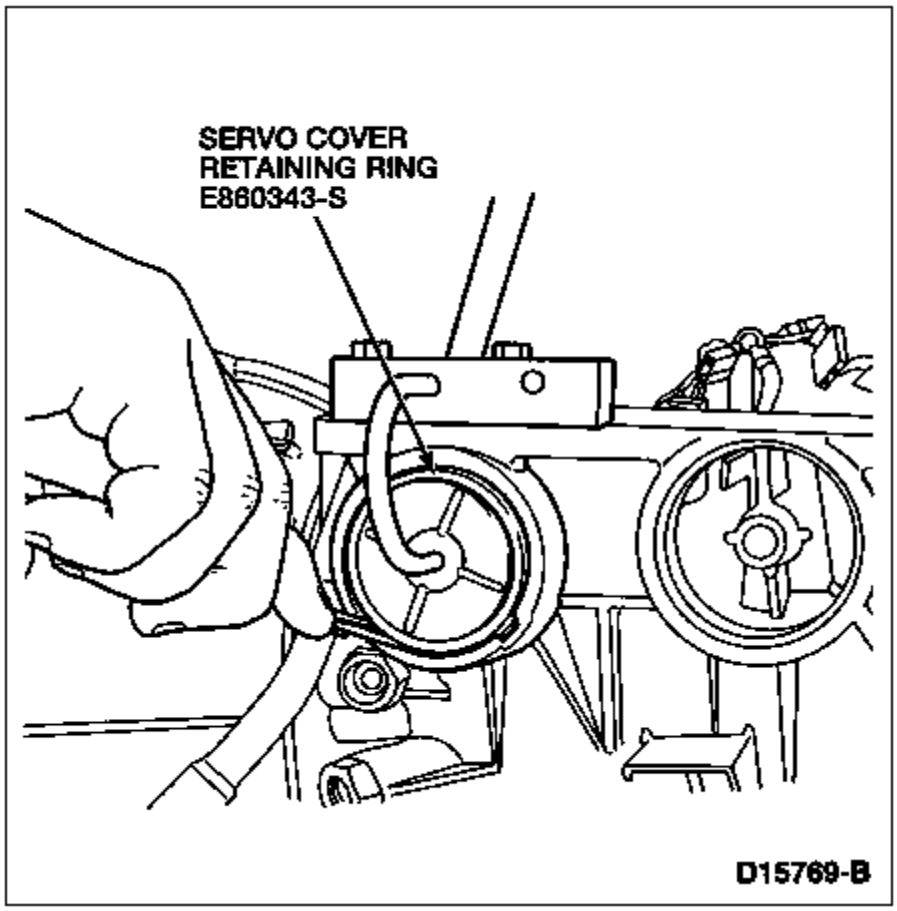
87. Use a 1/2-inch wrench to tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



88. Carefully install the servo cover retaining ring.

tomsn048@gmail.com



89. **CAUTION: The servo cover is under spring tension.**

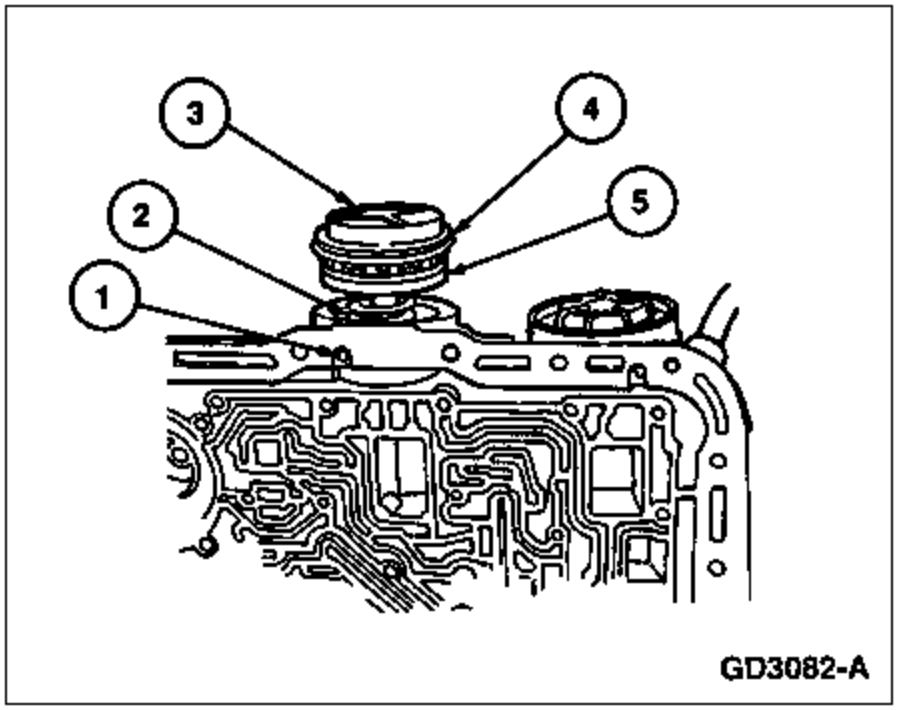
    Carefully back off the nut on the J-hook until the servo spring is unloaded.

90. Remove Servo Cover Compressor T95L-77028-A.

91. **CAUTION: Do not damage the intermediate servo cover to case O-ring during installation. Do not press the intermediate servo cover and seal assembly and O-ring past the relief hole in the case. O-ring damage may occur.**

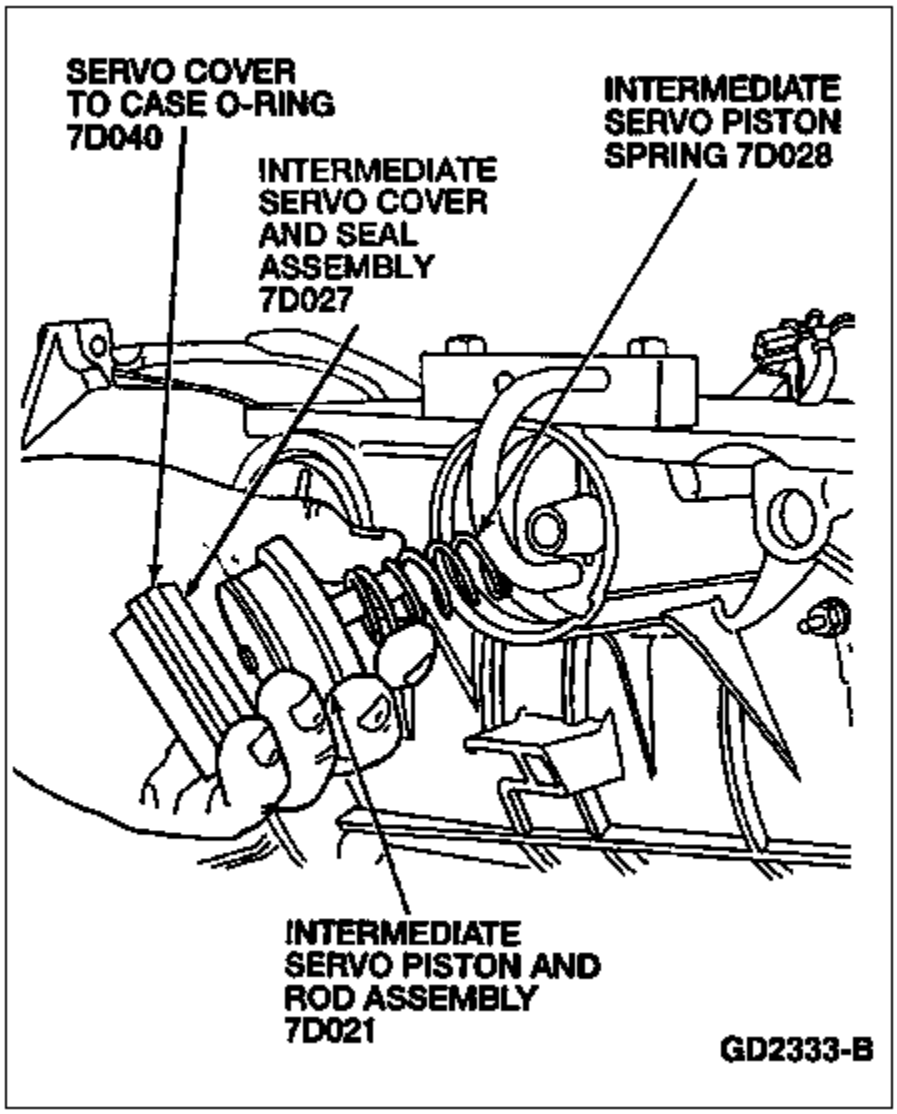
    Install the intermediate servo piston spring, servo piston and rod assembly, servo cover to case O-ring with servo cover assembly with O-ring.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Relief Hole (Part of 7005)
2	7D028	Intermediate Servo Piston Spring
3	7D027	Intermediate Servo Cover and Seal Assembly
4	7D040	Intermediate Servo O-Ring
5	7D021	Intermediate Servo Piston and Rod Assembly

tomsn048@gmail.com

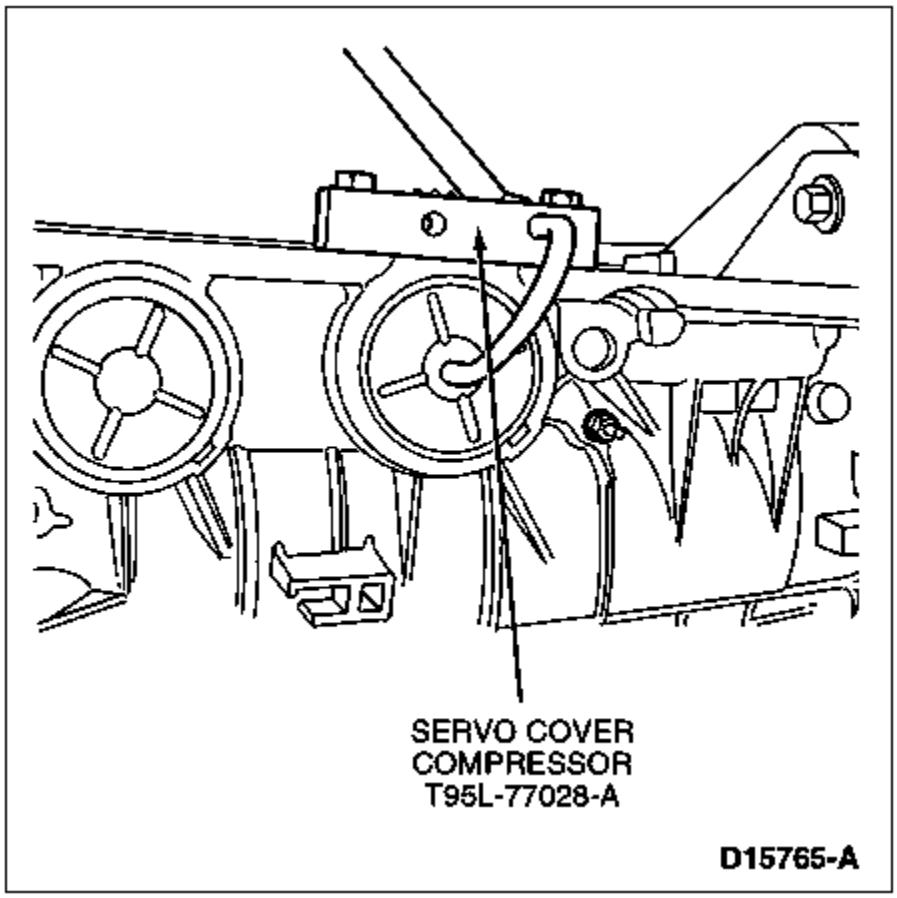


92. **NOTE: The J-hook must be in the appropriate hole for the servo being removed, and tool number should be facing up.**

    Install Servo Cover Compressor T95L-77028-A over the intermediate servo cover at the fluid pan rail. Tighten the screws.

93. Use a 1/2-inch wrench to tighten the nut on the J-hook until there is a gap between the servo cover and the snap ring.

tomsn048@gmail.com



94. Carefully install the intermediate servo cover retaining ring.

tomsn048@gmail.com

95. **CAUTION: The servo cover is under spring tension.**

    Carefully back off the nut on the J-hook until the servo piston spring is unloaded.

96. Remove Servo Cover Compressor T95L-77028-A.

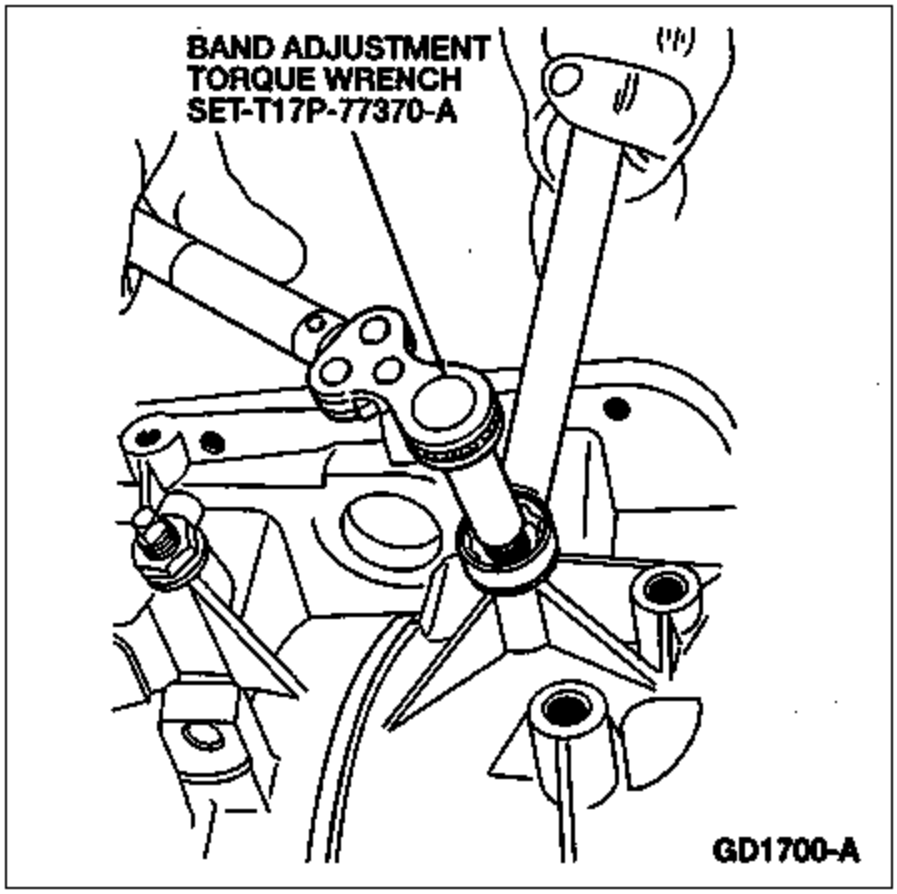
97. **CAUTION: Install, but do not tighten, a new locknut on the band adjusting screw. Apply petroleum jelly to the locknut seal.**

    CAUTION: The front servo must be installed prior to band adjustment.

    Install a new locknut.

    Tighten the front band adjusting screw using Band Adjustment Torque Wrench Set T71P-77370-A. The wrench will click at 14 Nm (10 lb-ft). Back off the band adjusting screw exactly two (2) turns and hold that position. Tighten the front band locknut to 47-61 Nm (35-45 lb-ft) using a 19 mm wrench.

tomsn048@gmail.com



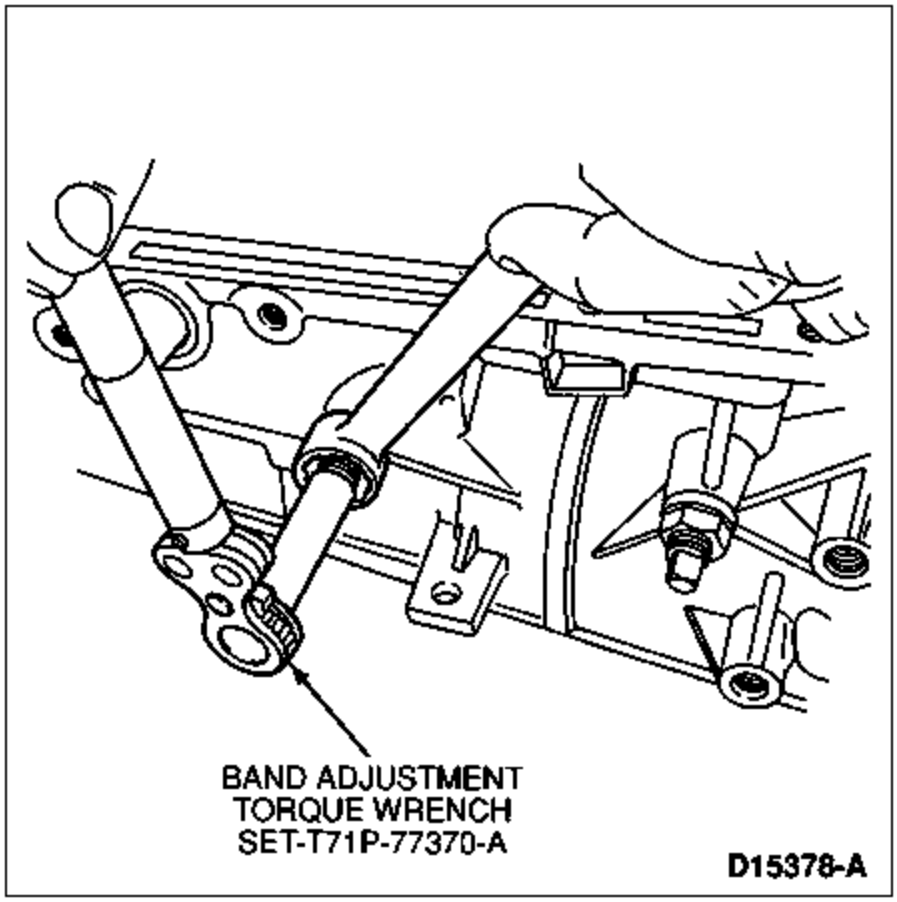
98. **CAUTION: Install, but do not tighten, a new locknut on the band adjusting screw. Apply petroleum jelly to the locknut seal.**

CAUTION: Intermediate servo must be installed prior to band adjustment.

Install a new locknut.

Tighten the intermediate band adjusting screw using Band Adjustment Torque Wrench Set T71P-77370-A. The wrench will click at 14 Nm (10 lb-ft). Back off the band adjusting screw exactly two and one-half (2 1/2) turns and hold that position. Tighten the intermediate band locknut to 47-61 Nm (35-45 lb-ft) using a 19 mm wrench.

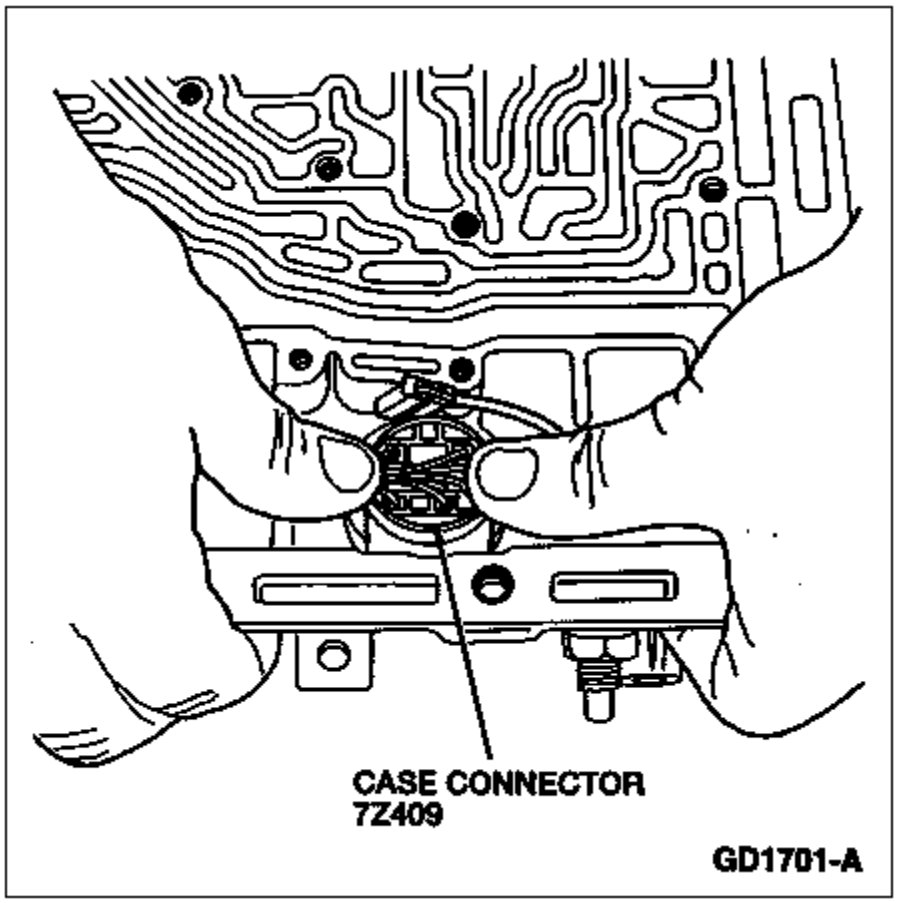
tomsn048@gmail.com



99. **NOTE: Make sure the tab is in the lock position.**

Inspect O-rings (W703015-S300) for damage. Replace if damaged. Lubricate and install the 16-pin connector assembly through the case until a click is heard.

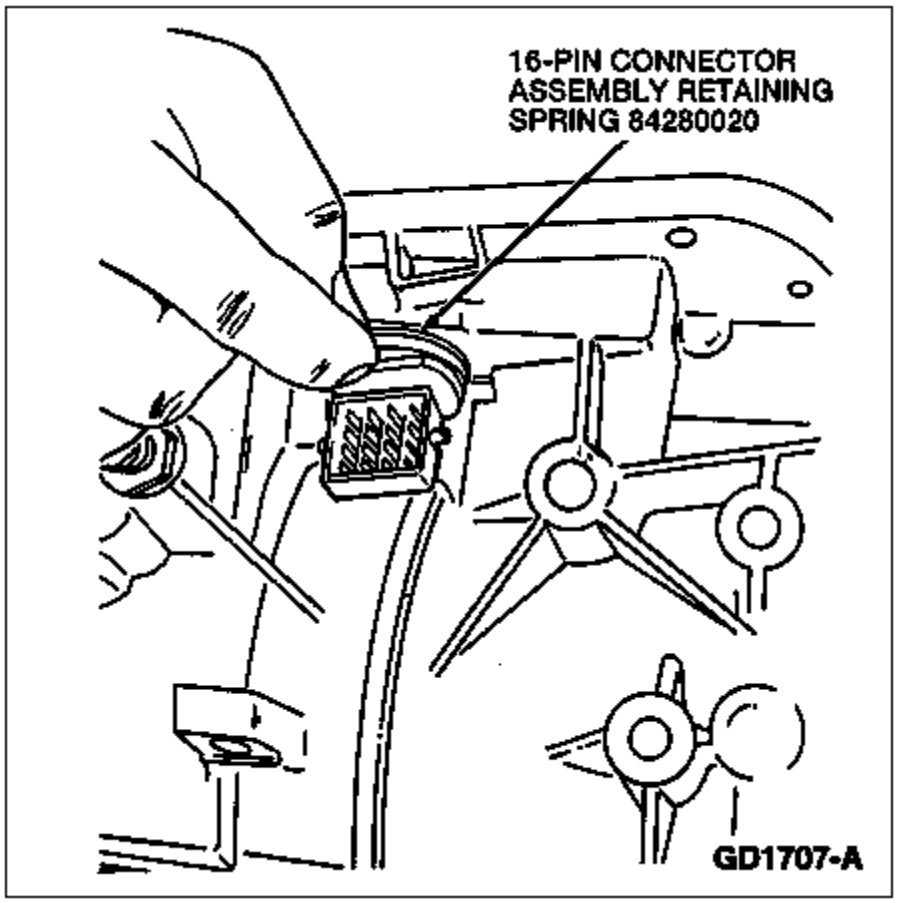
tomsn048@gmail.com



100. **CAUTION: Do not overstretch the 16-pin connector assembly retaining spring.**

Install the 16-pin connector assembly retaining spring.

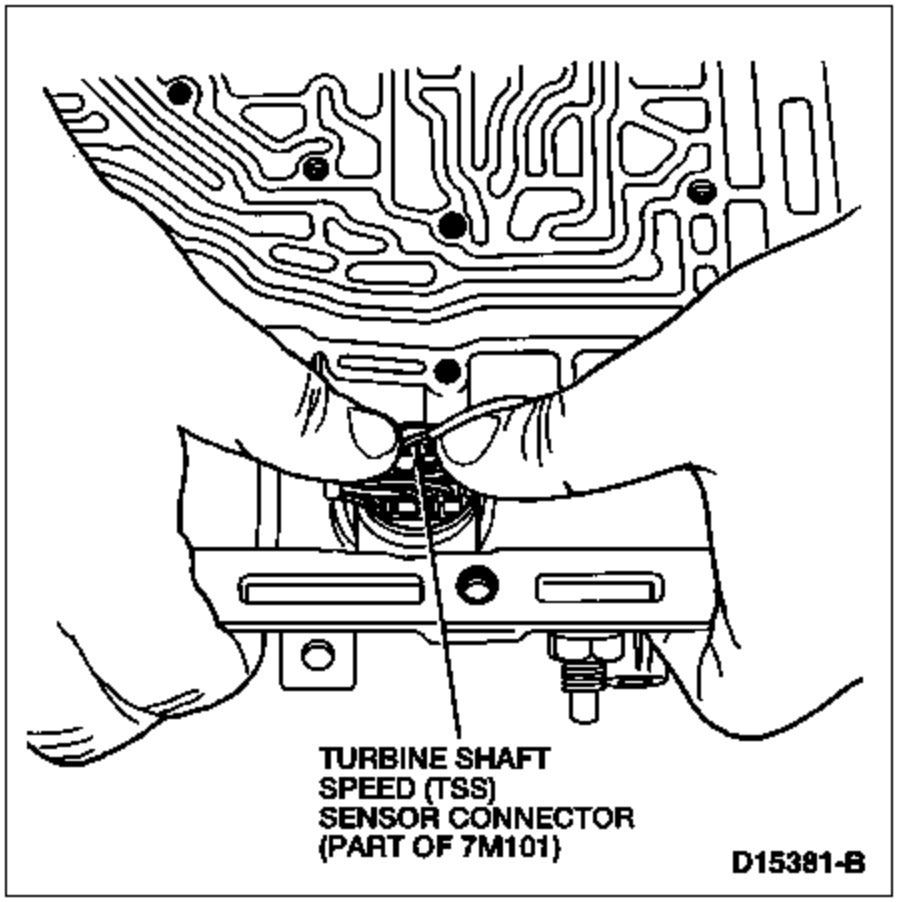
tomsn048@gmail.com



101. **NOTE: Align the slot on the turbine shaft speed (TSS) sensor connector with the slot on the 16-pin connector assembly.**

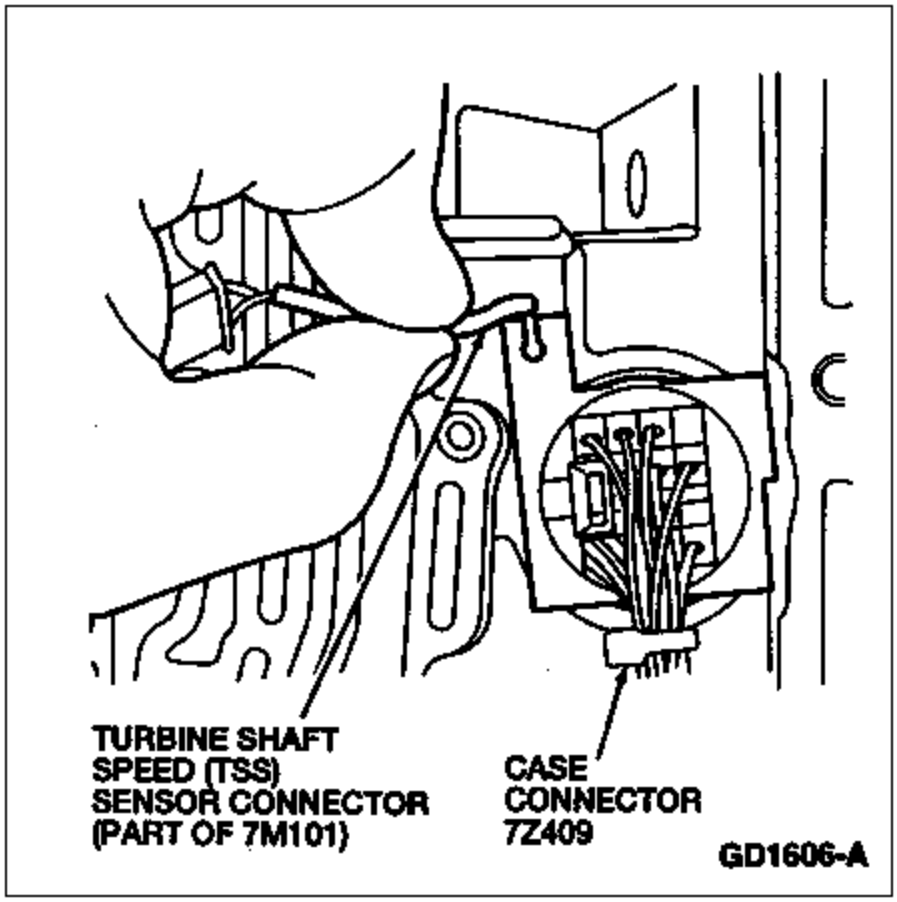
Carefully install the TSS sensor connector into the 16-pin connector assembly.

tomsn048@gmail.com



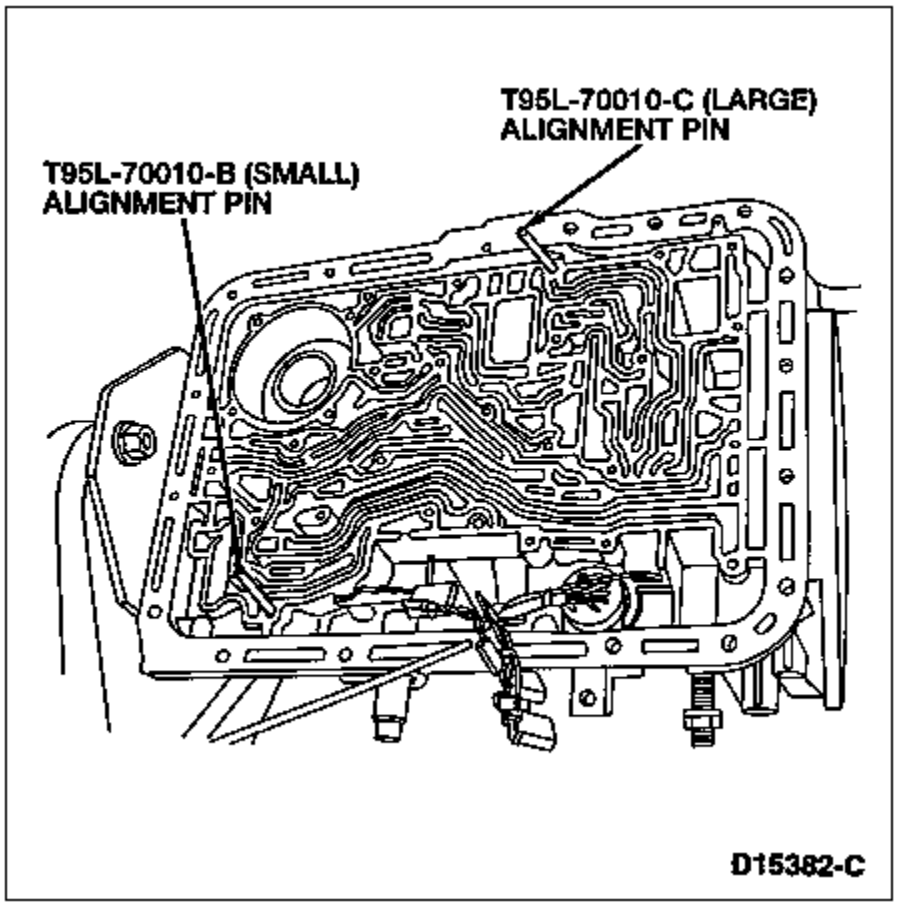
102. Carefully insert TSS sensor connector wires into the retaining slot on the 16-pin case connector.

tomsn048@gmail.com



103. Install the valve body guide pins into the case in the positions shown.

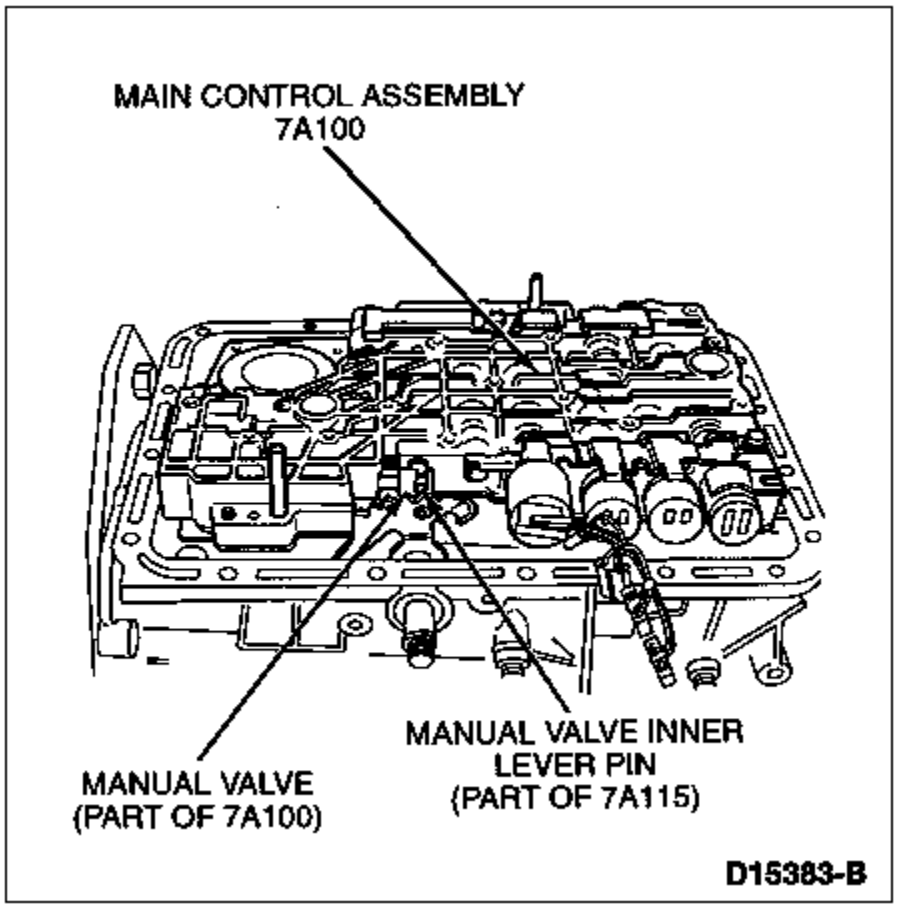
tomsn048@gmail.com



104. **NOTE: Ensure main control assembly gasket is properly aligned.**

Install the main control assembly on the case. Align the manual valve with the manual valve inner lever pin as shown.

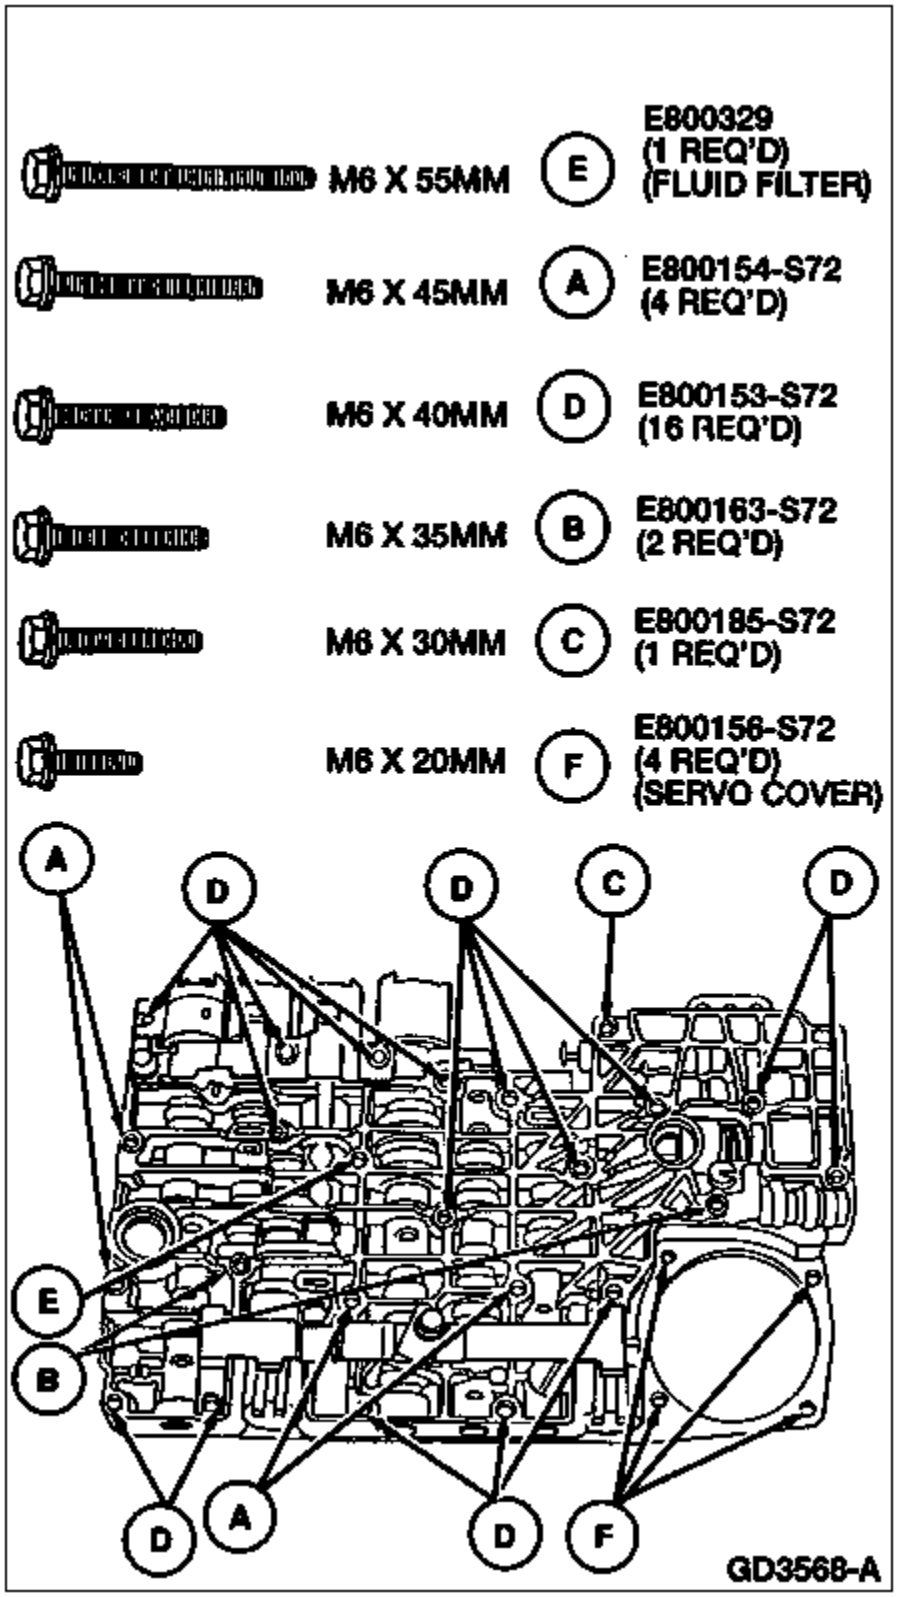
tomsn048@gmail.com



105. Install four M6 x 45 mm main control assembly-to-case screws in location A. Fingertighten.

Main Control Assembly Screws and Locations

tomsn048@gmail.com



106. Install two M6 x 35 mm main control assembly-to-case screws in location B. Fingertighten.

107. Install one M6 x 30 mm main control assembly-to-case screw in location C. Fingertighten.

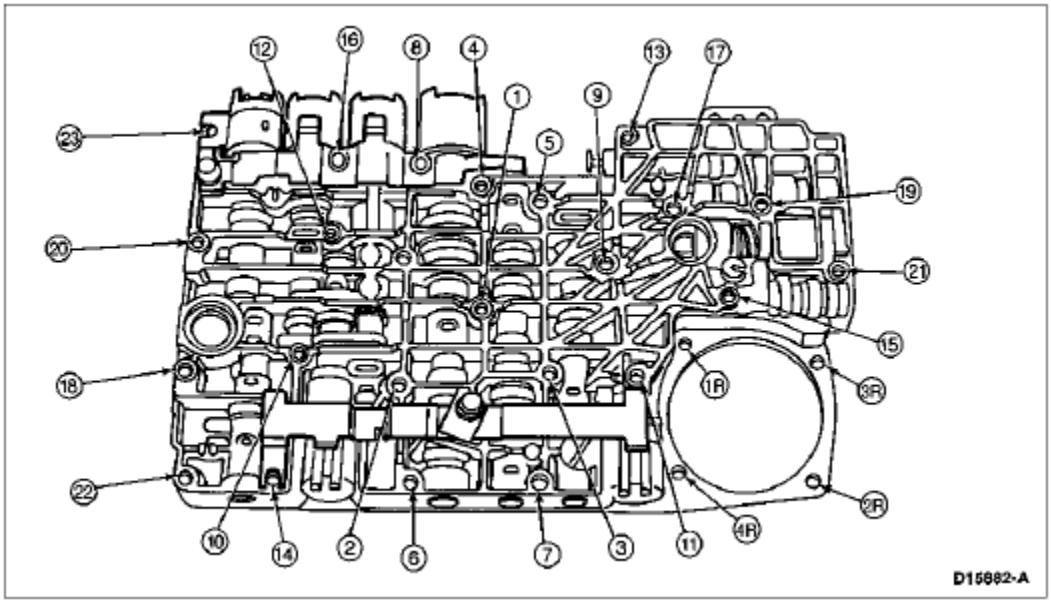
tomsn048@gmail.com

108. Remove both Valve Body Guide pins T95L-70010-B and T95L-70010-C.

109. Install sixteen M6 x 40 mm main control assembly-to-case screws in location D. Fingertighten.

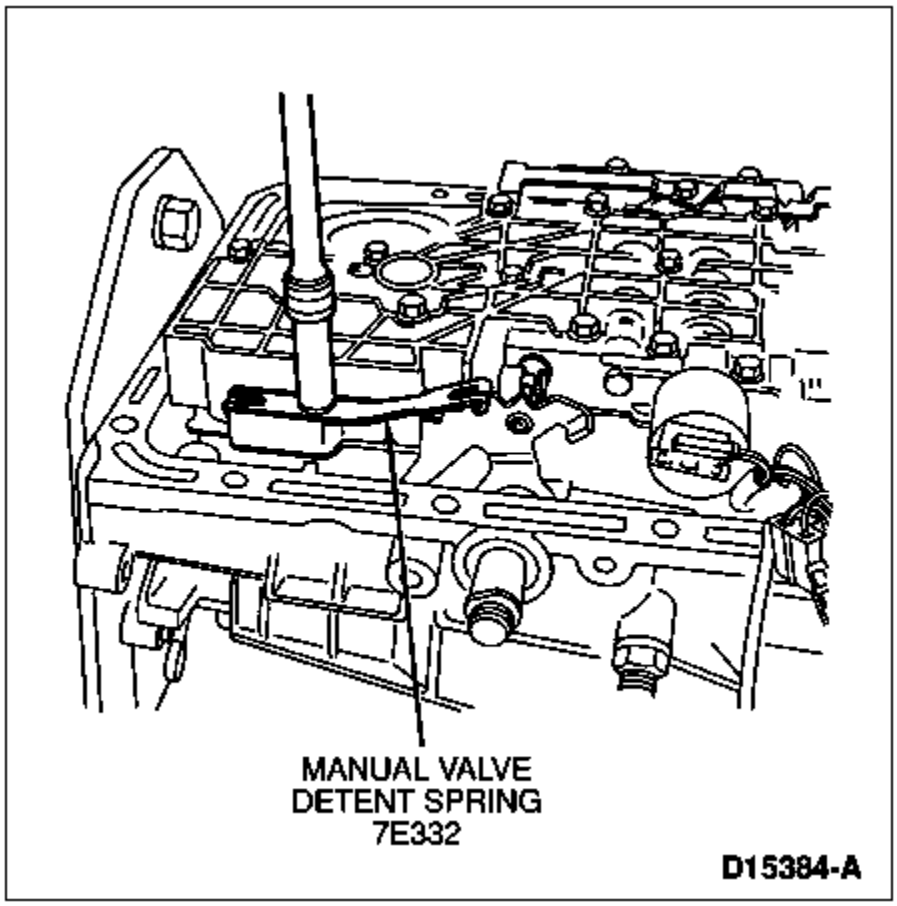
110. Tighten all main control assembly-to-case screws including reverse servo cover sequence (1R, 2R, 3R and 4R), to 8-11 Nm (71-97 lb-in) in sequence shown, using a 10mm socket wrench.

Tightening Sequence



111. Install the manual valve detent spring. Install the manual valve detent spring screw in location A. Tighten the manual valve detent spring screw to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com



112. **NOTE: Perform Steps 105 through 112 only if low/rear reverse servo piston and rod is to be checked.**

Remove the low/reverse servo piston and rod from the case.

113. **NOTE: An A4LD Reverse Servo Return Spring D4ZZ-7D031-A is to be used only as a test spring.**

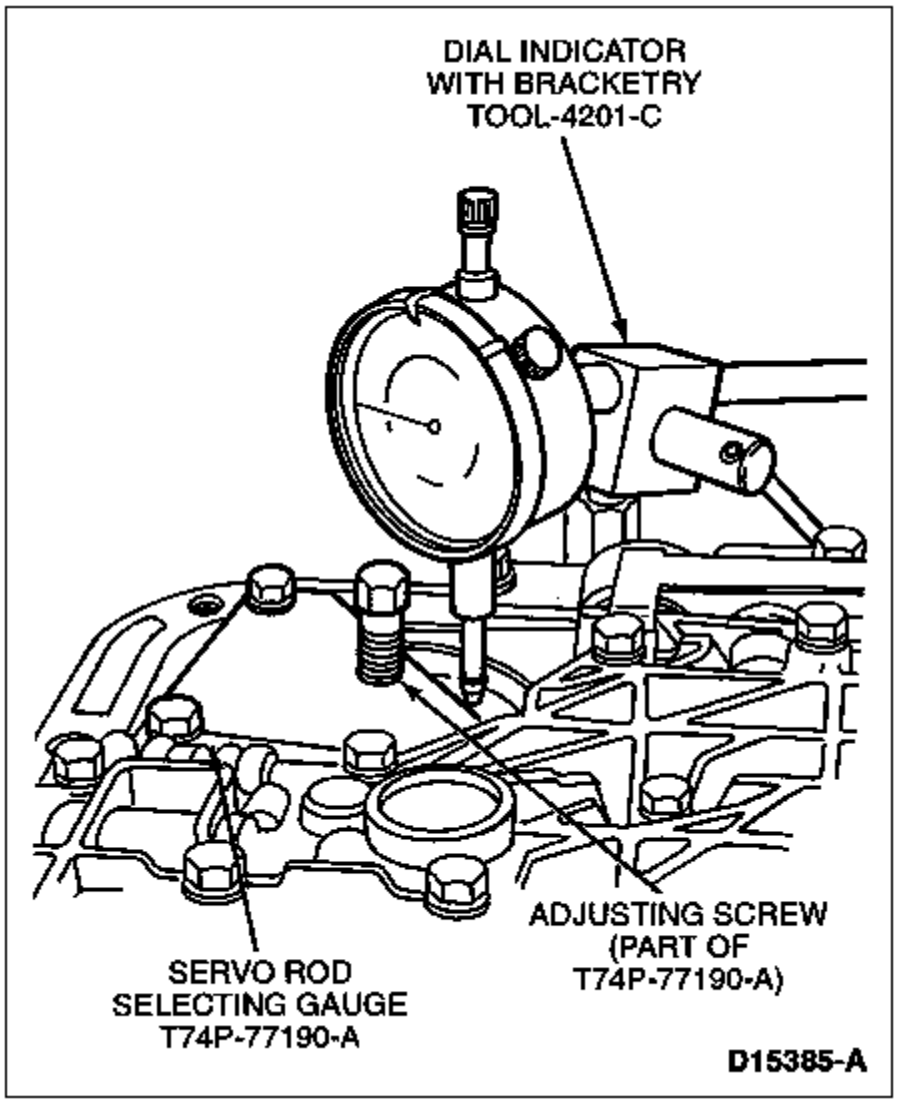
Install the low/reverse servo piston and rod into the servo bore along with a D4ZZ-7D031-A reverse servo return spring.

114. Install a new low/reverse servo separator plate cover gasket. Install Servo Rod Selecting Gauge T74P-77190-A and tighten with the three screws.

115. Tighten the servo gauge adjusting screw to 4 Nm (35.5 lb-in).

116. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent on the transmission case. Position the indicator on the piston pad. Set the dial indicator to zero.

tomsn048@gmail.com



117. **NOTE: If the piston travel in this step is 3-5.6 mm (0.120-0.220 inch), it is within specification. If the piston travel is greater than 5.6mm (0.220 inch), use the next longer piston and rod. If the piston travel is less than 3 mm (0.120 inch), use the next shorter piston and rod.**

Back out the servo gauge adjusting screw until it bottoms out on the tool. Record the distance the servo piston traveled.

118. **CAUTION: Make sure the test spring is removed after this step.**

Use the above procedure to check the piston travel with the newly selected reverse band servo piston and rod (if required) to make sure that the piston travel is 3-5.6 mm (0.120-0.220 inch).

Remove the servo gauge and the reverse band servo return spring.

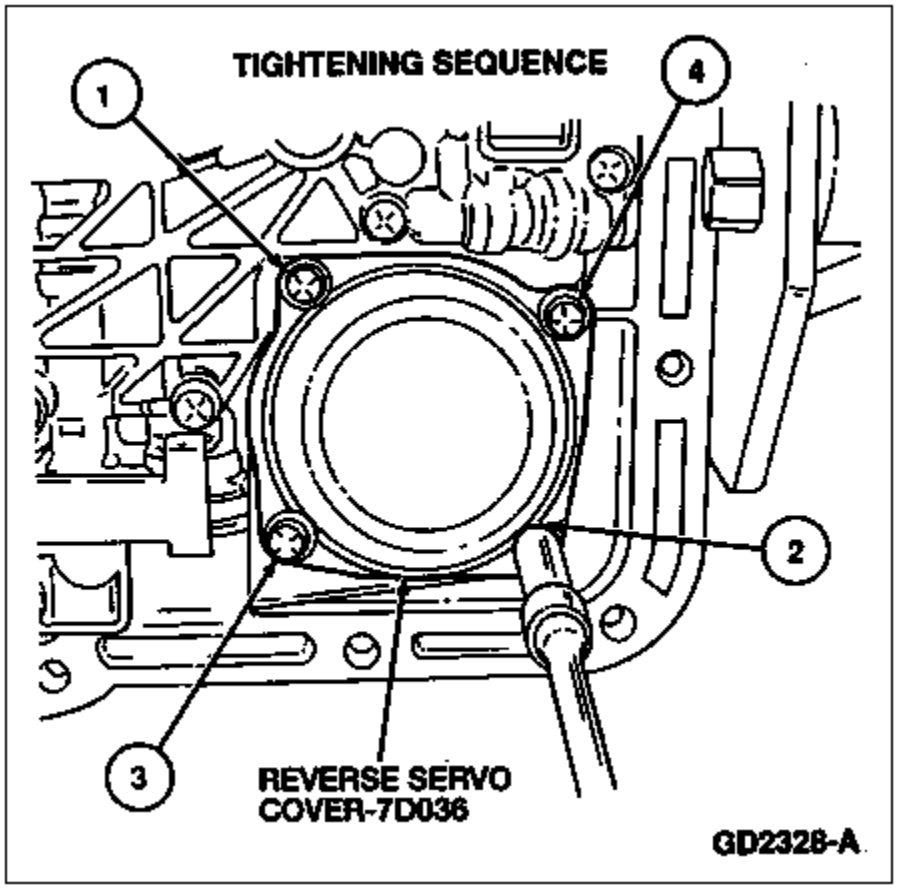
NOTE: Grooves are located on reverse servo rod.

tomsn048@gmail.com

Length — mm	Length — Inches	I.D.
54/53	2.112/2.085	1 Groove
51/50	2.014/1.986	No Groove
49/48	1.915/1.888	2 Grooves

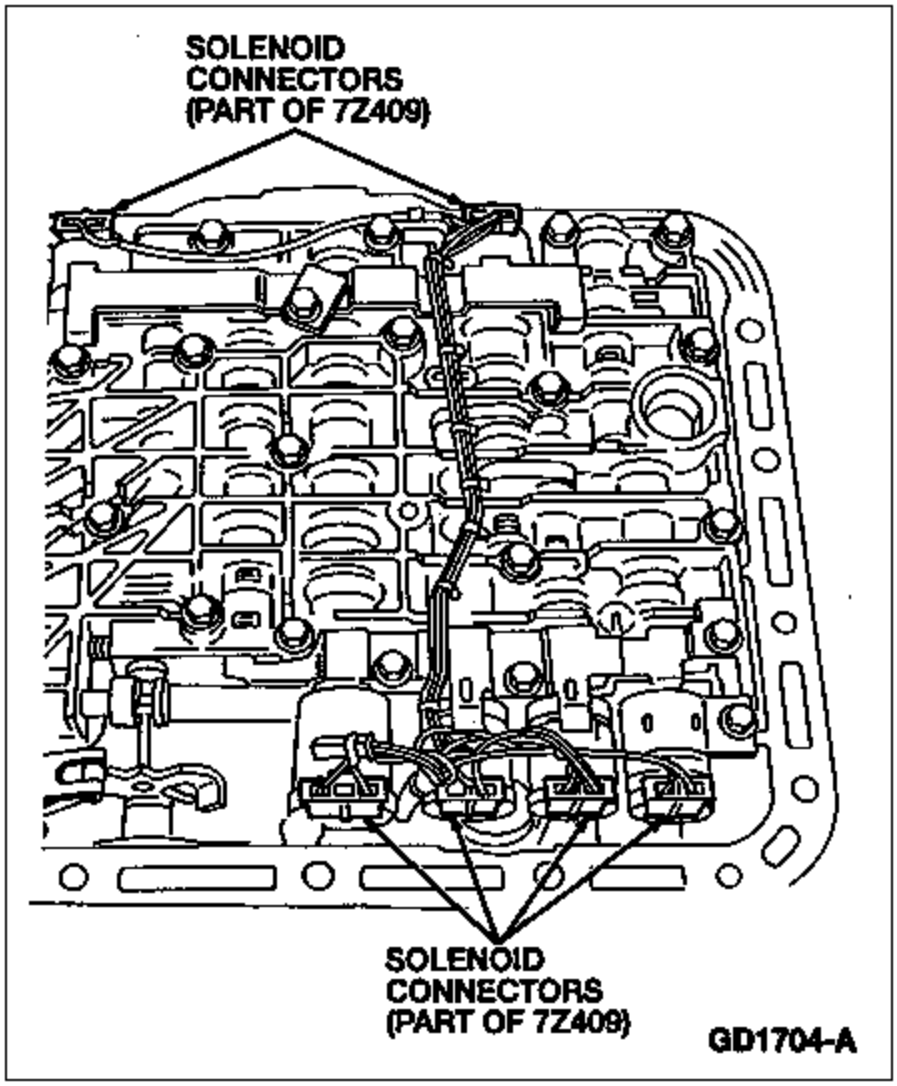
119. **CAUTION: The reverse servo test spring must be removed.**

Install the low/reverse servo cover and the four low/reverse servo cover-to-case screws. Tighten the low/reverse servo cover-to-case screws to 12-14 Nm (106-124 lb-in) in the sequence shown.



120. Carefully press down to install the solenoid connectors on the solenoids as shown.

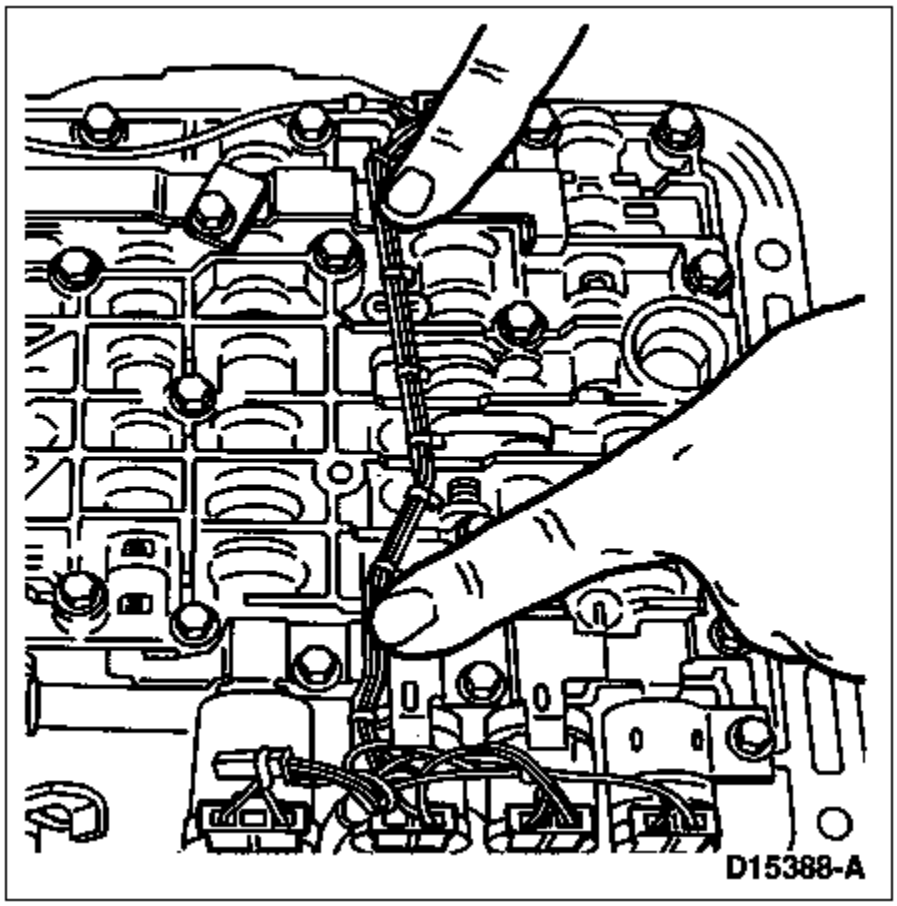
tomsn048@gmail.com



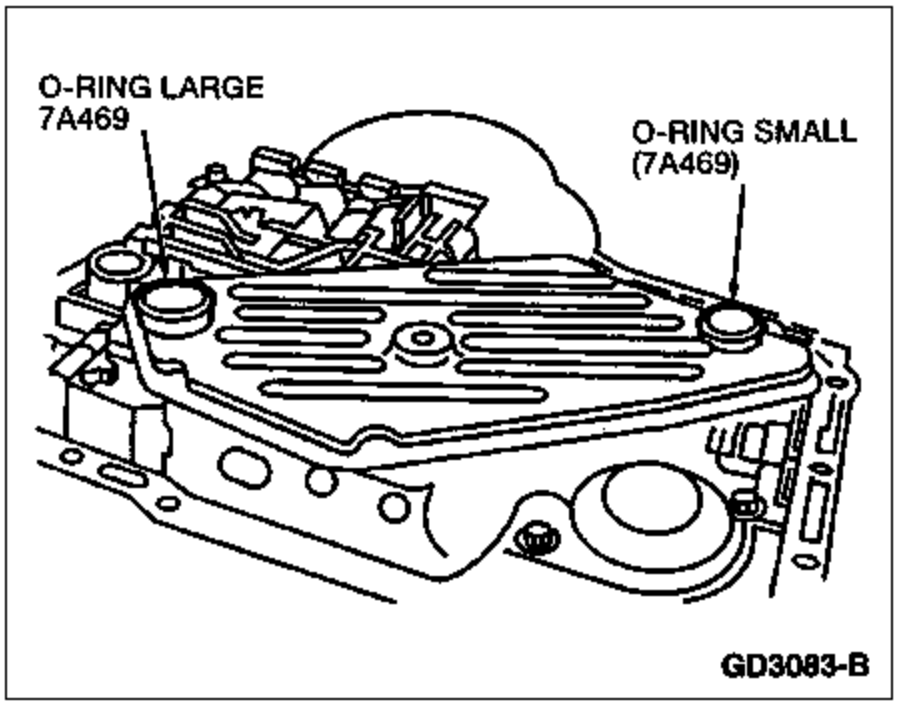
121. **CAUTION: Excessive pressure may break the locating pins.**

Install the wiring loom protector and guide. Align the pins in the holes of the solenoid clamps and gently push down.

tomsn048@gmail.com



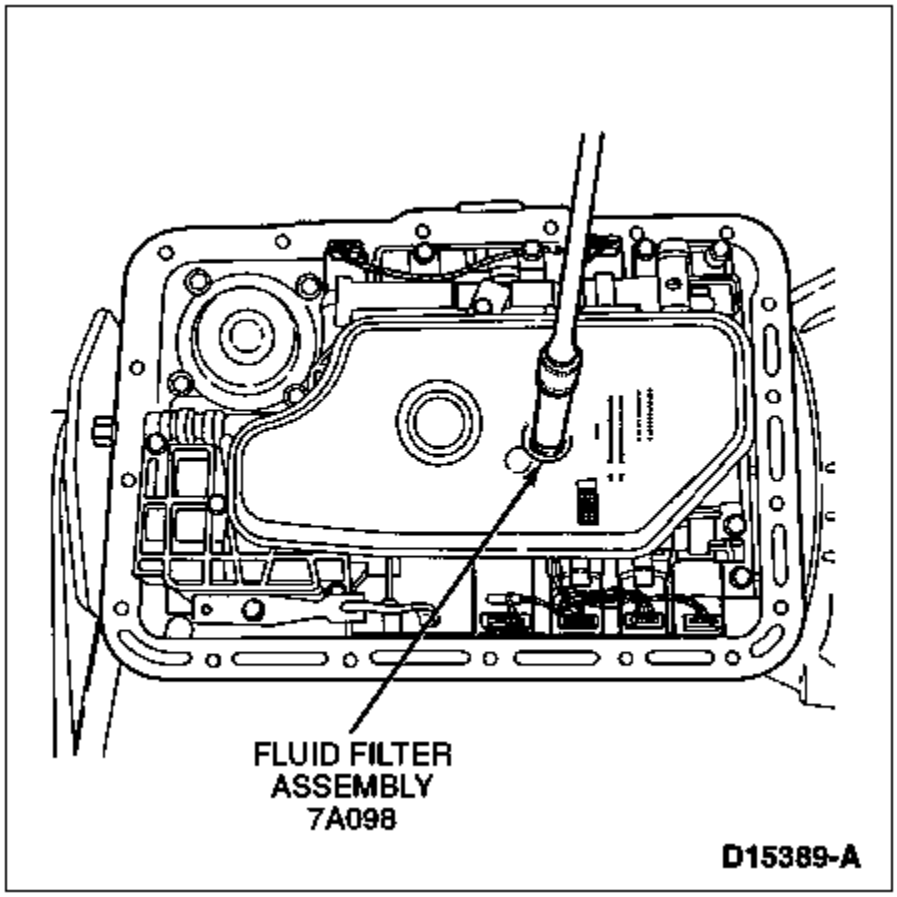
122. Ensure that both O-rings are properly installed on filter prior to installation.



tomsn048@gmail.com

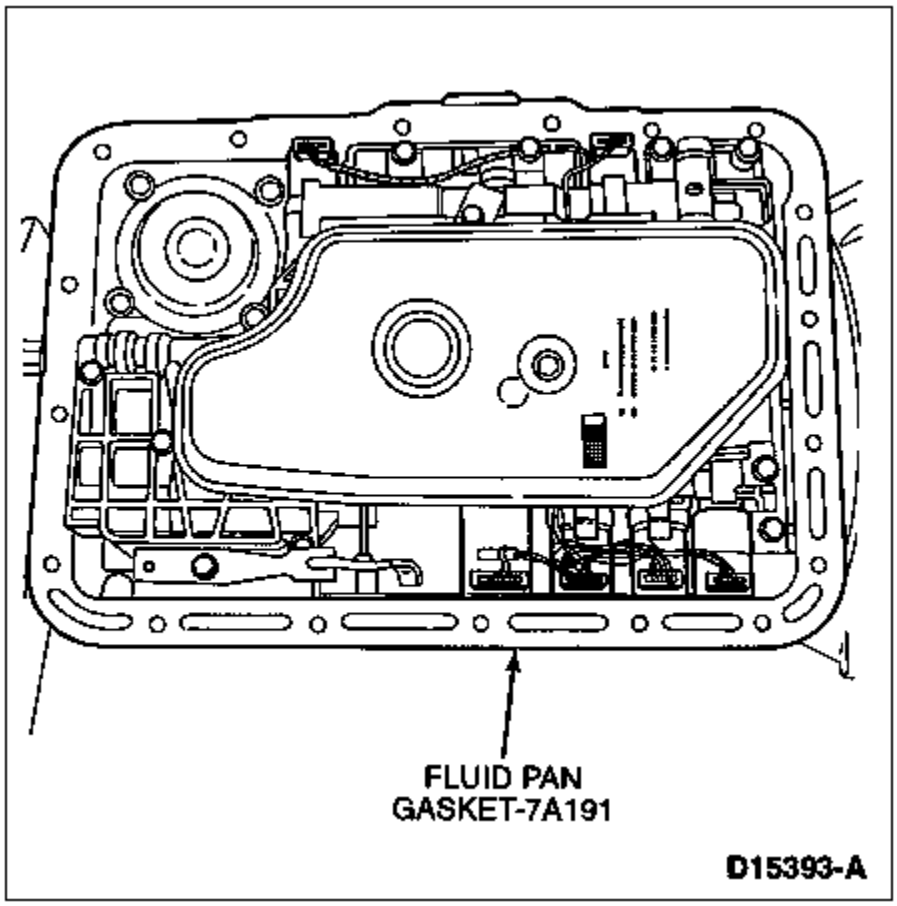
123. **CAUTION: Lubricate the fluid filter O-rings with MERCON V® XT-5-QM or equivalent approved fluid, or they may be damaged.**

Lubricate and install new O-rings onto filter assembly. Install a new fluid filter assembly into the main control assembly. Install one "E" length M6 x 55 fluid filter assembly-to-main control assembly screw and tighten to 8-11 Nm (71-97 lb-in).



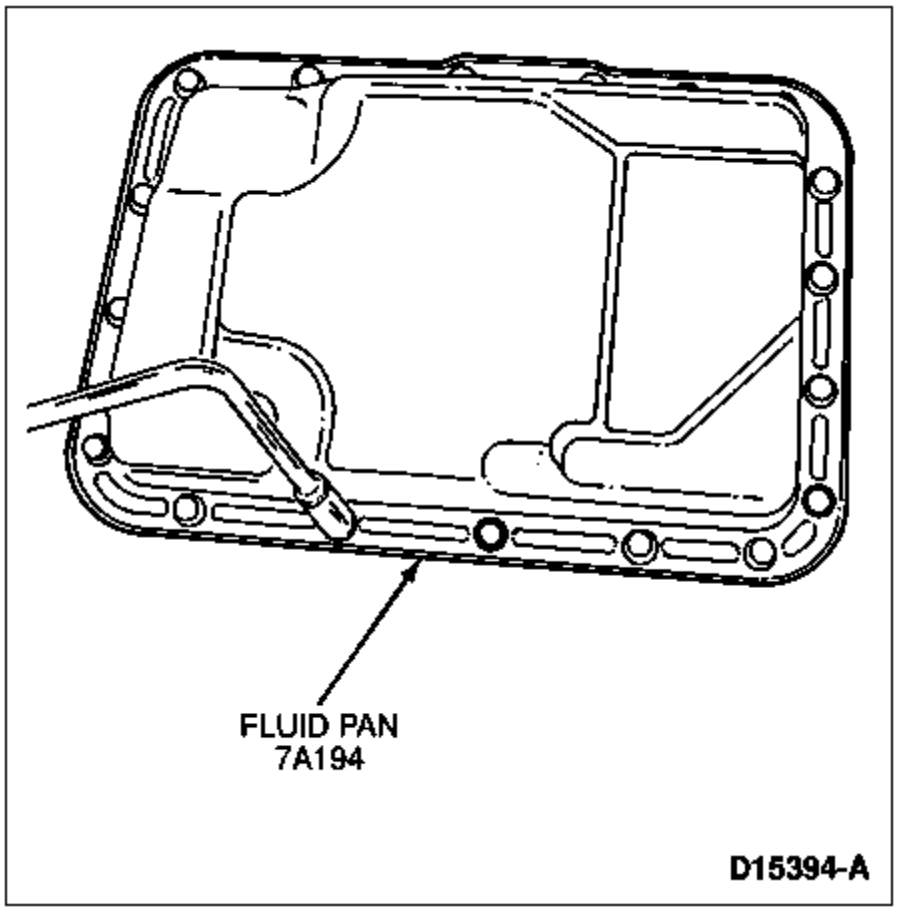
124. Position a new fluid pan gasket on the case fluid pan rail.

tomsn048@gmail.com



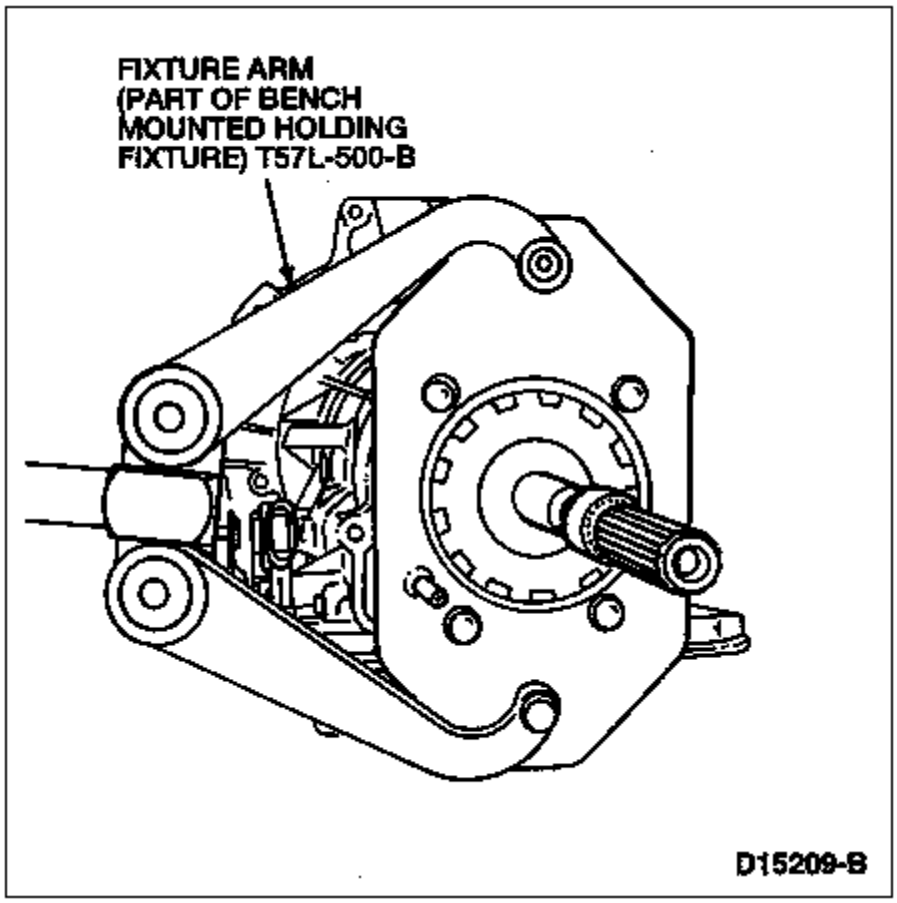
125. Install the fluid pan on top of the gasket. Use a 13 mm socket wrench to install the eighteen M8 x 16 mm fluid pan-to-case screws. Tighten the fluid pan-to-case screws to 13-15 Nm (115-133 lb-in).

tomsn048@gmail.com



126. Remove the transmission from the bench fixture pivot. Place the transmission on a flat surface. Remove the fixture and adapter plate.

tomsn048@gmail.com



127. **CAUTION: Make sure the parking lever actuating rod is correctly seated into the case parking rod guide cup.**

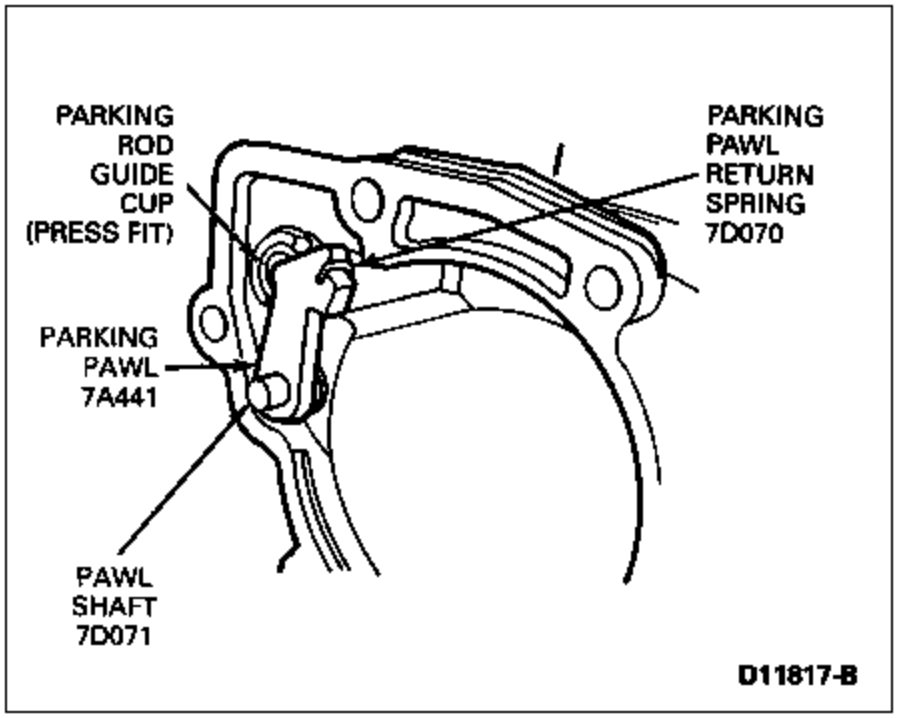
NOTE: Use petroleum jelly to hold the gasket in place.

NOTE: The guide cup is press-fit into the extension housing and is not serviced separately.

Install a new extension housing gasket on the case.

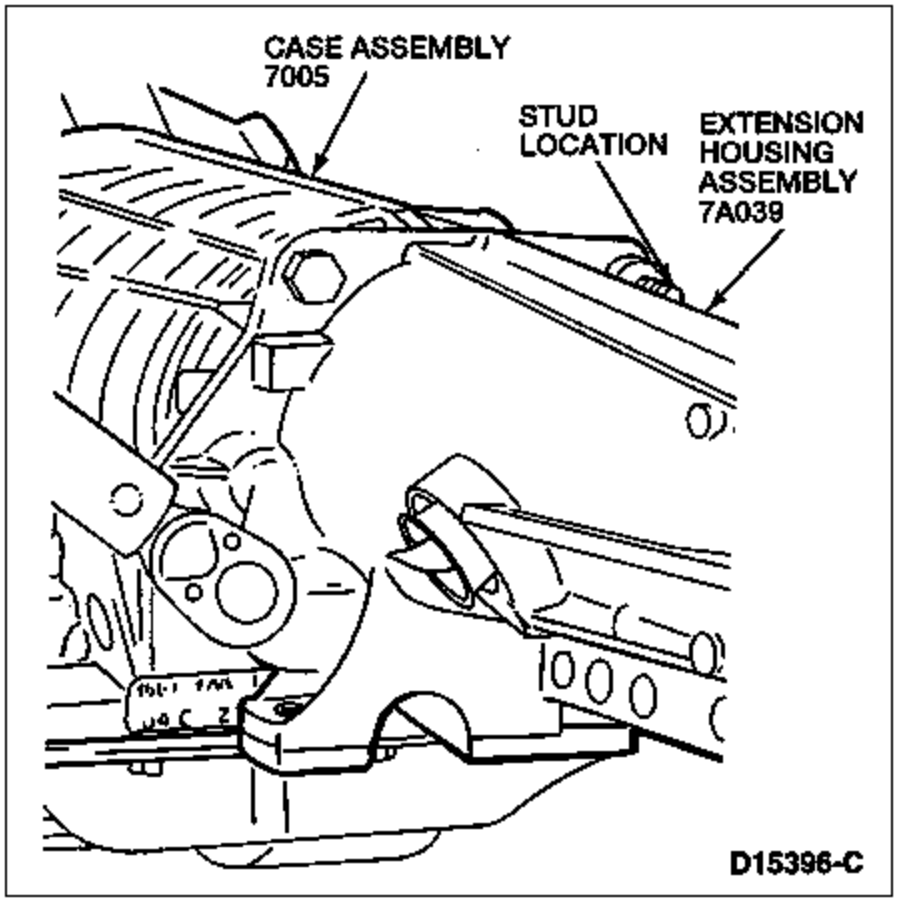
128. Install the parking pawl, pawl return spring and pawl shaft into the extension housing.

tomsn048@gmail.com



129. Install the extension housing. Install the five M10 x 30 mm extension housing-to-case screws and one stud. Tighten the extension housing-to-case screws and stud to 36-52 Nm (27-39 lb-ft).

tomsn048@gmail.com



130. **CAUTION: The lube hole in the bushing must be aligned with the lube groove in the extension housing.**

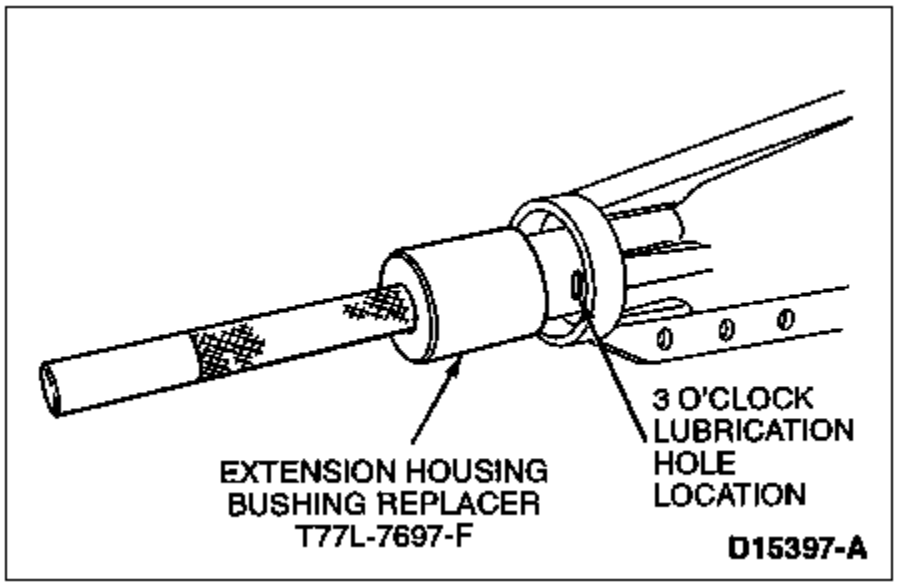
CAUTION: Tool will bottom when bushing is in the proper position.

NOTE: The lube hole should be located at the 3 o'clock position with view extension from the rear.

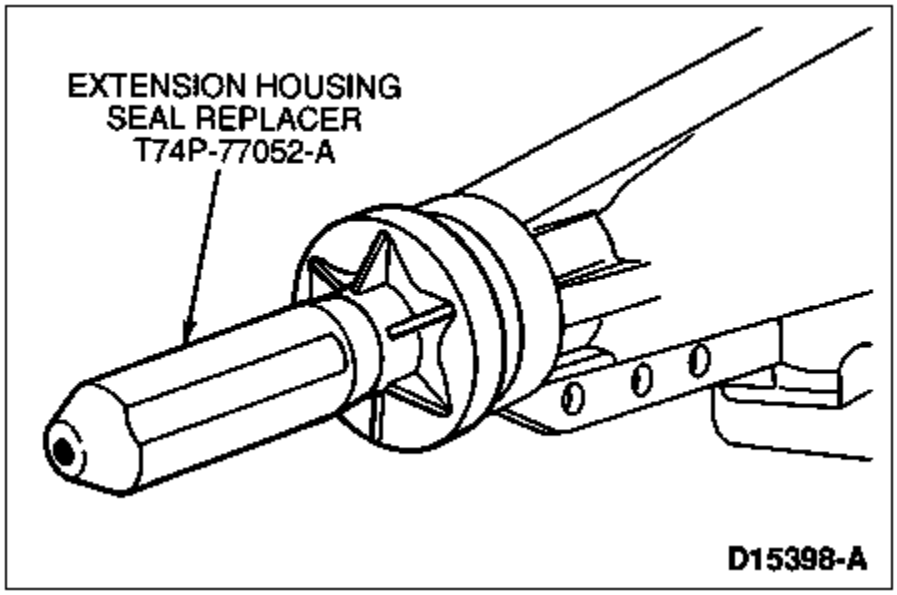
NOTE: Install the extension housing bushing only if it was removed in disassembly.

Install the extension housing bushing using Extension Housing Bushing Replacer T77L-7697-F.

tomsn048@gmail.com

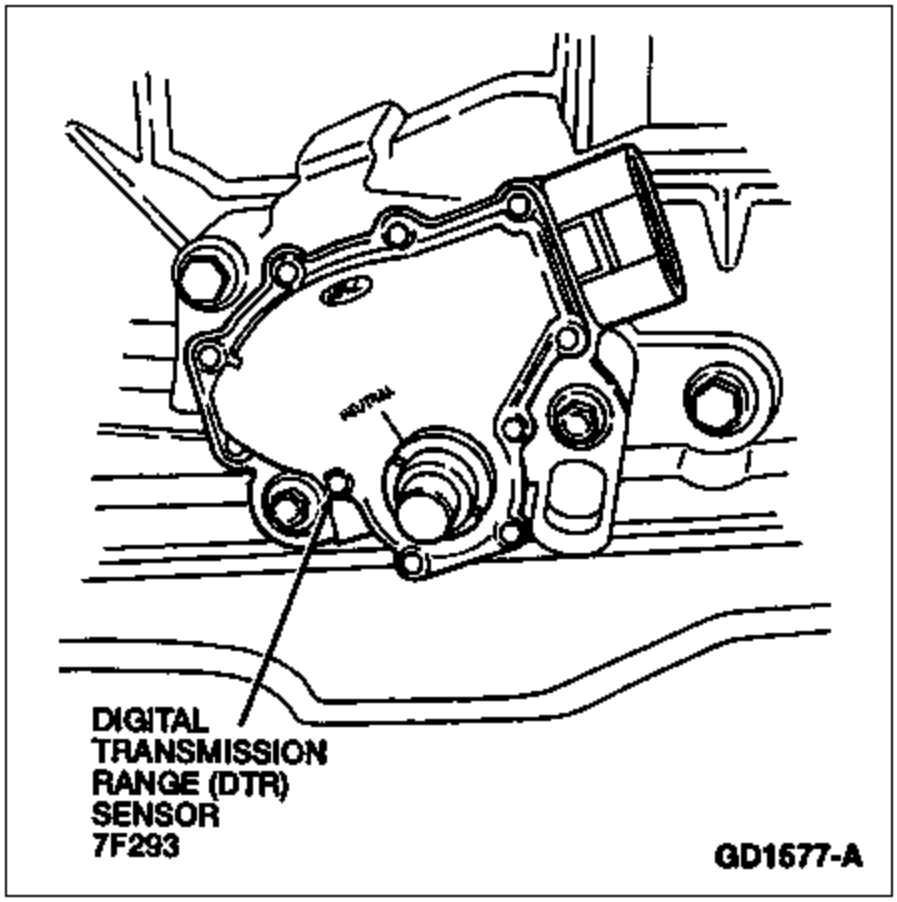


131. Position the extension housing seal drain hole at the 6 o'clock (down) position and install the extension housing seal using Extension Housing Seal Replacer T74P-77052-A.



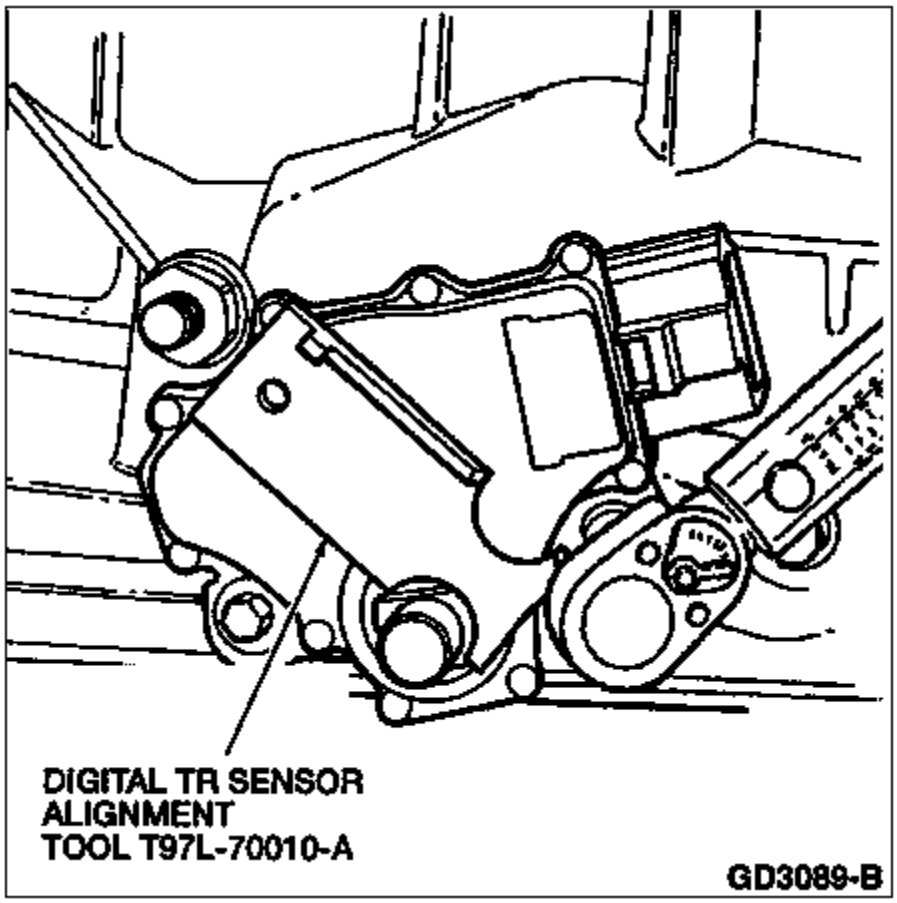
132. Install the digital transmission range (DTR) sensor on the manual lever. Install the two TR sensor screws and finger tighten. Rotate the manual lever to the neutral position (two detents rearward).

tomsn048@gmail.com



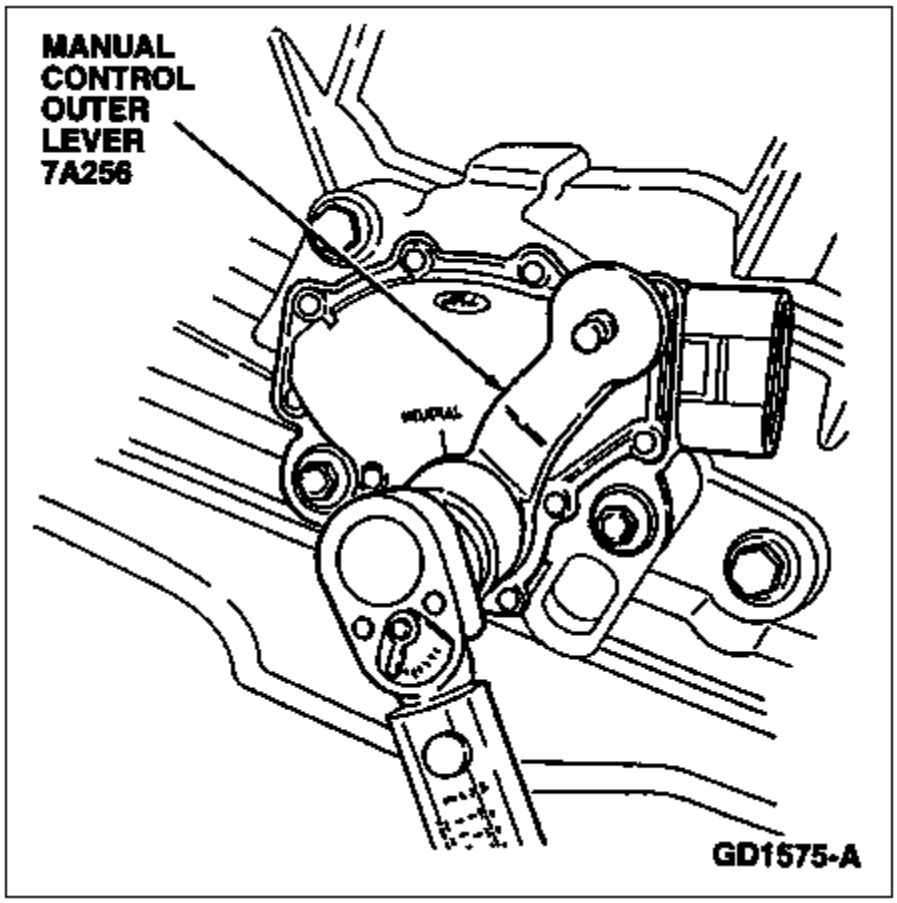
133. Install Digital TR Sensor Alignment Tool T97L-70010-A into the three slots on the DTR sensor. Tighten the TR sensor-to-case screws to 8-11 Nm (71-97 lb-in). Remove the alignment tool.

tomsn048@gmail.com



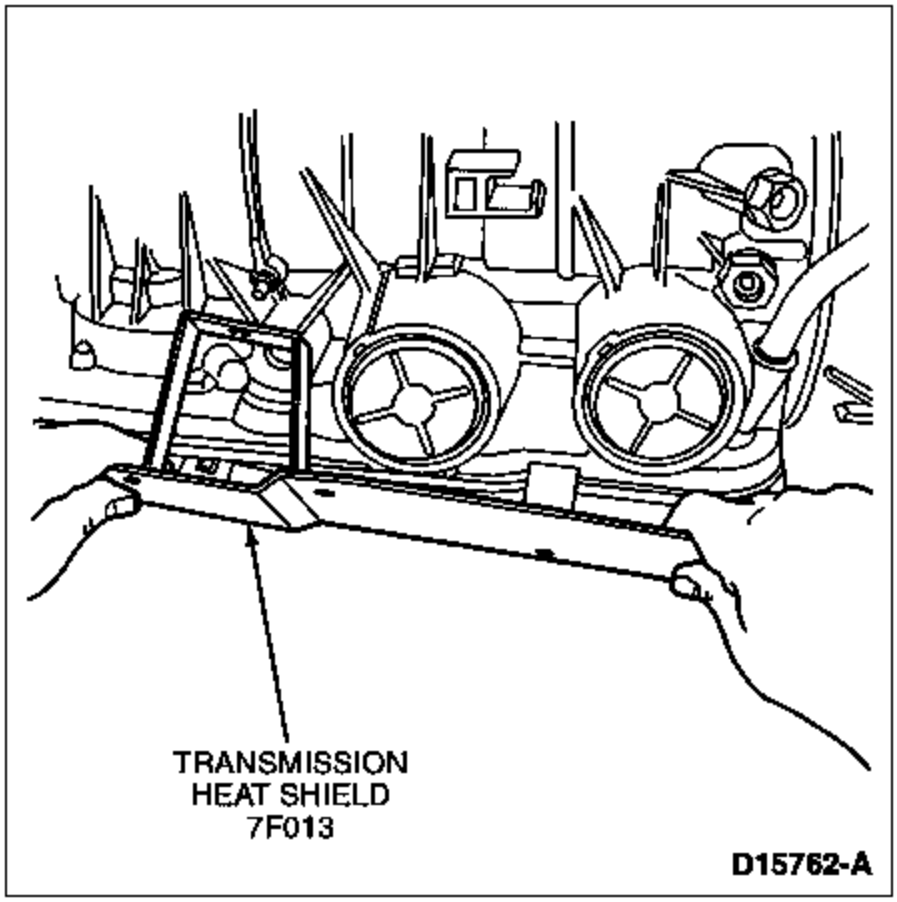
134. Install the manual control outer lever and manual control outer lever nut. Tighten the manual control outer lever nut to 41-54 Nm (30-40 lb-ft).

tomsn048@gmail.com



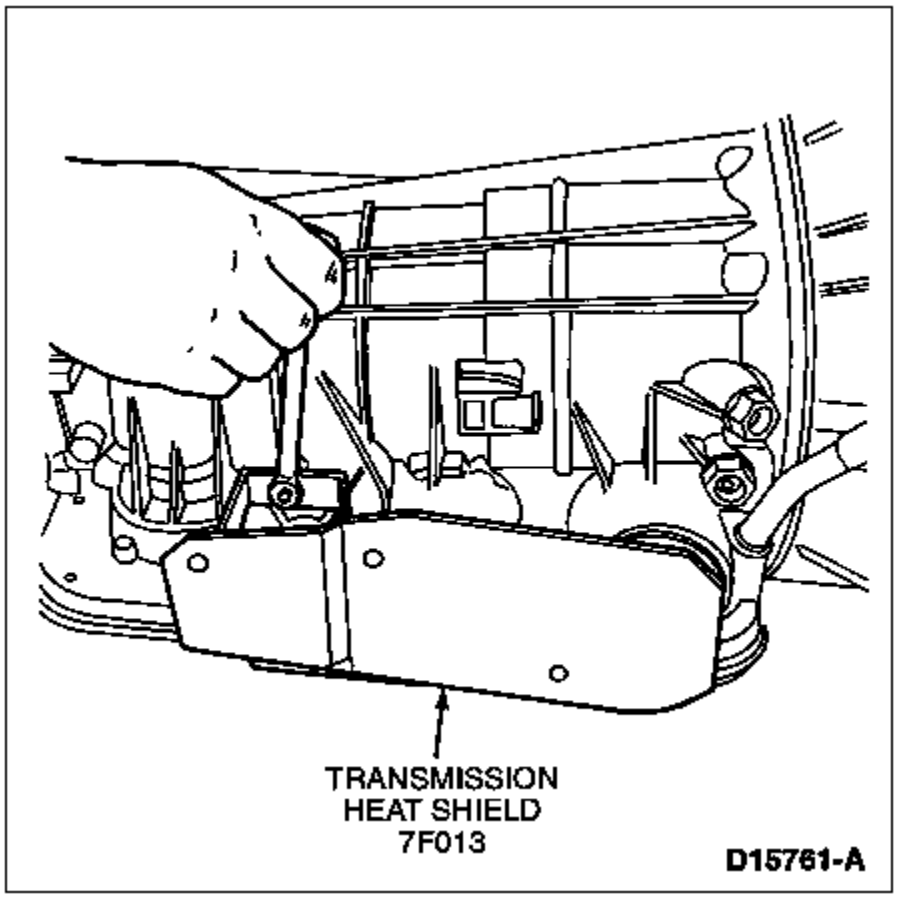
135. Align transmission heat shield retaining clips over fluid pan rail and install the heat shield on the fluid pan rail.

tomsn048@gmail.com



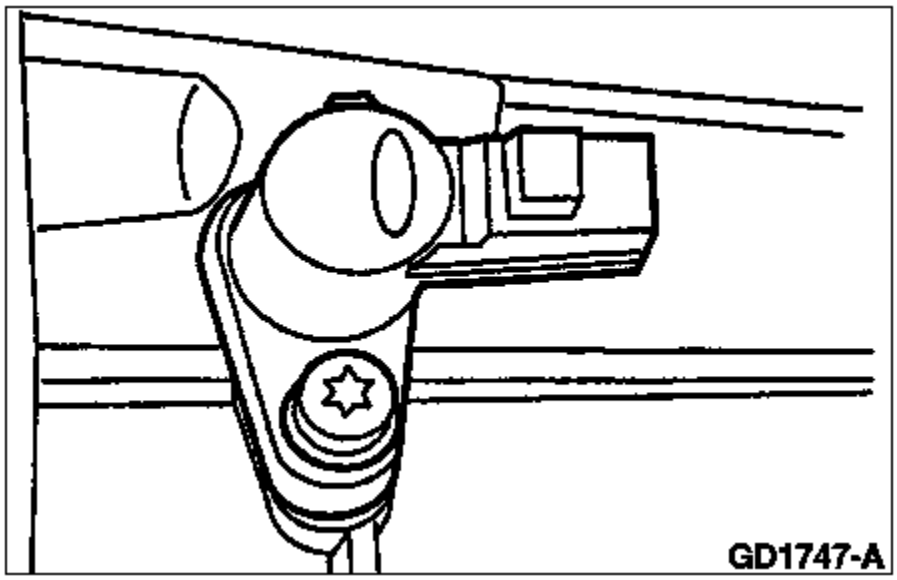
136. Install the transmission heat shield nut. Tighten the transmission heat shield nut to 8-11 Nm (71-97 lb-in).

tomsn048@gmail.com



137. Inspect O-ring (W702981) for damage. If damaged, replace O-ring.

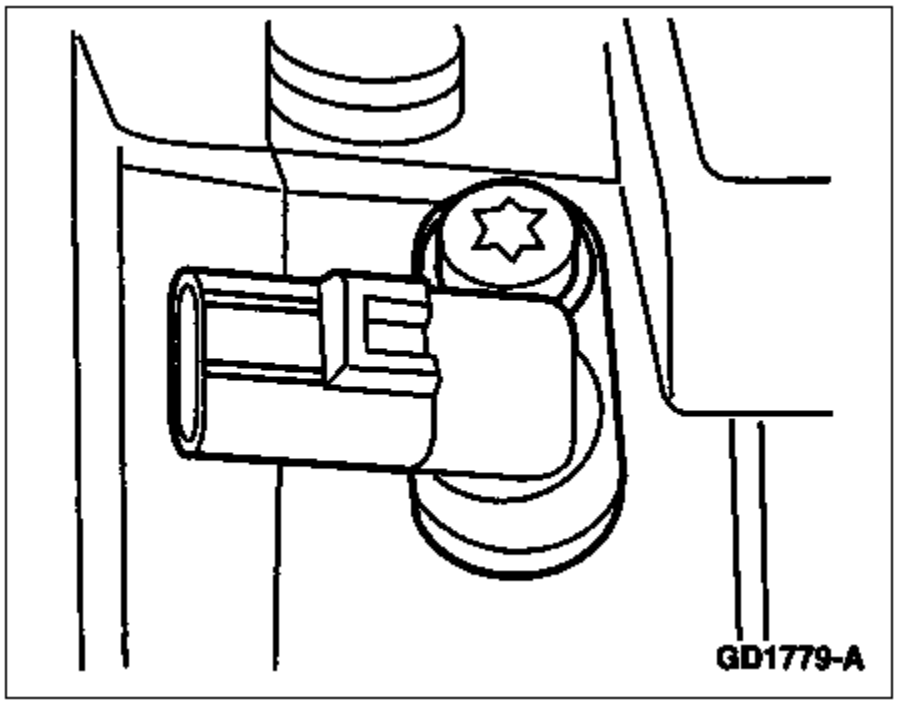
138. Install overdrive drum speed (7M183) sensor into case. Install attaching bolt and tighten to 8-11 Nm (71-97 lb-in).



tomsn048@gmail.com

139. Inspect O-ring (W702981) for damage. If damaged, replace O-ring.

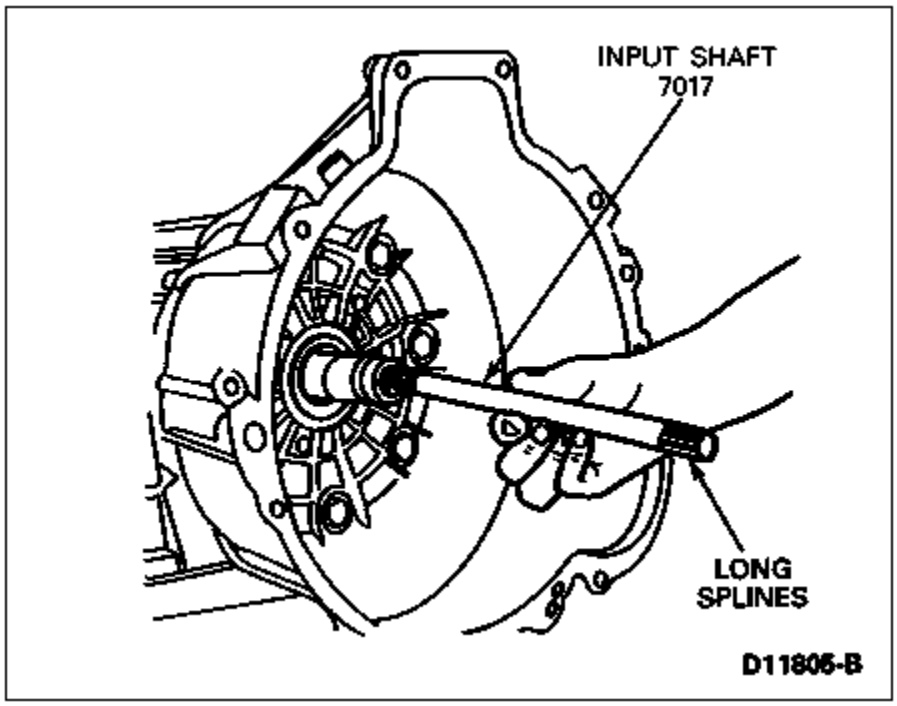
140. Install output shaft speed (7H103) sensor into case. Install attaching bolt and tighten to 8-11 Nm (71-97 lb-in).



141. **CAUTION: The splines are not the same on both ends. The shaft end with the shorter splines goes into the front pump support and gear.**

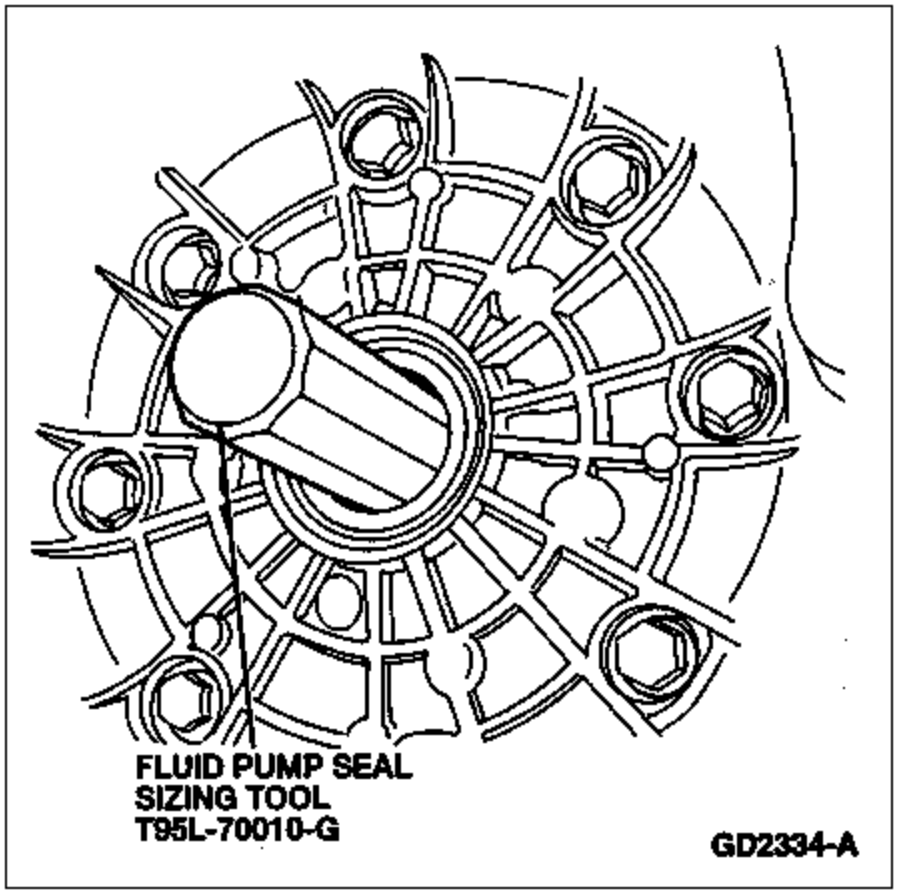
Install the input shaft into the front pump support and gear.

tomsn048@gmail.com



142. Insert Fluid Pump Seal Sizing Tool T95L-70010-G into pump drive gear to make sure the drive gear O-ring is properly seated prior to installing the torque converter. Remove tool.

tomsn048@gmail.com



143. **WARNING: THE TORQUE CONVERTER CAN FALL OUT IF THE TRANSMISSION IS TIPPED.**

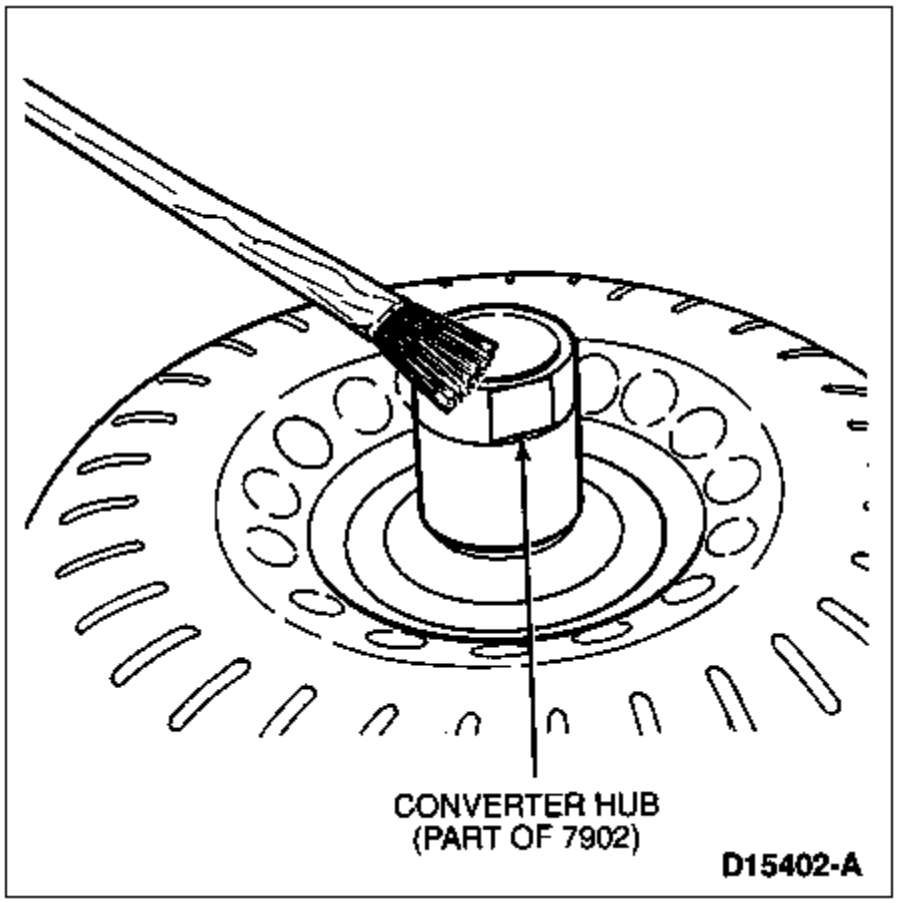
CAUTION: Do not damage the pump drive gear O-ring when installing the torque converter.

CAUTION: Make sure the converter hub is fully engaged in the front pump support and gear and rotates freely. Do not damage the hub seal.

CAUTION: If the torque converter slides out, the hub seal may be damaged.

Lightly lubricate the converter hub with MERCON V® XT-5-QM transmission fluid.

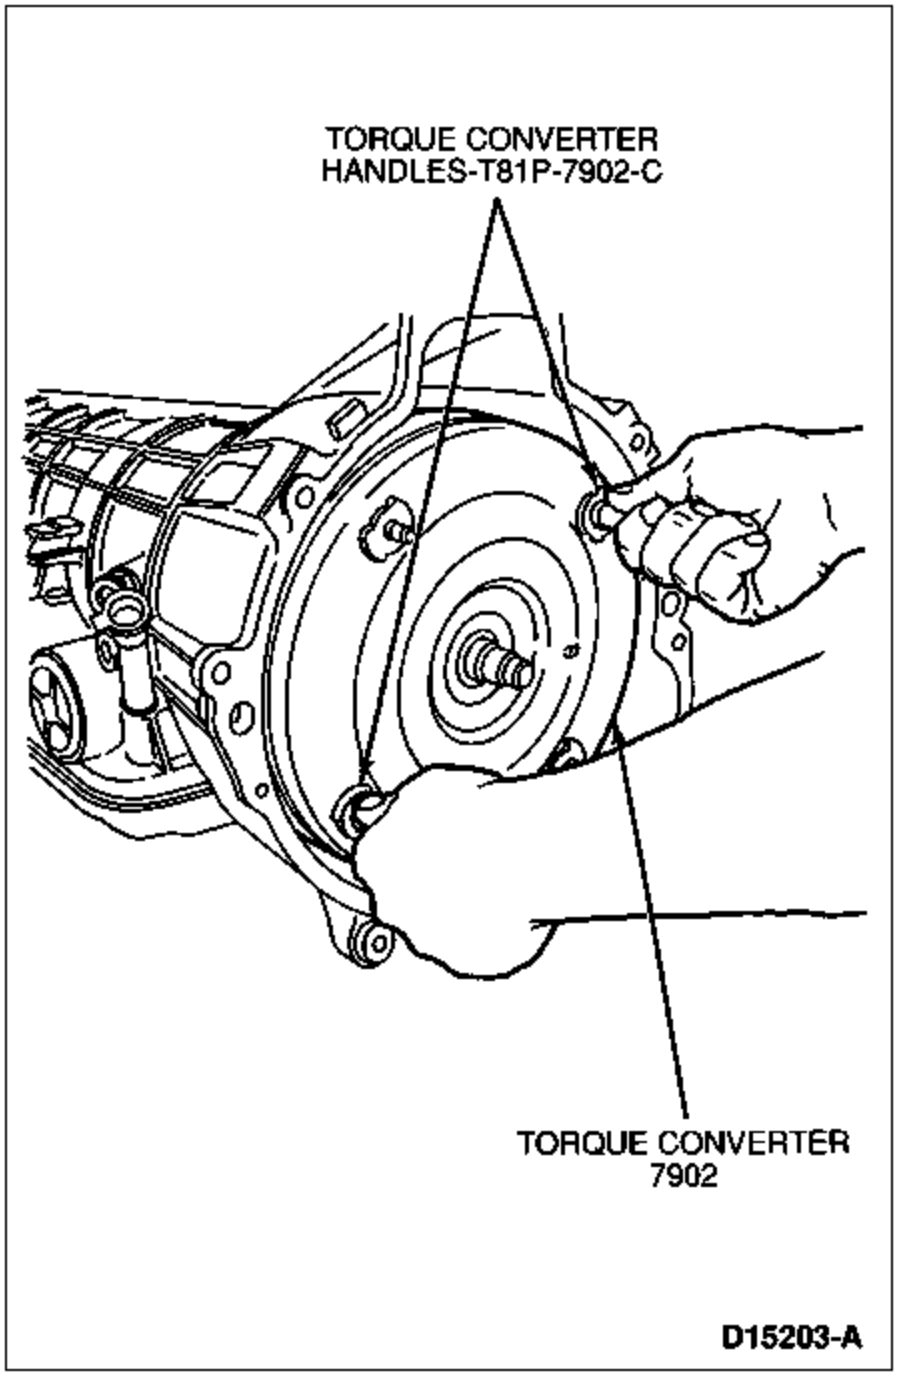
tomsn048@gmail.com



144. **WARNING: THE TORQUE CONVERTER IS HEAVY, ESPECIALLY WHEN FULL OF FLUID.**

Use Torque Converter Handles T81P-7902-C to install the torque converter by pushing and rotating.

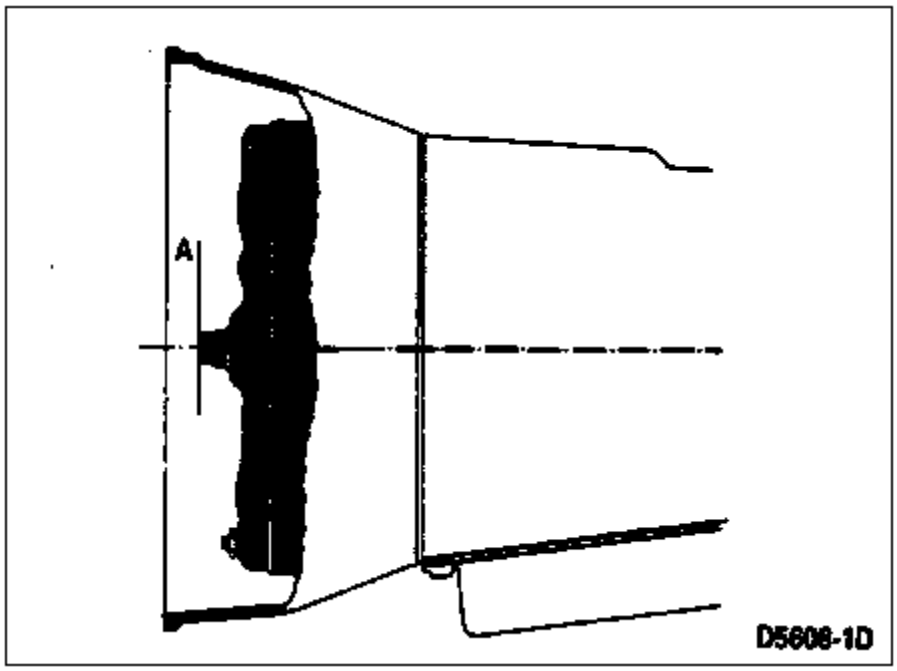
tomsn048@gmail.com



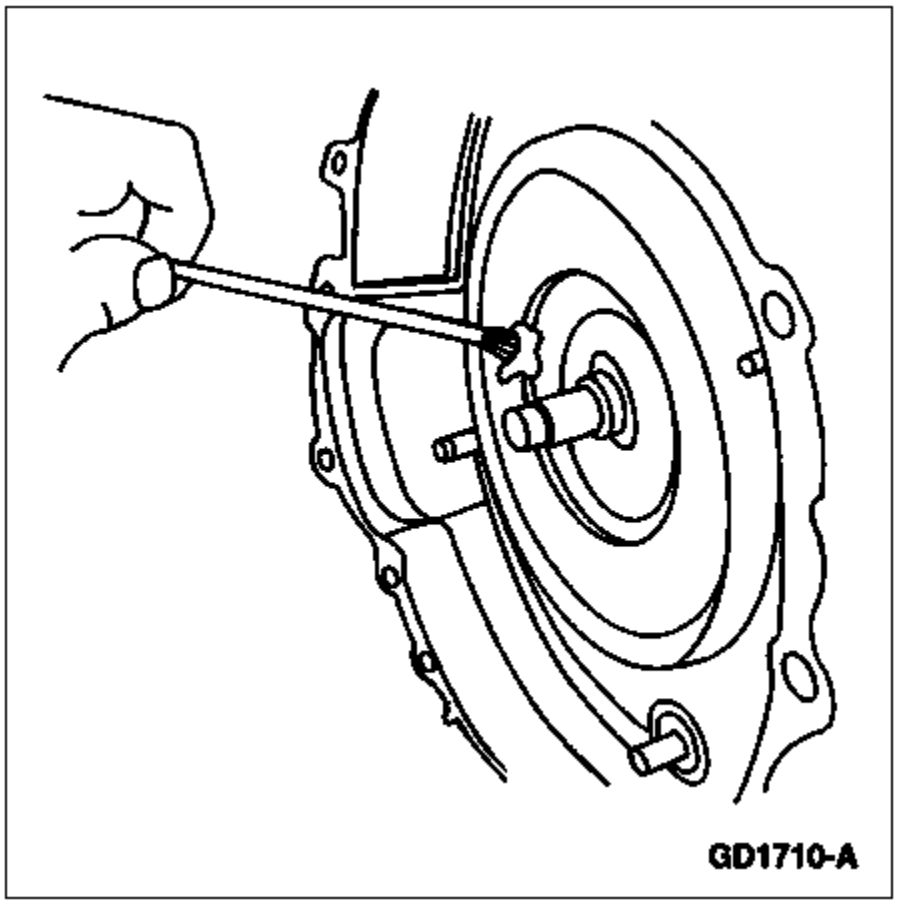
145. **NOTE: dimension "A" should be 10.23-14.43 mm (0.43-0.56 inch).**

Check dimension "A."

tomsn048@gmail.com



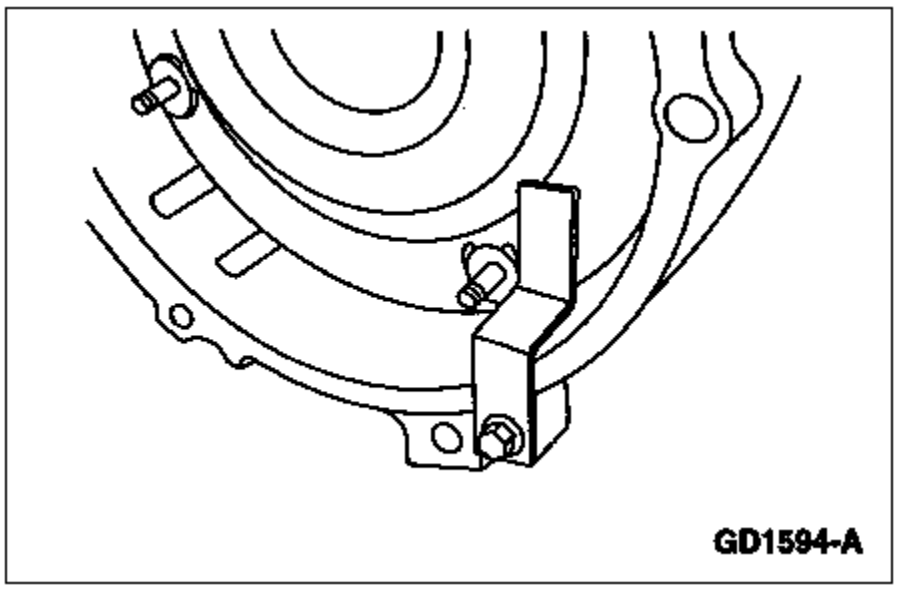
146. Prior to vehicle installation, lubricate the converter pilot hub with Ford Multi-Purpose Grease (D0AZ-19584-A, specification ESA-M1C45-A).



tomsn048@gmail.com

147. Before installing transmission, make sure that the transmission cooling system (line and cooler[s]) have been thoroughly flushed. Use procedures found in this section. If contamination cannot be removed or proper flow cannot be obtained, replace cooler(s) and/or lines.

148. Install Torque Converter Holding Tool T97T-7902-A on case using a standard bolt and nut to prevent converter from falling forward when moving to jackstand and to vehicle.



tomsn048@gmail.com

Transmission — 4x2

1. **WARNING: SECURE THE TRANSMISSION TO THE TRANSMISSION JACK WITH A SAFETY CHAIN.**

   Position the transmission on a transmission jack.

2. Raise the transmission jack and position the transmission near the engine.

3. Remove the Torque Converter Holding Tool T97T-7902-A.

4. Align the flex plate-to-converter index mark made at removal.

5. Align the mating holes and install the four converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft).

6. **CAUTION: Use care not to bend or otherwise damage the cooler lines.**

   Remove the plugs and connect the transmission cooler lines-to-case connectors. Tighten the cooler tube nuts to 24-31 Nm (18-23 lb-ft).

7. Install the two lower converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft).

8. Install the fluid filler tube into the fluid inlet short tube.

9. Install the two upper converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft).

10. Install the catalytic converter assembly. Install the catalytic converter-to-crossover pipe nuts and tighten to 34-46 Nm (25-34 lb-ft).

11. Position the catalytic converter to the exhaust pipe. Install the catalytic converter-to-exhaust pipe nuts and bolts and tighten to 34-46 Nm (25-34 lb-ft).

12. Install the rear engine mount. Refer to Section 02-03 .

13. On Aerostar vehicles, install the two crossmember-to-frame through nuts and bolts. Tighten to 37-52 Nm (28-38 lb-ft).

14. On Aerostar vehicles, install the engine support-to-crossmember screws. Tighten to 98-132 Nm (73-97 lb-ft).

15. On Ranger vehicles, position the crossmember and install the two crossmember-to-frame sidemember through nuts and bolts. Tighten to 88-115 Nm (65-85 lb-ft).

16. On Ranger vehicles, install the engine support-to-crossmember nuts. Tighten to 88-115 Nm (65-85 lb-ft).

tomsn048@gmail.com

17. Remove the transmission jack.

18. Install the two rear engine support-to-crossmember nuts. Tighten to 85-118 Nm (63-87 lb-ft).

19. Connect the vehicle harness connectors to the 16-pin transmission connector the overdrive drum speed (ODS) sensor, the output shaft speed (OSS) sensor and the digital transmission range (DTR) sensor.

20. Install the transmission shift cable into the transmission shift cable bracket.

21. Install the transmission shift bellcrank onto the ball and stud lever. Connect the transmission shift cable to the transmission manual control lever.

22. Install the speed control/speedometer cable and/or VSS (if equipped) into the extension housing.

23. Remove plug from the extension housing.

24. Install the driveshaft. Refer to Section 05-01 .

25. **CAUTION: Use new flexplate-to-converter nuts.**

    Install the four new flexplate-to-converter nuts using a breaker bar and a 22mm socket wrench on the crankshaft pulley bolt to rotate each stud into position. Rotate the crankshaft pulley clockwise (as viewed from the front) of the vehicle. Tighten the flexplate-to-converter nuts to 30-40 Nm (22-30 lb-ft).

26. Install the starter motor. Refer to Section 03-06 .

27. Lower the vehicle.

28. Fill the transmission with MERCON V® XT-5-QM fluid to the proper level. Refer to the procedure in this section.

29. Install the fluid level indicator.

30. Connect the battery ground cable.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission — 4x4

1. **WARNING: SECURE THE TRANSMISSION TO THE TRANSMISSION JACK WITH A SAFETY CHAIN.**

   Position the transmission on a transmission jack.

2. Raise the transmission jack and position the transmission near the engine.

3. Remove Torque Converter Holding Tool T97T-7902-A.

4. Position the transmission to the engine and align the converter stud-to-flex plate index mark made at removal.

5. Install the four converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft).

6. **CAUTION: Use care not to bend or otherwise damage the cooler lines.**

   Remove the plugs and install the transmission cooler lines. Tighten the transmission cooler lines tube nuts to 24-31 Nm (18-23 lb-ft).

7. Install the two lower converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft).

8. Install the fluid filler tube into the lube fluid inlet short tube.

9. Install the two upper converter housing-to-engine screws. Tighten to 40-55 Nm (30-41 lb-ft).

10. Install the transfer case. Refer to Section 07-07A , Section 07-07B , Section 07-07C or Section 07-07D .

11. Install the transfer case vent bracket. Tighten the transfer case vent bracket screws to 34-46 Nm (25-34 lb-ft).

12. Install the five transfer case-to-extension housing bolts. Tighten to 34-48 Nm (25-35 lb-ft).

13. Install the catalytic converter and crossover pipe nuts using 15mm socket wrench. Tighten the nuts to 24-34 Nm (18-25 lb-ft).

14. Install the catalytic converter-to-exhaust bolts. Tighten to 24-34 Nm (18-25 lb-ft).

15. Install the rear engine mount. Refer to Section 02-03 .

16. On Aerostar vehicles, install the two crossmember-to-frame through nuts and bolts. Tighten to 37-52 Nm (28-38 lb-ft).

17. On Aerostar vehicles, install the engine support-to-crossmember screws. Tighten to 98-132 Nm (73-97 lb-ft).

tomsn048@gmail.com

18. On Ranger vehicles, install the two crossmember-to-frame through nuts and bolts. Tighten to 88-115 Nm (65-85 lb-ft).

19. On Ranger vehicles, install the engine support-to-crossmember nuts. Tighten to 88-115 Nm (65-85 lb-ft).

20. Install the two rear engine support-to-crossmember nuts. Tighten to 85-118 Nm (63-87 lb-ft).

21. Connect the transfer case electrical connectors.

22. Install the front axle driveshaft. Refer to Section 05-03A , Section 05-03B or Section 05-03C .

23. Install the transfer case skid plate. Tighten the skid plate screws to 22-28 Nm (16-21 lb-ft).

24. Connect the vehicle harness connectors to the 16-pin transmission connector, the overdrive drum speed (ODS) sensor, the output shaft speed (OSS) sensor and the digital transmission range (DTR) sensor connector.

25. Install the transmission shift cable into the cable bracket.

26. Install the transmission shift bellcrank on the ball stud lever.

27. Connect the transmission shift cable to the transmission manual control lever.

28. Adjust shift cable; refer to cable adjustment.

29. Install the vehicle speed sensor (VSS) (if equipped) into the transfer case.

30. Align the index mark made at removal and install the rear driveshaft. Refer to Section 05-01 .

31. **CAUTION: Never turn the engine counterclockwise (as viewed from the front).**

    CAUTION: Use new flexplate-to-converter nuts.

    Install the four new flexplate-to-converter nuts, using a 22mm socket wrench and breaker bar on the crankshaft pulley to turn the engine into position. Tighten the flexplate-to-converter nuts to 30-40 Nm (22-30 lb-ft).

32. Install the starter motor. Refer to Section 03-06 .

33. Lower the vehicle.

34. Fill the transmission with MERCON V® XT-5-QM fluid to the proper level. Refer to procedure in this section.

35. Install the fluid level indicator.

36. Install the battery ground cable.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission Fluid Lines

When one or more of the fluid cooler steel tubes must be replaced, each replacement tube must be fabricated from the same size steel tubing as the original line.

Using the old tube as a guide, bend the new tube as required. Add the necessary fittings and install the tube. Make sure the tube has adequate clearance to the other components, especially the exhaust system and parts having sharp edges.

After the fittings have been tightened, add fluid as needed and check for fluid leaks.

tomsn048@gmail.com

Transmission

It is important to completely clean all transmission components including the converter, fluid cooler, cooler lines, main control valve body, all clutches and check balls after any transmission servicing that generates contamination. These contaminants are a major cause for recurring transmission troubles and must be removed from the system before the transmission is put back into service. The cleaning of debris from the coast, direct/reverse, and the forward clutch check balls is often omitted. This omission can lead to a repeat servicing of the transmission.

Clean the parts with a suitable solvent and use moisture-free air to dry off all the parts and clean out fluid passages.

CAUTION: Do not use mineral spirits or oil based solvent.

The composition clutch plates, bands, and synthetic seals should not be cleaned in a vapor degreaser or any type of detergent solution.

To clean these parts, wipe them off with a lint-free cloth. New clutch plates or bands should be soaked in transmission fluid specified for that transmission type for 30 minutes before being assembled.

tomsn048@gmail.com

Main Control Valve Body

1. Clean all parts thoroughly in clean solvent and blow dry with moisture-free compressed air.

2. Inspect all valve and plug bores for scores. Check all fluid passages for obstructions. Inspect the check valve for free movement. Inspect all mating surfaces for burrs or distortion. Inspect all plugs and valves for burrs or scores. Replace the control valve body if the bores or valve are scored beyond the point of being cleanable.

3. **CAUTION: Do not sand, stone or polish valves and bores. This removes the anodizing treatment and destroys them.**

   Inspect all springs for distortion. Check all valves and plugs for free movement in their respective bores. Valves and plugs, when dry, must fall from their own weight into their respective bores.

4. Roll the manual valve on a flat surface to check for a bent condition.

tomsn048@gmail.com

Front and Intermediate Servos

NOTE: Identify servo covers, pistons, and springs with a tag.

1. Inspect the servo bore for cracks and the servo piston for damage (the rubber sealing surfaces should be pliable). Inspect the piston bore, servo piston bore and servo piston stem for scores. Check the fluid passages for obstructions. Replace damaged seals.
2. Check the servo springs, servo band strut(s) and apply levers for distortion and wear.
3. Inspect the cover seal and gasket cover sealing surface for damage.
4. Inspect the band lining for excessive wear and for proper bonding to the metal band.

tomsn048@gmail.com

Low-Reverse Servo and Band

1. Inspect the bore for scores.
2. Check the fluid passages for obstructions.
3. Inspect the band for distortion. Inspect the band ends for cracks.
4. Inspect the servo for distortion.
5. Inspect the band lining for excessive wear and for proper bonding to the metal band.
6. Replace the cover seal if damaged.
7. Replace the piston seals if damaged.

tomsn048@gmail.com

Extension Housing

1. Inspect the housing for cracks. Inspect the gasket surface for burrs or warpage.
2. Inspect the bushing for scores or wear. Inspect slip yoke for damage. Replace if required.
3. Inspect the rear seal for hardness, cracks or wear. Replace if required.
4. Inspect the seal counterbore and remove all burrs and scores with a crocus cloth.

tomsn048@gmail.com

Pump

1. Inspect the mating surfaces of the pump body and case for burrs.
2. Inspect the drive and driven gear bearing surfaces for scores. Check the gear teeth for burrs.
3. Inspect the inner pump gear O-ring for damage.
4. Inspect the front pump seal for cuts or nicks. Inspect the pump bushing for scoring.
5. Check all fluid passages for obstruction.
6. If any parts are found damaged or worn, replace the pump as an assembly. Minor burrs and scores may be removed with a crocus cloth.

tomsn048@gmail.com

Direct, Low/Reverse and Coast Clutches

1. Inspect the drum band surface, bushing and thrust surfaces for scores. Minor scores may be removed with a crocus cloth. Badly scored parts must be replaced.

2. Inspect the clutch piston bore and piston inner and outer bearing surfaces for scores.

3. Check the fluid passages for obstructions. All fluid passages must be clean and free of obstruction.

4. Inspect the clutch plates for wear, scoring and fit on the clutch hub serrations. Replace all plates that are badly scored, worn or do not fit freely in the hub serrations.

5. Inspect the clutch pressure plate for scoring and binding on the clutch plate surface. Check the clutch release spring for distortion pressure.

6. The clutch cylinders have check balls. Inspect the check balls for freedom of movement and proper seating.

7. Inspect the friction plates for proper installation (direction).

tomsn048@gmail.com

Forward Clutch

1. Inspect the clutch cylinder thrust surfaces, piston bore and clutch plate serration for scores or burrs. Minor scores and burrs may be removed with a crocus cloth. Replace the clutch cylinder if it is badly scored or damaged.

2. Check the fluid passages in the clutch cylinder for obstructions. Clean out all fluid passages. Inspect the clutch piston for scores and replace if necessary. Inspect the piston check ball for freedom of movement and proper seating.

3. Check the clutch release springs for distortion and cracks. Replace the springs if they are distorted or cracked.

4. Inspect the composition clutch plates, steel clutch plates and clutch pressure plate for worn or scored surfaces. Replace all parts that are deeply scored.

5. Check all clutch plates for flatness and fit on the clutch hub serrations. Discard any plate that does not slide freely on the serrations or that is not flat.

6. Check the clutch hub thrust surfaces for scores. Check the clutch hub splines for wear.

tomsn048@gmail.com

Input Shaft

Check the input shaft for damaged or worn splines. Replace the shaft if the splines are excessively worn. Inspect the bushings in the stator support for scores.

tomsn048@gmail.com

Front One-Way Clutch and Rear One-Way Clutch

1. Inspect the outer and inner races for scores or damaged surface areas where the sprags contact the races.

2. Inspect the sprags for excessive wear or damage.

tomsn048@gmail.com

Converter and Fluid Cooler

When wear or internal damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the converter and fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back into service.

Whenever a transmission has been disassembled to replace worn or damaged parts, or because the valve body sticks from foreign material, the converter, fluid cooler and cooler lines must be cleaned and flushed. Rotunda Torque Converter/Transmission Oil Cooler Cleaner 014-00028 or equivalent can be used. Under no circumstances should an attempt be made to clean the torque converter by hand agitation with solvent.

The lack of a drain plug in the torque converter increases the amount of residual flushing solvent in the torque converter after cleaning. This retained solvent is not acceptable and a method of diluting is required. The following procedure is to be used after the removal of the torque converter from the cleaning equipment.

1. Thoroughly drain the remaining solvent through the converter hub.
2. Add 1.9L (2.0 quarts) of clean MERCON V® XT-5-QM transmission fluid to the converter. Agitate by hand.
3. Thoroughly drain the solution through the converter hub.

tomsn048@gmail.com

Pinion Carriers

Individual parts of the planetary carriers are not serviceable.

1. Check the pins and shafts in the planetary assemblies for loose fit and/or complete disengagement. Use a new planetary assembly if either condition exists. Before installing a planetary assembly, the shaft retaining pins should be checked for adequate staking. Do not restake the planetary pinion. If necessary, replace the planetary assembly.

2. Inspect the pinion gears for damaged or excessively worn teeth.

3. Check for free rotation of the pinion gears.

tomsn048@gmail.com

Stator Support

1. Inspect the stator support splines for burrs and wear.
2. Check the oil ring grooves in the stator support for nicks, burrs or damaged edges.
3. Check the front and rear bushings of the stator support for wear or scoring.
4. Check front pump support seal and groove.
5. Check the seal rings for damage.
6. Check bearings for damage.

tomsn048@gmail.com

Case

Inspect the case for cracks and stripped threads. Inspect the gasket surfaces and mating surfaces for burrs. Check the vent for obstructions, and check all fluid passages for obstructions and leakage.

Inspect the case bearing for scores. Check all parking linkage parts for wear or damage.

Inspect the case threads for damage.

tomsn048@gmail.com

Case Thread Repair Procedures

If a transmission case thread is damaged, service kits may be purchased from local jobbers. To service a damaged thread, the following procedure should be carefully followed.

1. Drill out the damaged threads, using the same drill size as the thread outside diameter. For example, use a 5/16-inch drill for a 5/16-18-inch thread.

2. Select the proper special tap and tap the drilled hole. The tap is marked for the size of the thread being repaired. The special tap marked 5/16-18 inch will not cut the same thread as a standard 5/16-18-inch tap. It does cut a thread large enough to accommodate the insert, and after the insert is installed, the original thread size is restored.

3. Select the proper coil inserting tool. These tools are marked with the thread size being repaired. Place the insert on the tool and adjust the sleeve to the length of the insert being used. Press the insert against the face of the tapped hole. Turn the tool clockwise and wind the insert into the hole until the insert is one-half turn below the face.

4. Working through the insert, bend the insert tang straight up and down until it breaks off in the notch.

5. Improperly installed inserts can be removed with the extractor tool. Place the extractor tool in the insert with the blade resting against the top coil one-quarter to one-half turn away from the end of the coil. Tap the tool sharply with a hammer until the blade cuts into the insert. Exert downward pressure on the tool and turn it counterclockwise until the insert is removed.

tomsn048@gmail.com

SPECIFICATIONS

Fluid Capacity

Vehicle	Engine	Approximate Refill Capacity [1]	
		Liters	U.S. Quarts
Aerostar, Ranger — 5R55E (4x2)	4.0L	9.0	9.5
Aerostar, Ranger — 5R55E (4x4)	4.0L	9.3	9.8

[1] Approximate dry capacity, includes cooler and lines. Fluid level indicator should be used to determine actual fluid requirements and fluid specification. Check level at normal operating temperature. DO NOT OVERFILL.

If it is necessary to add or replace fluid, use only fluid which has been certified by the supplier as meeting one of the Ford Motor Company specifications shown.

Note: Use Motorcraft MERCON V® or fluid meeting Ford specification XT-5-QM.

Inspection and Verification

CAUTION: Do not repair the radiator (8005) . Aluminum tabs securing radiator outlet tank (8054) are permanently damaged during disassembly.

When transmission fluid leakage is found at the auxiliary transmission fluid cooler (7A095), the Auxiliary Cooler must be replaced. Refer to the procedure in this section.

When transmission fluid leakage is found at the radiator, the radiator must be replaced. Refer to Section 03-03 .

Symptom Chart — Transmission Overheating

TRANSMISSION OVERHEATING

Condition	Possible Source	Action
• Transmission Overheating	• Low transmission fluid.	• REFER to Section 07-01A or Section 07-01B for adding fluid procedure.
	• Clogged radiator or auxiliary transmission fluid cooler.	• Refer to the Transmission Fluid Flow in the Component Tests.
	• Leaking auxiliary transmission fluid cooler.	• INSPECT auxiliary transmission fluid cooler for leaks. Service as required.
	• Leaking radiator transmission fluid cooler.	**WARNING: NEVER REMOVE THE RADIATOR CAP UNDER ANY CONDITIONS WHILE THE ENGINE IS OPERATING. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN PERSONAL INJURY AND/OR DAMAGE TO THE COOLING SYSTEM OR ENGINE. TO AVOID HAVING SCALDING HOT COOLANT OR STEAM BLOW OUT OF THE RADIATOR, USE EXTREME CARE WHEN REMOVING THE RADIATOR CAP FROM A HOT RADIATOR. WAIT UNTIL THE ENGINE HAS COOLED, THEN WRAP A THICK CLOTH AROUND THE RADIATOR CAP AND TURN IT SLOWLY TO THE FIRST STOP. STEP BACK WHILE THE PRESSURE IS RELEASED FROM THE COOLING SYSTEM. WHEN YOU ARE CERTAIN ALL THE PRESSURE HAS BEEN RELEASED, PRESS DOWN ON THE RADIATOR CAP (WITH A CLOTH), TURN AND REMOVE.**

	• Clogged or leaking fluid tubes, hoses or connections.	• INSPECT engine coolant for signs of transmission fluid. REPLACE radiator as required. • INSPECT fluid tubes, hoses, and connections for leaks. SERVICE as required.

Component Tests

Transmission Fluid Cooler Flow Test

NOTE: The transmission linkage/cable adjustment, fluid level, and line pressure must be within specification before performing this test. Refer to service procedures in Section 07-01A or Section 07-01B .

1. Remove fluid level indicator (7A020) from fluid filler tube.
2. Place funnel in fluid filler tube.
3. Raise vehicle on hoist and position suitable safety stands under vehicle.
4. Remove cooler return line (rear fitting) from fitting on transmission case.
5. Connect one end of a hose to the cooler return line and route the other end of the hose to a point where it can be inserted into the funnel at the fluid filler tube.
6. Remove safety stands and lower vehicle. Insert end of hose into funnel.
7. Start engine and run at idle with transmission in neutral range.
8. When fluid flowing from hose is all liquid, an adequate amount of fluid should be observed (approximately 1 liter [1 quart] delivered in 30 seconds). If adequate flow is observed, test is completed.
9. If the flow is not adequate, stop engine. Disconnect hose from cooler return line and connect it to converter out line fitting (front fitting) on transmission case.
10. Repeat Steps 7 and 8. If flow is now adequate, refer to the Symptom Chart . If flow is not adequate, service pump and/or converter assembly, and main control.

Transmission Fluid Cooler — Auxiliary

Removal

1. Place a drain pan under the transmission fluid cooler (7A095).
2. Disconnect all transmission fluid cooler tubes and hoses at the transmission fluid cooler. Plug all port openings.
3. Remove nuts and bolts and remove the transmission fluid cooler from the vehicle.

Installation

CAUTION: Make sure all plugs are removed from port openings before installing tubes.

To install, reverse the removal procedure.

Refill transmission fluid to proper operating levels. Start engine and check for leaks.

Fluid Cooler Tube(s)

Removal and Installation

CAUTION: To prevent cross threading, all tube nuts must be hand started before being torqued to specifications.

When one or more of the transmission fluid cooler steel tubes must be replaced, each replacement tube must be fabricated from the same size steel tubing as the original line.

Using the original transmission fluid tube as a guide, bend the new tube as required. Add the necessary fittings and install the tube. Make sure that the replacement tube has adequate clearance to other components, especially the exhaust system and parts having sharp edges.

After the fittings have been tightened, add fluid as needed, and check for fluid leaks.

Transmission Fluid Cooler

When internal wear or damage has occurred in the automatic transmission/transaxle (A/T) (7000), metal particles, clutch plate material, or band material may have been carried into the torque converter (7902) and transmission fluid cooler (7A095). These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the automatic transmission/transaxle is put back into service.

Whenever a automatic transmission/transaxle has been disassembled to replace worn or damaged parts or because the valve body sticks due to foreign material, the torque converter and transmission fluid cooler must be cleaned by using a mechanically agitated cleaner, such as Rotunda Torque Converter/Oil Cooler Cleaner 014-00028 or equivalent.

Transmission Fluid Cooler Tube(s)/Hose(s)

1. Loosen hose clamps and remove each auxiliary cooler hose.
2. Disassemble and remove the clip attaching the cooler tubes to the engine and C-clips holding the tubes together.
3. Disassemble all cooler tube connections at the transmission and radiator and remove the cooler tubes, taking care not to bend them.
4. Flush out all the cooler tubes and hoses to remove all foreign materials by using Rotunda Torque Converter/Oil Cooler Cleaner 014-00028 or equivalent. Each tube can be connected to the fluid source by a piece of commercially available flexible hose if required. Hoses must not be soaked in the fluid.
5. Blow out each tube and hose with air to remove any remaining degreasing fluid.
6. Reinstall parts on vehicle without bending the tubes. Make sure that all clips, brackets, and connections are properly secured.
7. Verify tube clearances to other components, especially the exhaust system are free from interference. Also, check that hoses are not kinked before starting vehicle.

Description

The M5OD is a top-shift, fully-synchronized, five-speed manual transmission (7003), equipped with an overdrive fifth gear ratio. All gear changes (including reverse) are accomplished with synchronizer sleeves.

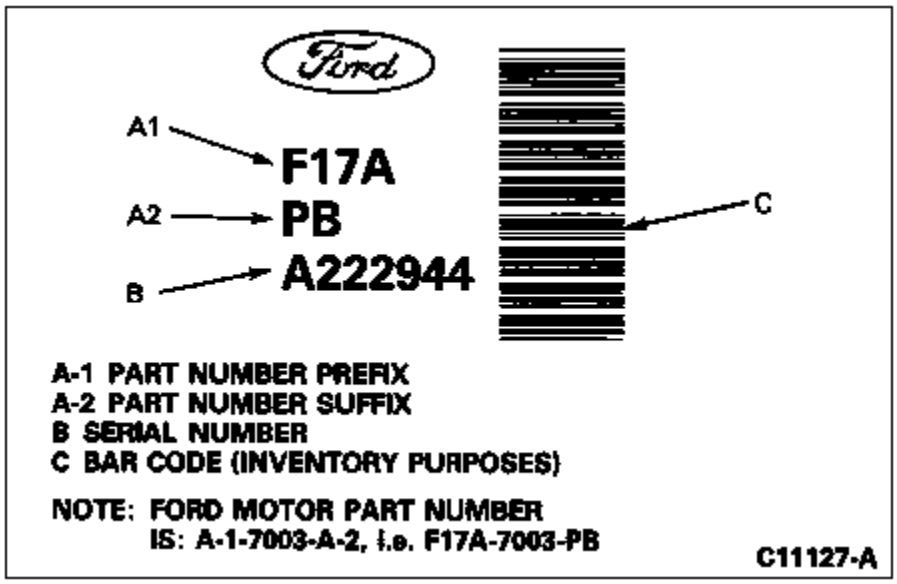
The case (7005), case cover (7222), and extension housing (7A039) are constructed of aluminum alloy. Steel bearing race inserts provide durability in appropriate areas.

tomsn048@gmail.com

Transmission Identification

The Vehicle Safety Compliance Certification Label (located on the driver's door lock pillar) lists applicable transmission identification codes. For identification of the label codes, refer to Section 00-01 .

Manual transmissions (7003) are equipped with service identification tags. The M5OD transmission service tag is located on the driver's side of the transmission.



tomsn048@gmail.com

Powerflow

Powerflow is accomplished with a series of gears and synchronizers as follows:

Neutral

The synchronizer sleeves are centered. The input gear drives the countershaft (7111). Since no gears are locked to the output shaft, it is not driven.

First Gear

The first/second synchronizer is splined to the output shaft. The first/second synchronizer sleeve locks the first gear (1GR) (7100) to the output shaft through the synchronizer. The input gear drives the countershaft. First gear on the countershaft drives the first gear on the output shaft, which is driven in reduction at 3.72:1.

Second Gear

The synchronizer is splined to the output shaft. The synchronizer sleeve locks second gear (2GR) (7102) to the output shaft through the synchronizer. The input gear drives the countershaft. Second gear on the countershaft drives second gear on the output shaft. The output shaft is driven in reduction at 2.20:1.

Third Gear

The third/fourth synchronizer is splined to the output shaft. The synchronizer sleeve locks third gear to the output shaft through the synchronizer. The input gear drives the countershaft. Third gear on the countershaft drives third gear on the output shaft. The output shaft is driven in reduction at 1.50:1.

Fourth Gear

The third/fourth synchronizer is splined to the output shaft. The synchronizer locks the input shaft (7017) to the output shaft. The input shaft and output shaft turn at the same speed (1:1 ratio).

Fifth Gear (Overdrive)

The fifth/reverse gear synchronizer is splined to the countershaft. The synchronizer sleeve locks fifth gear to the countershaft. The input gear drives the countershaft. Fifth gear on the countershaft drives fifth gear which is splined to the output shaft. The output shaft is overdriven at a ratio of 0.79:1.

Reverse Gear

A reverse idler gear produces rotation in the opposite direction of output shaft rotation. The fifth/reverse synchronizer is splined to the countershaft. The synchronizer sleeve locks reverse gear to the countershaft. The input gear drives the countershaft. The countershaft reverse gear drives the reverse idler gear. The reverse idler gear drives reverse gear (which is splined to the output shaft) at a reduction ratio of 3.40:1.

tomsn048@gmail.com

Symptom Chart — Transmission, Manual

TRANSMISSION, MANUAL

Condition	Possible Source	Action
• Transmission Shifts Hard	• Transmission oil low or improper type.	• ADD lubricant or CHANGE lubricant as required.
	• Shift lever binding or worn.	• REMOVE cap from shift tower. ELIMINATE binding condition or REPLACE components as required.
	• Worn or damaged internal shift mechanism.	• REMOVE transmission cover. CHECK internal shift mechanism by shifting into and out of all gears. REPAIR or REPLACE as required.
	• Binding of sliding gears and/or synchronizers.	• CHECK for free movement of gears and synchronizers. REPAIR or REPLACE as required.
	• Housings and/or shafts out of alignment.	• REMOVE transmission and CHECK for binding condition between input shaft and engine crankshaft pilot bearing or bushing. CHECK flywheel housing alignment. REPAIR or REPLACE as required.
	• Incomplete clutch disengagement.	• SEE Section 08-00 , Clutch General Service for reserve measurement test.
• Noisy in Forward Gears **NOTE: While verifying the condition, determine whether the noise is gear rollover noise, release bearing rub or some other transmission related noise. Gear rollover noise, inherent in manual transmissions, is caused by the constant mesh gears turning at engine idle speed, while the clutch is engaged and the transmission is in neutral; and release bearing rub is sometimes mistaken for mainshaft bearing noise. Gear rollover noise will**	• Lubricant level low, or improper type.	• ADD lubricant, or REFILL with specified lubricant.

tomsn048@gmail.com

disappear when the clutch is disengaged or when the transmission is engaged in gear. Release bearing rub will disappear when the clutch is engaged. In the event that a bearing is damaged, the noise is more pronounced while engaged in gear under load or coast than in neutral.		
	• Components grinding on transmission.	• CHECK for screws, bolts, etc., of cab or other components grinding. CORRECT as required.
	• Component housing bolts loose.	• CHECK torque on transmission-to-flywheel housing bolts, output shaft flange nut and flywheel housing-to-engine block bolts. TIGHTEN bolts to specification.
	• Flywheel housing-to-engine crankshaft alignment.	• CHECK and ALIGN flywheel housing to engine crankshaft.
	• Noisy bearings or gears.	• REMOVE and DISASSEMBLE transmission. INSPECT input, output and countershaft bearings. INSPECT speedometer gear and gear teeth for wear or damage. REPLACE as required.
• Gears Clash when Shifting from One Forward Gear to Another	• Incomplete clutch disengagement.	• REFER to Section 08-00 for clutch reserve measurement test.
	• Pilot bearing binding.	• REMOVE transmission and CHECK for binding condition between input shaft and engine crankshaft pilot bearing. REPLACE as required.
	• Damaged gear teeth and/or synchronizer.	• DISASSEMBLE transmission, REPAIR or REPLACE as required.
	• Engine idle speed too high.	• ADJUST engine idle speed.
	• Improper manual shift linkage.	• ADJUST and REPAIR manual shift linkage as required.
• Transmission Jumps Out of Gear	• Loose transmission-to-engine block	• TIGHTEN transmission-to-engine block bolts to specifications. LOOSEN all

tomsn048@gmail.com

	bolts, or loose levers.	bolts and RESEAT flywheel housing. TIGHTEN all bolts. TIGHTEN levers if necessary.
	• Crankshaft pilot bearing worn.	• REPLACE bearing.
	• Interior components damage.	• DISASSEMBLE transmission. INSPECT the synchronizer sleeves for free movement on their hubs. INSPECT the synchronizer blocking rings for widened index slots, rounded clutch teeth and smooth internal surface. CHECK countershaft cluster gear for excessive end play. CHECK shift forks for loose mounting on shift rails. INSPECT synchronizer sliding sleeve and gear clutch teeth for wear or damage. REPAIR or REPLACE as required.
	• Worn gear teeth due to partial engagement.	• REPLACE worn or damaged gears.
• Transmission Will Not Shift into One Gear — All Others OK	• Backup switch ball frozen.	• If reverse is problem, CHECK backup switch for ball frozen in extended position (if so equipped).
	• Internal components.	• REMOVE transmission. If transmission will not shift into reverse, CHECK for damaged reverse gear train, in single rail shift transmission. Also, CHECK for misaligned reverse relay lever. INSPECT shift rail and fork system synchronizer system and gear clutch teeth for restricted travel. REPAIR or REPLACE as required.
• Transmission Is Locked in One Gear. It Cannot Be Shifted Out of That Gear	• Internal components.	• REMOVE transmission. INSPECT problem gears, shift rails and forks and synchronizer for wear or damage. REPAIR as required. CHECK for broken fork slot tabs on single rail transmissions.
	• Loose fork on rail.	• On single rail shift, CHECK for broken selector arm pin or selector plate. REPAIR or REPLACE as necessary.
• Transmission Leaks	• Improper amount or type of lubricant.	• CHECK level and type. FILL to bottom of filler plug hole.

tomsn048@gmail.com

	• Other component leaking.	• IDENTIFY leaking fluid as from engine, power steering or transmission. REPAIR as required.
	• False report.	• REMOVE all traces of lube on exposed transmission surfaces. CHECK vent for free breathing. OPERATE transmission and INSPECT for new leakage. REPAIR as required.
	• Internal components.	• REMOVE transmission. INSPECT for leaks at the input shaft bearing retainer seal and gasket and shift rail expansion plug. INSPECT for leaks at the top cover gasket. INSPECT case for sand holes or cracks. REPAIR or REPLACE as required.
	• Improper installation torque.	• TIGHTEN to specified torque value.
• Shift Lever Loose	• Retaining bolts loose.	• TIGHTEN to specified torque.
• Shift Lever Tight	• Worn or damaged shift lever lower bushing.	• INSPECT shift lever assembly. REMOVE and REPLACE parts as required.
• Noise from Transfer Case	• Incorrect tire inflation pressures and/or incorrect size tires and wheels.	• MAKE sure that all tires and wheels are the same size, and that inflation pressures are correct.
	• Excessive tire tread wear.	• CHECK tire tread wear to see if there is more than .06 inch difference in tread wear between front and rear. INTERCHANGE one front and one rear wheel. REINFLATE tires to specifications.
	• Internal components.	• OPERATE vehicle in all transmission gears with transfer case in 2HI, or HI range. If there is noise in transmission in neutral gear, or in some gears and not in others, REMOVE and REPAIR transmission.If there is noise in all gears, OPERATE vehicle in all transfer case ranges. If

tomsn048@gmail.com

		noisy in all ranges, DISASSEMBLE transfer case. CHECK input gear, planetary gear assembly, sprockets, chain and single cardan U-joint for damage. REPLACE as necessary.
• Transfer Case Jumps Out of Gear	• Incomplete shift linkage travel. • Loose mounting bolts. • Front and rear driveshaft slip-yokes dry or loose. • Internal components.	• CHECK for interference to shift boot or body. • TIGHTEN mounting bolts. • LUBRICATE and REPAIR slip-yokes as required. TIGHTEN flange yoke attaching nut to specifications. • DISASSEMBLE transfer case. INSPECT input gear, planetary gear assembly, sliding shift collar hubs and detent spring for damage. REPLACE as required.

tomsn048@gmail.com

Transmission

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Coupling Tool	T88T-70522-A
Seal Remover	T74P-77248-A

Removal

1. Shift the transmission (7003) into neutral position.
2. Remove the retainer screws and slide the gearshift lever boot (7277) up the shaft of gearshift lever (7210).
3. Remove the retaining bolt and remove the gearshift lever. Remove the stub shaft through the floor opening.
4. Disconnect the battery ground cable (14301) from the battery terminal.
5. Raise the vehicle on hoist and position suitable safety stands under vehicle.
6. **NOTE: Drain transmission only if disassembly is required.**

   Place drain pan under transmission. Using a 24mm wrench, remove case plug (7A010) and drain transmission.
7. Disconnect the driveshaft (4602) at the rear axle. On Ranger SuperCab, remove the driveshaft center bearing bracket (4A499).
8. Pull the driveshaft rearward and disconnect from the transmission. Install a suitable plug in the extension housing (7A039) to prevent lubricant leakage if transmission was not drained. On 4x4 models, unbolt driveshaft from rear case yoke (7B214) at the case (7005). Remove driveshaft.
9. Disconnect the hydraulic clutch hose (7T504) at the case using Clutch Coupling Tool T88T-70522-A. Plug both ends of the hydraulic clutch hose to prevent fluid leakage and entry of contaminants.
10. Remove the speedometer cable (17260) from the extension housing or driveshaft center bearing bracket.
11. Disconnect starter motor (11001) wires and backup lamp switch (15520).
12. Remove exhaust system components for adequate clearance (V-6 engines only). Refer to Section 09-00 .
13. Place a jack under the engine (6007), protecting theoil pan (6675) with a wood block.
14. On 4x4 vehicles, remove the transfer case (7A195), as described in Section 07-07A , Section 07-

tomsn048@gmail.com

07B , Section 07-07C or Section 07-07D .

15. Remove the starter motor. Position Hi-Lift Transmission Jack 014-00942 or equivalent under the transmission.

16. Remove the bolts, lockwashers and flatwashers attaching thetransmission to the rear plate of engine.

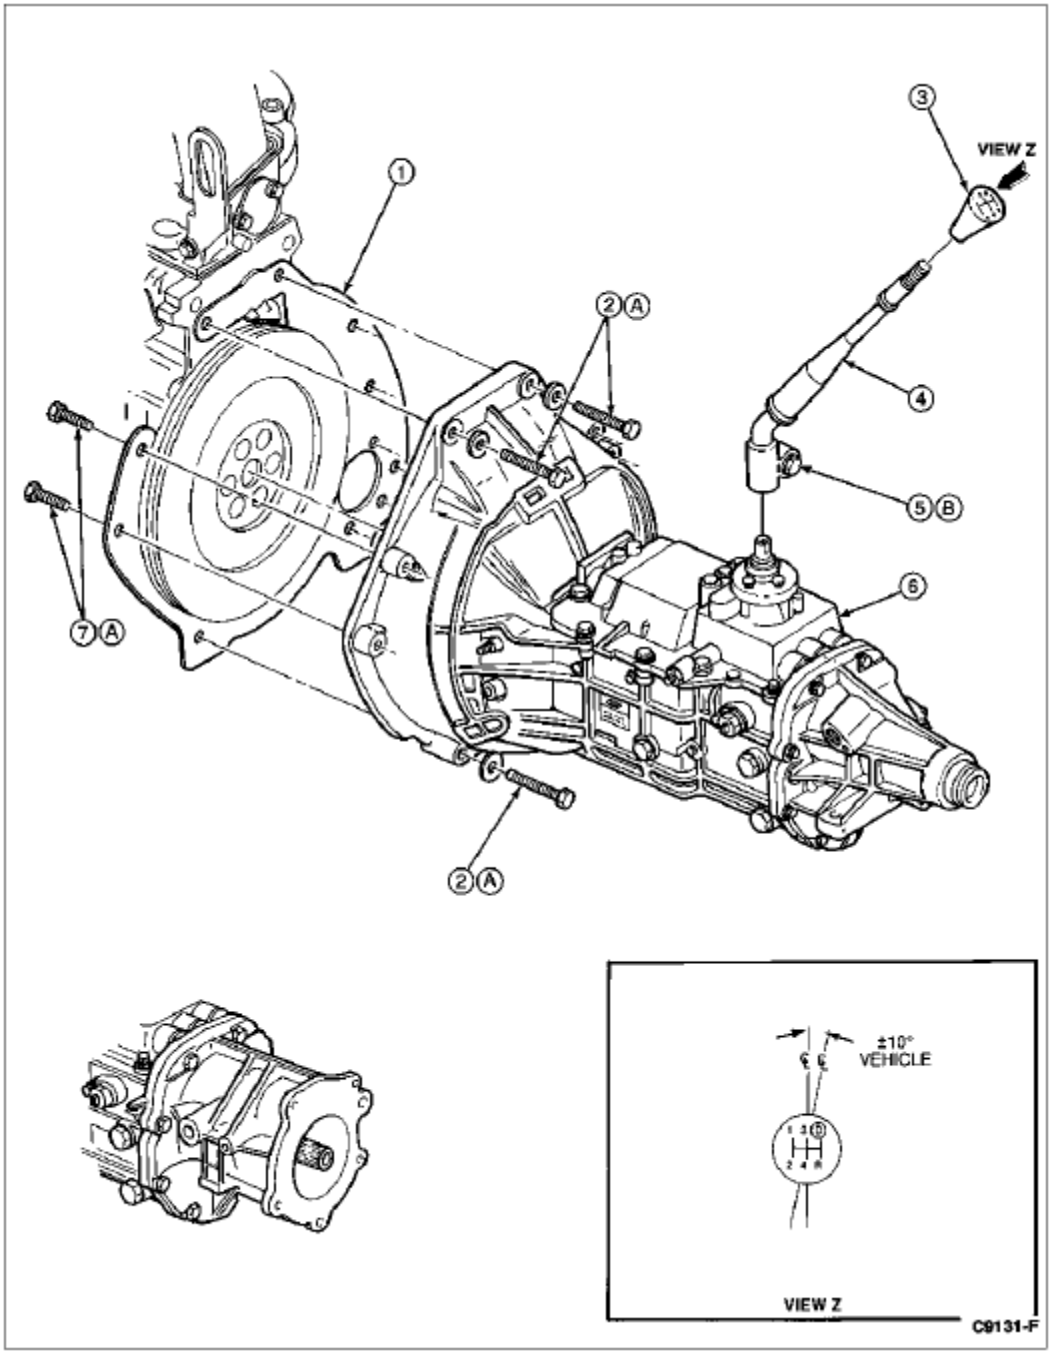
17. Remove the nuts and bolts attaching the transmission support insulator (6068) to the crossmember.

18. Remove the nuts attaching the crossmember to the frame side rails and remove the crossmember. Refer to Section 02-03 .

19. Work the transmission off the locating dowels and slide the transmission rearward until the spline on input shaft (7017) clears the clutch disc (7550). Lower the transmission from the vehicle.

Transmission Assembly, Typical

tomsn048@gmail.com



Item	Part Number	Description
1	7007	Engine Rear Plate
2	N802244-S100	Bolt
3	7213	Gearshift Lever Knob
4	7210	Gearshift Lever
5	N605906-S100	Bolt
6	7003	Transmission
7	N8023281-S100	Bolt

tomsn048@gmail.com

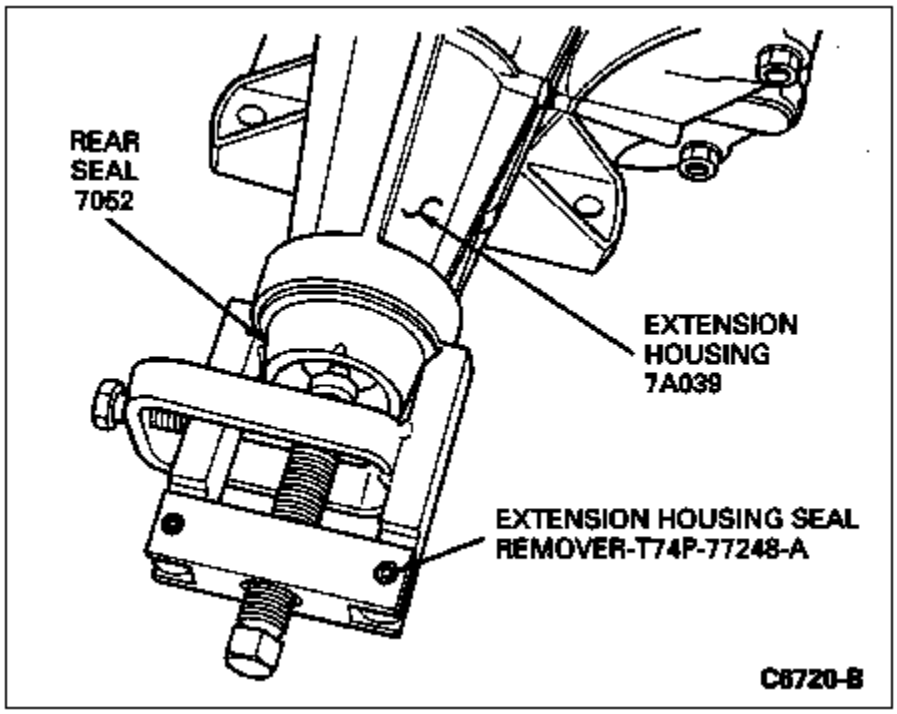
A	—	Tighten to 38-51 Nm (28-38 Lb-Ft)
B	—	Tighten to 27-40 Nm (20-30 Lb-Ft)

tomsn048@gmail.com

Extension Housing

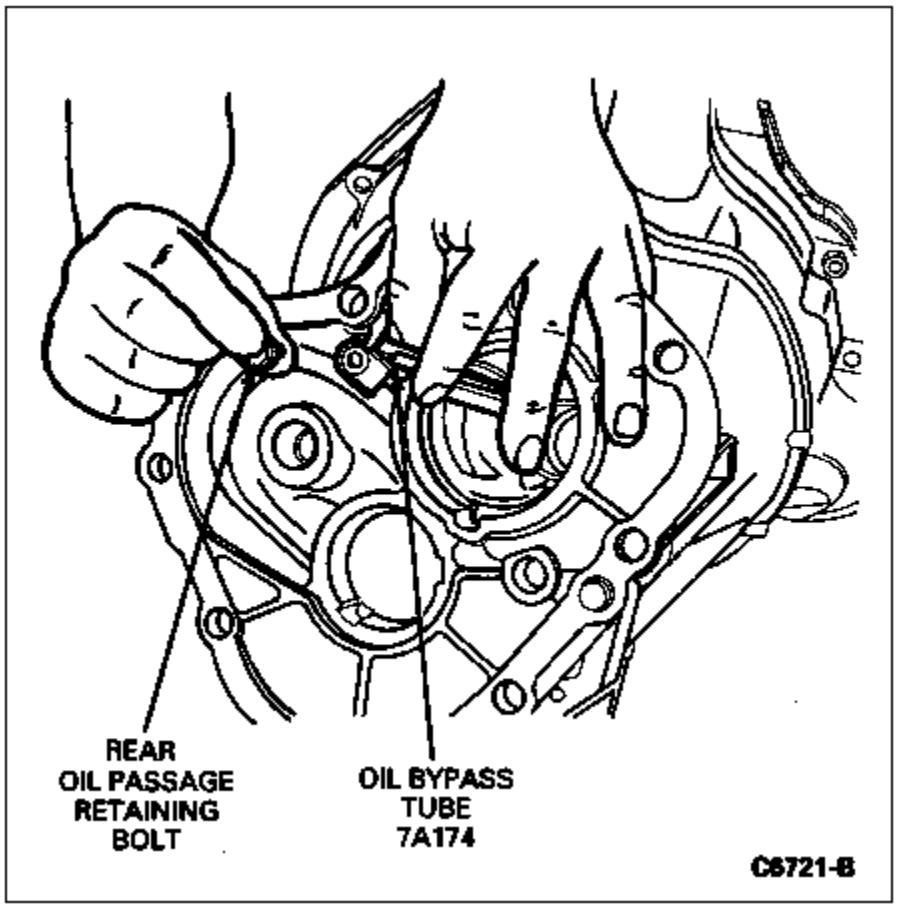
1. **NOTE: On 4x2 vehicles, if it is necessary to remove oil seal (7052), the extension housing (7A039) must be installed to case (7005). Remove oil seal using extension housing Seal Remover T74P-77248-A.**

   Using a 14mm wrench, remove eight retaining bolts from extension housing. Pry gently at locations provided on extension housing and case. Remove extension housing from case.



2. If necessary, remove rear oil bypass tube (7A174) from extension housing using a 10mm socket (4x2 vehicles only).

tomsn048@gmail.com



tomsn048@gmail.com

Shift Lever and Boot

1. Place gearshift in neutral position.
2. Remove the retaining screws and slide gearshift lever boot up the shift lever shaft.
3. Remove retaining bolt and remove shift lever shaft.

tomsn048@gmail.com

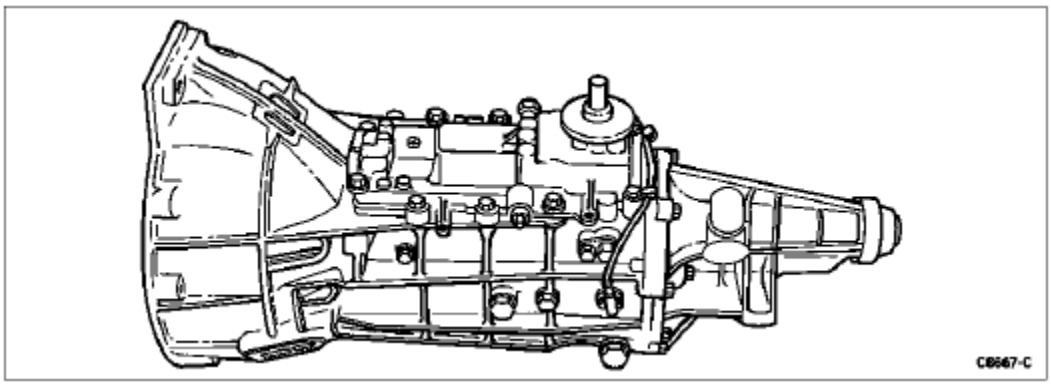
Transmission

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Remover/Replacer Tube	T75L-7025-B
TOD Forcing Screw	T84T-7025-B
Bearing Puller	T77J-7025-H

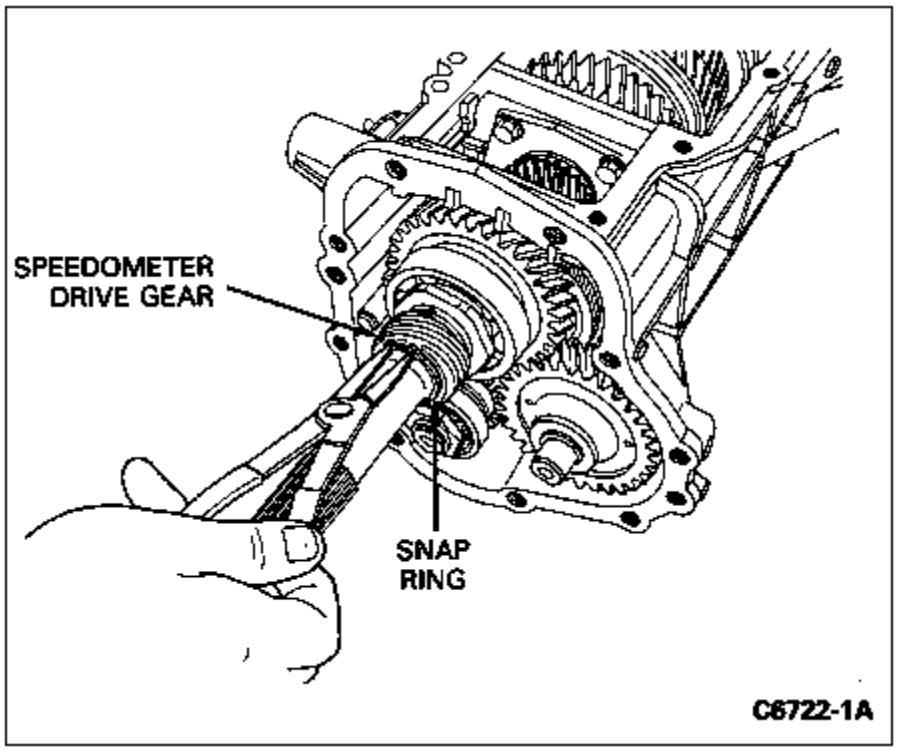
1. Remove transmission (7003) from vehicle as outlined in Removal, Transmission in this section. Set transmission on workbench.

M5OD Transmission Assembly



2. Remove gearshift lever (7210) and gearshift lever boot (7277) if necessary.
3. Using a 12mm wrench, remove 10 retaining bolts and remove case cover (7222).
4. Remove output shaft seal from output shaft (4x2 vehicles only).
5. Remove the speedometer drive gear and steel ball (4x2 vehicles only).

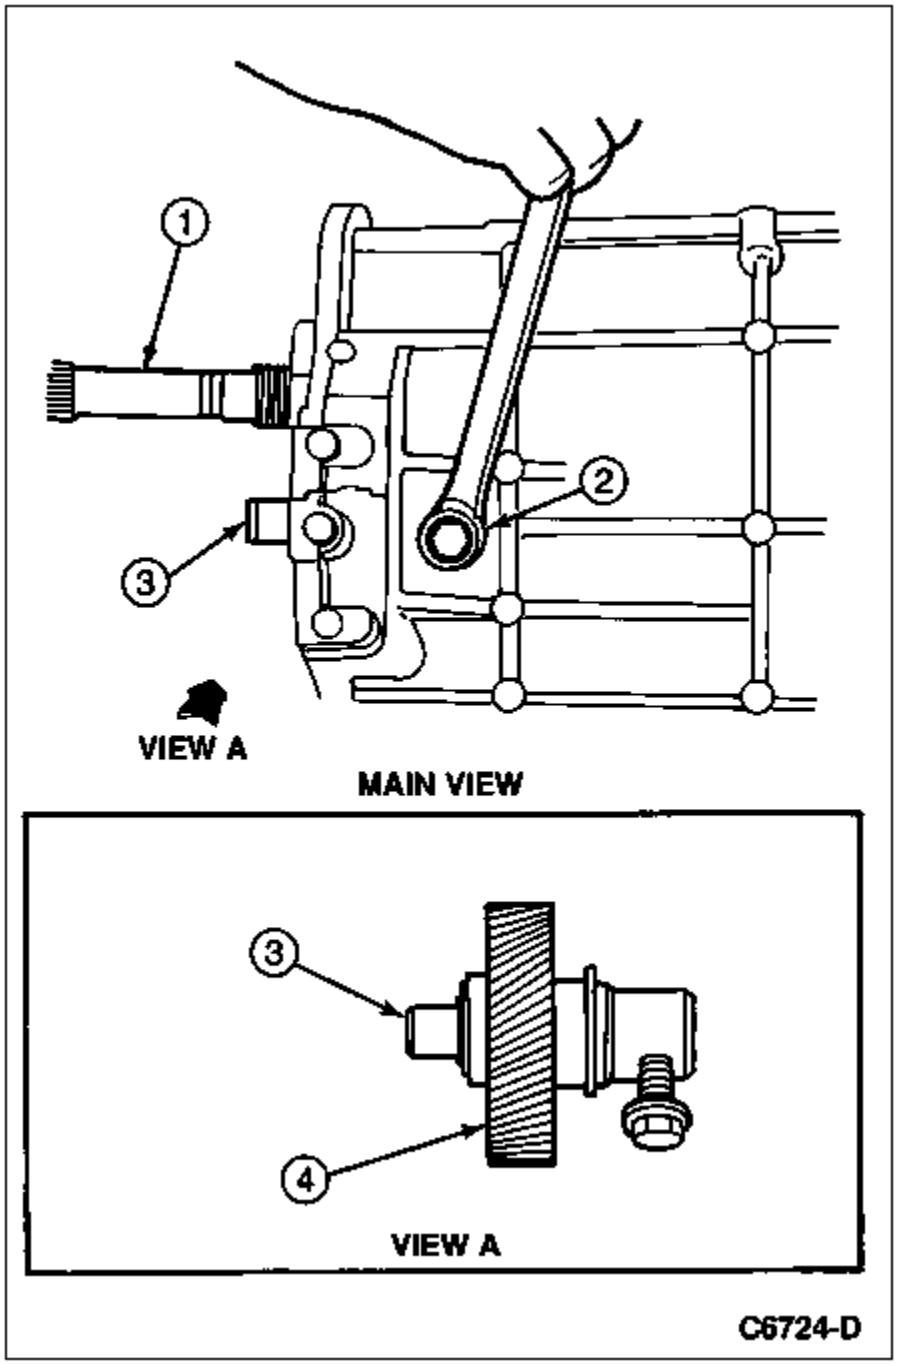
tomsn048@gmail.com



6. Remove thrust bearing (7C096) and thrust washer.

7. Using a 17mm wrench, remove holding bolt from reverse idler gear shaft (7140). Remove reverse idler gear and bushing (7141) by grasping and pulling rearward.

tomsn048@gmail.com

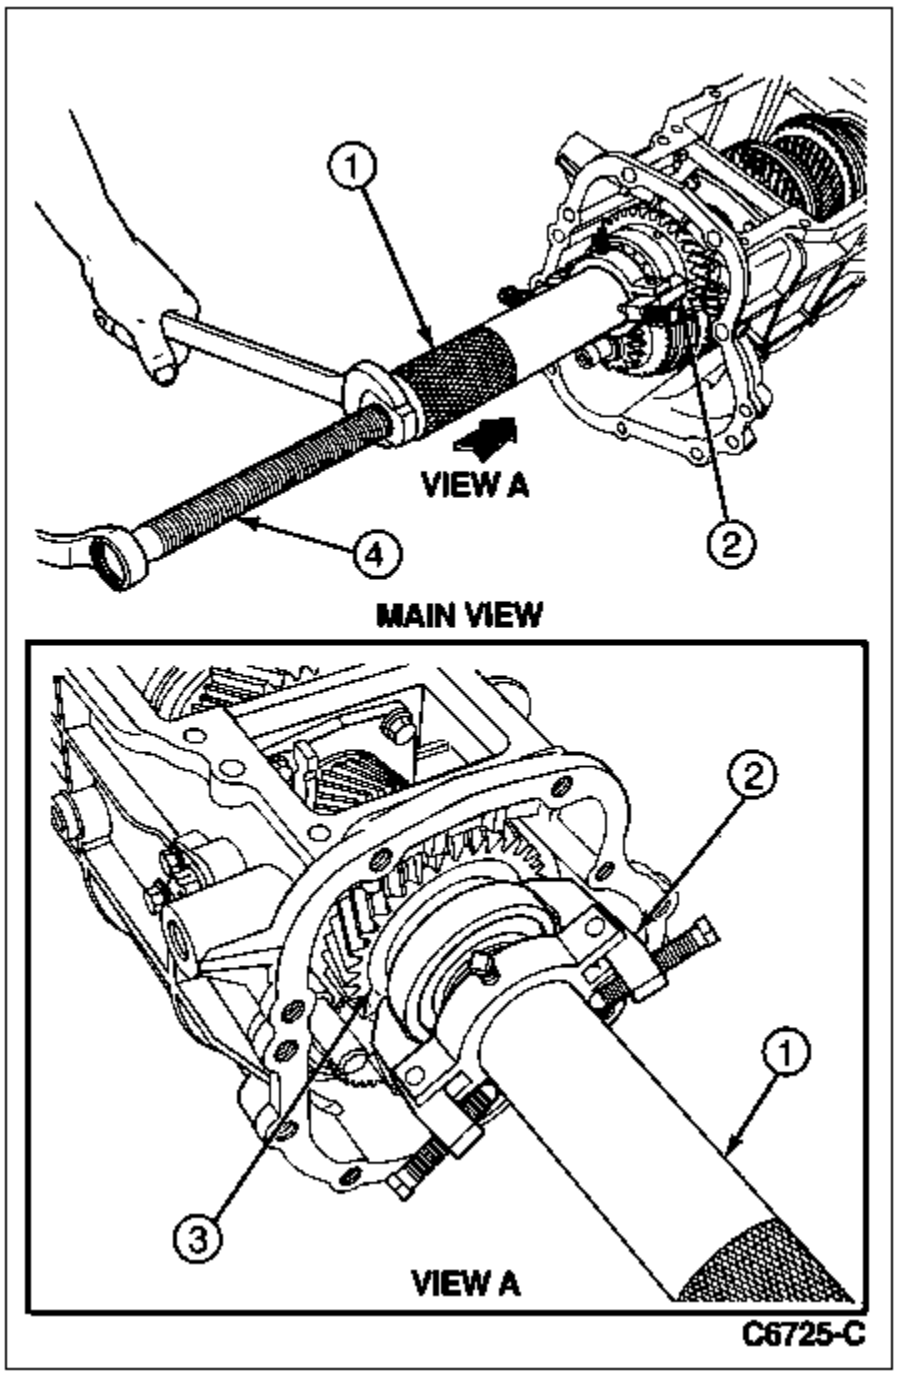


Item	Part Number	Description
1	7061	Output Shaft
2	7214	Bolt
3	7140	Reverse Idler Gear Shaft
4	7141	Reverse Idler Gear and Bushing

8. **CAUTION: Be sure tools are properly positioned so as not to damage parts being removed.**

tomsn048@gmail.com

Remove output shaft bearing (7065) from mainshaft using Remover/Replacer Tube T75L-7025-B, TOD Forcing Screw T84T-7025-B, Bearing Puller T77J-7025-H.



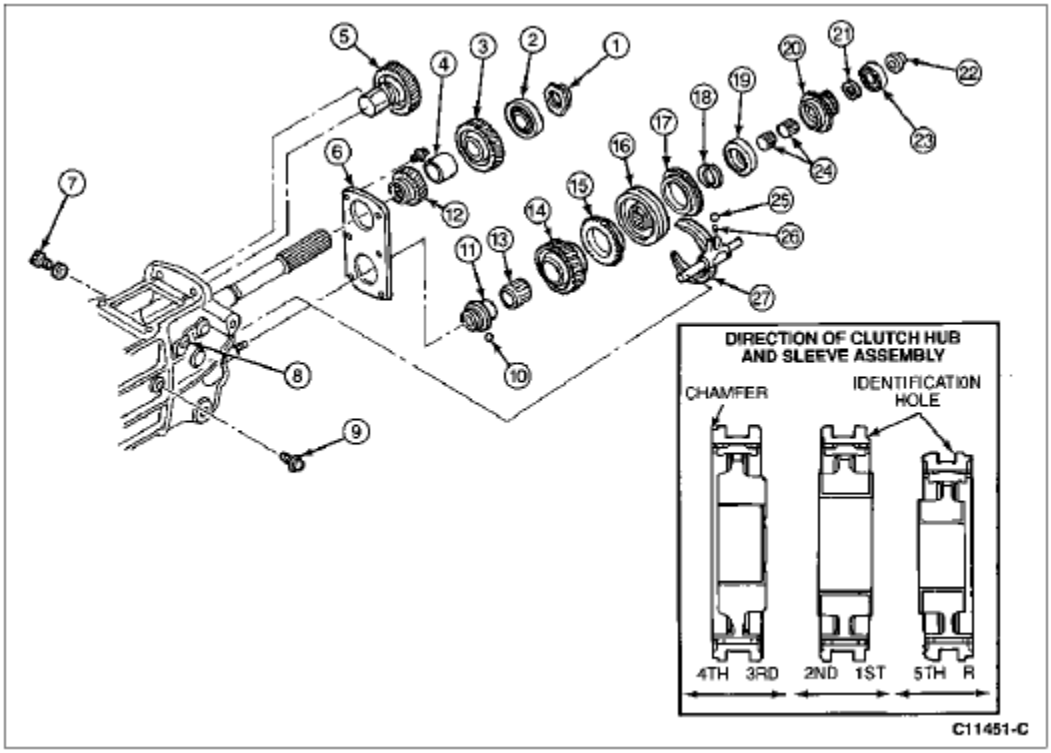
Item	Part Number	Description
1	T75L-7025-B	Remover/Replacer Tube
2	T77J-7025-H	Bearing Puller
3	7R205	Output Shaft Rear Bearing

tomsn048@gmail.com

4	T84T-7025-B	TOD Forcing Screw

9. Remove reverse idler gear and bushing from output shaft.
10. Remove sleeve from output shaft.
11. Remove countershaft reverse gear (7N040) with two reverse idler gear bearings (7E139) and reversesynchronizer blocking ring (7107).

Transmission, Rear Housing



Item	Part Number	Description
1	7B364	Locknut
2	7R205	Output Shaft Rear Bearing
3	7142	Output Shaft Reverse Gear
4	7072	Spacer or Sleeve
5	7141	Reverse Idler Gear and Bushing
6	7085	Bearing Retainer
7	7K179	Reverse Idler Gear Holding Bolt
8	99796-0612	Bolt
9	7214	Fifth and Reverse Shift Rod Bolt
10	99611-2000	Ball

tomsn048@gmail.com

25	7289	Lockball (Steel) Shift Rail
26	99796-0612	Bolt
27	7289	Shift Fork (Fifth and Reverse)

12. Remove thrust washer and split washer from countershaft (7111).

13. Using a 12mm wrench, remove holding bolt from reverse gear shift rail (7240).

14. **NOTE: When performing the following, do not separate steel ball and shifter interlock spring (7234) (removed from shift fork groove) unless necessary.**

    Remove the following parts as an assembly:

    - Fifth/reverse synchronizer (7124) (countershaft)
    - Fifth/reverse gear shifter fork (7230) and reverse gear shift rail

15. Remove fifth gear synchronizer blocking ring.

16. **NOTE: Do not remove the Torx® nut retaining theshift lever connecting pin (7F301) at this time.**

    Remove the lockplate retaining bolt and inner circlip. Remove fifth and reverse shift lever (7243) from case (7005).

17. Remove fifth speed gear (7K316) with needle bearing.

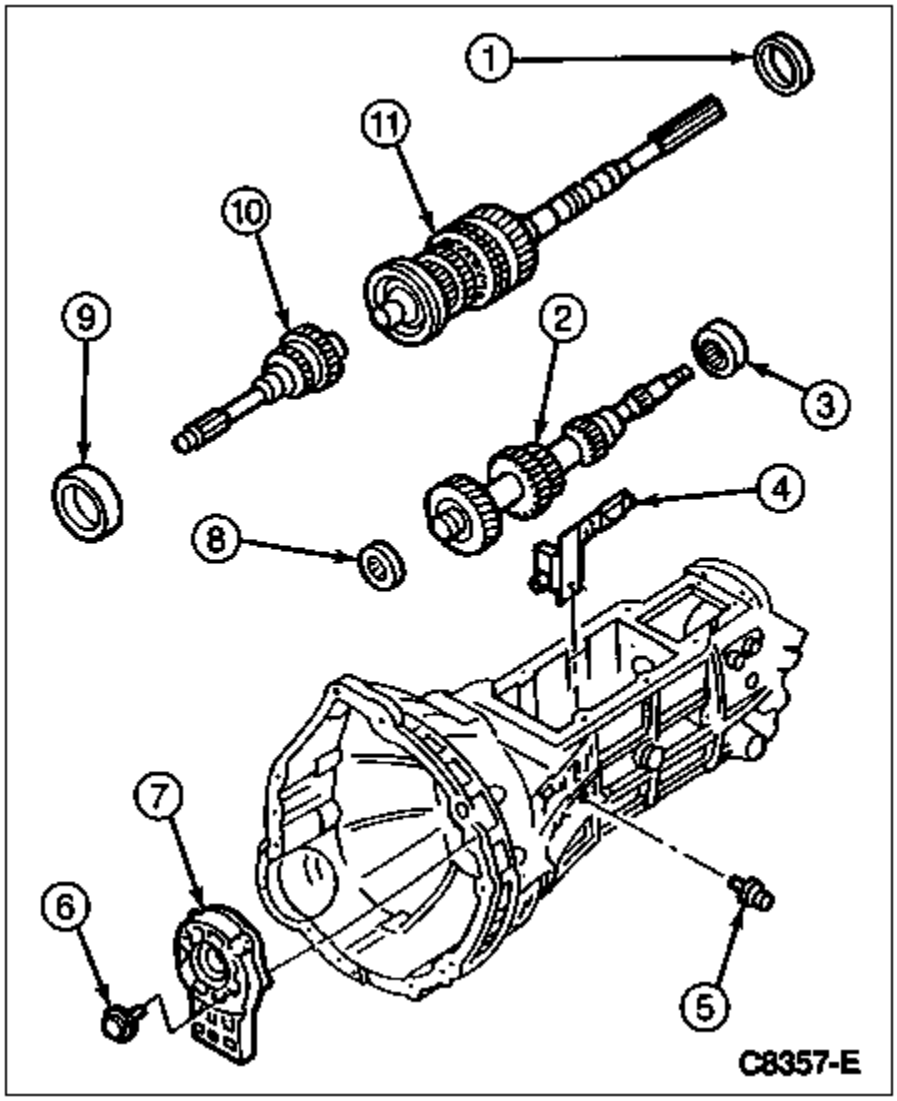
18. Remove fifth speed gear from output shaft.

19. Remove fifth gear spacer or sleeve (7072) and (positioning) ball.

20. Remove front and rear bearing retainers. Refer to procedures in this section.

tomsn048@gmail.com

21. Using a 10mm socket, remove retaining bolt and oil bypass tube (7A174) from upper case.

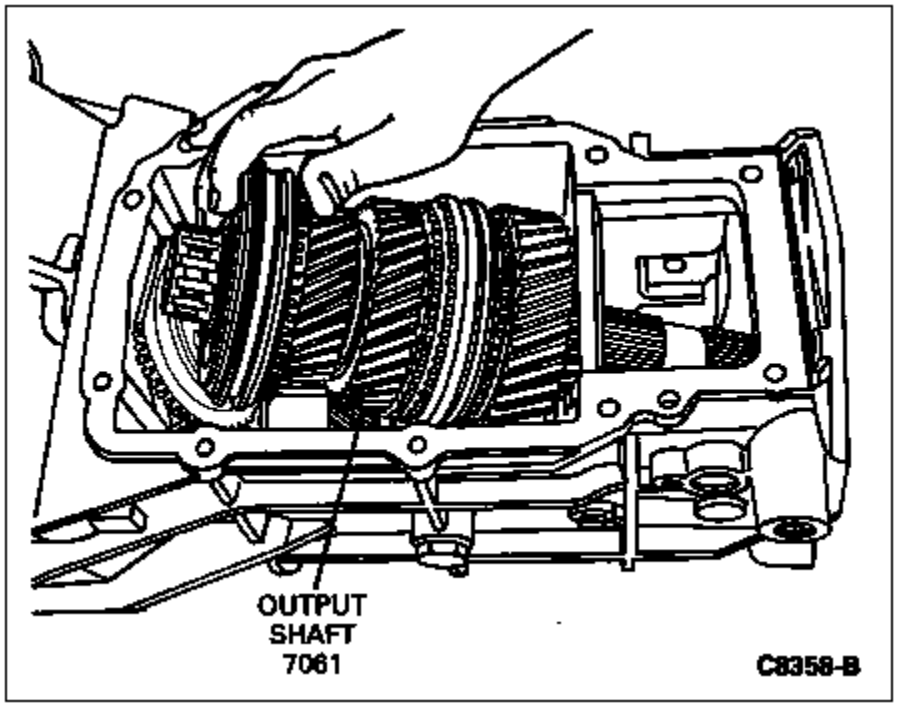


Item	Part Number	Description
1	7052	Center Bearing Outer Race
2	7111	Countershaft
3	7C096	Thrust Bearing
4	7A174	Oil Bypass Tube
5	99796-0620	Bolt
6	99796-0825	Bolt
7	7050	Main Drive Gear Bearing Retainer
8	7065	Output Shaft Bearing
9	7025	Bearing

tomsn048@gmail.com

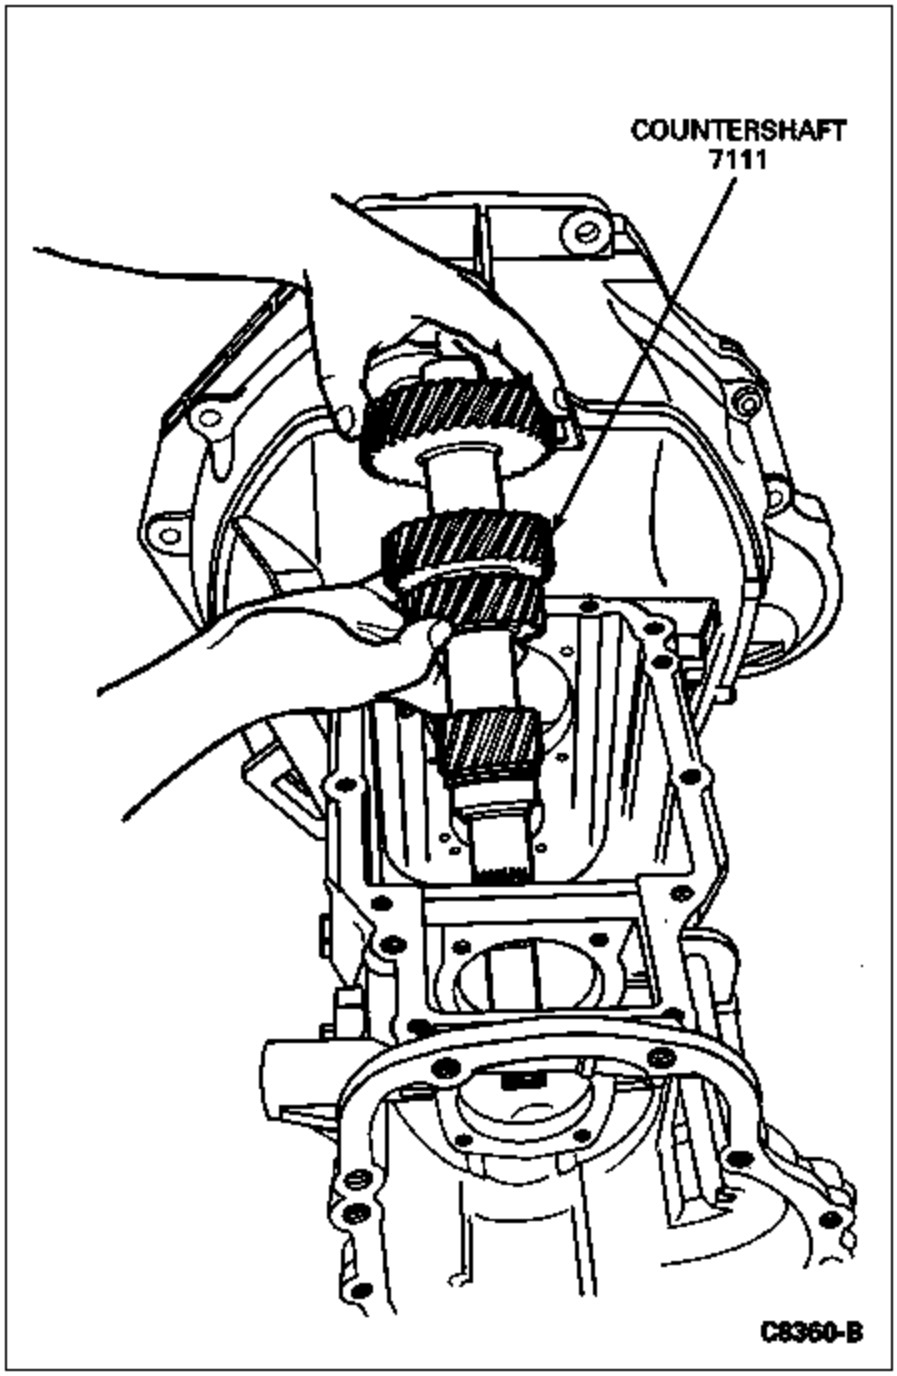
10	7017	Input Shaft
11	7061	Output Shaft

22. Pull input shaft (7017) forward and remove bearing (7025). Pull mainshaft rearward.
23. Pull input shaft forward and separate it from mainshaft.
24. Incline mainshaft upward and lift from case.



25. Tip (angle) input shaft and remove fromcase.
26. Remove countershaft through upper opening of case.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Shift Control Housing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Top Cover Holding Fixture	T88T-7025-C

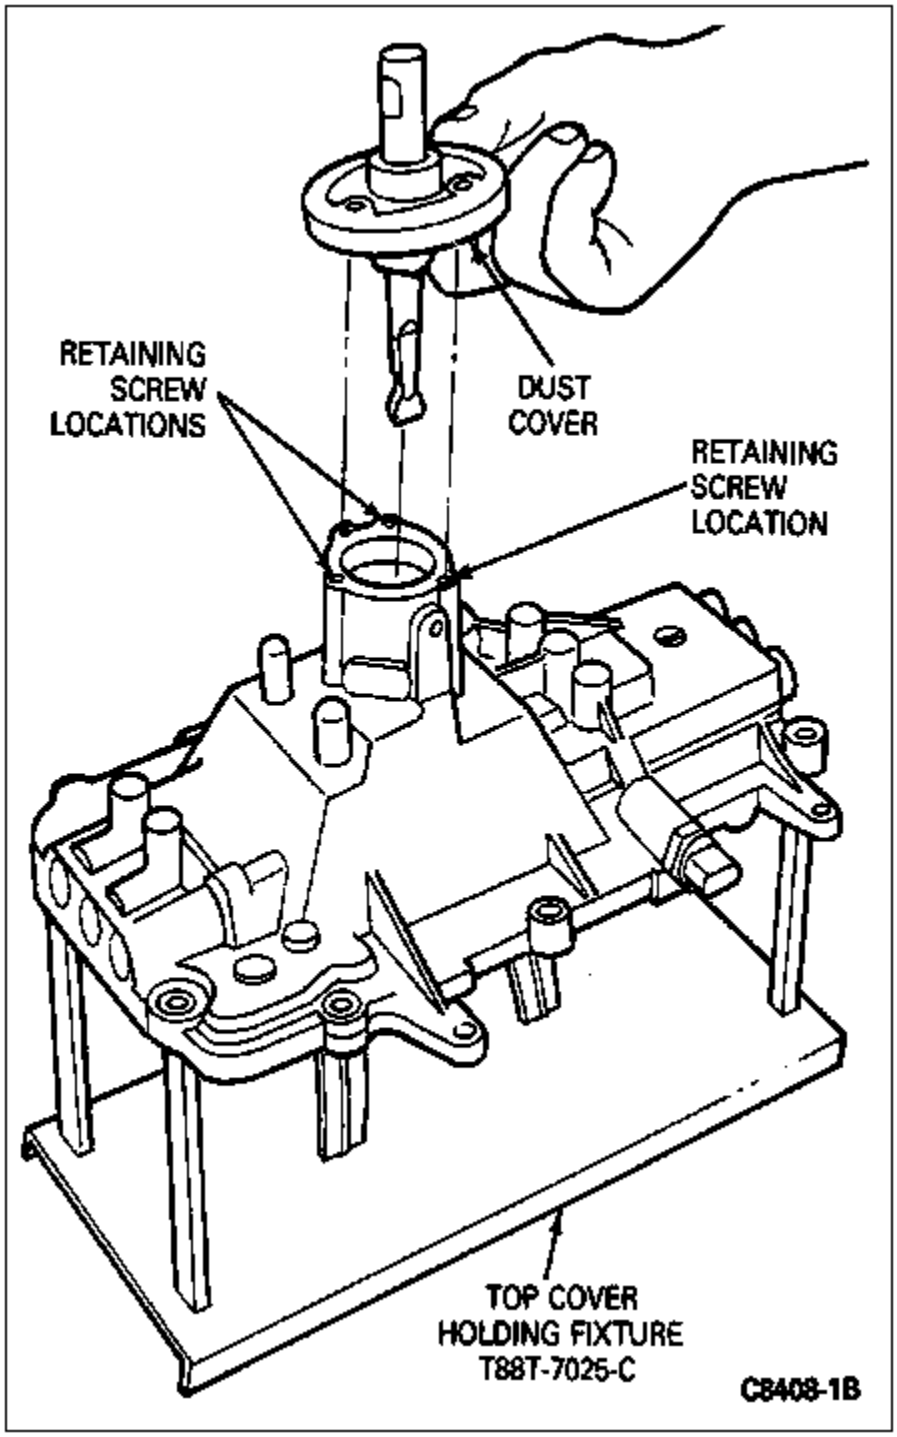
Disassembly

1. **NOTE: For reference during assembly, notice that grooves in bushing align with slots in lower shift lever pivot ball. Notice that the notch in the lower gearshift lever (7210) faces toward front of transmission (7003).**

   If necessary, remove gearshift lever boot (7277) and gearshift lever from case cover (7222) if not removed during disassembly. Remove three dust cover retaining screws using a T30 Torx® Allen wrench. Remove dust cover.

2. Position case cover into Top Cover Holding Fixture T88T-7025-C.

tomsn048@gmail.com



3. Remove backup lamp switch (15520) from case cover. Remove backup lamp switch pin from groove in case cover.

4. Remove manual lever position (MLP) switch and pin from case cover.

5. Invert case cover on Top Cover Holding Fixture T88T-7025-C. Using a 5/32-inch drift punch, remove and discard spring pins retaining gear shifter forks (7230) to the shift rail.

6. Make sure all shift rails and gates are positioned in NEUTRAL. Remove and discard spring pins

tomsn048@gmail.com

retaining shift gates to shift rails. Remove shift gates.

7. Remove three rubber plugs sealing service bores.

8. **WARNING: WEAR SAFETY GLASSES WHILE PERFORMING SHIFT RAIL REMOVAL PROCEDURE.**

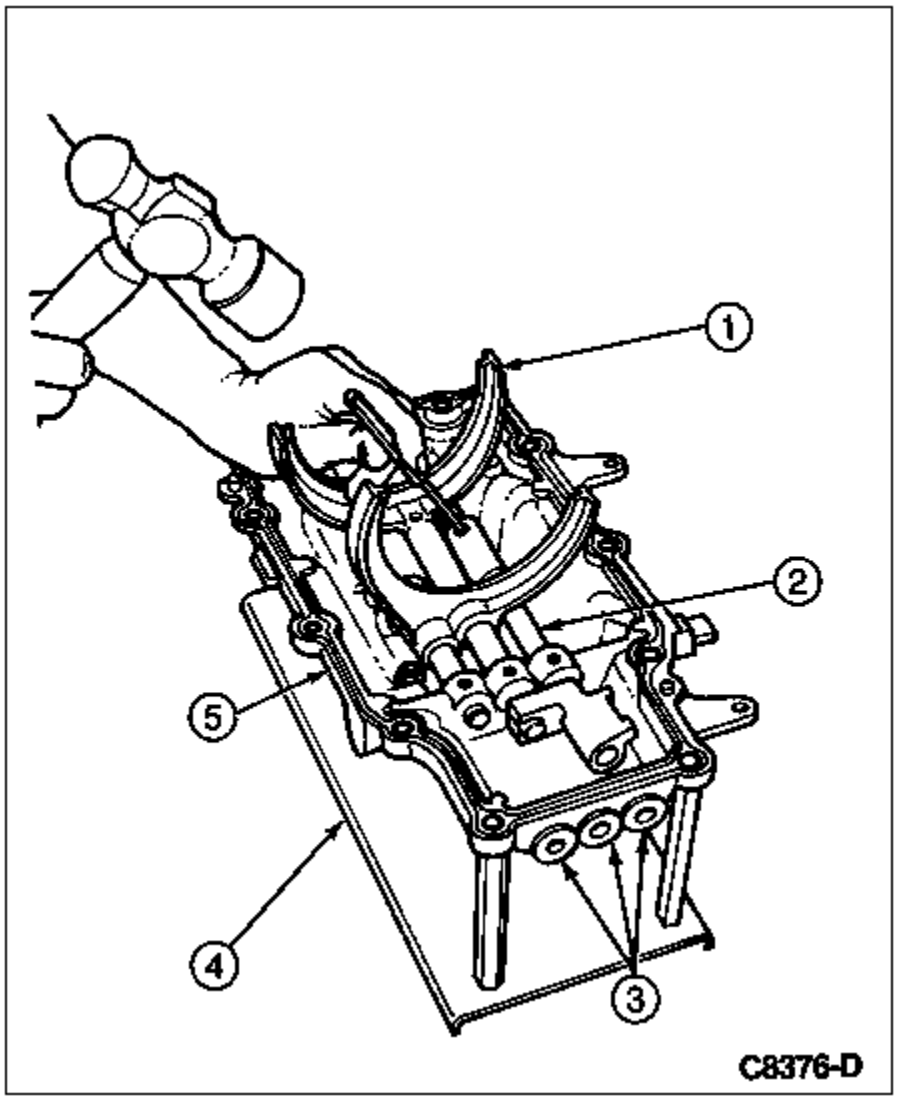
   CAUTION: Perform the following shift rail removal procedures with great care. Cover the lockball and friction device bores and spring seats with a clean cloth held firmly in place during shift rail removal. Failure to firmly cover lockball and friction device bores can result in component loss when the ball/friction device and spring forcefully leave their installed positions.

   Remove fifth/reverse shift rail from case cover through service bore. If necessary, insert a 5/16-inch drift punch through spring pin bore and gently rock shift rail from side to side while maintaining rearward pressure.

9. Remove first/second shift rail from case cover through service bore. If necessary, insert a 5/16-inch drift punch through spring pin bore and gently rock shift rail from side to side while maintaining rearward pressure.

10. Remove third/fourth shift rail from case cover through service bore. If necessary, insert a 5/16 drift punch through spring pin bore and gently rock shift rail from side to side while maintaining rearward pressure.

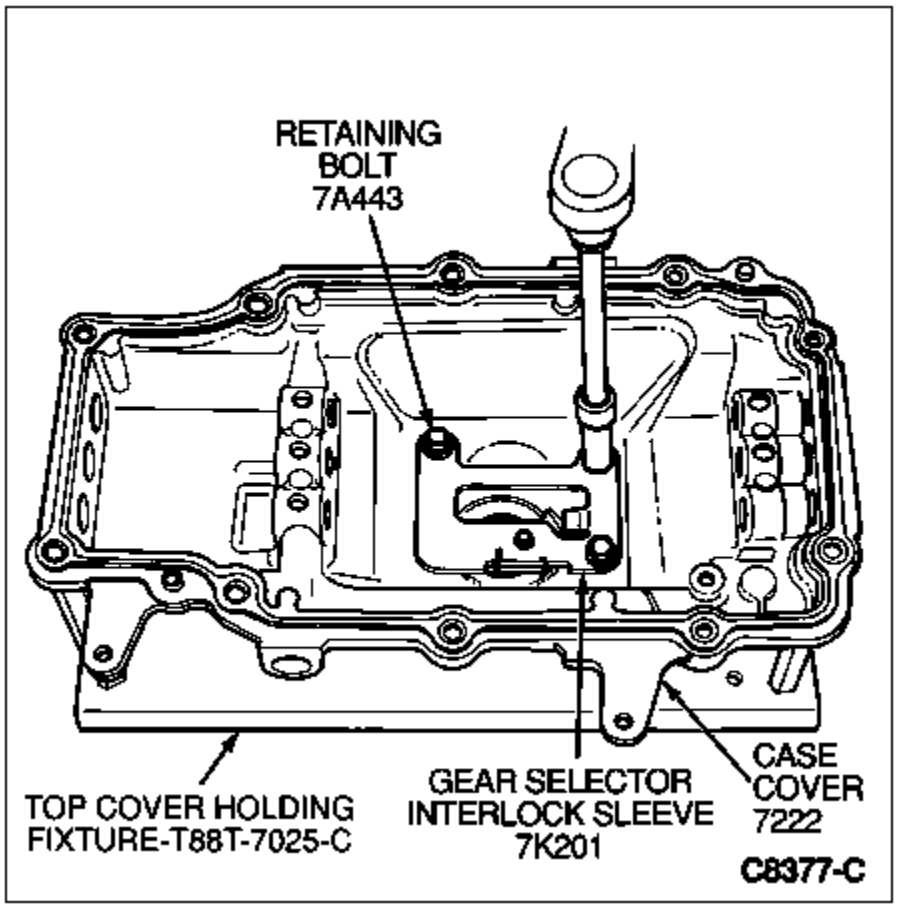
tomsn048@gmail.com



Item	Part Number	Description
1	7230	Shift Fork
2	7240	Shift Rail
3	—	Service Bore Plugs (Part of 7222)
4	T88T-7025-C	Top Cover Holding Fixture
5	7222	Case Cover

11. Remove retaining bolts using a 10mm socket. Remove gear selector interlock sleeve (7K201).

tomsn048@gmail.com



Assembly

1. **NOTE: During installation, apply Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid to all moving parts.**

   Position case cover into Top Cover Holding Fixture T88T-7025-C.

2. Position fifth/reverse cam lockout plate to top case cover. Install retaining bolts and tighten to 8-10 Nm (6-7 lb-ft).

3. Position third/fourth shift control shaft into case cover through service bore. If necessary, insert a 5/16-inch drift punch through spring pin bore and gently rock third/fourth shift control shaft from side to side while maintaining forward pressure. Position detent ball and shifter interlock spring (7234) into shift rod spring seats (7D210). Compress the detent ball and spring assembly using a suitable tool, and push third/fourth shift control shaft into position over detent ball. Engage third/fourth gear shifter fork with third/fourth shift control shaft. Position friction device and spring into shift rod spring seats. Compress the friction device and spring assembly using a suitable tool, and push third/fourth shift control shaft into position over friction device. Install spring pins retaining third/fourth shift control shaft to case cover. Install shifter interlock spring retaining third/fourth gear shifter fork to third/fourth shift control shaft.

4. Position first/second shift control shaft into case cover through service bore. If necessary, insert a 5/16-inch drift punch through spring pin bore and gently rock shift control shaft from side to side while maintaining forward pressure. Position detent ball and shifter interlock spring into shift rod spring

tomsn048@gmail.com

seats. Compress the detent ball and spring assembly using a suitable tool and push reverse shift control shaft (7241) into position over detent ball. Engage first/second gear shifter fork with shift control shaft. Position friction device and shifter interlock spring into shift rod spring seats. Compress friction device and spring assembly using a suitable tool, and push shift control shaft into position over friction device. Install spring pins retaining shift control shaft to case cover. Install spring pin retaining first/second gear shifter fork to shift control shaft.

5. Position fifth/reverse shift control shaft to case cover through service bore. If necessary, insert a 5/16-inch drift punch through spring pin bore and gently rock fifth/reverse shift control shaft from side to side while maintaining forward pressure. Position detent ball and shifter interlock spring into shift rod spring seats. Compress the detent ball and shifter interlock spring using a suitable tool, and push fifth/reverse shift control shaft into position over detent ball. Engage fifth/reverse gear shifter fork with fifth/reverse shift control shaft. Install spring pins retaining fifth/reverse shift control shaft tocase cover. Install spring pin retaining fifth/reverse gear shifter fork to fifth/reverse shift control shaft.

6. Install rubber plugs into service bores.

7. **NOTE: Improper installation of interlock pins will prevent activation of manual lever position (MLP) switch and backup lamp switch.**

   Install interlock pins into shift rails. Make sure that large and small interlock pins are installed into their original positions.

8. Apply sealant to backup lamp switch and manual lever position switch threads. Install switches tocase cover and tighten to 25-35 Nm (18-26 lb-ft).

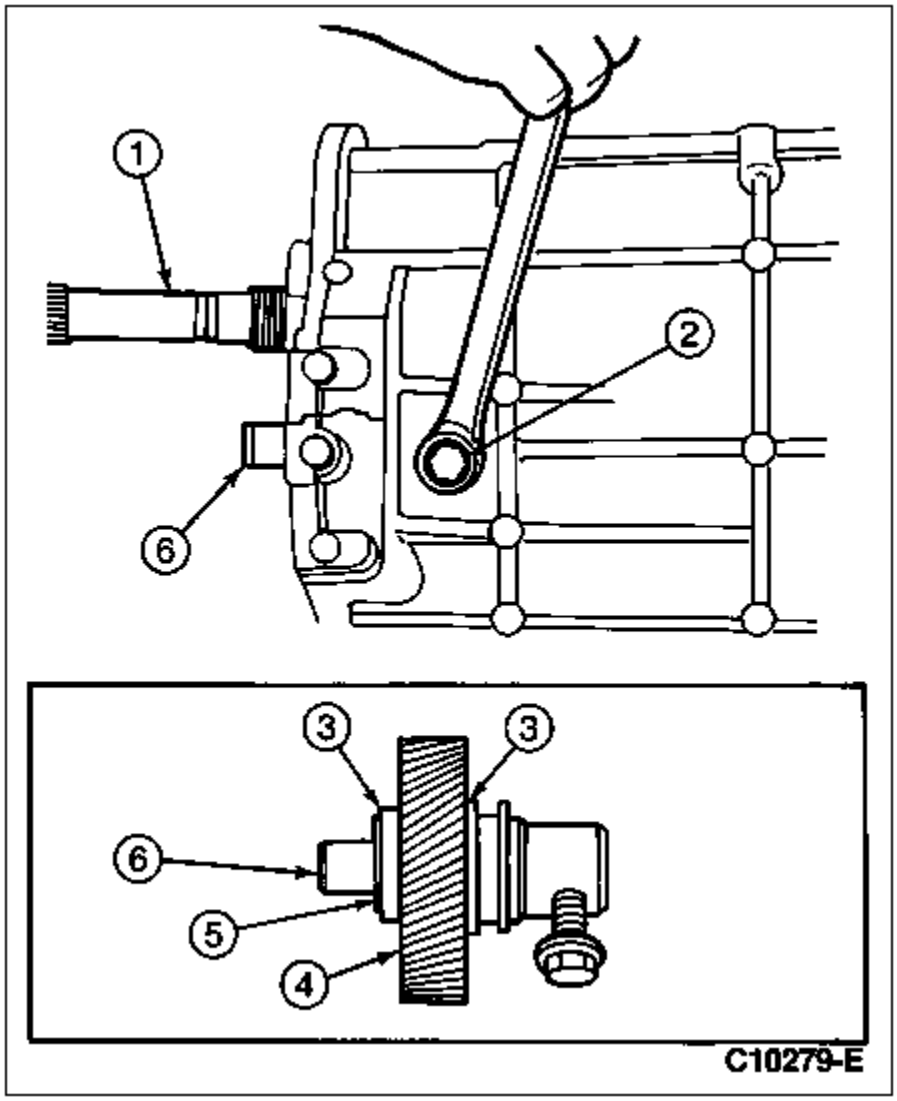
9. Position lower gearshift lever and dust cover assembly to case cover. Install three retaining screws and tighten to 8-11 Nm (6-8 lb-ft).

---

tomsn048@gmail.com

Reverse Idler Gear Shaft

1. Using a 17mm wrench, remove holding bolt from reverse idler gear shaft (7140) and pull rearward.



Item	Part Number	Description
1	7061	Output Shaft
2	7214	Bolt
3	7N037	Thrust Washer with Tang
4	7141	Reverse Idler Gear and Bushing
5	7156	Retaining Ring

tomsn048@gmail.com

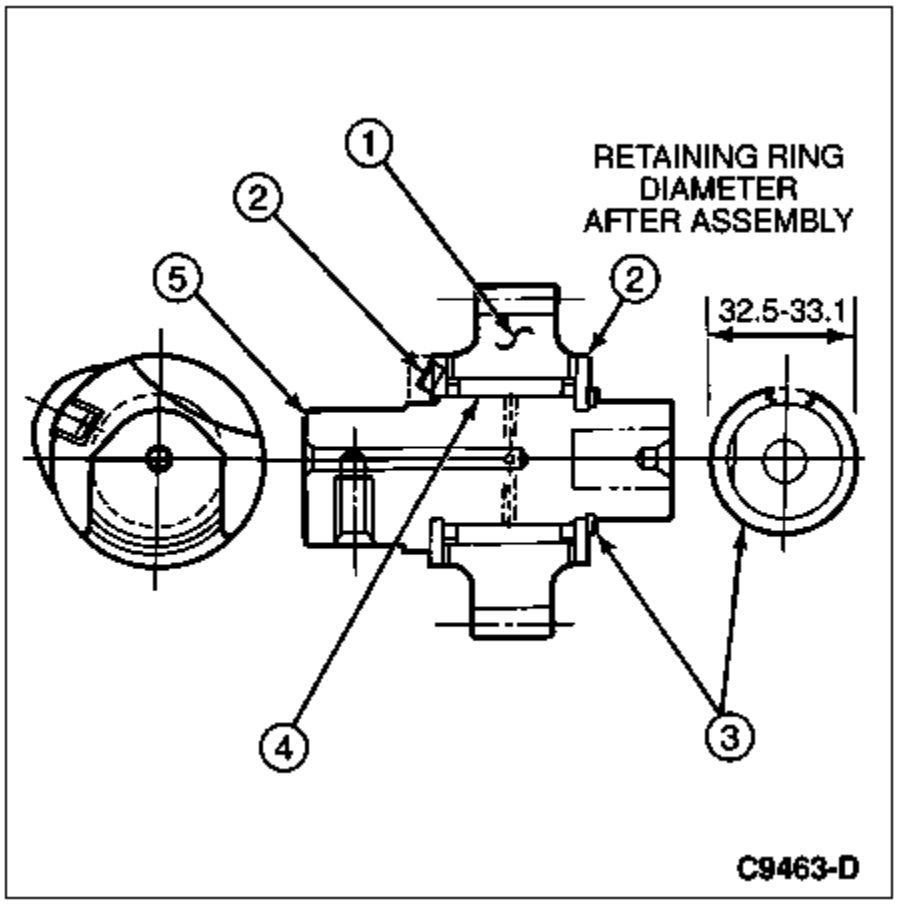
6	7140	Reverse Idler Gear Shaft

tomsn048@gmail.com

Reverse Idler Gear Retaining Rings

Disassembly

1. Remove the following parts from reverse idler gear shaft (7140):
    - Reverse idler gear retaining ring (7156)
    - Spacer
    - Reverse idler gear and bushing (7141)
    - Reverse idler gear bearings (7E139)
    - Reverse idler gear thrust washer (7N037)



Item	Part Number	Description
1	7141	Reverse Idler Gear and Bushing
2	7N037	Reverse Idler Gear Thrust Washer
3	7064	Reverse Idler Gear Retaining Ring
4	7E139	Reverse Idler Gear Bearing

tomsn048@gmail.com

5	7140	Reverse Idler Gear Shaft

Assembly

1. **NOTE: During installation, apply Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid to all rotating or sliding parts.**

   Install reverse idler gear thrust washer onto reverse idler gear shaft. Make sure that tab on reverse idler gear thrust washer mates with groove on reverse idler gear shaft to prevent rotation of reverse idler gear thrust washer.

2. Install the following parts onto reverse idler gear shaft in the order listed.

   - Reverse idler gear bearings
   - Reverse idler gear and bushing
   - Spacer

3. Install original reverse idler gear retaining ring onto reverse idler gear shaft. Insert a feeler gauge between reverse idler gear retaining ring and reverse idler gear and bushing to measure end play. Using the chart, adjust end play to 0.1mm-0.2mm (0.0039-0.0078 inch) by installing a retaining ring of necessary thickness.

REVERSE IDLER GEAR RETAINING RINGS

Part Number	Thickness
E8TZ-7156-A	1.5mm (0.059 In.)
E8TZ-7156-G	1.6mm (0.0629 In.)
E8TZ-7156-H	1.7mm (0.0669 In.)
E8TZ-7156-J	1.8mm (0.0708 In.)
E8TZ-7156-K	1.9mm (0.0748 In.)

tomsn048@gmail.com

tomsn048@gmail.com

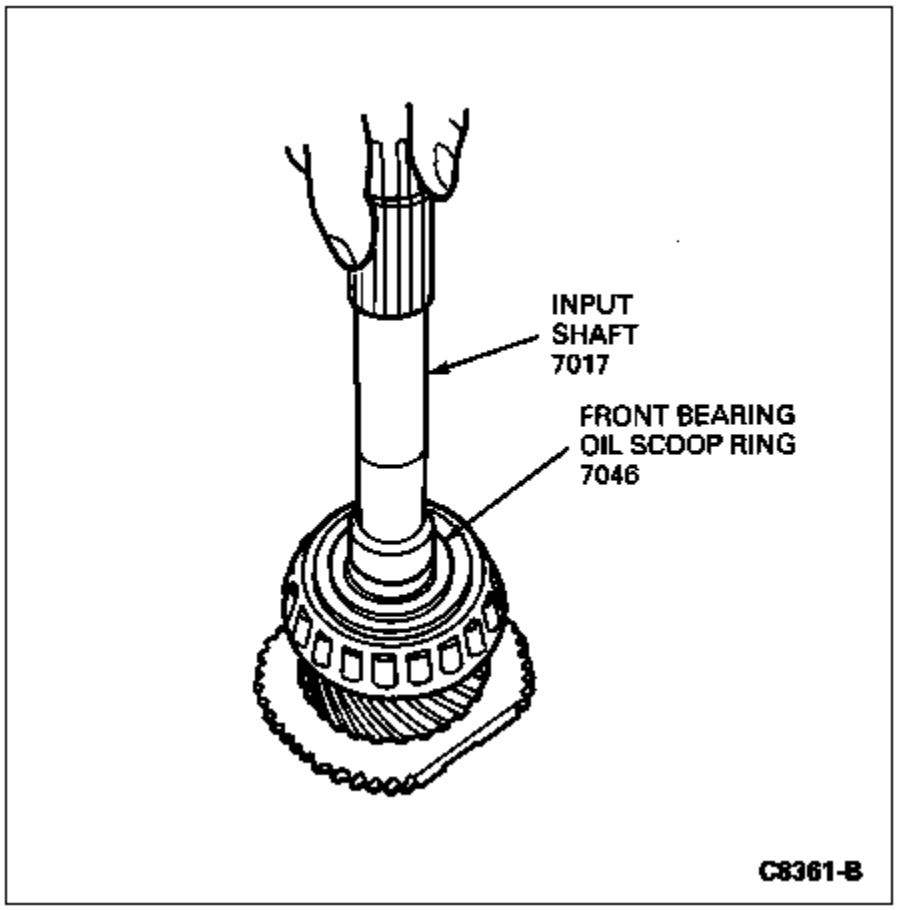
Input Shaft and Bearing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pinion Bearing Cone Remover	T71P-4621-B
Bearing Cone Replacer	T88T-7025-B

Disassembly

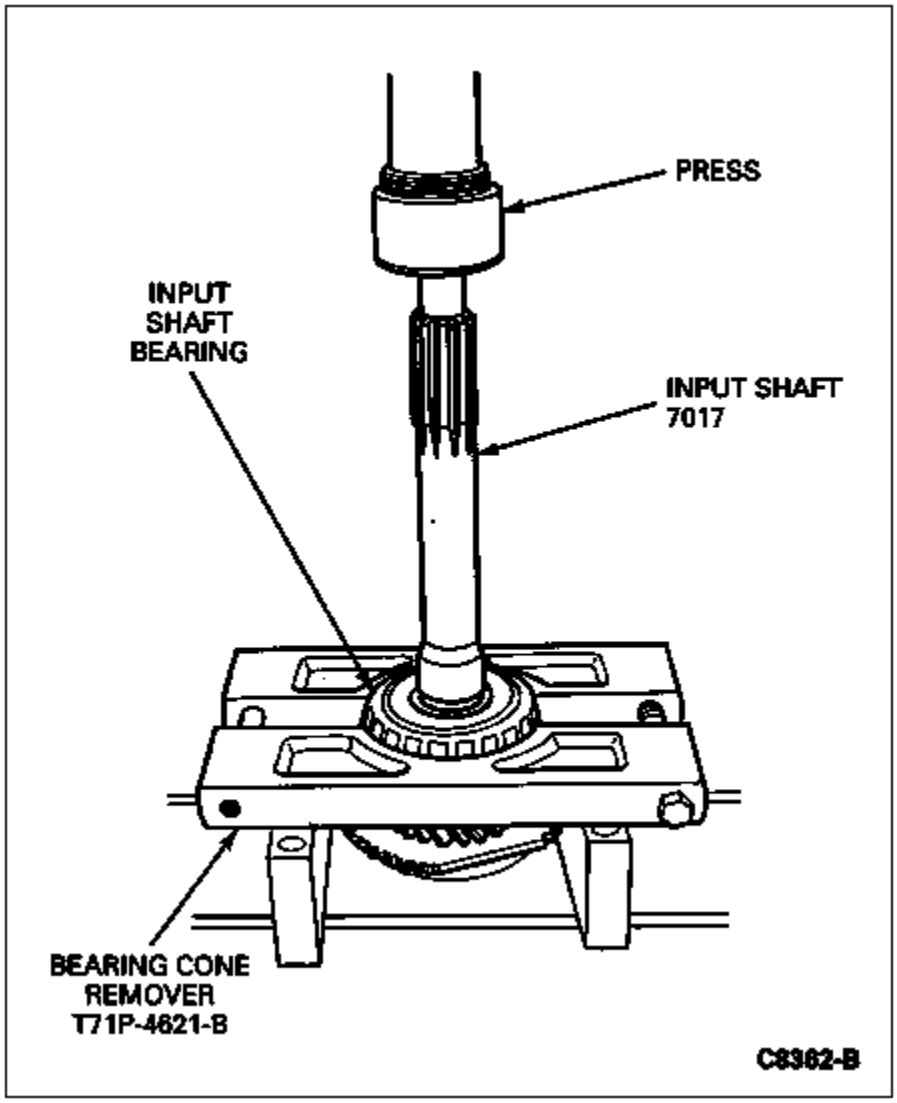
1. Remove and discard front bearing oil scoop ring (7046).



2. **CAUTION: Use of essential tools may cause damage to the bearings being removed.**

   Press bearing from input shaft (7017) using Pinion Bearing Cone Remover T71P-4621-B and arbor press.

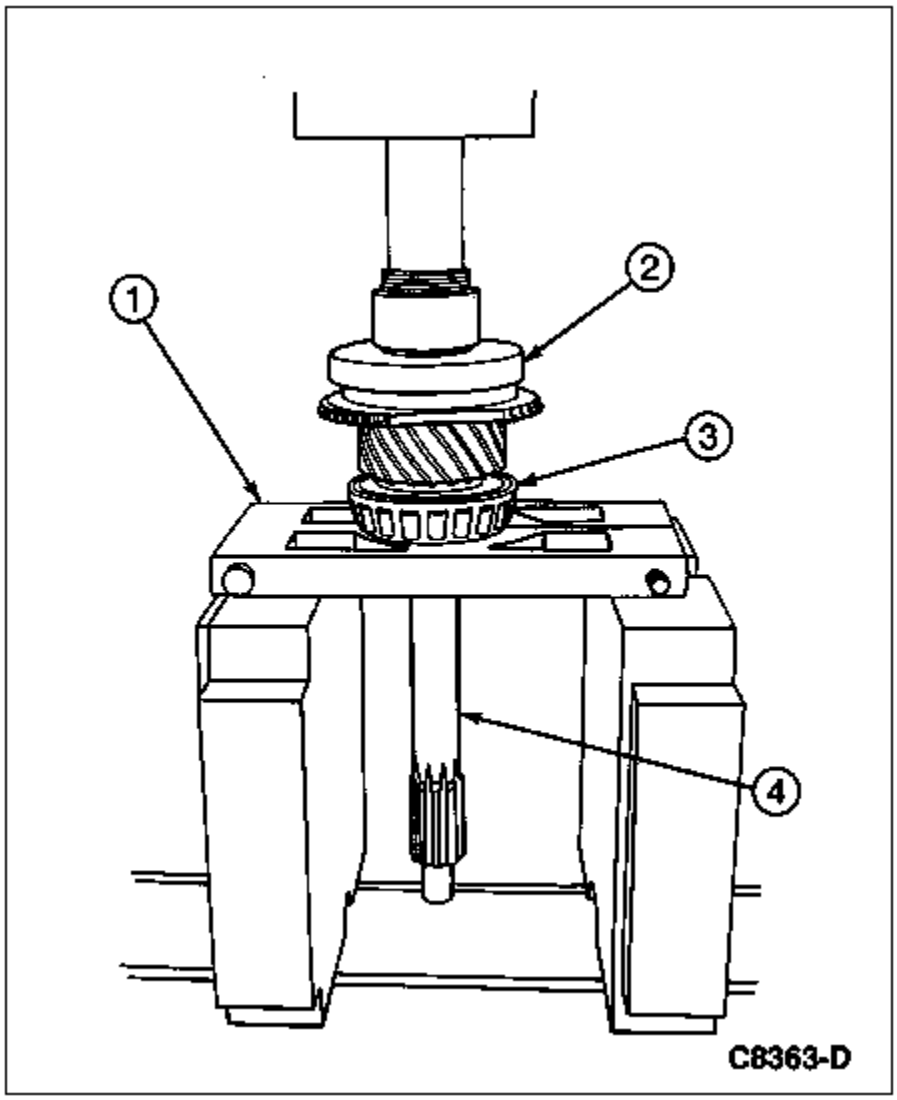
tomsn048@gmail.com



Assembly

1. Press tapered roller bearing onto input shaft using Bearing Cone Replacer T88T-7025-B and Pinion Bearing Cone Remover T71P-4621-B as a press plate.

tomsn048@gmail.com



Item	Part Number	Description
1	T71P-4621-B	Bearing Cone Remover
2	T88T-7025-B	Bearing Cone Replacer
3	7025	Bearing
4	7017	Input Shaft

2. Install front bearing oil scoop ring onto input shaft. (Manually rotate clockwise to make sure that input shaft oil holes properly engage front bearing oil scoop ring. A click should be heard as scoop ring notches align with input shaft oil holes.)

tomsn048@gmail.com

tomsn048@gmail.com

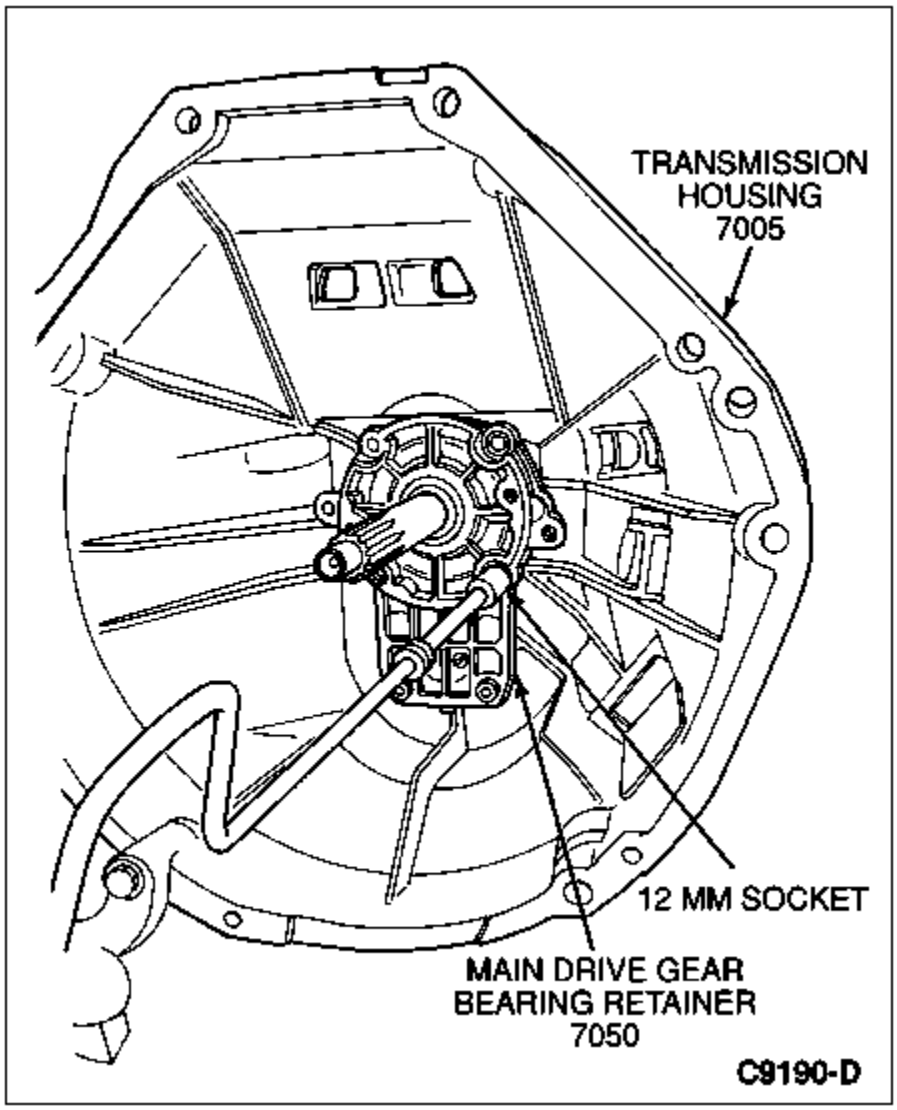
Bearing Retainer, Front

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bell Housing Seal Replacer	T77J-7025-G

Disassembly

1. Using a 12mm socket, remove six attaching bolts from main drive gear bearing retainer (7050).



2. **NOTE: Bolts threaded into slave cylinder bolt locations will bottom out and lift main drive gear bearing retainer away from case (7005).**

tomsn048@gmail.com

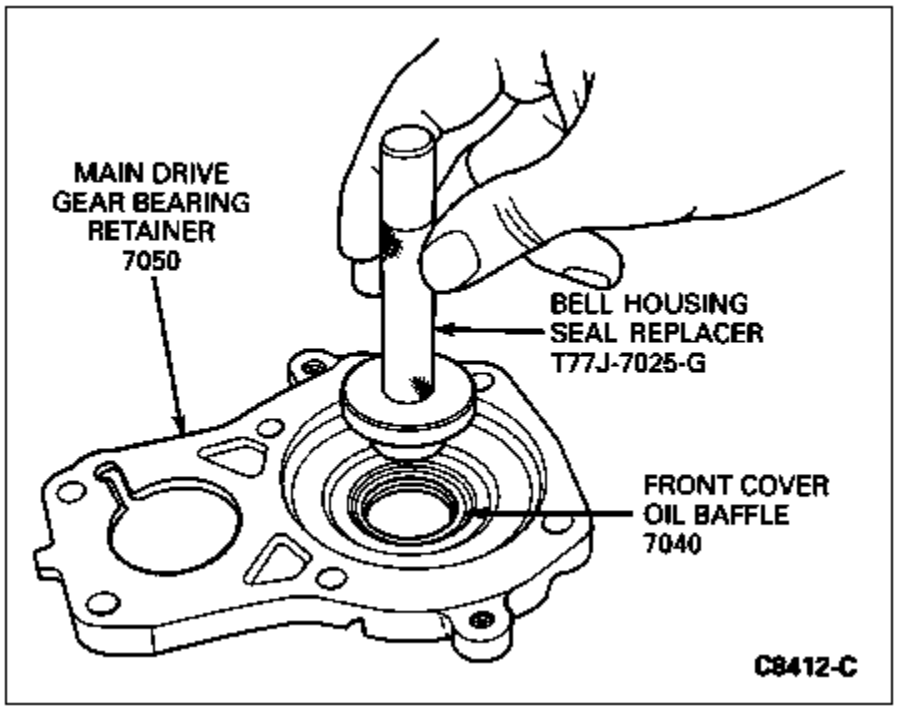
NOTE: Do not remove front bearing oil scoop ring (7046) at this time.

Remove main drive gear bearing retainer by threading two M8 x 1.25 (40mm or longer) bolts into the bearing retainer slave cylinder bolt locations. Alternately tighten bolts until main drive gear bearing retainer can be lifted away by hand.

Assembly

1. **NOTE: If any related parts (such as output shaft, bearing, etc.) have been replaced, measure dimensions A, B, C, and D as illustrated. After measuring all dimensions, select bearing shim to maintain end play within specified limits.**

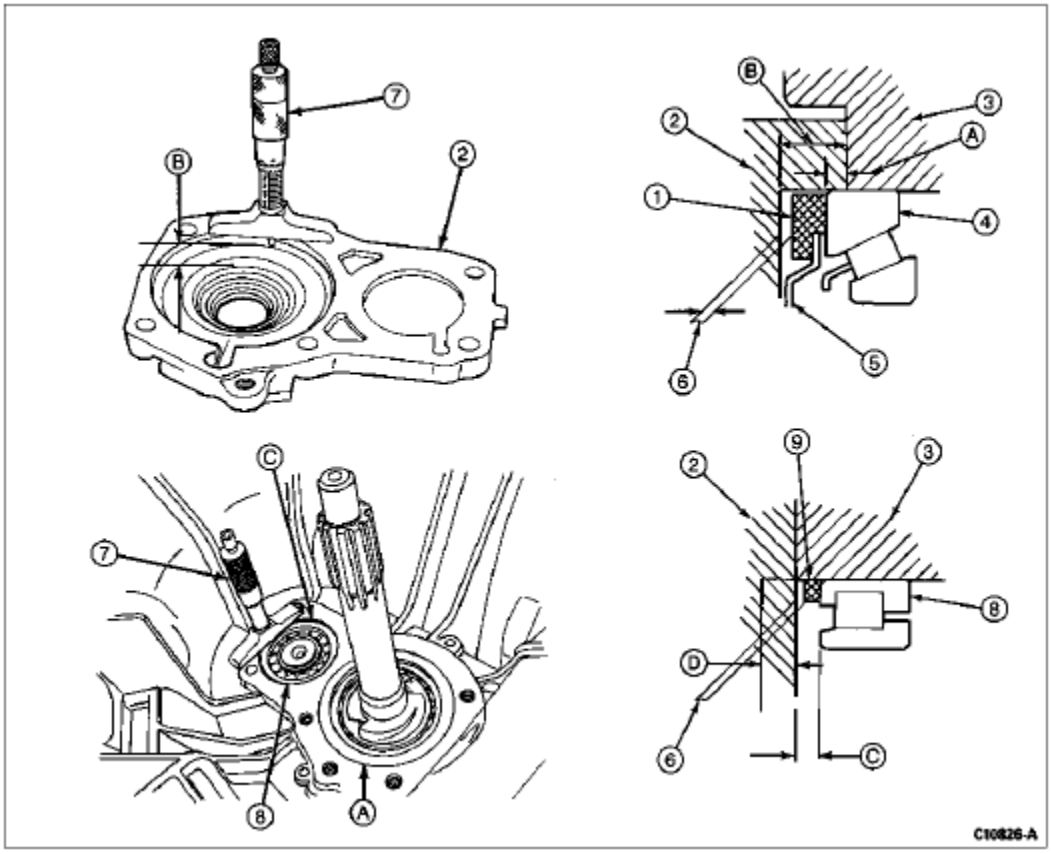
   Position transmission (7003) vertically (input shaft (7017) and flywheel housing (6392) facing upward). Make sure that bearing (7025) is squarely positioned in bore. If removed, install front cover oil baffle (7040) using Bell Housing Seal Replacer T77J-7025-G.



2. Install output shaft bearing (7065) by hand.

Measuring to Select Shim Thickness

tomsn048@gmail.com



Item	Part Number	Description
1	7029	Selective Shim (Output Shaft)
2	7050	Main Drive Gear Bearing Retainer
3	7005	Case
4	7025	Bearing
5	7040	Oil Baffle
6	—	End Play Area
7	D82L-4201-C	Depth Micrometer
8	7065	Output Shaft Bearing
9	7C434	Selective Shim (Countershaft)
A	—	Dimension "A"
B	—	Dimension "B"
C	—	Dimension "C"
D	—	Dimension "D"

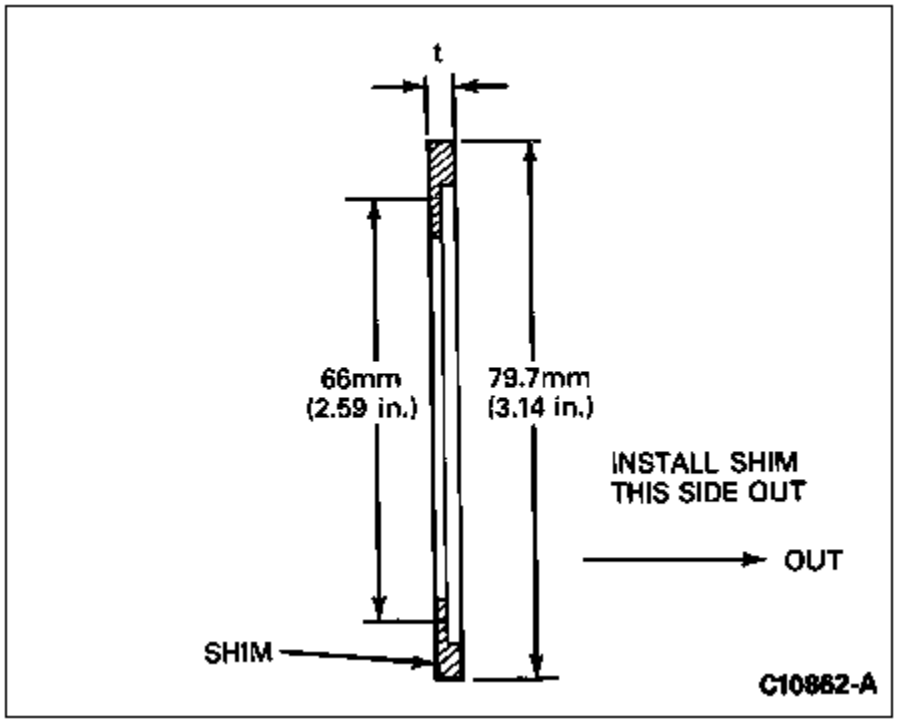
- **Dimension A:** Height of bearing above mating surface of main drive gear bearing retainer.
- **Dimension B:** Depth of bearing retainer bore (input shaft).
- **Dimension C:** Depth of countershaft front bearing race (transmission case-to-retainer mating surface).
- **Dimension D:** Depth of main drive gear bearing retainer bore (countershaft).

tomsn048@gmail.com

- Shim computation equations are as follows:

Dimension B - [Dimension A + shim thickness] = 0.05 to 0.15mm (0.002-0.006 inch)

Dimension C + [Dimension D - shim thickness] = 0.15 to 0.25mm (0.006-0.010 inch)



Output Shaft Shim Select Chart — M5OD — R1

Part Number	Thickness (t)
E8TZ-7029-C	2.7mm (0.106 In.)
E8TZ-7029-D	2.8mm (0.110 In.)
E8TZ-7029-E	2.9mm (0.114 In.)
E8TZ-7029-F	3.0mm (0.118 In.)
E8TZ-7029-G	3.1mm (0.122 In.)
E8TZ-7029-H	3.2mm (0.125 In.)

E8TZ-7C434-G	2.9mm (0.114 In.)
E8TZ-7C434-H	3.0mm (0.118 In.)
E8TZ-7C434-J	3.1mm (0.122 In.)

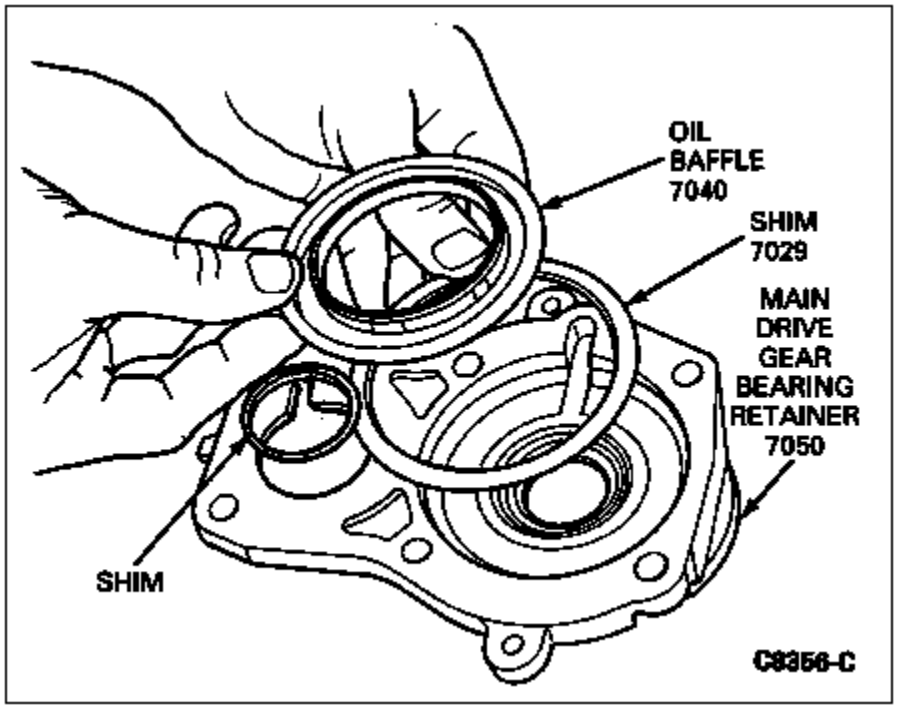
3. Remove any sealant residue remaining on mating surfaces of transmission and main drive gear bearing retainer.

4. **NOTE: To prevent damage to oil seal lip during assembly, tape the input shaft splines along their entire length.**

   NOTE: If necessary, apply a sufficient quantity of grease to shim, main drive gear bearing retainer and oil baffle to retain them in position during assembly.

tomsn048@gmail.com

Apply a thin coat of oil to oil seal lip. Position bearing shim and oil baffle into main drive gear bearing retainer (install shim with groove showing). Install spacer to bore of output shaft bearing.



5. **NOTE: Make sure that retaining bolt heads are marked with a "6."**

   Apply a 3.18mm (1/8-inch) bead of silicone rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to main drive gear bearing retainer and retaining bolt threads. Install main drive gear bearing retainer to case. Install and tighten front bearing cover retaining bolts to 16-22 Nm (12-16 lb-ft).

---

tomsn048@gmail.com

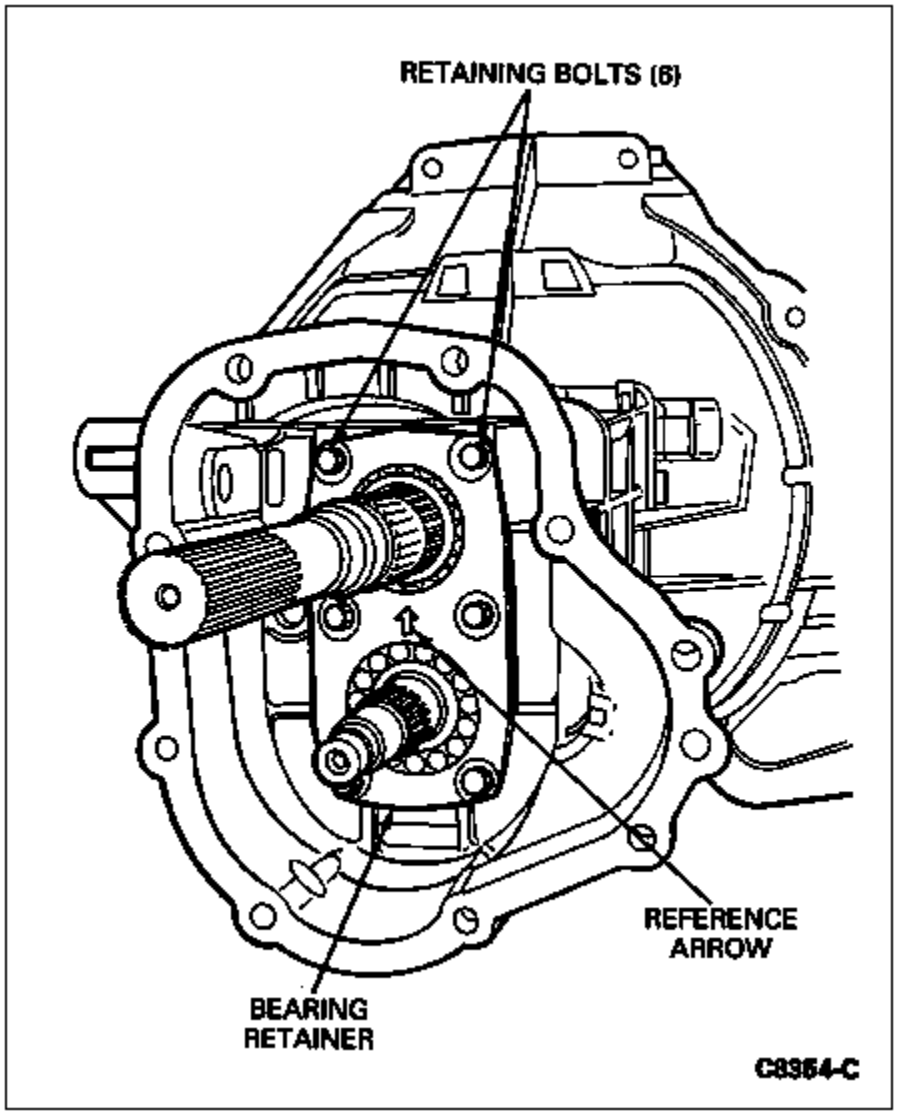
tomsn048@gmail.com

Bearing Retainer, Rear

Disassembly

1. **NOTE: For reference during assembly, observe that reference arrow in middle of bearing retainer points upward. Observe that flanged side faces inward.**

   Using a 12mm socket, remove retaining bolts. Remove bearing retainer (7085).



Assembly

1. **NOTE: Make sure that all retaining bolt heads are marked with an "8."**

tomsn048@gmail.com

Position bearing retainer to case with reference arrow pointing upward. Install and tighten retaining bolts to 18-26 Nm (13-19 lb-ft).

---

tomsn048@gmail.com

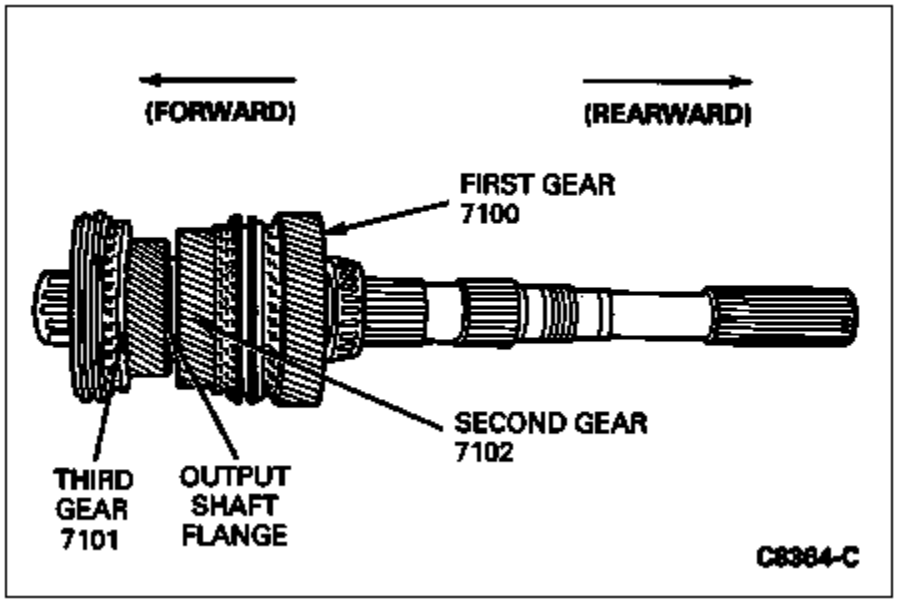
Output Shaft

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Remover/Replacer Tube	T75L-7025-B
Pinion Bearing Cone Replacer	T53T-4621-B
Axle Bearing/Seal Plate	T57L-1165-B
Bearing Cone Replacer	T88T-7025-B

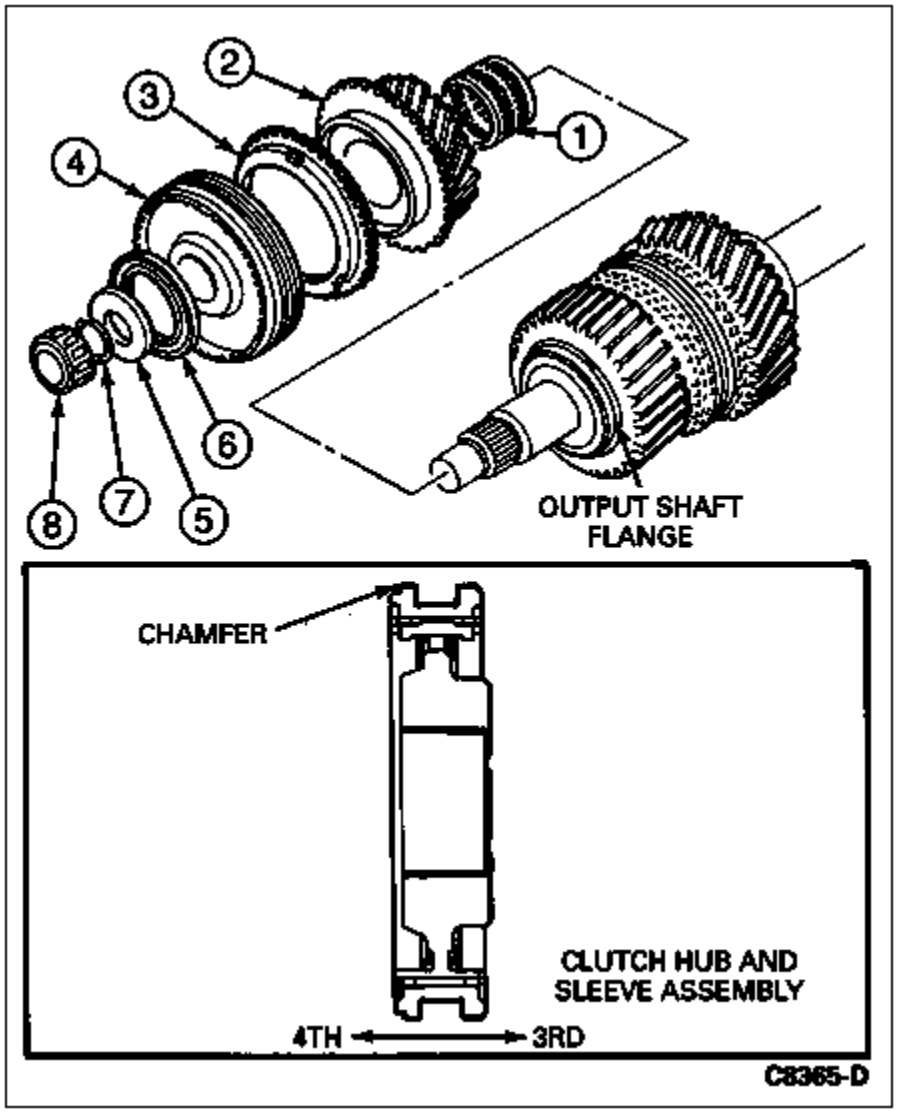
Disassembly

1. Position front flange of output shaft forward as shown in the following illustration. Use this flange as a reference point and dividing line during assembly and disassembly procedures.



2. Remove transmission input shaft pilot bearing (7118), bearing outer snap ring (7030), thrust bearing (7C096), and third and fourth synchronizer spacer (7N112) from front (short side of flange) of output shaft.

tomsn048@gmail.com



Item	Part Number	Description
1	7127	Gear Bearing
2	7101	Third Gear
3	7124	Synchronizer
4	7124	Synchronizer
5	7N112	Third and Fourth Synchronizer Spacer
6	7C096	Thrust Bearing
7	7030	Bearing Outer Snap Ring
8	7118	Transmission Input Shaft Pilot Bearing

3. Position the front (short side of flange) of the mainshaft so that it faces upward. Lift off the following components as a unit:

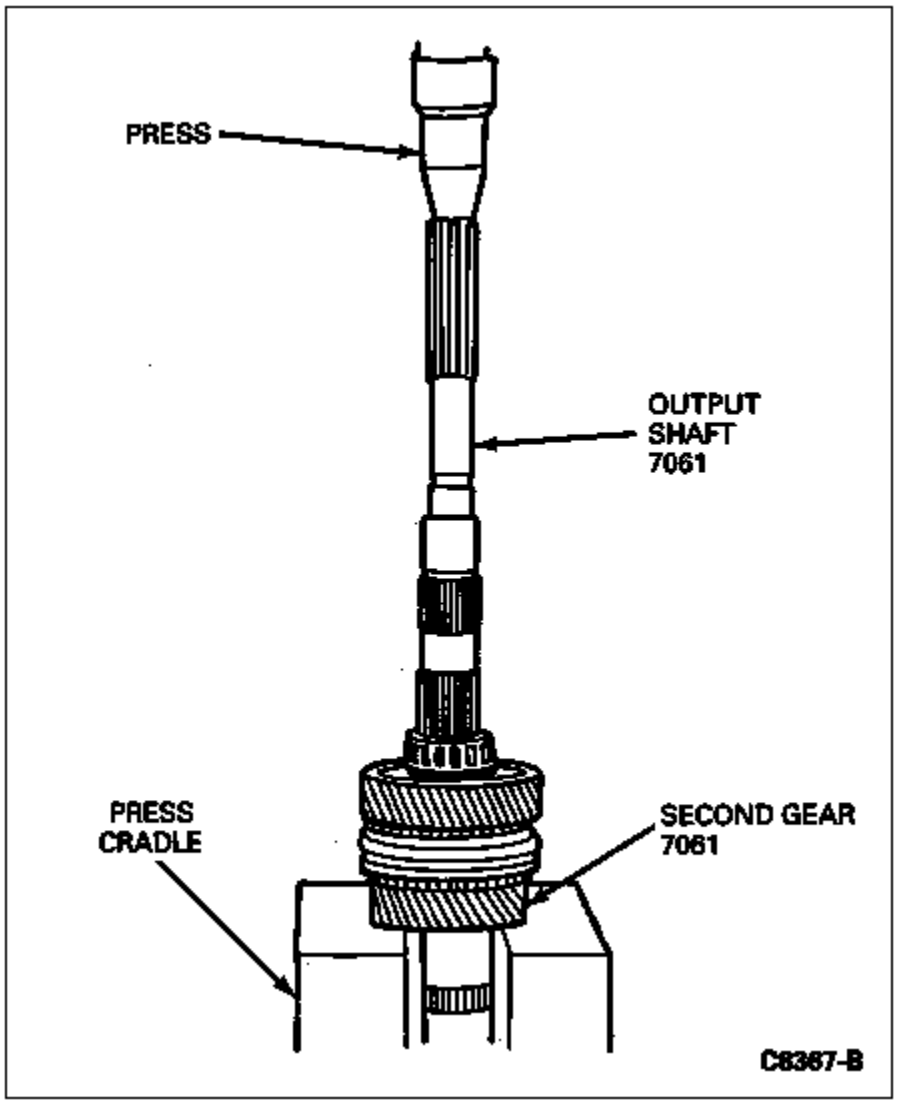
    - Synchronizer (7124) (third/fourth).

tomsn048@gmail.com

- Synchronizer blocking ring (7107) (third).
- Third gear.
- Gear bearing (7127).

4. **CAUTION: Make sure that flange does not contact or ride up onto press cradle. Improper positioning can result in component damage.**

   Position mainshaft, with rear end (long side of flange) facing upwards into press using Pinion Bearing Cone Replacer T53T-4621-B as a press plate, and Bearing Cone Replacer T88T-7025-B to protect inner race rollers.



5. Press off the following components as a unit:

   - Bearing (7025)
   - Input bearing spacer (7173)
   - First gear (1GR) (7100)

tomsn048@gmail.com

- First and second speed gear bearing (7133)
- First/second synchronizer
- First/second Synchronizer blocking rings
- Second gear (2GR) (7102)
- First and second speed gear bearing.

Assembly

NOTE: Make note of the differences between the third gear synchronizer blocking ring and the first, second and fourth gear synchronizer blocking rings. The third gear synchronizer blocking ring has three teeth cut out 120 degrees apart from each other. Directly adjacent to one side of the missing teeth, two teeth have been bridged together. This is to help eliminate any upshift "crunch" that may occur.

NOTE: To install components onto output shaft, position components as illustrated. Press components into position using Pinion Bearing Cone Replacer T53T-4621-B and Axle Bearing/Seal Plate T75L-1165-B.

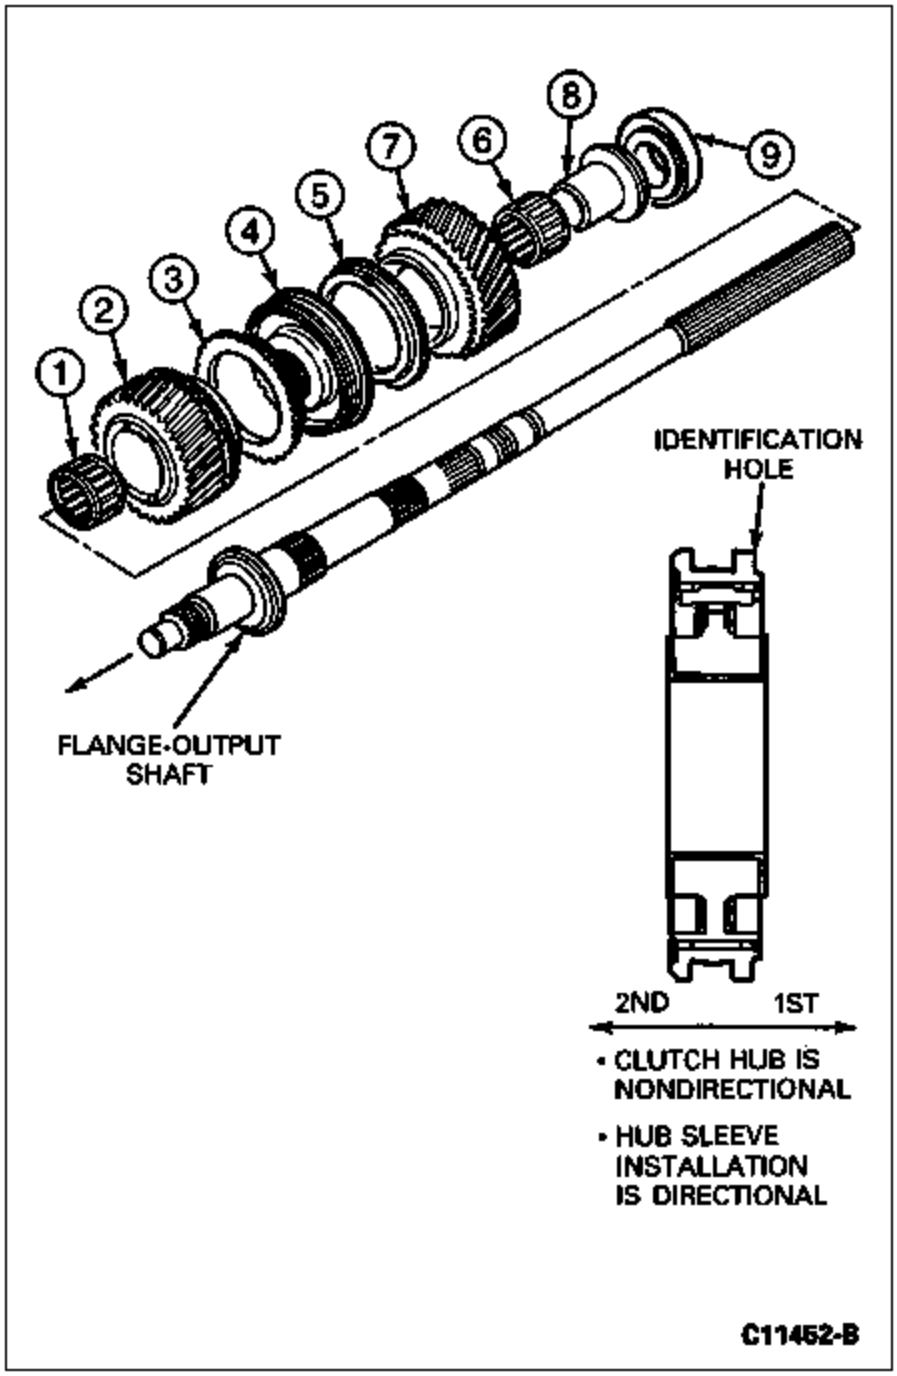
NOTE: Make sure that bearing is still positioned in case (7005).

1. **NOTE: During installation, apply Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid to all rotating or sliding parts.**

   Position mainshaft so that the rear end (long side of flange) faces upward. Install the following parts in the order listed:

   - Second gear needle bearing
   - Second gear
   - Second gear synchronizer blocking ring
   - First/second synchronizer
   - First gear synchronizer blocking ring
   - First gear needle bearing
   - First gear
   - Input bearing spacer
   - Bearing

tomsn048@gmail.com



Item	Part Number	Description
1	7133	First and Second Speed Gear Bearing
2	7102	Second Gear
3	7107	Synchronizer Blocking Ring
4	7124	Synchronizer
5	7107	Synchronizer Blocking Ring
6	7133	First and Second Speed Gear Bearing

tomsn048@gmail.com

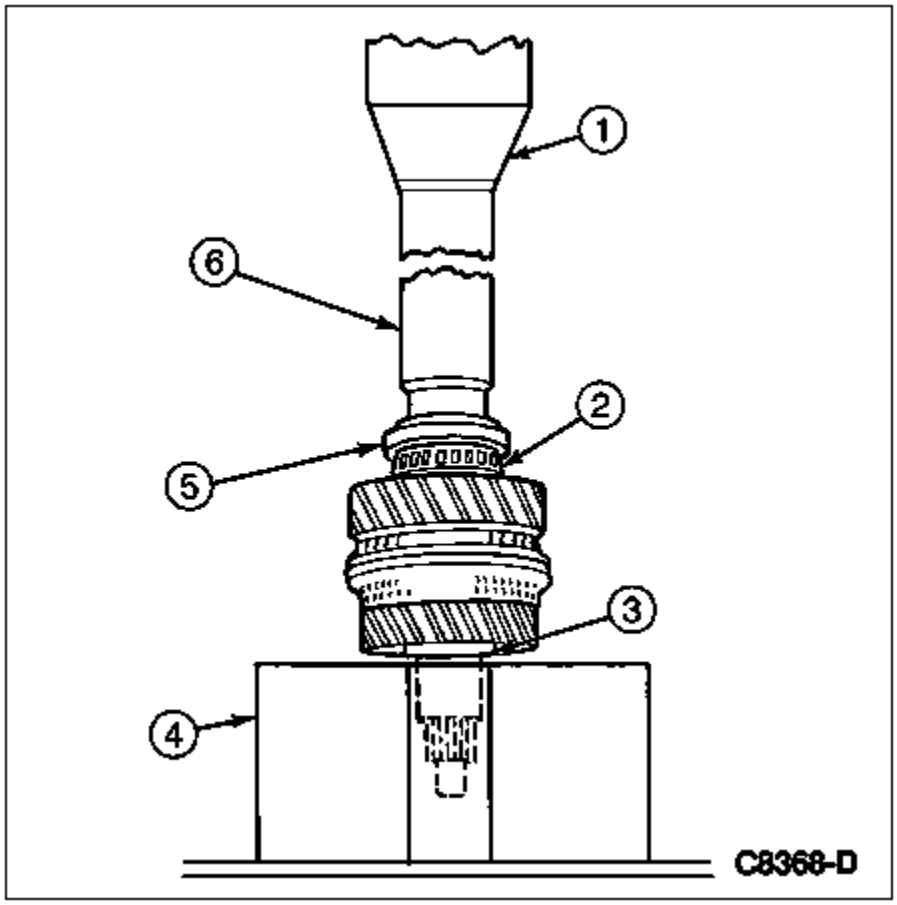
7	7100	First Gear
8	7173	Input Bearing Spacer
9	7025	Bearing

2. **NOTE: When installing first/second synchronizer, make sure that smaller width of sleeve faces second gear (front) side. Make sure that reference marks face rear of transmission (7003); they reference installation position of synchronizer hub insert (7A044).**

   Press the center bearing onto the mainshaft using the following tools:

   - Remover/Replacer Tube T75L-7025-B.
   - Locally fabricated sleeve where the inside diameter is large enough to fit over the output shaft but small enough to engage the inner bearing race.

   Position the mainshaft on a press cradle as shown in the following illustration. Using the sleeve and replacer tube as a press ram, seat the center bearing.



Item	Part Number	Description
1	—	Press
2	7C096	Thrust Bearing

tomsn048@gmail.com

3	7061	Output Shaft
4	—	Bearing Plate
5	T83T-7025-B	Output Shaft Bearing Replacer
6	T75L-7025-B	Remover/Replacer Tube

3. **NOTE: Make note of the differences between the third gearsynchronizer blocking ring and the first, second and fourth gear synchronizer blocking rings. The third gear synchronizer blocking ring has three teeth cut out 120 degrees apart from each other. Directly adjacent to one side of the missing teeth, two teeth have been bridged together. This is to help eliminate any upshift "crunch" that may occur.**

   Position output shaft so that the front (short side) of flange faces upward. Install the following parts in the order listed.

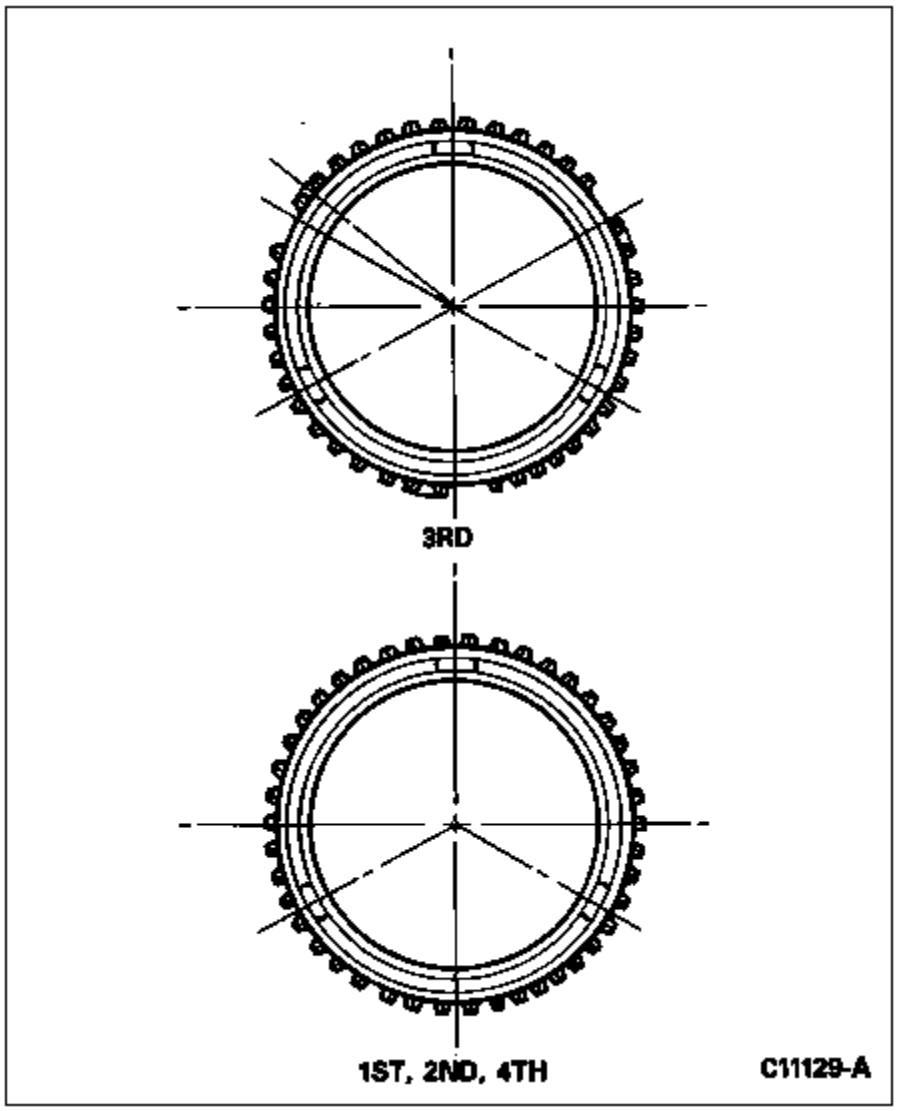
   - Gear bearing
   - Third gear
   - Third gear synchronizer blocking ring

4. **NOTE: The front and rear sides of the clutch hub may appear to be similar. Be sure to install it with the chamfer facing toward fourth gear (4GR) (7112).**

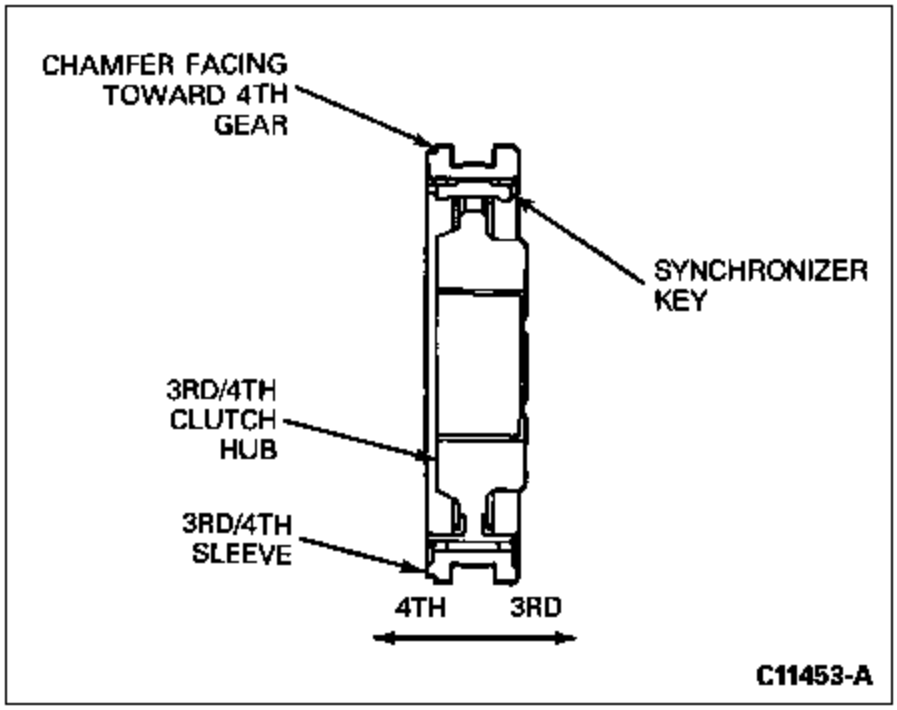
   Install third/fourth synchronizer as follows:

   - Mate clutch hub synchronizer key groove with the slants on the inner surface of the clutch hub sleeve. The turned edge of the clutch hub sleeve should face toward fourth gear.
   - Install longer flange on clutch hub sleeve toward third gear (rear) side.

tomsn048@gmail.com

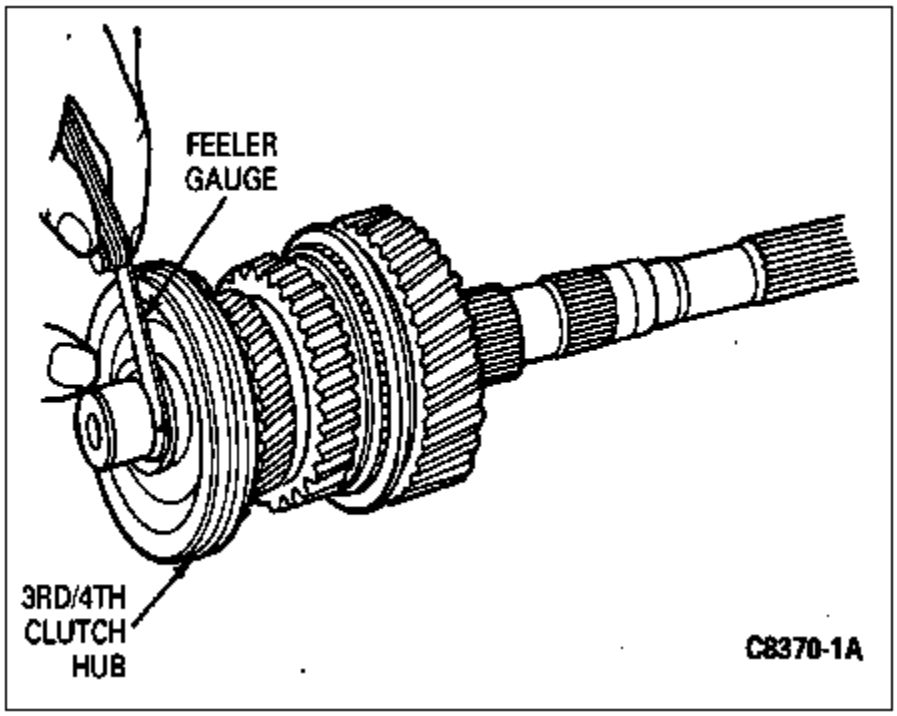


tomsn048@gmail.com



5. Install the spacer and bearing outer snap ring onto the output shaft.

6. With the original bearing outer snap ring installed, measure the clutch hub end play using a feeler gauge.



7. If necessary adjust third/fourth clutch hub end play to 0.00-0.05mm (0.00-0.0019 inch) by selecting required bearing outer snap ring according to the chart.

tomsn048@gmail.com

8. After determining the correct retaining ring, install the needle bearing (with the rollers visible), bearing outer snap ring and pilot bearing.

BEARING OUTER SNAP RING SELECT CHART

Part Number	Thickness
E8TZ-7030-A	1.50mm (0.059 In.)
E8TZ-7030-B	1.55mm (0.061 In.)
E8TZ-7030-C	1.60mm (0.0629 In.)
E8TZ-7030-D	1.65mm (0.0649 In.)

tomsn048@gmail.com

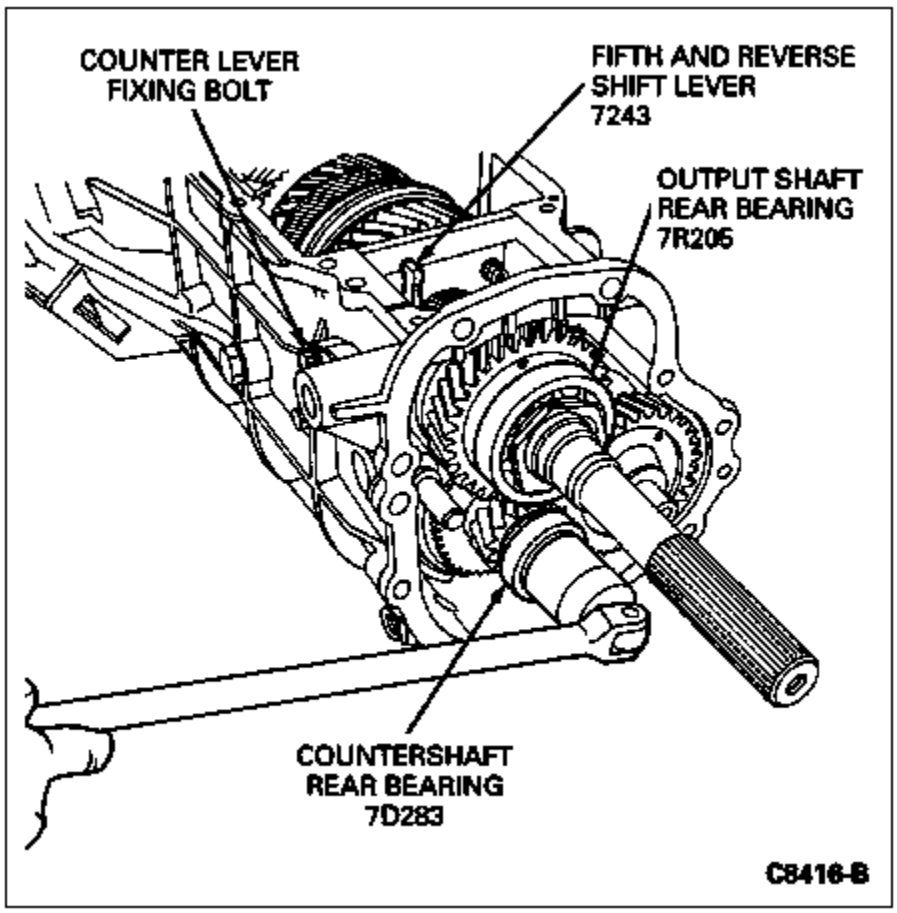
Bearing, Countershaft

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Mainshaft Locknut Wrench	T88T-7025-AR
Remover/Replacer Tube	T75L-7025-B

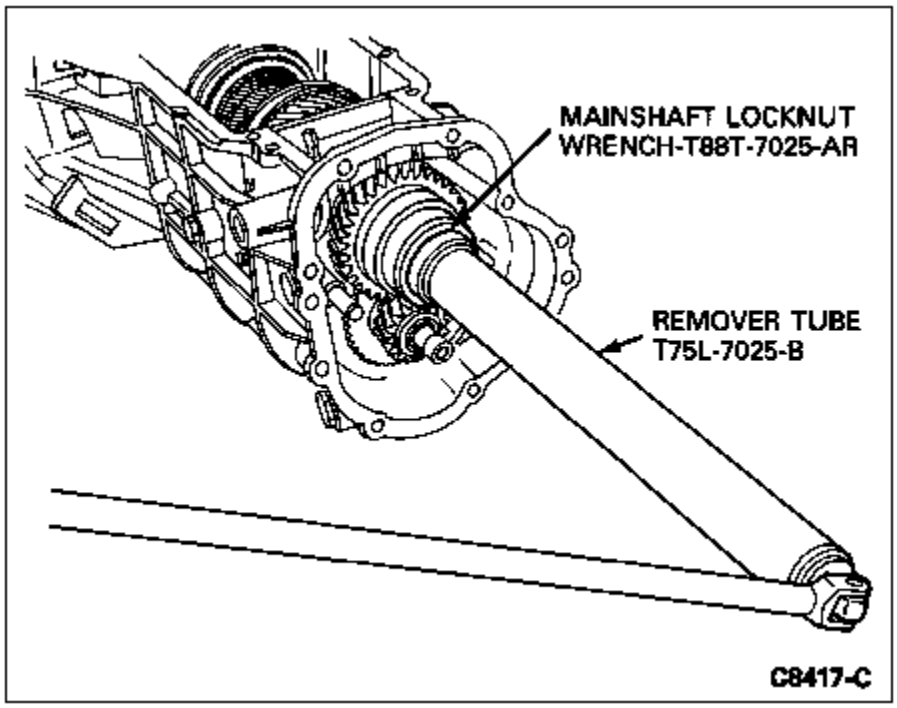
1. Lock transmission (7003) into first and third gears.

2. Using a 32mm socket, remove and discard locknut, then remove the countershaft rear bearing (7D283) and thrust washer.



3. Using Mainshaft Locknut Wrench T88T-7025-AR and Remover/Replacer Tube T75L-7025-B, remove and discard locknut from output shaft.

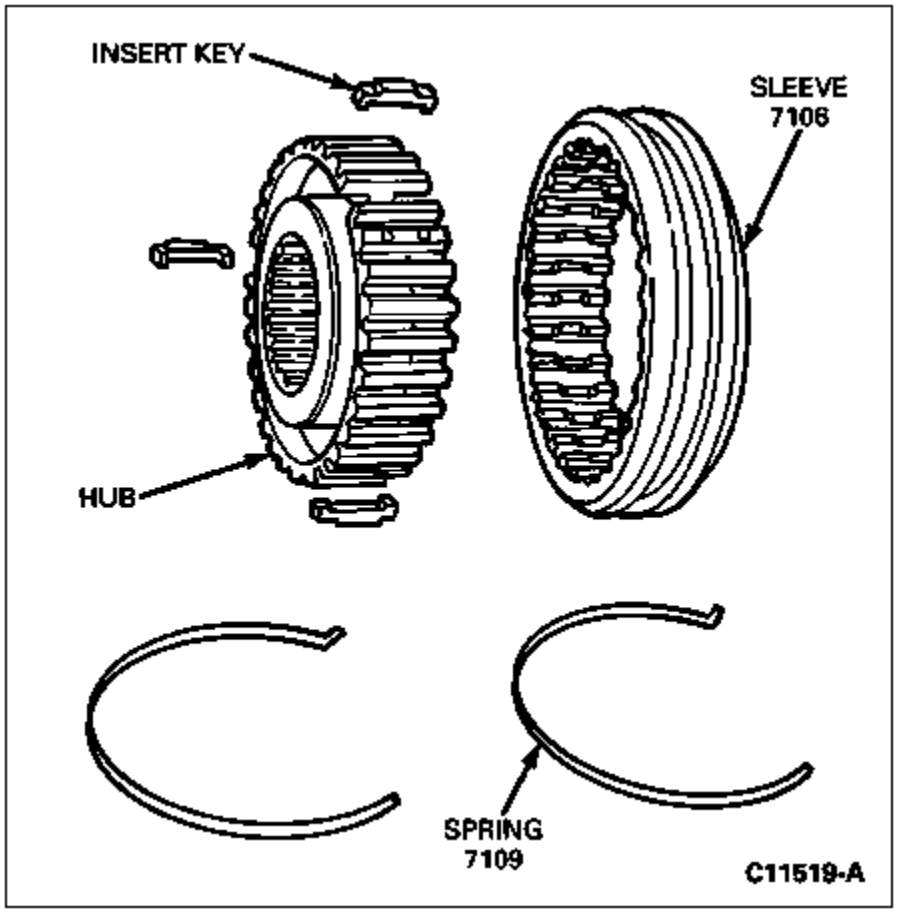
tomsn048@gmail.com



tomsn048@gmail.com

Synchronizers

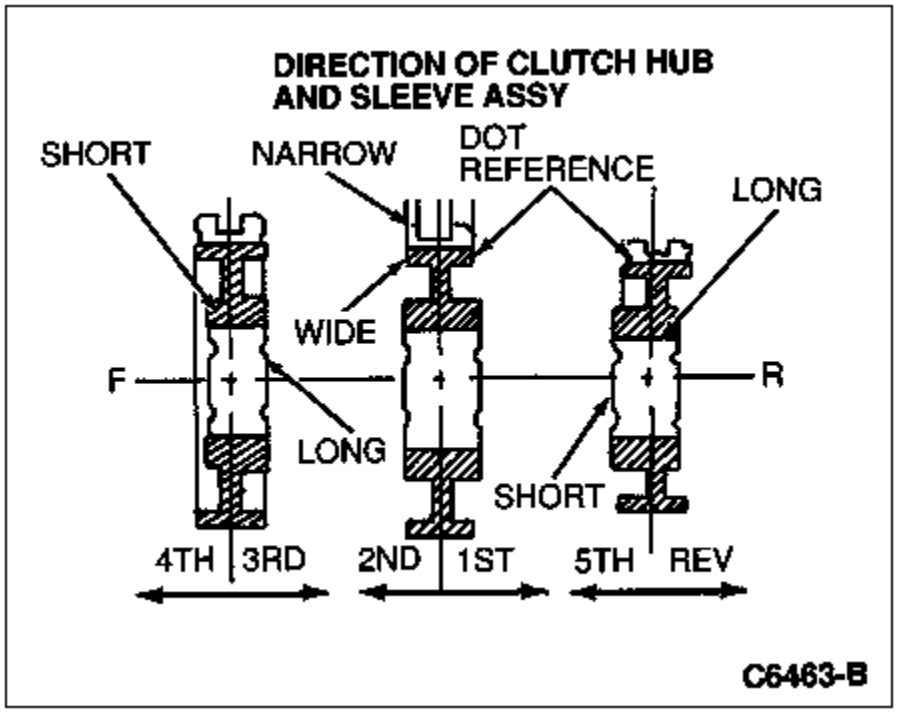
1. Lay synchronizer (7124) face down and remove one synchronizer blocking spring (7109), using a suitable tool.
2. Hold synchronizer sleeve (7106) and hub assembly in place and turn assembly over to the opposite face and lay flat on work table.
3. Remove second synchronizer blocking spring and three insert keys.
4. Slide synchronizer sleeve from hub. Replace parts as necessary.



Assembly

1. Locate indented dot reference mark on the shoulder of one face side of synchronizer sleeve. Check drawing for direction of clutch hub to sleeve assembly. Insert hub into synchronizer sleeve with one of the three insert slots of hub aligned with reference mark. This will make certain of proper orientation of hub to sleeve splines. Make sure hub moves freely on synchronizer sleeve.

tomsn048@gmail.com



2. Lay hub and sleeve assembly face down on work table and place three insert keys into hub slots.

3. Insert one synchronizer blocking spring into clip hole located in inner shoulder of synchronizer sleeve, and place synchronizer blocking spring under protruding edge of each insert key.

4. Holding hub and synchronizer sleeve together, turn assembly over to opposite face side.

5. Insert second synchronizer blocking spring just like the first, but in the opposite direction. One synchronizer blocking spring should be counterclockwise to the other.

6. When sliding synchronizer assembly onto shaft, do not allow excessive movement between hub and sleeve. This will cause insert keys to pop out of hub slots and require reassembly.

tomsn048@gmail.com

tomsn048@gmail.com

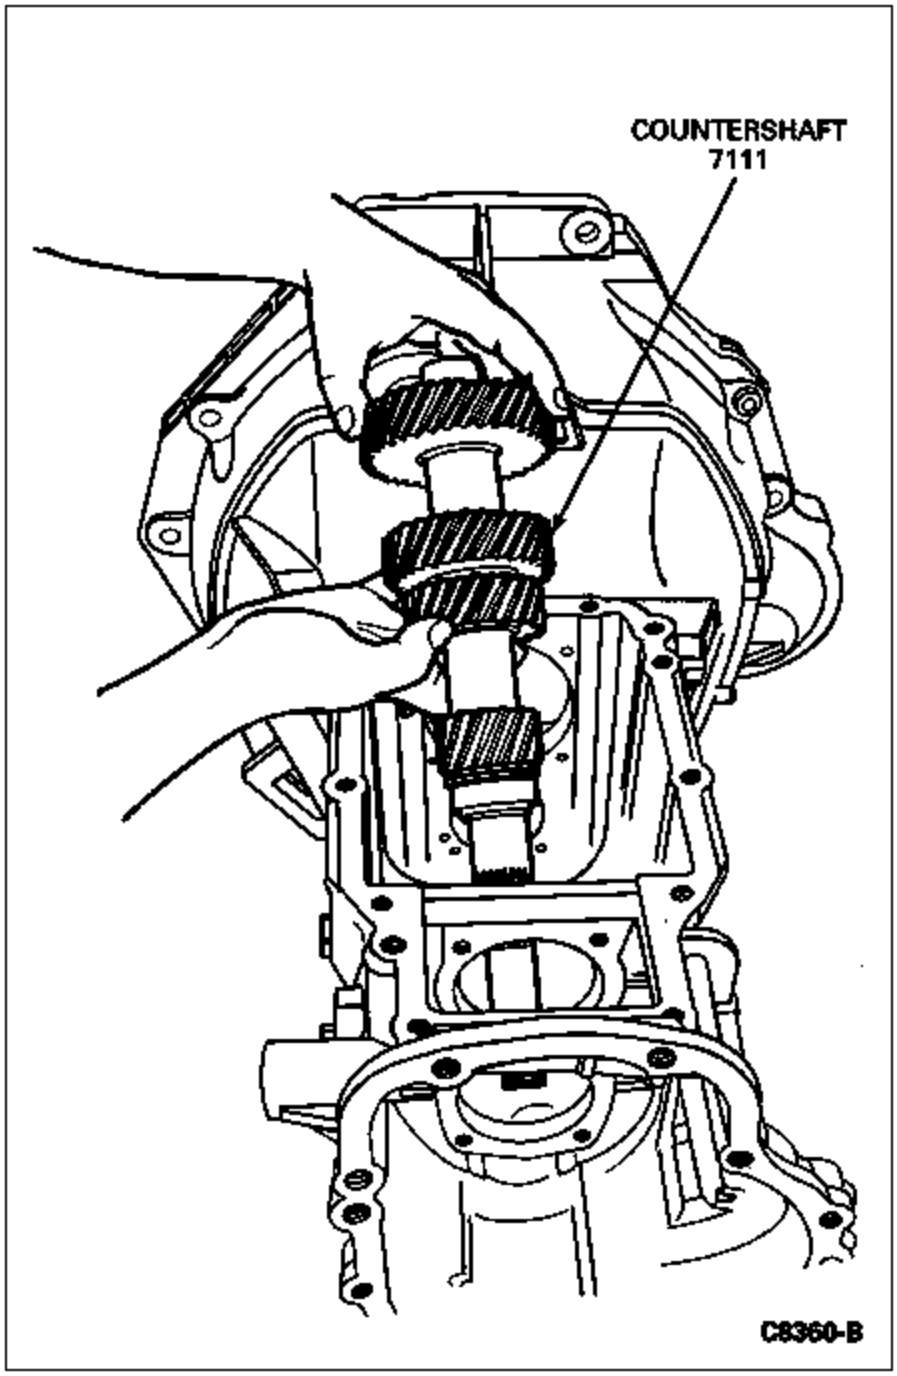
Transmission

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Gear Replacing Spacer	T88T-7025-F
Gear Replacing Spacer	T88T-7025-E
Shaft Collar	T75L-7025-M
Shaft Collar	T75L-7025-P
Shaft Sleeve — Replacer	T75L-7025-K
Remover/Replacer Tube	T75L-7025-B
Remover/Replacer Tube	T85T-7025-A
Shaft Adapter — Replacer	T75L-7025-L
Adapter	T88T-7025-J2

1. Position countershaft (7111) into case (7005) through top opening.

tomsn048@gmail.com



2. **NOTE: Make sure that needle roller bearing is installed into input shaft (7017).**

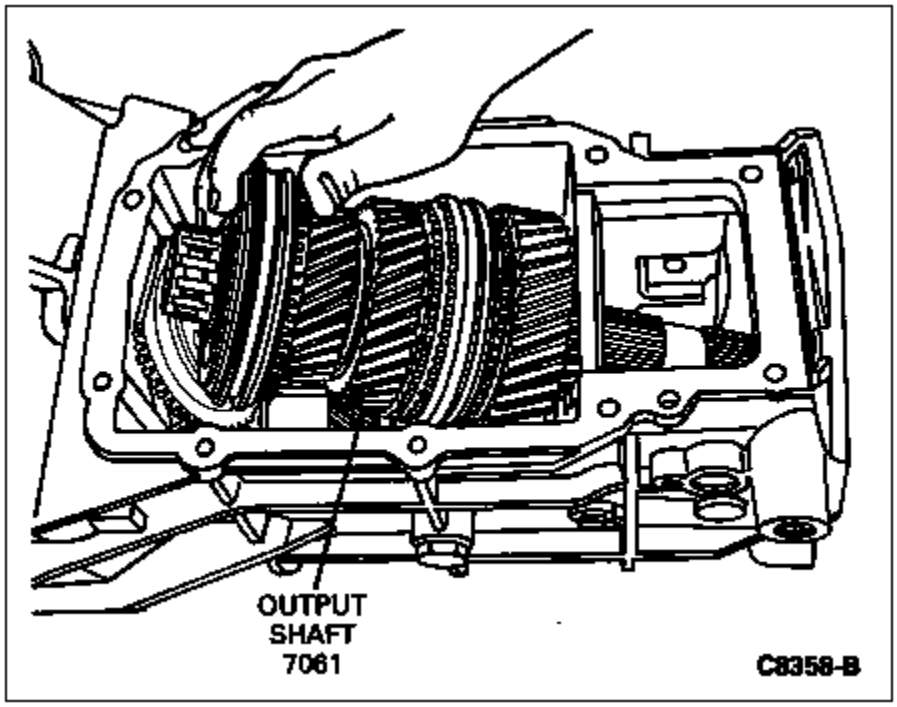
   NOTE: Needle bearing is symmetric.

   Position input shaft into case through top opening.

3. **NOTE: Make sure that fourth gear synchronizer blocking ring (7107) is installed at this time.**

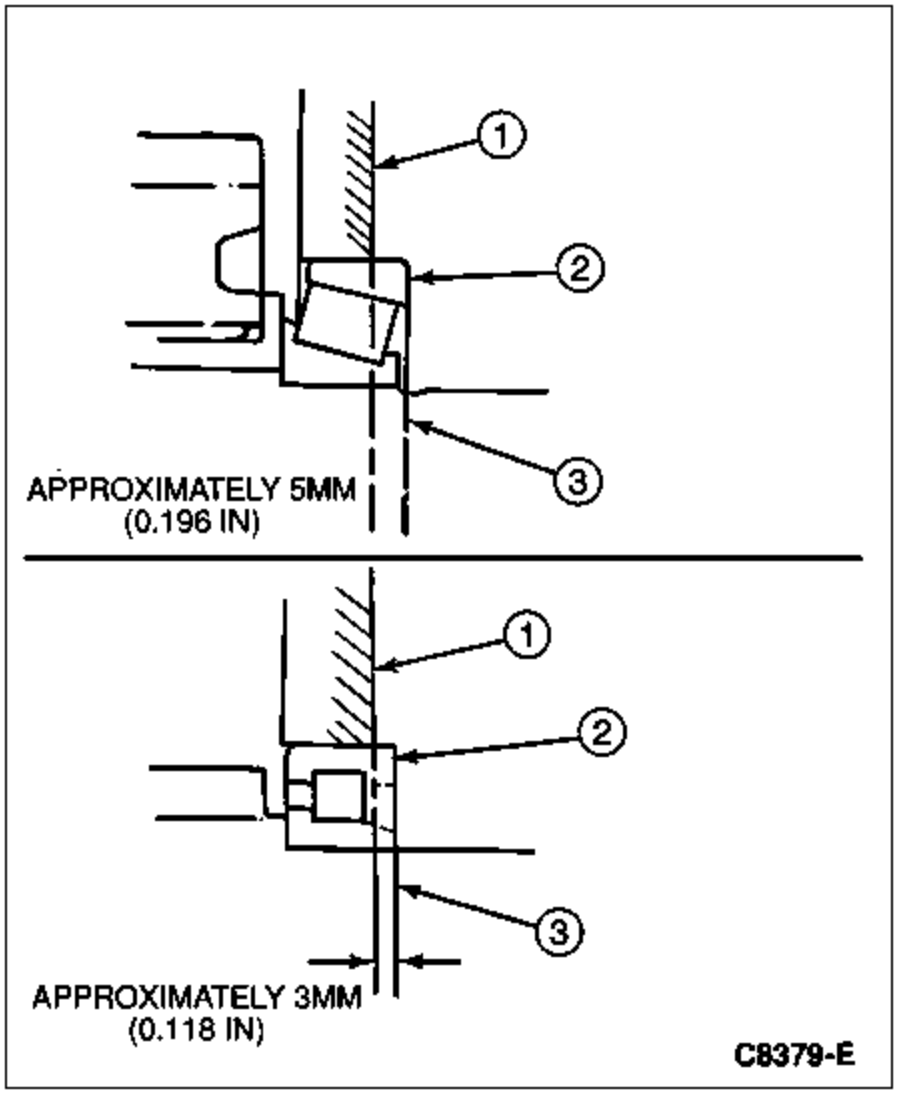
   Position output shaft into case. Mate input shaft and output shaft by positioning them at an upward angle and setting them together.

tomsn048@gmail.com



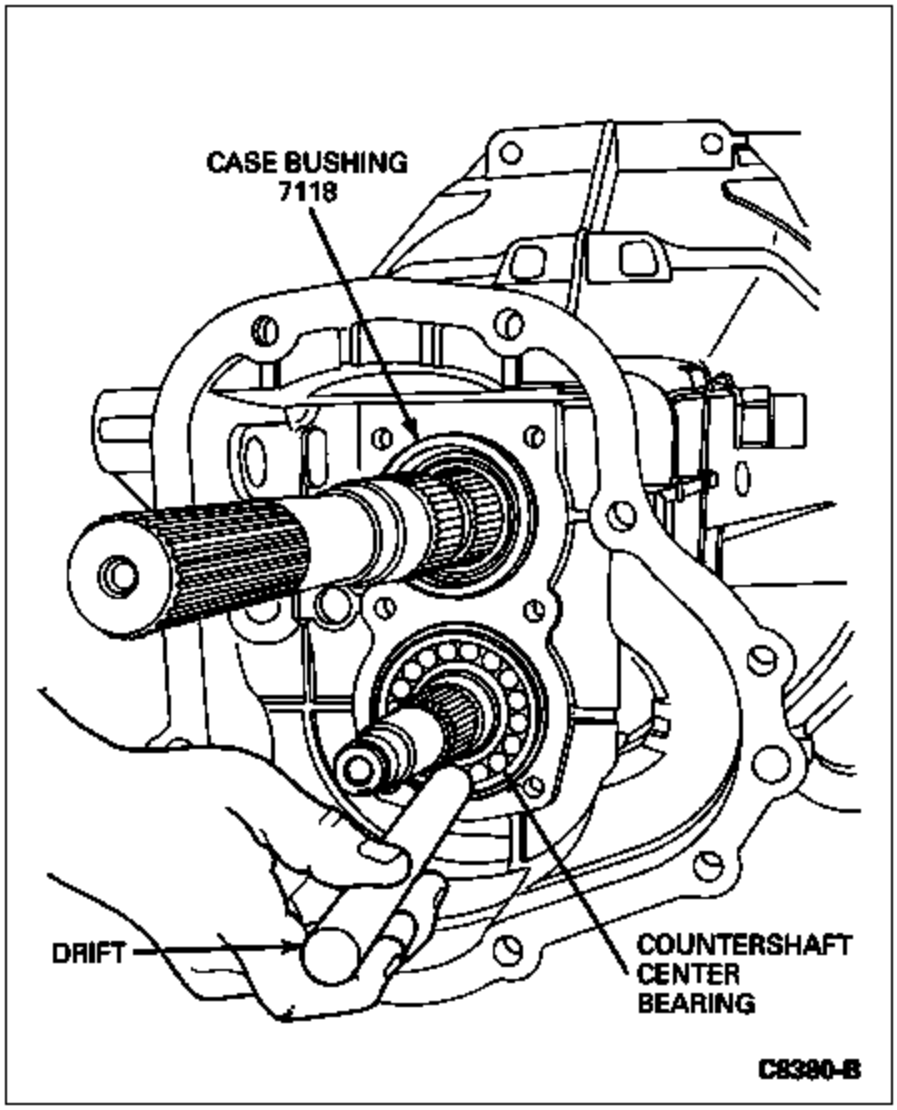
4. Install bearing (7025) using a brass drift.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Transmission Case Wall (Part of 7003)
2	7118	Bearing
3	7061	Output Shaft

tomsn048@gmail.com



5. **NOTE: Make sure that center bearing outer races are squarely positioned in bores.**

   Install countershaft center bearing.

6. Install bearing retainer (7085) to case.

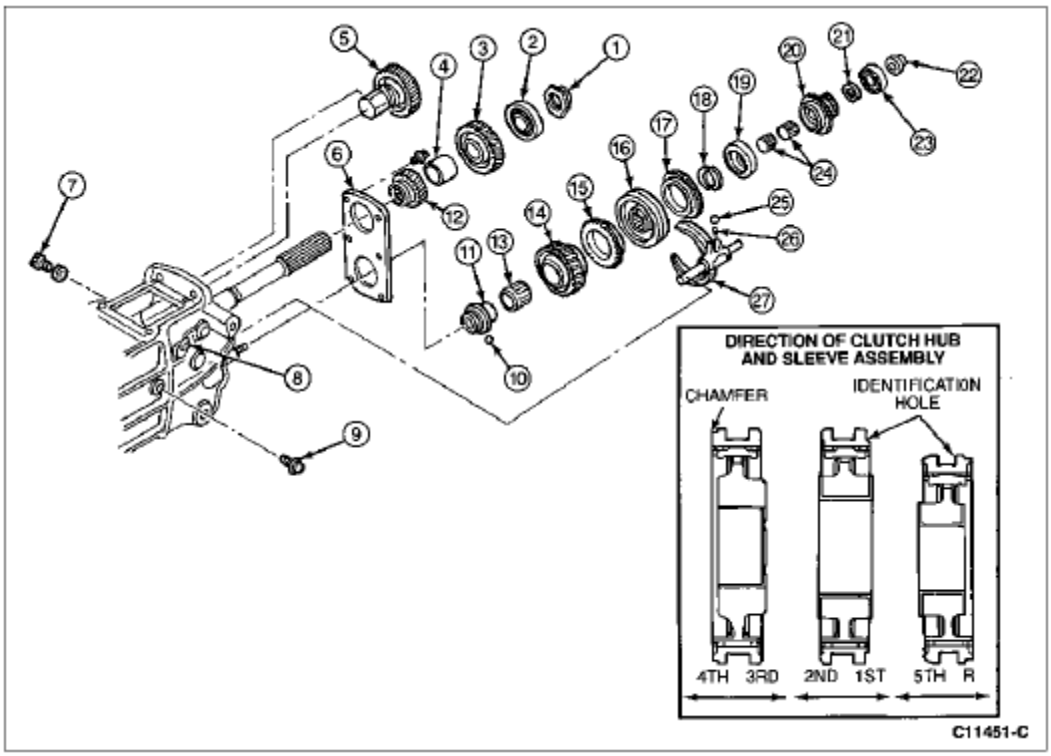
7. **NOTE: Install fifth gear sleeve using nut, Shaft Adapter — Replacer T75L-7025L, Adapter T88T-7025-J2 and Remover/Replacer Tube T75L-7025-B.**

   Position transmission (7003) horizontally in holding fixture. Assemble the following parts in the order listed.

   - Ball
   - Fifth gear sleeve

Transmission, Rear Housing

tomsn048@gmail.com



Item	Part Number	Description
1	7B364	Locknut

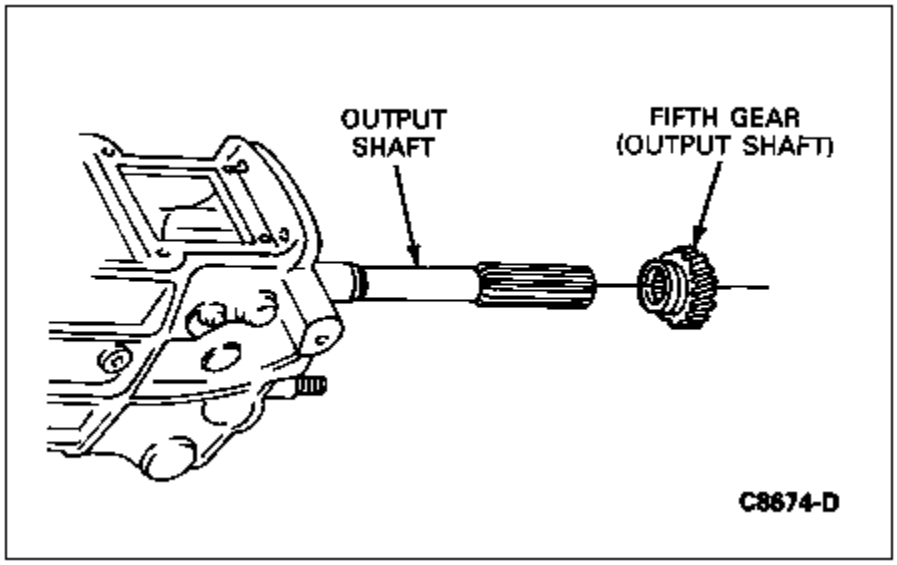
12	7112	Fifth Gear
13	7R130	Needle Bearing, Fifth Gear
14	7142	Fifth Gear, Countershaft
15	7107	Synchronizer Blocking Ring
16	7124	Synchronizer
17	7107	Synchronizer Blocking Ring
18	7R482	Synchronizer Split Washer
19	7C340	Thrust Washer
20	7N040	Countershaft Reverse Gear

tomsn048@gmail.com

21	7L324	Thrust Washer
22	7N170	Locknut
23	7D283	Countershaft Rear Bearing
24	7N270	Needle Bearing
25	7289	Lockball (Steel) Shift Rail
26	99796-0612	Bolt
27	7289	Shift Fork (5th and Reverse)

8. Install fifth gear (countershaft) and needle bearing onto countershaft.

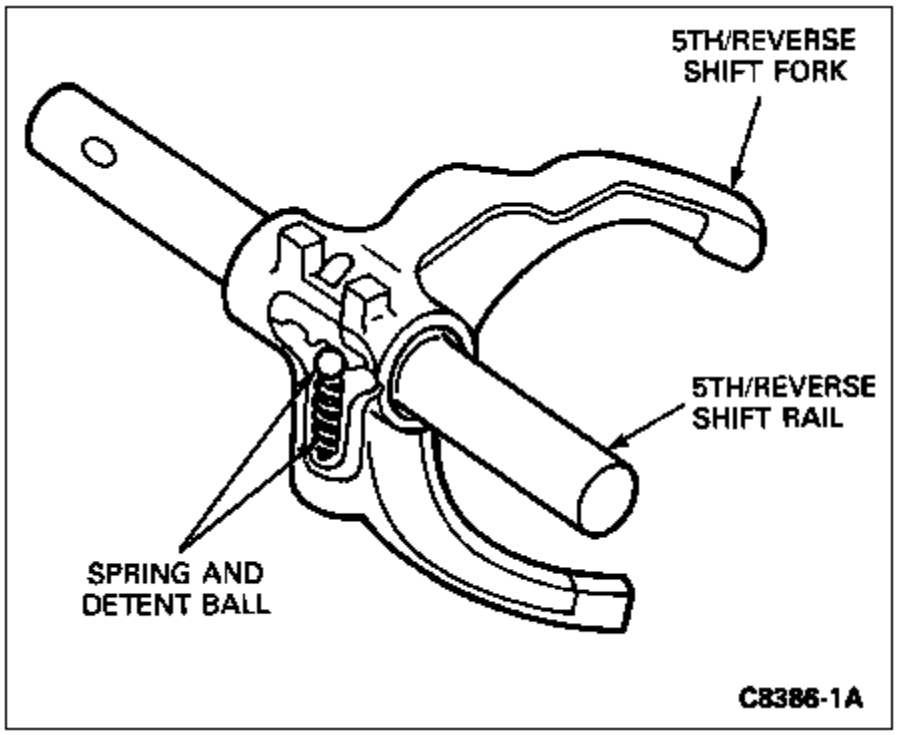
9. Install fifth gear onto output shaft. Make sure that long flange on fifth gear faces forward.



10. Position counter lever shaft assembly to transmission and install thrust washer and retaining ring. Apply sealant to holding bolt threads. Install bolt and tighten to 8-10 Nm (6-7 lb-ft).

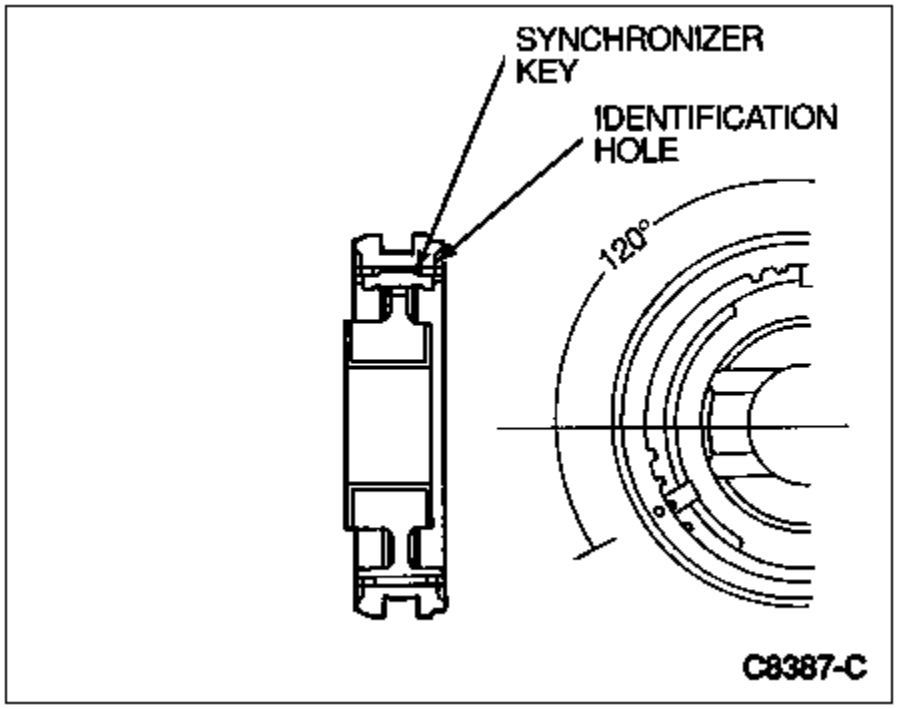
11. If disassembled, install shifter interlock spring (7234) and detent ball into fifth/reverse gear shifter fork (7230). Depress ball and insert fifth/reverse shift rail. Locate to neutral position.

tomsn048@gmail.com



12. **NOTE: Install the longer flange (on the fifth/reverse synchronizer (7124)) toward the front of transmission. The reference mark on synchronizer sleeve must be installed toward reverse gear side.**

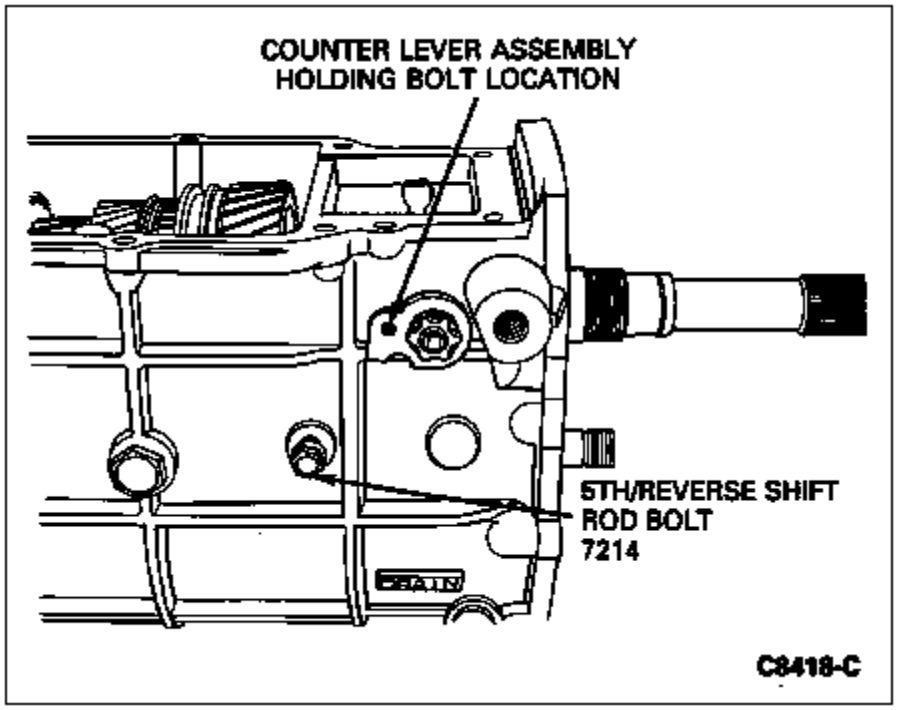
    Assemble the fifth/reverse synchronizer to fifth/reverse gear shifter fork and rail assembly.



tomsn048@gmail.com

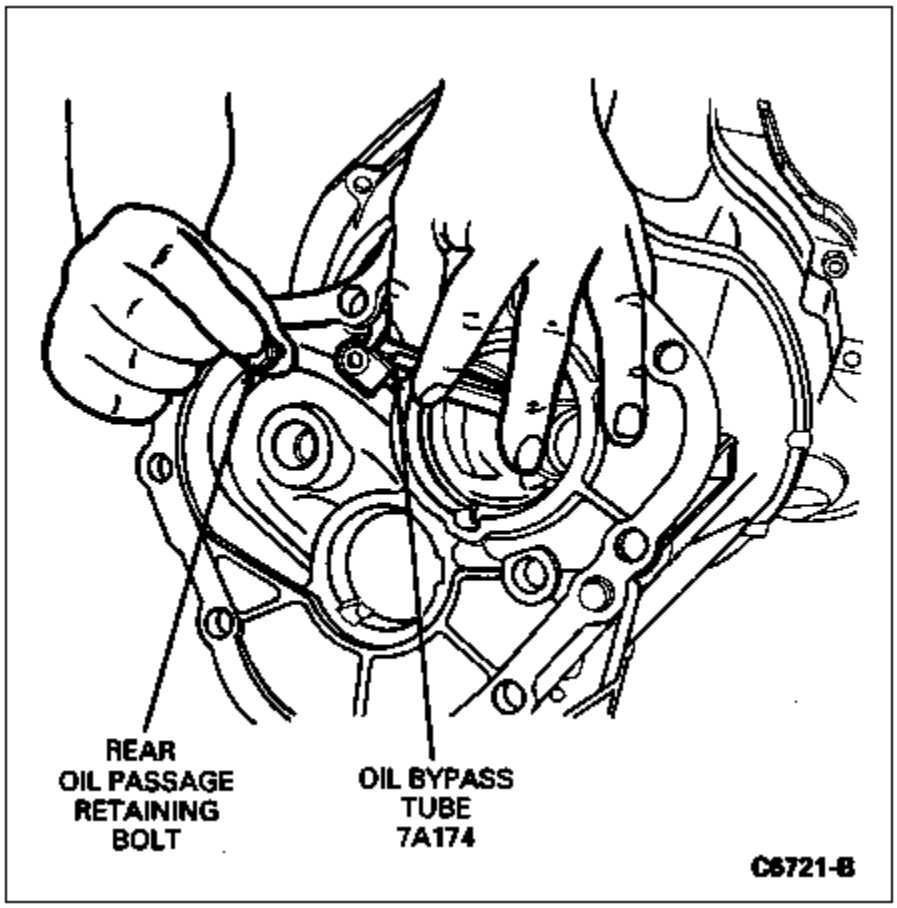
13. Install fifth/reverse shift fork and shift rail assembly (including fifth/reverse synchronizer) to countershaft. Mate shift fork gate to end of fifth/reverse counter lever end. Install fifth/reverse fork and shift rail assembly with threaded holding bolt bores (in rail and case) aligned with each other.

    a. Apply sealant to holding bolt threads. Install holding bolt to case. Tighten to 20-30 Nm (15-22 lb-ft).



14. Position oil bypass tube (7A174) to case and install retaining bolt. Tighten bolt to 8-10 Nm (6-7 lb-ft).

tomsn048@gmail.com

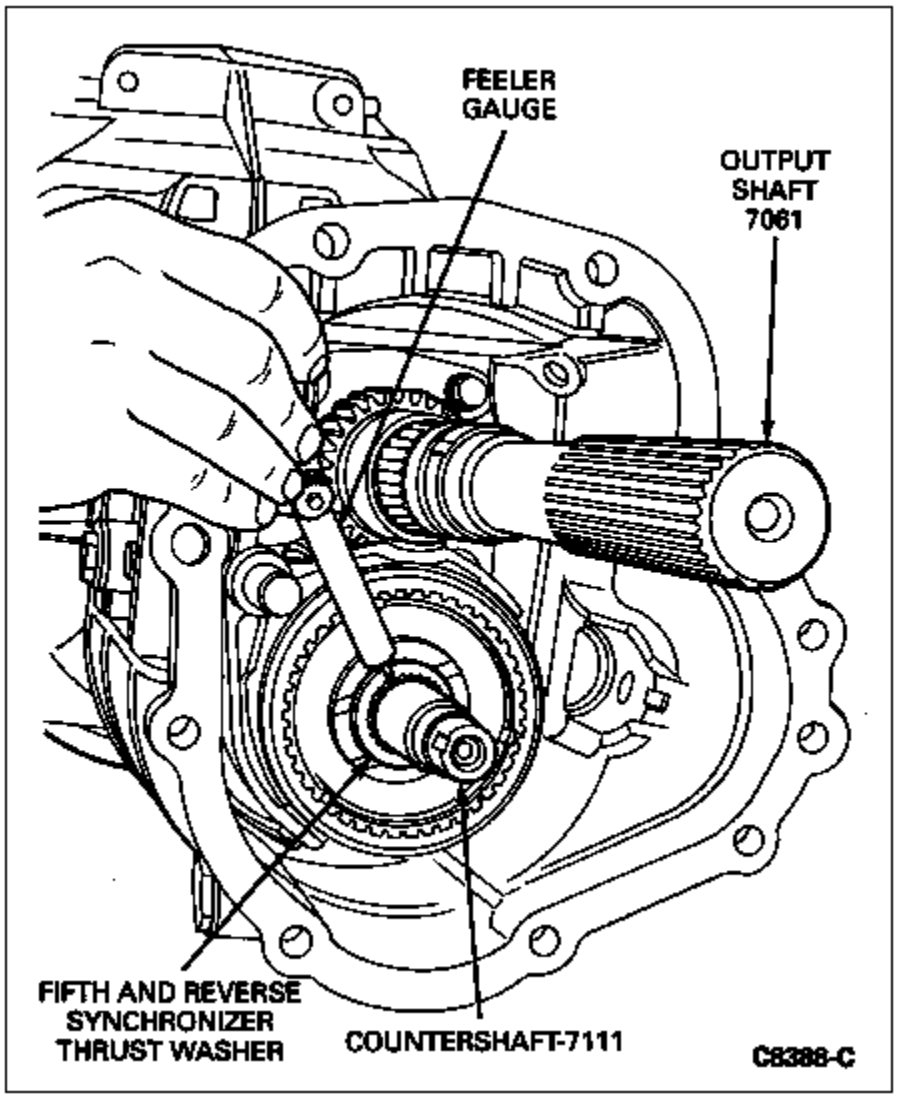


15. If original clutch hub and/or counter reverse gear are being used, install original split and thrust washers, then proceed to Step 22.

16. **NOTE: Make sure new synchronizer split washers (7R482) are matched, having identical thickness. Refer to Specifications for end play specifications.**

    If clutch hub and/or counter reverse gear have been replaced, measure end play using a feeler gauge. Select replacement synchronizer split washer using the following chart and install new synchronizer split washers onto output shaft.

tomsn048@gmail.com



SPLIT WASHER SELECT CHART

Part Number	Thickness
E8TZ-7R482-A	3.0mm (0.118 In.)
E8TZ-7R482-B	3.1mm (0.122 In.)
E8TZ-7R482-C	3.2mm (0.125 In.)
E8TZ-7R482-D	3.3mm (0.129 In.)
E8TZ-7R482-E	3.4mm (0.133 In.)
E8TZ-7R482-F	3.05mm (0.120 In.)
E8TZ-7R482-G	3.15mm (0.124 In.)
E8TZ-7R482-H	3.25mm (0.127 In.)
E8TZ-7R482-J	3.35mm (0.131 In.)
E8TZ-7R482-K	3.45mm (0.135 In.)

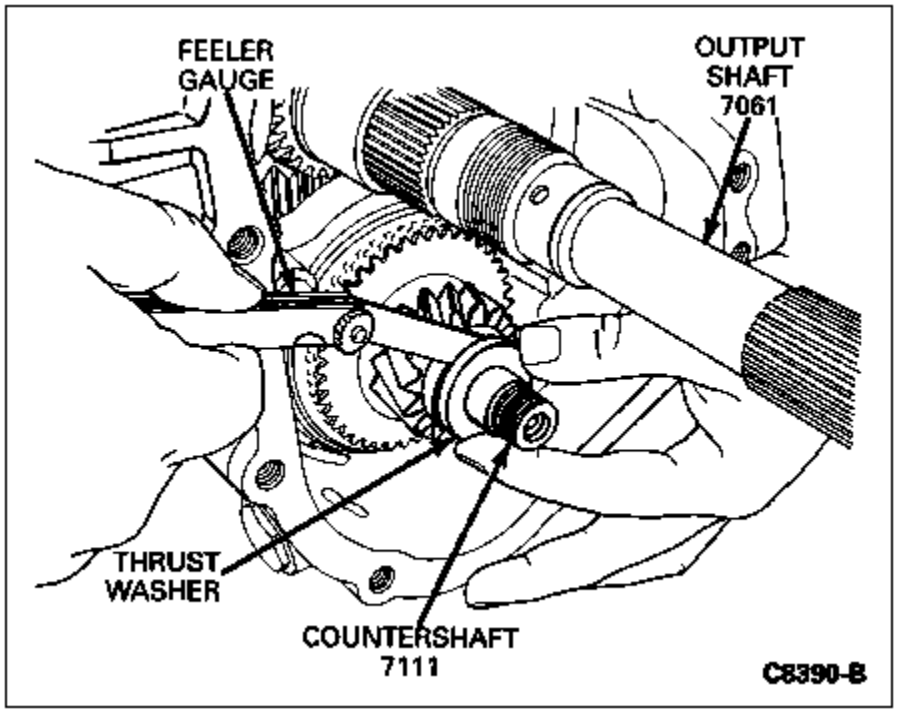
tomsn048@gmail.com

E8TZ-7R482-L	3.50mm (0.137 In.)

17. Install reverse synchronizer blocking ring and needle bearings into counter reverse gear. Install counter reverse gear and needle bearings onto countershaft as an assembly. Install thrust washer to countershaft.

18. **NOTE: If end play is not correct, the thrust washer that must be replaced is called out as item No. 21. Refer to the exploded view of the transmission rear housing.**

    Press thrust washer forward (by hand) against shoulder on countershaft. Maintain forward pressure against thrust washer and insert feeler gauge between thrust washer and counter reverse gear. Using the chart, determine correct thrust washer to obtain specified end play. Counter reverse gear end play: 0.25-0.35mm (0.010-0.014 inch).



THRUST WASHER SELECT CHART

Part Number	Thickness
E8TZ-7C340-A	7.45mm (0.293 In.)
E8TZ-7C340-B	7.65mm (0.301 In.)
E8TZ-7C340-C	7.85mm (0.309 In.)
E8TZ-7C340-D	7.35mm (0.289 In.)
E8TZ-7C340-E	7.55mm (0.297 In.)
E8TZ-7C340-F	7.75mm (0.305 In.)

tomsn048@gmail.com

19. **NOTE: Installation of a suitable spacer prevents thrust washer and split washers from slipping off shaft, and avoids interference with reverse idler gears.**

    Temporarily install a suitable spacer (inner bore larger than 21mm [.83 inch], outer bore smaller than 36mm [1.4 inch], 15-20mm [.59-.78 inch] overall length) in place of countershaft bearing. Loosely install countershaft locknut to retain components.

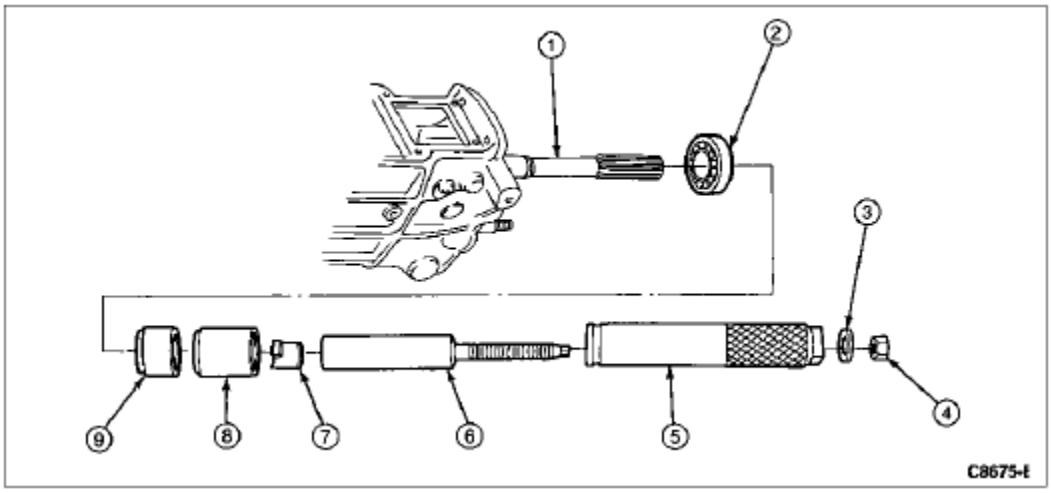
20. Install reverse idler gear and bushing (7141). Apply sealant Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specifications ESB-M4G92-A or ESE-M4G195-A to holding bolt threads. Install and tighten holding bolt to 79-117 Nm (58-86 lb-ft).

21. **NOTE: Install reverse gear with longer flange facing forward.**

    Install sleeve and reverse gear assembly onto mainshaft.

22. Install output shaft rear bearing (7R205) using Gear Installing Spacer T88T-7025-F (4x2 models only), Gear Installing Spacer T88T-7025-E, Shaft Adapter T75L-7025-P (4x2 models only), Shaft Adapter T75L-7025-M (4x4 models only), Shaft Sleeve — Replacer T75L-7025-K, Remover/Replacer Tube T75L-7025-B, nut and washer. (This procedure employs the same tools as fifth gear installation.)

Output Shaft Rear Bearing Installation



Item	Part Number	Description
1	7061	Output Shaft
2	7R205	Output Shaft Rear Bearing
3	—	Washer (Part of T75L-7025-K)
4	—	Nut (Part of T75L-7025-K)
5	T75L-7025-B	Remover/Replacer Tube
6	T75L-7025-K	Shaft Adapter Screw
7	T75L-7025-P	Shaft Adapter

tomsn048@gmail.com

8	T88T-7025-F	Gear Replacing Spacer
9	T88T-7025-G	Gear Replacing Spacer

23. Remove temporary spacer from countershaft.

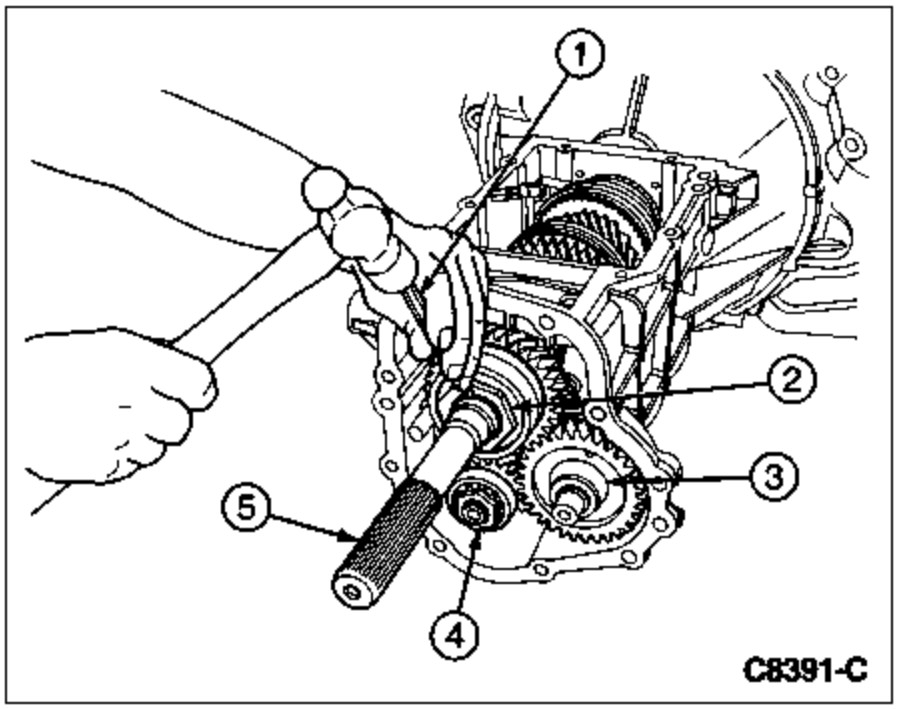
24. **NOTE: Tightening shaft locknuts without fully seating bearing can cause damage to mainshaft threads.**

    Install countershaft rear bearing (7D283) by hand.

25. **NOTE: Always install new output and countershaft locknuts when assembling transmission. Locknuts unstaked during disassembly cannot be reused.**

    Lock transmission into first and third gear. Install new output and countershaft locknuts hand-tight. Tighten output shaft locknut to 216-274 Nm (160-202 lb-ft). Tighten countershaft locknut to 128-196 Nm (94-144 lb-ft).

26. Stake (secure) locknuts to bottom of shaft groove using Countershaft Locknut Staking Tool T77J-7025-F.

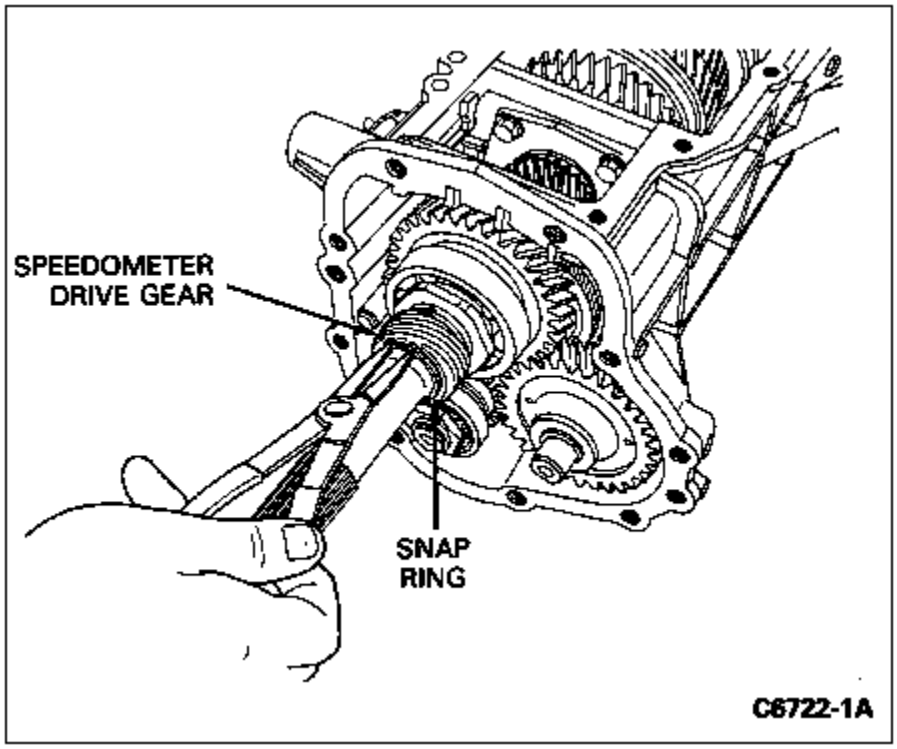


Item	Part Number	Description
1	T77J-7025-F	Countershaft Locknut Staking Tool
2	7B364	Output Shaft Rear Bearing Lock Nut
3	7141	Reverse Idler Gear and Bushing
4	7N170	Countershaft Locknut
5	7061	Output Shaft

tomsn048@gmail.com

27. **NOTE: The speedometer drive gear contains three detents into which the steel drive ball can be installed. The steel drive ball can be installed into any of the three detents.**

    Install speedometer drive gear and steel ball to output shaft. Install speedometer gear snap ring (7059) retaining speedometer drive gear to output shaft (4x2 vehicles only).



28. Remove any sealant residue from mating surfaces of case and extension housing (7A039). Apply a 3.18mm (1/8-inch) bead of Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to case.

29. Place synchronizers into neutral gear position. Make sure that shift forks on case cover (7222) are in neutral gear position.

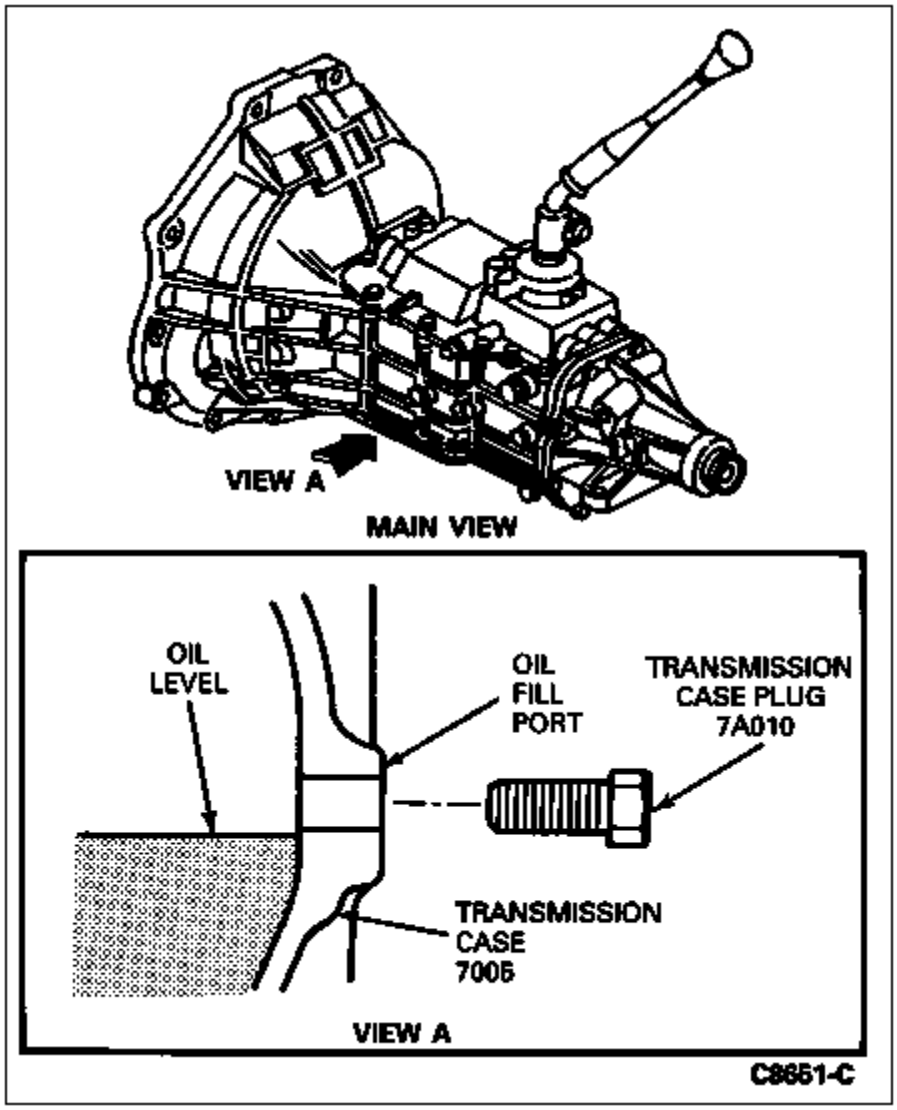
30. **NOTE: When performing this next step, do not apply sealant to mating surfaces of case cover or case. If necessary, apply a small quantity of grease to case cover gasket (7223) to retain case cover gasket in position during assembly.**

    Position new case cover gasket and case cover to case, and carefully engage shift forks with synchronizers. Install the retaining bolts (no sealant). Tighten bolts to 16-22 Nm (12-16 lb-ft).

31. Install case plug (7A010) and tighten to 40-58 Nm (30-43 lb-ft).

32. Fill transmission with specified quantity of Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Shift Lever and Boot

1. Install the retaining bolt in the shift lever hole such that the flat aligns with the mating flat on the transmission stub shaft. Push bolt fully into position. Install nut and tighten to 16-22 Nm (12-16 lb-ft).

2. Slide the gearshift lever boot into position on the shift control selector lever and housing, and install the retaining screws.

3. Install the isolator pad assembly. Install the floor pan cover and floor carpet (13000) if previously removed.

tomsn048@gmail.com

Extension Housing Bushing

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Extension Housing Seal Replacer	T61L-7657-A

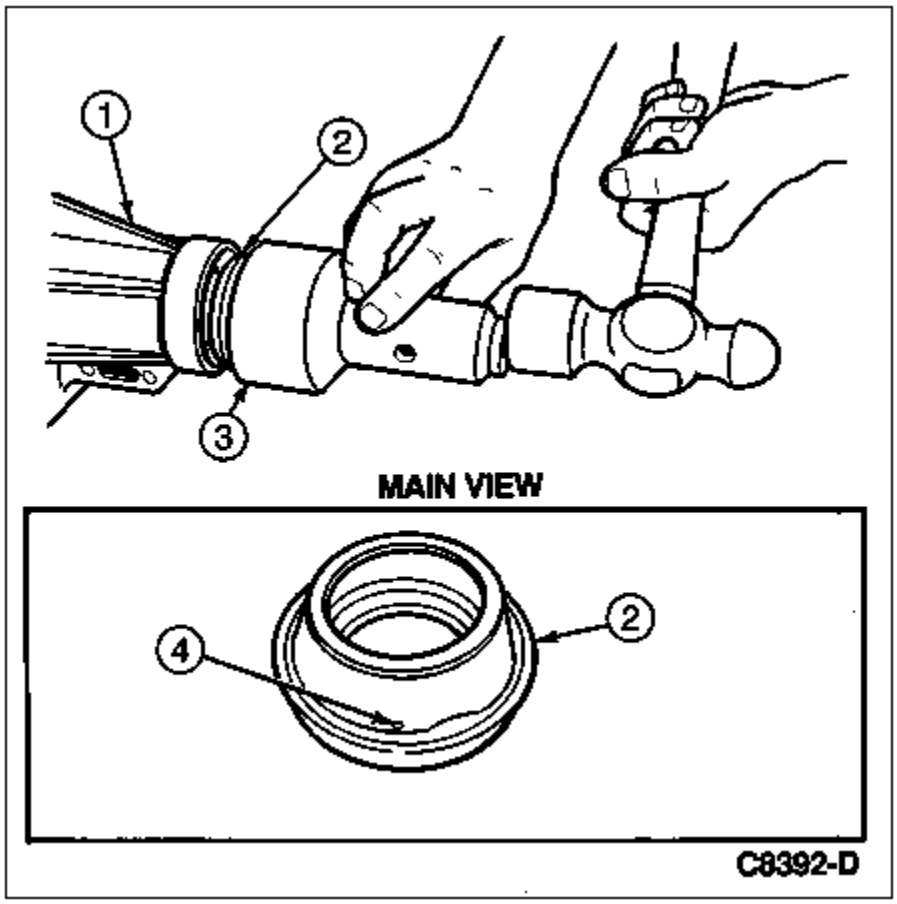
NOTE: Extension housing bushing cannot be serviced. If bushing requires service, extension housing (7A039) must be replaced as a unit.

tomsn048@gmail.com

Extension Housing

1. Position extension housing (7A039) to case and install retaining bolts. Tighten bolts to 32-46 Nm (24-34 lb-ft).

2. If removed, install input shaft (7017) and extension housing seal using Extension Housing Seal Replacer T61L-7657-A. Make sure that oil seal drain hole faces downward.



Item	Part Number	Description
1	7A039	Extension Housing
2	7052	Input Shaft and Extension Housing Seal
3	T61L-7657-A	Extension Housing Seal Replacer
4	—	Drain Hole to Face Downward (Part of 7025)

tomsn048@gmail.com

tomsn048@gmail.com

Transmission

1. Make sure that the machined mating surfaces and the locating dowels on the engine (6007) are free of burrs, dirt or paint. Check the mating face of the transmission (7003) and the locating dowel holes for burrs, dirt or paint.

2. Mount the transmission on a transmission jack such as Hi-Lift Transmission Jack 014-00942 or equivalent. Position it under the vehicle and start the input shaft (7017) into the clutch disc (7550). Align the splines on the input shaft with the splines in the clutch disc. Move the transmission forward and carefully seat the case (7005) on the locating dowels of the engine. The dowels must not shave or burr the dowel holes.

3. Install the bolts and flatwashers that attach the transmission to the engine and tighten to 38-51 Nm (28-38 lb-ft).

4. Install the starter motor (11001). Tighten the attaching bolts to specifications.

5. Raise the engine and install the rear crossmember, transmission support insulator (6068), and attaching nuts and washers. Tighten nuts to 65-85 Nm (48-63 lb-ft) for 3.0L applications. Tighten nuts to 88-115 Nm (65-85 lb-ft) for all other applications. Refer to Section 02-03 . Remove the transmission jack.

6. On 4x4 vehicles, install the transfer case (7A195) as described in Section 07-07A , Section 07-07B , Section 07-07C , or Section 07-07D .

7. On SuperCab vehicles, insert the driveshaft into theextension housing (7A039) and install the center bearing attaching nuts, washers and lockwashers. Tighten the nuts to specification.

8. Connect the driveshaft (4602) to the rear axle drive flange. Tighten the attaching nuts to specifications. Refer to Section 05-01 for torque specification.

9. Connect wires for the starter motor and backup lamp switch (15520).

10. Reinstall exhaust system (V-6 engines only). Refer to Section 09-00 .

11. Connect the hydraulic clutch hose (7T504) and bleed the system per instructions in Section 08-02 .

12. Install the speedometer cable (17260).

13. Check fluid level. Fill transmission with Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid.

14. Remove safety stands and lower the vehicle.

15. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect the battery ground cable (14301) to the battery terminal.

tomsn048@gmail.com

tomsn048@gmail.com

Transmission

Cleaning

NOTE: Do not clean, wash or soak transmission seals in cleaning solvent.

1. Wash all parts, except ball bearings and seals, in a suitable cleaning solvent.
2. Brush or scrape all foreign matter from the parts. Be careful not to damage any parts with the scraper.
3. Dry all parts with compressed air.

Inspection

NOTE: If a transmission case thread is damaged, service kits may be purchased from local jobbers. To service a damaged thread, refer to Case Thread Service in this section.

1. Inspect case (7005) for cracks, worn or damaged bores, stripped or damaged threads, or any other damage that could affect operation of the transmission (7003).
2. Inspect the gasket surfaces and machined mating surfaces for burrs, nicks or damage.
3. Check the vent for obstructions, and check all fluid passages for obstructions and leakage.
4. Inspect the case bushing for scores.
5. Check all parking linkage parts for wear or damage.

Case Service

1. Drill out the damaged threads, **using the same drill size as the thread outside diameter** . For example, use a 5/16-inch drill for a 5/16-18 thread.
2. Select the proper special tap and tap the drilled hole. The tap is marked for the size of the thread being repaired. Thus, the special tap marked 5/16-18 will not cut the same thread as a standard 5/16-18 tap. It does cut a thread large enough to accommodate the insert, and after the insert is installed, the original thread size (5/16-18) is restored.
3. Select the proper coil inserting tool. These tools are marked with the thread size being repaired. Place the insert on the tool and adjust the sleeve to the length of the insert being used. Press the insert against the face of the tapped hole. Turn the tool clockwise and wind the insert into the hole until the insert is one-half turn below the face.
4. Working through the insert, bend the insert tang straight up and down until it breaks off at the notch.
5. Improperly installed inserts can be removed with the extractor tool. Place the extractor tool in the insert with the blade resting against the top coil, one-quarter to one-half turn away from the end of the coil. Tap the tool sharply with a hammer until the blade cuts into the insert. Exert downward pressure on the tool and turn it counterclockwise until the insert is removed.

tomsn048@gmail.com

tomsn048@gmail.com

Extension Housing

1. **NOTE: The extension housing rear bushing cannot be serviced. If it requires service, the extension housing (7A039) must be replaced as a unit (4x2 vehicles only).**

   Inspect the extension housing for cracks.

2. Make sure that the machined mating surfaces are free from burrs, nicks, or any other damage.

   If necessary, replace the oil seal (7052) after the extension housing has been installed on the transmission (7003).

tomsn048@gmail.com

Bearings

1. Rotate the bearings in a cleaning solvent until all lubricant is removed. Hold the bearing assembly to prevent it from rotating while drying it with compressed air.

2. Lubricate the bearings with Motorcraft MERCON® Automatic Transmission Fluid XT-2-DDX or -QDX or equivalent MERCON® fluid. Wrap them in a clean, lint-free cloth or paper, until ready for use.

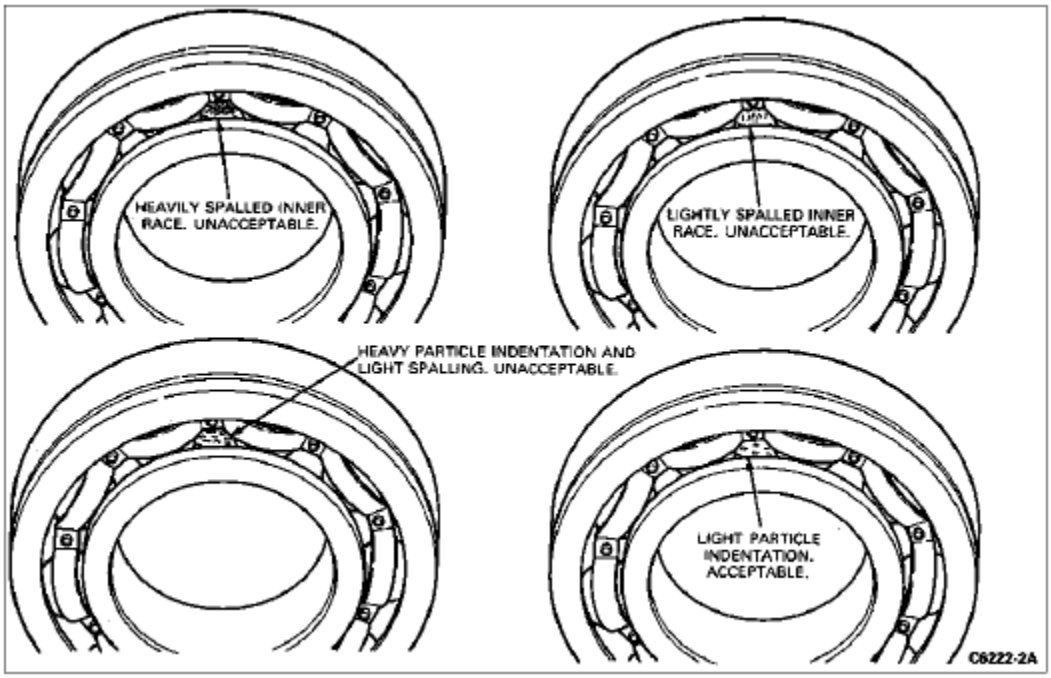
Raceways

1. **NOTE: Bearings that have been removed using special service tools may have been damaged simply due to the tool design. Be sure the following checks are made to determine if the bearing can be put back into service.**

   Inner Ring Raceway — While holding outer ring stationary, rotate inner ring at least three revolutions. Examine raceway of inner ring for pits or spalling. If pits or spalling are unacceptable, replace the bearing assembly. Light particle indentation is acceptable.

2. Outer Ring Raceway — While holding inner ring stationary, rotate outer ring at least three revolutions. Examine raceway of the outer ring from the same side as the raceway of the inner ring. If raceway is spalled or pitted, replace the bearing assembly. Light particle indentation is acceptable.

Bearing Inspection



tomsn048@gmail.com

External Surfaces

The bearing must be replaced if damage in any of the following areas is found:

1. Radial cracks on front and rear faces of outer or inner rings.
2. Cracks on outside diameter or outer ring (particularly around snap ring groove).
3. Deformation or cracks in ball cage (particularly around rivets).

Spin Test

1. Lubricate bearing raceways with a slight amount of clean oil. Turn the bearing back and forth slowly until raceways and balls are coated with oil.
2. Hold bearing by inner ring in a vertical position. Vertical movement between the inner and outer rings is acceptable. Spin outer ring several times by hand (do not use compressed air). If roughness or vibration is noticeable or the outer ring stops abruptly, the bearing should be cleaned again and lubricated. Roughness in a bearing is usually caused by foreign particles in the bearing, which comes from inside the transmission case. If bearing is still rough after cleaning and relubricating three times, it must be replaced.
3. Hold bearing by the inner ring in a horizontal position with the snap ring groove up. Spin outer ring several times by hand (do not use compressed air). If bearing is still rough after cleaning and relubricating three times (if not done in Step 2), it must be replaced. If bearing passes the visual inspection and spin tests, it can be reinstalled in transmission.

tomsn048@gmail.com

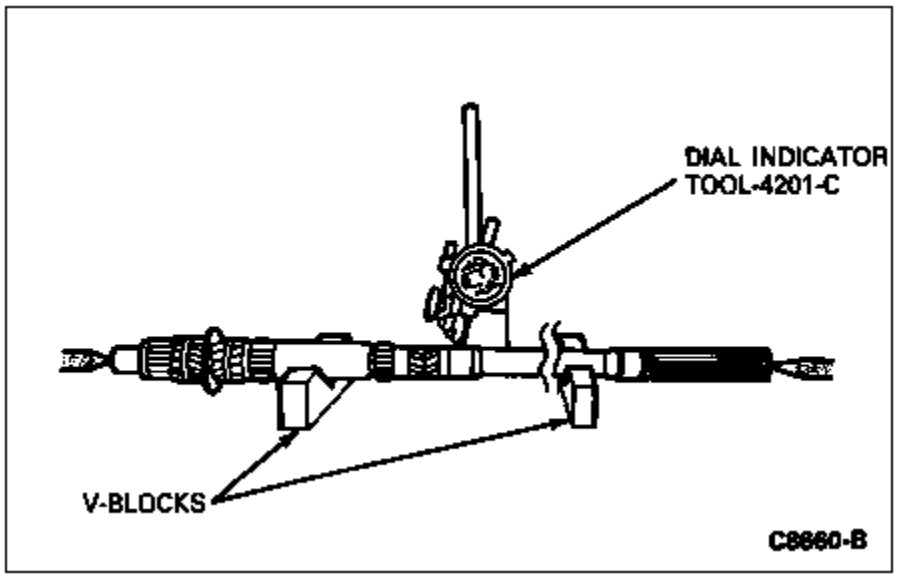
Gears

Inspect the teeth of each gear. If excessively worn (scratched, very shiny, etc), broken or chipped, replace the gear. Excessive wear increases backlash, which results in noise and unacceptable operating characteristics.

tomsn048@gmail.com

Output Shaft

Check output shaft for runout by mounting the shaft between V-blocks and applying Dial Indicator with Bracketry TOOL-4201-C or equivalent to several places along shaft. The standard reading of the indicator for runout should be less then 0.05mm (0.002 inch). If runout exceeds 0.05mm (0.002 inch), replace mainshaft.



tomsn048@gmail.com

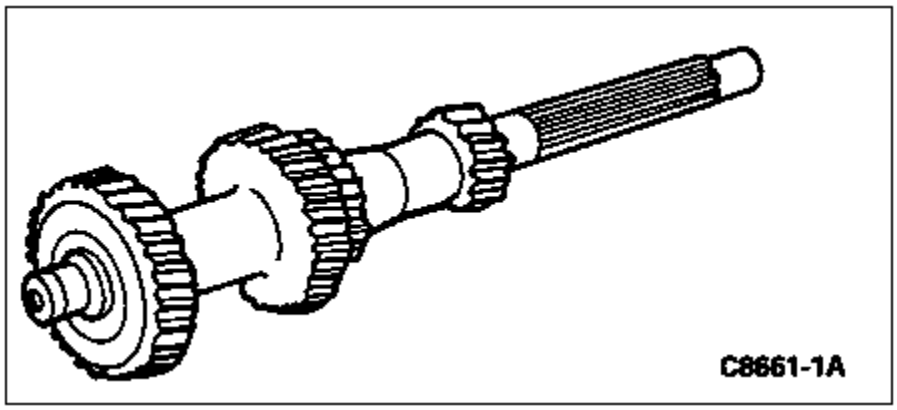
Input Shaft

Replace input shaft (7017) if splines are damaged. If needle bearing surface is worn or rough, or if other bearing contact surfaces are damaged, replace input shaft.

tomsn048@gmail.com

Countershaft

Check countershaft gear teeth and countershaft splines for wear or damage. Replace countershaft (7111) if bent, scored, or worn.



tomsn048@gmail.com

Synchronizers

1. **NOTE: Make note of the differences between the 3rd gear synchronizer blocking ring (7107) and the 1st, 2nd and 4th gear synchronizer blocking rings. The 3rd gear synchronizer blocking ring has three teeth cut out 120 degrees apart from each other. Directly adjacent to one side of the missing teeth, two teeth have been bridged together. This is to help eliminate any upshift "crunch" that may occur.**

   Inspect gear teeth on synchronizer blocking ring. If there is evidence of chipping or excessively worn teeth, replace with new parts.

2. **NOTE: First/second, third/fourth and fifth reverse synchronizer-to-gear clearance specifications are the same.**

   Inspect synchronizer blocking ring for wear. To check the wear, fit synchronizer blocking ring evenly to gear cone. Measure clearance between side faces of synchronizer blocking ring and gear with a feeler gauge. If clearance is less than 0.8mm (0.031 inch), replace synchronizer blocking ring or gear.

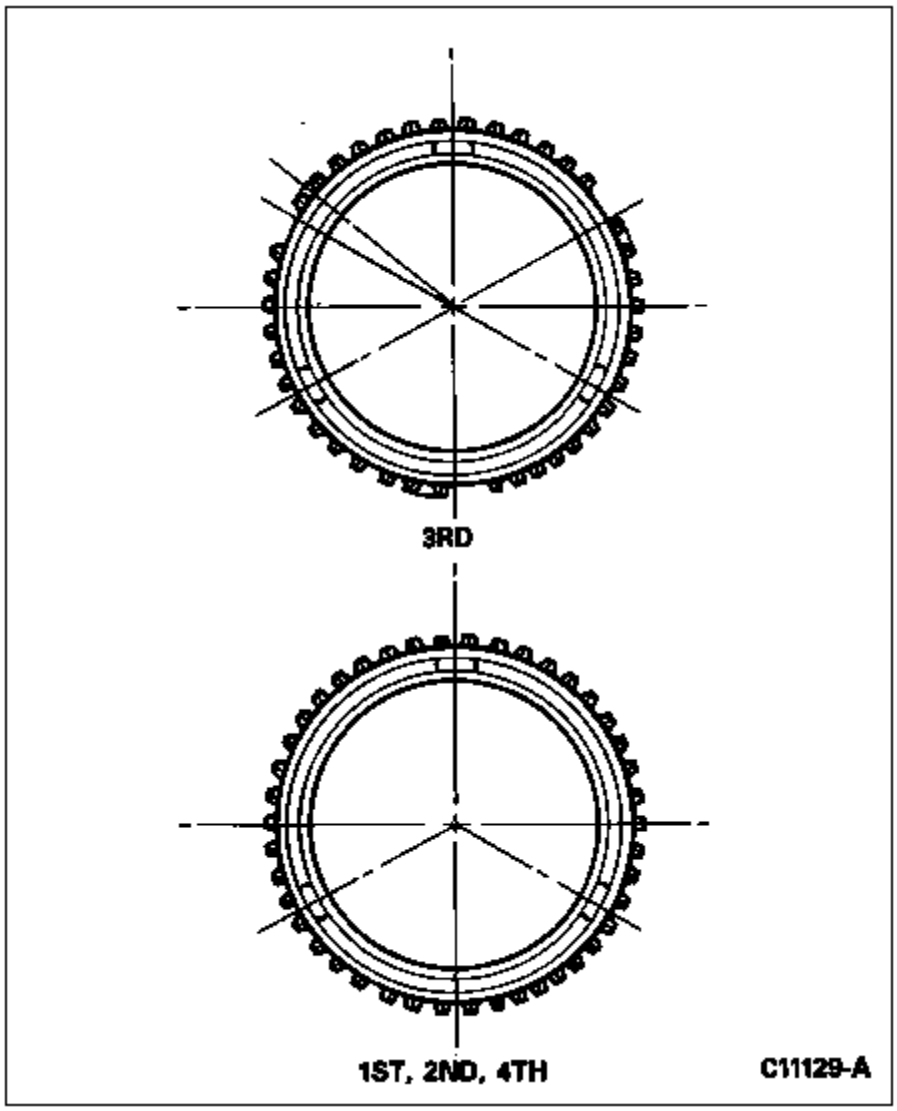
3. Inspect contact between inner surface of synchronizer blocking ring and cone surface of gear. To inspect, apply a thin coat of Prussian Blue or equivalent on cone surface of gear and fit it into the synchronizer blocking ring. If the contact pattern is poor, correct this by applying compound and lapping surfaces together.

4. Make sure clutch sleeve slides easily onto clutch hub.

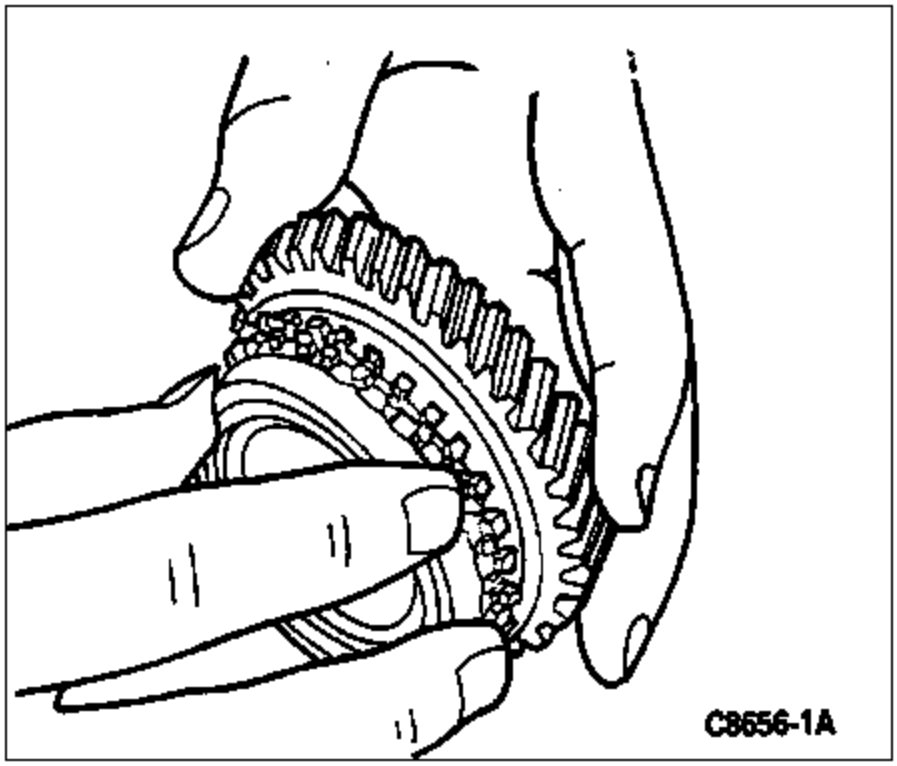
5. Check synchronizer hub inserts (7A044), inner surface of clutch sleeve, and insert groove on clutch hub for wear.

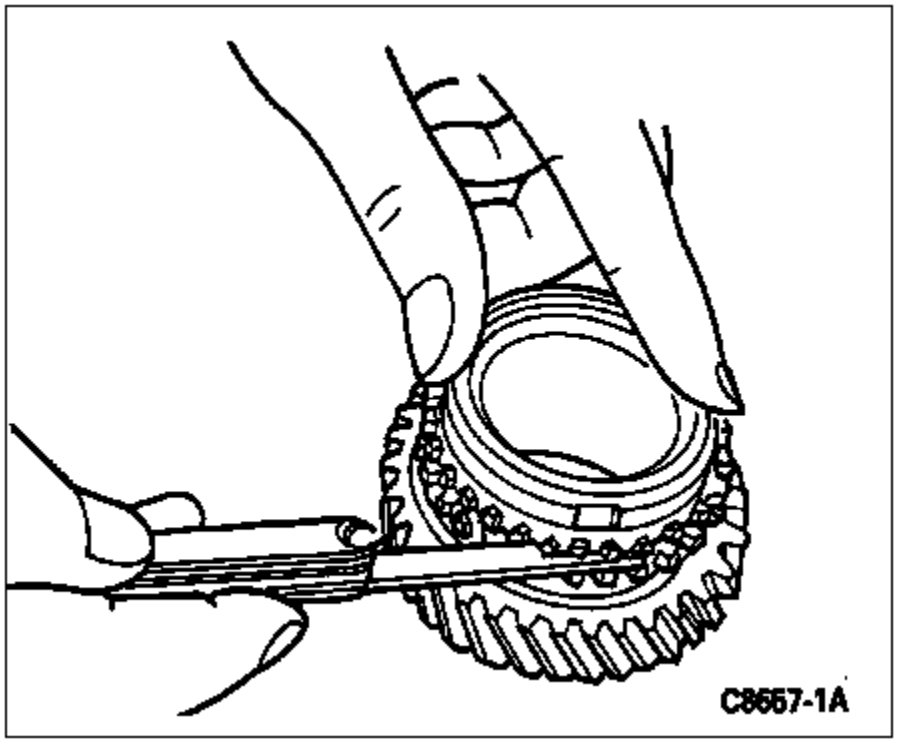
6. Check synchronizer insert spring for tension.

tomsn048@gmail.com



tomsn048@gmail.com

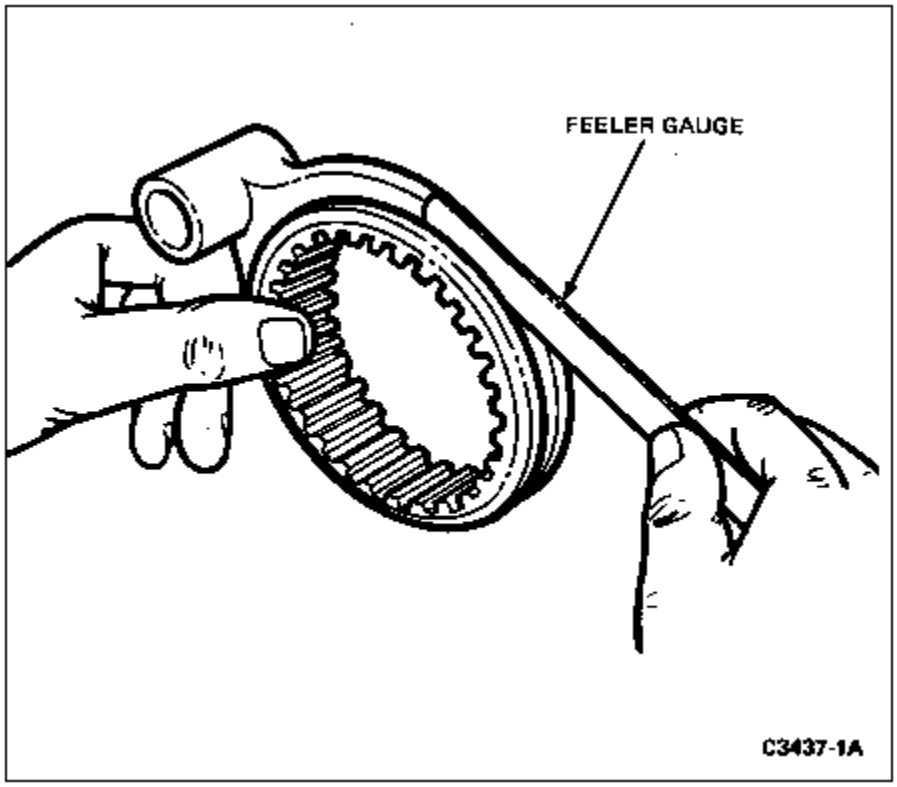




Shift Fork/Clutch Hub Sleeve

tomsn048@gmail.com

Check the contact surfaces of the shift fork and clutch hub sleeve for evidence of wear or damage. Measure from shift fork to the clutch hub sleeve. Clearance should not exceed 0.8mm (0.031 inch).



Clutch Hub

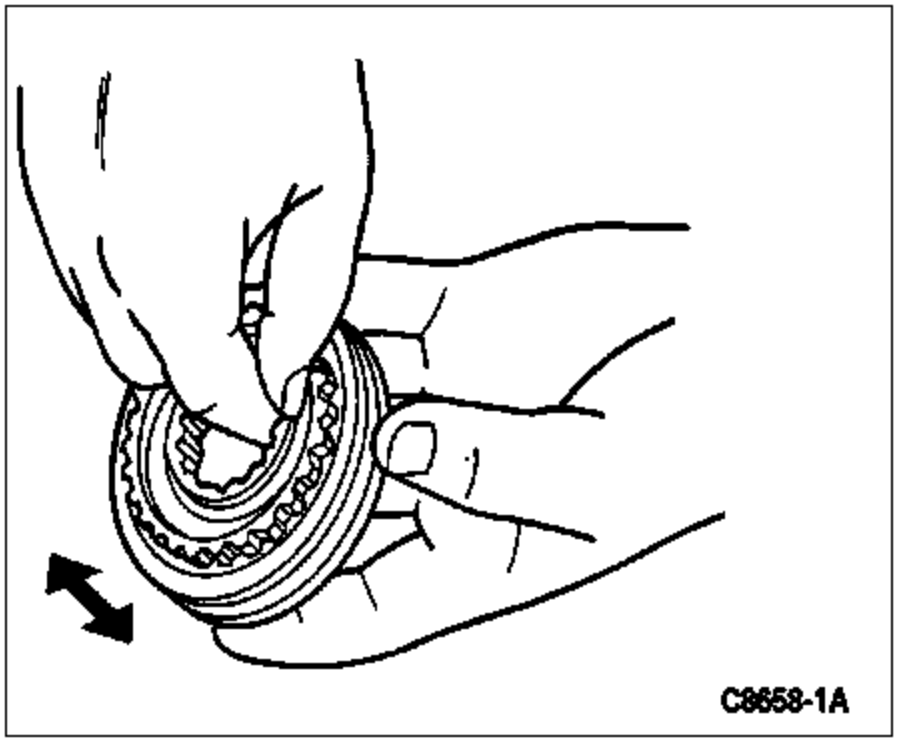
CLUTCH HUB SLEEVE-TO-SHIFT FORK CLEARANCE

Standard	Maximum
1st/2nd 0.05-0.37mm (0.0019-0.014 In.)	0.8mm (0.0314 In.)
3rd/4th 0.1-0.37mm (0.003-0.014 In.)	0.8mm (0.0314 In.)
5th/Rev. 0.1-0.37mm (0.003-0.014 In.)	0.8mm (0.0314 In.)

1. Check operation of clutch hub sleeve installed onto hub.

2. Position clutch hub and sleeve horizontally. Lift the hub approximately three-quarters of the way off the sleeve. Release the hub, and observe downward motion. Hub should slide downward into sleeve on its own. It should not be necessary to push hub into sleeve. Service as necessary.

tomsn048@gmail.com



tomsn048@gmail.com

Speedometer Gears

Check the drive gear and driven gear, and the driven gear shaft for wear or damage. Check the O-ring and oil seal for weakness or damage (4x2 vehicles only).

tomsn048@gmail.com

Thrust Washers

1. Check the surfaces of all thrust washers that are scored or reduced in thickness.

tomsn048@gmail.com

Bearing Retainers

1. Replace bearing covers that are grooved or showing wear from the thrust or adjacent bearings. Check the oil return threads in the bearing covers. If the sealing action of the threads has been destroyed by contact from the input shaft (7017) or output shaft, replace the covers.

Inspection and Verification

Visually inspect the following components of shift interlock system. Determine if any of the following electrical or mechanical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Blown fuse(s)	Kinked or bound shift-lock cable
• Poor connections	Kinked or bound shift cable
• Damaged wiring harness	Damaged selector linkage
Shift control selector lever out of adjustment	

Symptom Chart — Shift Control Linkage

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical Pinpoint Tests.

Use the Symptom Chart as an aid in determining possible conditions, sources and necessary service actions for shift control linkage.

SHIFT CONTROL LINKAGE

Condition	Possible Source	Action
• Shift Interlock System Does Not Release or Lock Properly	• Circuitry open/shorted. • Blown fuse. • Damaged brake on/off (BOO) switch. • Damaged shift lock actuator.	• GO to Pinpoint Test A .
• Shift Control Linkage Binding, Out of Proper Gear Relationship	• Damaged shift cable and bracket. • Loose shift cable and bracket. • Loose retainer bracket. • Shift linkage misadjusted.	• GO to Pinpoint Test B .
• Transmission Range Indicator Does Not Correspond to the Gear	• Transmission shift cable bracket is loose.	• TIGHTEN bolts holding transmission shift cable bracket.
	• Transmission control indicator linkage misadjusted.	• ADJUST PRNDL at steering column housing.
	• Transmission shift cable loose from the transmission retainer bracket.	• TIGHTEN transmission shift cable bolts.
	• Shift linkage misadjusted.	• VERIFY shift cable adjustment. REFER to Adjustments in this section. ADJUST shift cable, if necessary.
	• Clip securing the transmission shift cable to the transmission range selector lever is loose.	• INSTALL clip properly.
• Transmission Range Indicator Lamp Does Not Illuminate	• Bulb burned out.	• REPLACE bulb.

	• Wiring harness damaged.	• INSTALL new wiring harness.
• Rattle, Noise, Buzz, etc.	• Selector lever knob loose. • Transmission range selector lever loose. • Shift interlock spring not hooked.	• REPLACE selector lever knob. • TIGHTEN housing bolts. • ATTACH shift interlock spring properly.
• Water Enters Inside the Vehicle	• Cable assembly grommet not secure to dash panel. • Cable assembly grommet torn.	• SECURE grommet to dash panel. • INSTALL new transmission shift cable.
• Excessive Shift Effort	• Kinked/broken transmission shift cable. • Cable bracket loose/bent.	• ADJUST cable. TIGHTEN cable bracket screws. • REPLACE transmission shift cable.
• Transmission Range Selector Lever Will Not Shift from Range	• Transmission shift cable detached from transmission bracket. • Lock tab loose. • Broken transmission shift cable. • Internal transmission components damaged.	• REINSTALL transmission shift cable. • REPLACE transmission shift cable. • REFER to Section 07-01A .
• Transmission Control Switch (TCS) Inoperative, DTC P1780	• Blown fuse. • Damaged TCS or TCS not cycled during self test. • Damaged powertrain control module. • Circuitry open/shorted.	• GO to Pinpoint Test C .
• Transmission Control Indicator Lamp (TCIL) Does Not Illuminate	• Burned out bulb. • Circuitry open/shorted. • Damaged powertrain control module.	• GO to Pinpoint Test D .
• Transmission Control Indicator Lamp (TCIL) Stays Illuminated	• Circuitry open/shorted. • Damaged powertrain control module.	• GO to Pinpoint Test E .

Pinpoint Tests

PINPOINT TEST A: SHIFT INTERLOCK SYSTEM DOES NOT RELEASE OR LOCK PROPERLY

A1 CHECK FUSES

Check the following fuses:

- In the instrument panel fuse box, Aerostar:

Fuse Location	Amperage
1	15
5	15

- In the instrument panel fuse box, Ranger:

Fuse Number	Amperage
10	7.5
13	15

Are fuses OK?

Yes	No
GO to **A3** .	GO to **A2** .

A2 CHECK SYSTEM

- Replace blown fuse(s).
- Key ON.

Do(es) fuse(s) fail again?

Yes	No
GO to **A8** .	GO to **A3** .

A3 CHECK POWER SUPPLY TO BRAKE ON/OFF (BOO) SWITCH

- Locate and disconnect brake on/off (BOO) switch.
- Measure voltage on the "LG/R" wire between the BOO switch connector and ground.

Is voltage greater than 10 volts?

Yes	No
GO to **A4** .	REPAIR "LG/R" wire for open. RETEST system.

A4 CHECK BRAKE ON/OFF (BOO) SWITCH

- BOO switch connected.
- Press brake pedal.
- Measure voltage at the "LG" wire terminal between the BOO switch connector and ground.

Is voltage greater than 10 volts?

Yes	No
GO to **A5** .	REPLACE BOO switch. RETEST system.

A5 CHECK POWER SUPPLY TO SHIFT LOCK ACTUATOR

- Locate and disconnect shift lock actuator.
- Key ON.
- Measure voltage on the "GY/Y" wire at the shift lock actuator connector.

Is voltage greater than 10 volts?

Yes	No
GO to **A6** .	REPAIR "GY/Y" wire for open. RETEST system.

A6 CHECK POWER SUPPLY TO SHIFT LOCK ACTUATOR

- Key OFF.
- Press brake pedal.
- Measure voltage on the "R/LG" (Aerostar) or "LG" (Ranger) wire at the shift lock actuator connector.

Is voltage greater than 10 volts?

Yes	No
GO to **A7** .	REPAIR "R/LG" OR "LG" wire foe open. RETEST system.

A7 CHECK SHIFT LOCK ACTUATOR GROUND

- Disconnect shift lock actuator connector.
- Measure resistance of the "BK" wire between the shift lock actuator connector and ground.

Is resistance less than 5 ohms?

Yes	No
REPLACE shift lock actuator.	REPAIR "BK" wire for open. RETEST system.

A8 CHECK POWER CIRCUITS FOR SHORT TO GROUND

- Disconnect shift lock actuator connector.
- Remove blown fuse.
- Check for continuity between blown fuse output circuit and know good ground.

Is continuity present?

Yes	No
REPAIR circuit for short to ground. REPLACE fuse. RETEST system.	CHECK all other circuits that are spliced into circuit having blown fuse. REPAIR as required. If all other circuits are OK, REPLACE shift lock actuator. RETEST system.

PINPOINT TEST B: SHIFT CONTROL LINKAGE BINDING, OUT OF PROPER GEAR RELATIONSHIP

B1 CHECK SHIFT CONTROL LINKAGE

- Gain access to shift control linkage.
- Actuate shift linkage in all ranges.
- Observe all linkages during operation.

Is linkage damaged?

Yes	No
REPLACE shift control linkage. RETEST system.	GO to **B2** .

B2 CHECK TRANSMISSION SHIFT CABLE

- Check transmission shift cable and bracket installation and tightness.

Is shift cable properly installed and adjusted?

Yes	No

VERIFY shift cable adjustment. REFER to Adjustments in this section. ADJUST shift cable, if necessary. GO to **B3**.	REPAIR as necessary. RETEST system.

B3 CHECK LINKAGE/CABLE FOR PROPER GEAR RELATIONSHIP

- Actuate transmission range selector lever in all ranges.

Does indicator match gear selection?

Yes	No
REPAIR is complete. RETEST system.	REPLACE damaged linkage/cable. RETEST system.

PINPOINT TEST C: TRANSMISSION CONTROL SWITCH (TCS) INOPERATIVE, DTC P1780

C1 CHECK FUSE 26

- Turn the ignition switch to the OFF position.
- Check the I/P fuse (10A).

Is the resistance less than 5 ohms?

Yes	No
REINSTALL fuse. Go to **C2**.	REPLACE failed fuse. RETEST system. If fuse fails again,check for short to ground in circuits 298 (P/O) and 224 (T/W). RETEST system.

C2 CHECK TRANSMISSION CONTROL SWITCH (TCS) CIRCUIT FOR VOLTAGE

- Disconnect the powertrain control module harness connector.
- Inspect the powertrain control module harness connector for damaged or pushed out pins, corrosion or loose wires.
- Install 104 Pin breakout box (014-00950); leave the PCM disconnected.
- Measure the voltage between test pin 29 and test pin 24 and 77 at the breakout box while cycling the several times.

Does the voltage cycle?

Yes	No
REPLACE PCM. REMOVE breakout box. RETEST system.	GO to **C3**.

C3 CHECK 224 (T/W) FOR SHORT TO GROUND

- Turn the ignition switch to the OFF position.
- Disconnect the transmission control switch harness connector.
- Inspect both ends of the TCS connector for damaged or pushed out pins, corrosion or, loose wires.
- Measure resistance between test pins 29 and test pins 24 and 77 at the breakout box.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to **C4** .	REPAIR circuit 224 (T/W). RETEST system.

C4 CHECK CIRCUIT 298 (P/O) AND CIRCUIT 224 (T/W) FOR OPEN

- Disconnect the I/P fuse 26 (10A).
- Measure resistance between the I/P fuse 26 (10A) connector pin I and the power side of the TCS vehicle harness connector circuit 298 (P/O).
- Measure resistance between test pin 29 at the breakout box and the signal side of TCS vehicle harness connector circuit 224 (T/W).

Are all resistance's less than 5 ohms?

Yes	No
GO to **C5** .	REPAIR circuit 298 (P/O) and /or circuit 224 (T/W). REMOVE breakout box. RECONNECT all components. RETEST system.

C5 CHECK CIRCUIT 224 (T/W) FOR SHORT TO POWER

- Measure resistance between test pin 29 and test pins 71 and 97 at the breakout box.

Is the resistance greater than 10,000 ohms?

Yes	No
REPLACE transmission control switch. REMOVE breakout box. RECONNECT all components. RETEST system.	REPAIR circuit 224 (T/W). REMOVE breakout box. RECONNECT all components. RETEST system.

PINPOINT TEST D: TRANSMISSION CONTROL INDICATOR LAMP (TCIL) DOES NOT ILLUMINATE

D1 CHECK TRANSMISSION CONTROL INDICATOR LAMP (TCIL) CIRCUIT FOR VOLTAGE

- Turn the ignition switch to the OFF position.
- Disconnect the powertrain control module harness connector.
- Inspect the powertrain control module harness connector for damaged or pushed out pins, corrosion or loose wires.
- Install 104 Pin breakout box (014-00950); leave the PCM disconnected.
- Turn the ignition switch to the ON position.
- Measure the voltage between test pin 79 and test pins 24 and 76 at the breakout box.

Is the voltage reading greater than 2 volts?

Yes	No
REPLACE PCM. CYCLE TCS to check operation of TCIL.	CHECK indicator bulb and fuse. If OK, open is wiring between ignition switch and test pin 79 at the PCM harness connector. REPAIR as needed. RETEST system.

PINPOINT TEST E: TRANSMISSION CONTROL INDICATOR LAMP (TCIL) STAYS ILLUMINATED

E1 CYCLE TRANSMISSION CONTROL SWITCH

- Turn the ignition switch to the ON position.
- Cycle the transmission control switch (TCS).

Does the transmission control indicator lamp (TCIL) turn on and off?

Yes	No
OK at this time. Concern may be intermittent.	GO to **E2** .

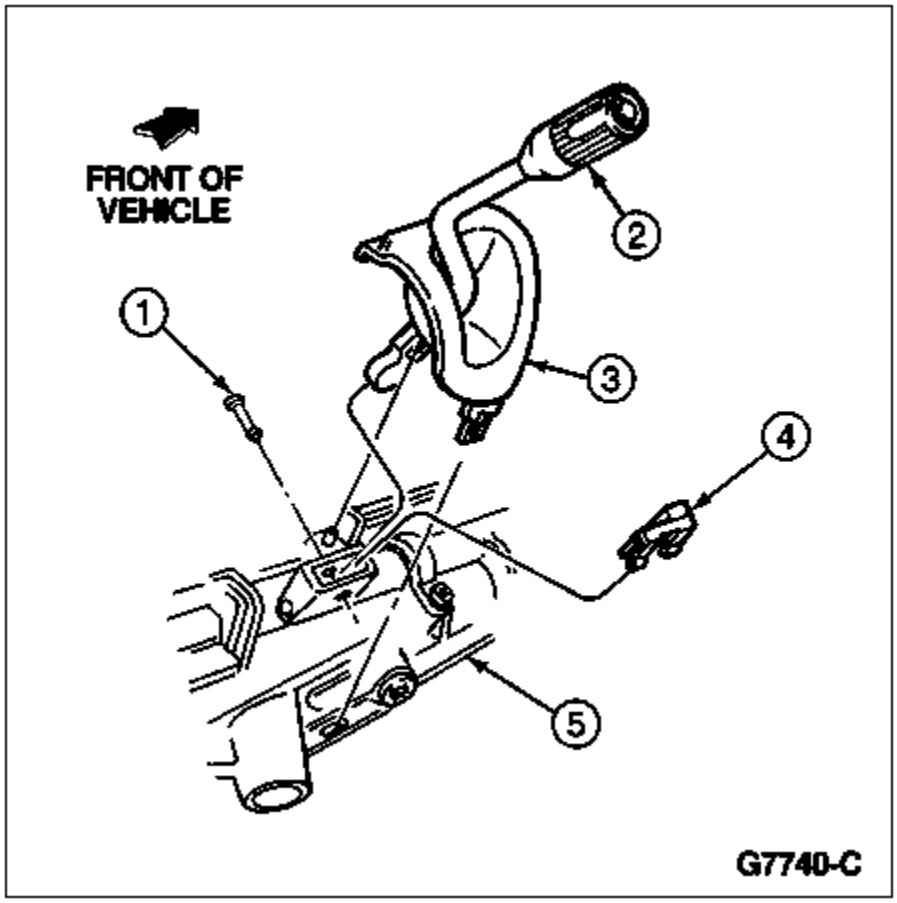
E2 CHECK CIRCUIT 911 (W/LG) FOR SHORT TO GROUND

- Turn the ignition switch to the OFF position.
- Disconnect the powertrain control module harness connector.
- Inspect the powertrain control module harness connector for damaged or pushed out pins, corrosion or loose wires.
- Turn the ignition switch to the ON position.

Does the TCIL remain on ?

Yes	No
REPAIR circuit 911 (W/LG). REMOVE breakout box. RECONNECT all components. RETEST system.	REPLACE PCM. RETEST system.

Transmission Range Selector Lever



Item	Part Number	Description
1	7G357	Gearshift Lever Pin
2	7210	Gearshift Lever
3	3513	Steering Column Opening Weather Seal
4	7C464	Clip
5	3514	Steering Column Tube

Removal

1. If required, remove tilt handle assembly by unscrewing from the column.
2. Disconnect battery ground cable.

3. Turn key lock cylinder to RUN position. Using a 1/8-inch drift, depress steering column lock cylinder pin through access hole and remove key lock cylinder.

4. Remove lower instrument panel cover retaining screws and remove cover.

5. Remove four retaining screws from steering column shroud. Remove the upper and lower steering column shrouds.

6. Using a small screwdriver, pry rubber shift lever cover upper attachment from pedestal on lock cylinder housing. Slide cover toward shift lever handle to expose shift lever retaining pin.

7. Using a small drift, tap retaining pin from bottom for removal. Discard lever retaining pin. Remove shift lever from shifter housing assembly.

Installation

1. Insert shift lever housing into opening in shifter housing assembly.

2. Install a new pin into position and tap in place until the head seats against shifter housing assembly.

3. Position shift lever cover on the lock cylinder housing. Insert lower attachment into the slot on side of housing.

4. Position upper attachment on mounting pin. Install a Tinnerman nut (Part No. 372659-S2) to secure cover to pedestal on lock cylinder housing.

5. Install steering upper and lower steering column shrouds with four screws.

6. Install lower instrument panel cover and retaining screws.

7. Install lock cylinder into lock cylinder housing.

8. Install tilt handle assembly onto column.

9. Connect battery ground cable.

Shift Lock Actuator

Removal

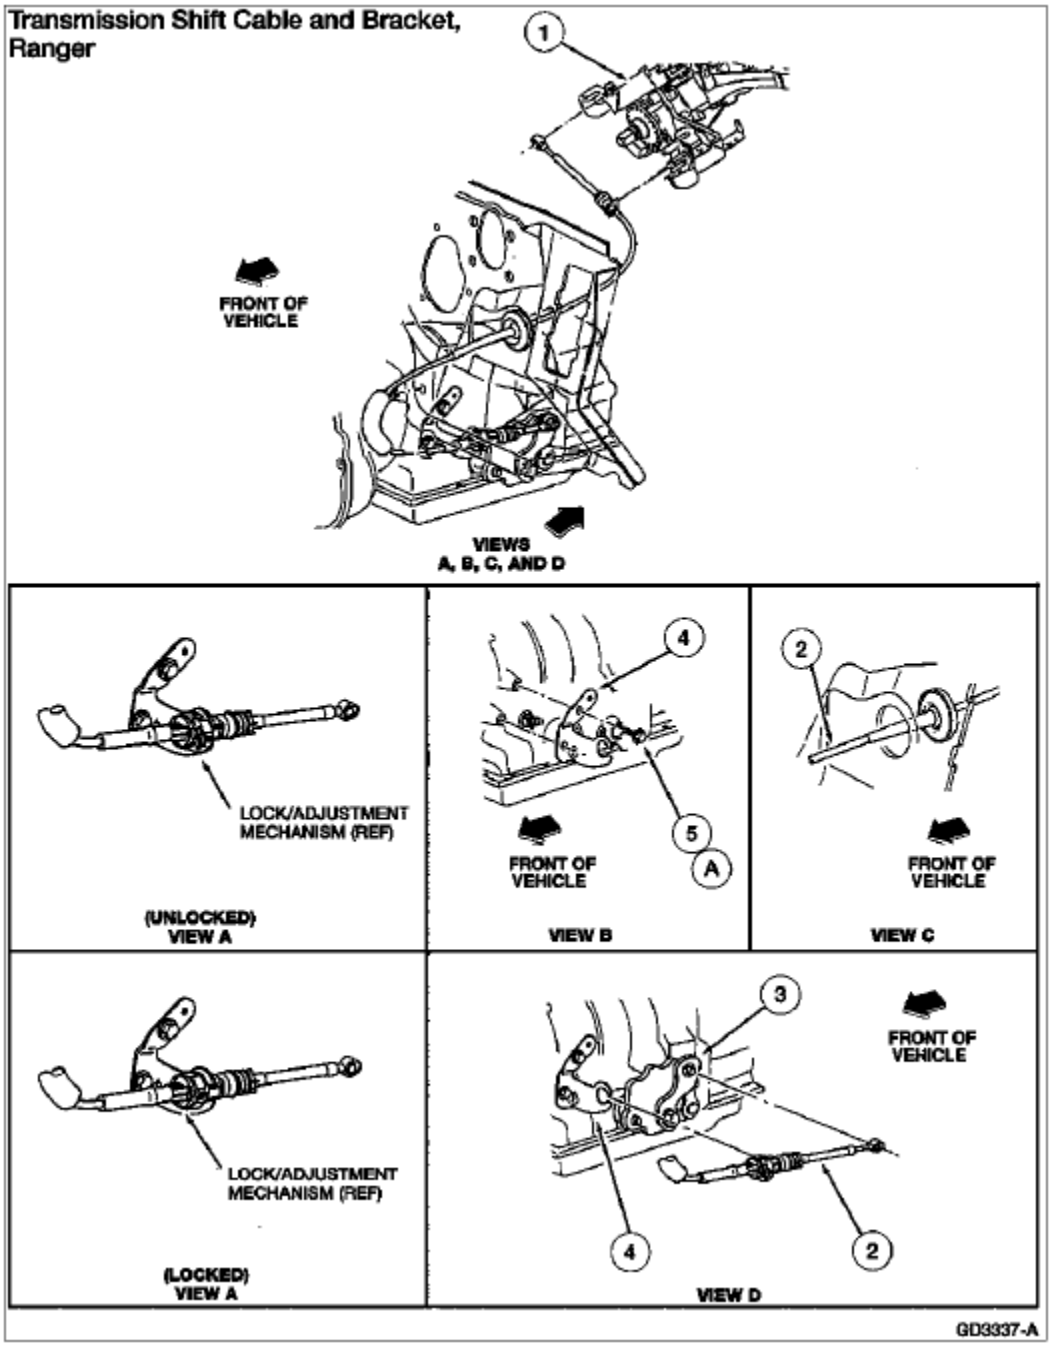
1. Remove steering column as outlined in Section 11-04A or Section 11-04B .
2. Unclip wire terminal from solenoid.
3. Remove insert plate and solenoid by removing three retaining screws.
4. Pry off clip.

Installation

1. **NOTE: The clip which retains the solenoid to the insert plate should not be replaced for service. The clip's sole purpose is an assembly aid for the assembly plant.**

   Position insert plate/solenoid assembly to the steering column and tighten the retaining screws.
2. Install the steering column in the vehicle as described in Section 11-04A or Section 11-04B .

Transmission Shift Cable and Bracket, Ranger



Item	Part Number	Description
1	7212	Transmission Column Shift Selector Tube

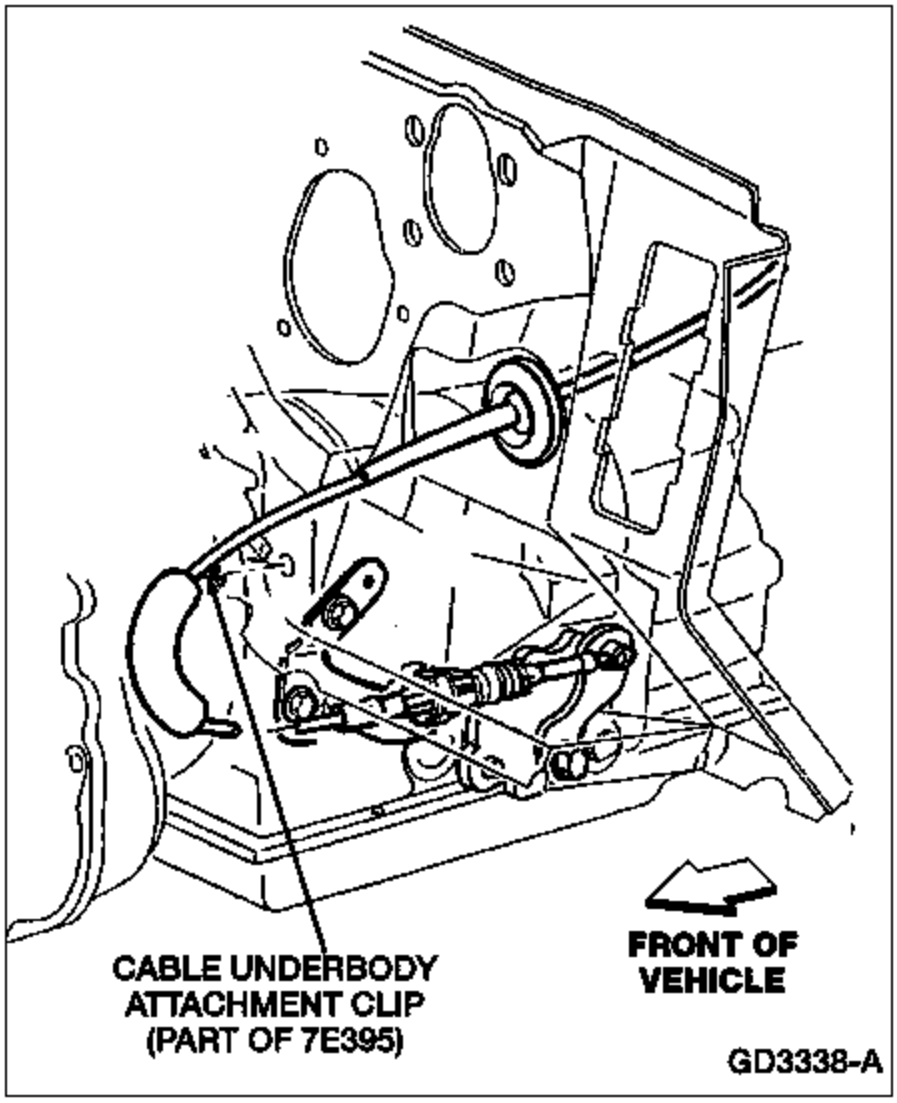
2	7E395	Shift Cable and Bracket
3	7A256	Manual Control Lever
4	7B229	Transmission Shift Cable Bracket
5	N605918-S300	Bolt (2 Req'd)
A	—	Tighten to 34-46 Nm (25-34 Lb/Ft)

Removal

1. Remove shift cable plastic terminal from the shift control selector lever pivot ball by prying with a screwdriver between cable plastic terminal and shift control selector lever and housing.

2. Remove transmission shift cable from steering column bracket by carefully lifting on the locking tab while pulling up on the fitting.

3. From inside passenger compartment, press tabs together on cable underbody attachment clip and push through the dash.



4. From engine compartment, pry cable grommet from dash panel.
5. Remove plastic slide adjuster from manual lever pivot ball, prying with a screwdriver between the slide adjuster and manual control lever.
6. Remove transmission shift cable from transmission shift cable bracket by carefully pressing on the locking tabs while pulling up on the fitting.
7. From engine compartment, pull cable through the instrument panel opening.

Installation

1. From instrument panel, feed plastic terminal end of cable through opening in dash panel to engine compartment.
2. Press rubber grommet on transmission shift cable into dash panel.

3. From engine compartment, install transmission shift cable into transmission shift cable bracket and make sure locking ears are properly located and seated into bracket.

4. Insert cable underbody attachment clip in proper position.

5. Place transmission shift cable on manual lever pivot ball and press into place.

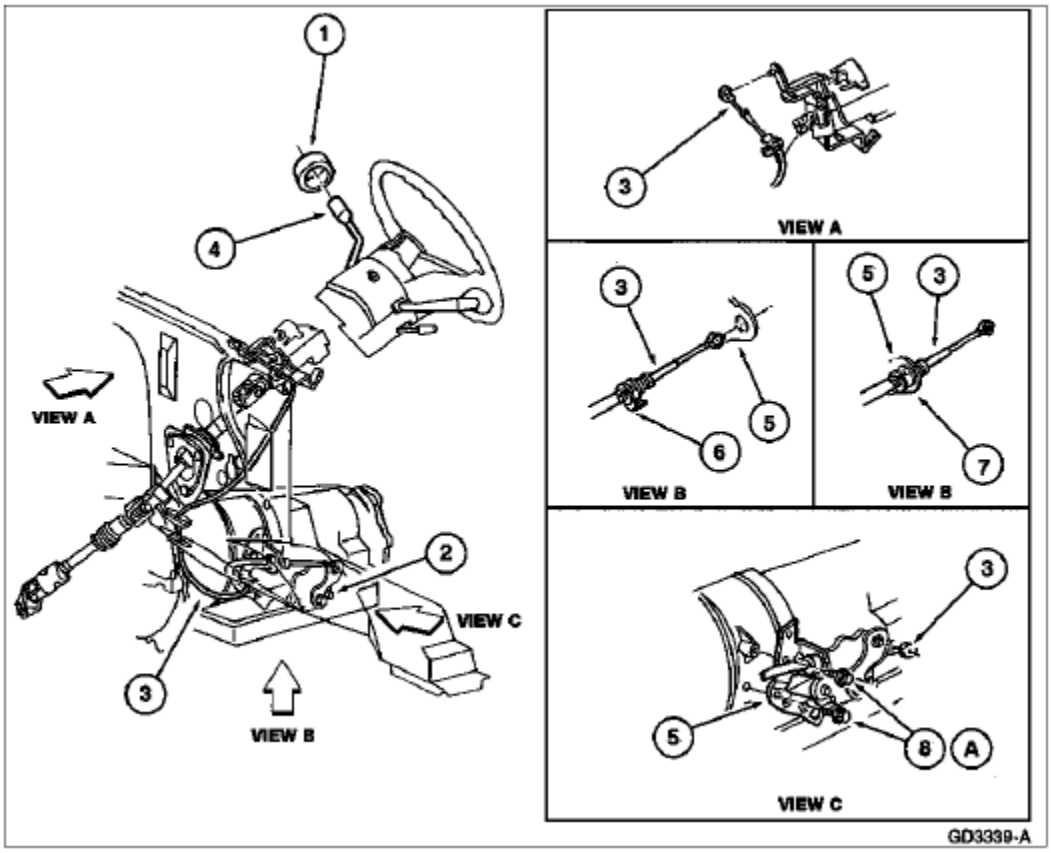
6. From the passenger compartment, install transmission shift cable into shift cable bracket and make sure locking tab is fully seated and locked into place.

7. Snap cable plastic terminal onto shift control selector lever pivot ball on the steering column.

8. Adjust transmission shift cable. Refer to Adjustments, Transmission Shift Cable and Bracket , Ranger in this section.

9. Remove the cable lock tab and replace with a new lock tab.

Transmission Shift Cable and Bracket, Aerostar



Item	Part Number	Description
1	—	1.4 kg (3 Lb.) Weight (To Be Improvised in Shop)
2	7A256	Manual Control Lever
3	7E395	Transmission Shift Cable
4	7210	Gearshift Lever
5	7B229	Transmission Shift Cable Bracket
6	—	Lock Mechanism Shown Unlocked (Part of 7E395)
7	—	Lock Mechanism Shown Locked (Part of 7E395)
8	N605918-S2	Bolt, M10-1.50 x 20 (2 Req'd)
A	—	Tighten to 34-46 Nm (25-34 Lb-Ft)

Removal

1. Raise vehicle on hoist and position suitable safety stands under the vehicle.
2. Unclip shift cable end fitting from transmission outer manual lever.
3. Remove shift cable from transmission shift cable bracket (7B229) by carefully squeezing shift cable ears together. Push shift cable out of transmission shift cable bracket.
4. Remove safety stands and lower vehicle.
5. Using a screwdriver, unclip the shift cable end fitting from the shift control selector lever.
6. Carefully remove shift cable from steering column bracket by prying back the lock tab with a small screwdriver and pushing the cable from the transmission shift cable bracket.
7. Peel back the carpet to expose shift cable grommet and clip.
8. Remove shift cable clip by gently squeezing shift cable ears together with suitable pliers.
9. Remove the shift cable from the vehicle by pulling or pushing shift cable through floorpan hole.

Installation

1. Route cable through floorpan hole.
2. Install the shift cable to the steering column bracket, making sure lock tabs are fully seated into bracket.
3. Seat shift cable grommet.
4. Place shift control selector lever in the (D) position and place a 1.4 kg (3 lb.) weight on the end of the shift control selector lever.
5. Raise vehicle on a hoist and position suitable safety stands under vehicle.
6. Route the shift cable away from exhaust and seat cable in transmission shift cable bracket.
7. Position the manual control lever (7A256) in the overdrive (D) position. This is three detents from the frontmost lever position with the first position counting as one.
8. Attach shift cable end fitting to the transmission outer manual lever.
9. Fully seat lock tab on transmission cable.
10. **CAUTION: Shift cable must be properly clipped to underbody. Failure to do so may result in the cable resting on the exhaust pipe, causing it to burn and ultimately causing complete loss of shifting ability.**

    Attach shift cable clip to vehicle underbody.
11. Remove safety stands and lower vehicle. Remove the weight from the shift control selector lever. Check for proper transmission engagement of all gears.

Transmission Control Switch

Removal

1. Disconnect the battery ground cable (14301).
2. Remove the plastic trim ring at the end of the transmission range selector lever.
3. Carefully pull the transmission control switch out of the transmission range selector lever.

Installation

To install, reverse the removal procedure.

Brake/Shift Interlock System

1. Turn ignition switch (11572) to RUN.
2. Verify that the transmission range selector lever is in PARK (P).
3. Without the brake pedal (2455) applied, verify that the transmission range selector lever cannot be shifted from PARK (P).
4. Apply the brake pedal. Verify that the transmission range selector lever can be shifted from PARK (P).
5. Shift to REVERSE (R).
6. Verify that the ignition switch cannot be turned to the LOCK position.
7. Shift to PARK (P).
8. Verify that the ignition switch can be turned to the LOCK position.
9. If the shift interlock system is not operating as specified, refer to Diagnosis and Testing in this section.

Transmission Range (TR) Selector Lever

Inspect the transmission range selector lever for damage, binding conditions and proper operation. Replace the transmission range selector lever as necessary. Refer to the procedure in this section.

Transmission Shift Cable and Bracket, Aerostar

1. Place shift control selector lever in the (D) (OVERDRIVE) position.
2. Hang a 1.4 kg (3 lb.) weight on the end of the shift control selector lever.
3. Raise the vehicle on a hoist and position suitable safety stands under the vehicle.
4. Use a screwdriver and pry the shift cable end from the manual control lever ball stud.
5. To unlock the adjuster body, release the lock tab on the top side of the cable by pushing down on two tangs.
6. Move the shift cable back and forth the full adjustment length four or five times to remove any dirt. Be sure the adjuster body moves freely.
7. Position the manual control lever (7A256) in the overdrive (D) position. This is three detents from the front-most lever position with the first position counting as one.
8. Holding the cable end fitting, push the cable rearward until the end fitting lines up with the outer manual control lever ball stud. Connect the cable end fitting to the ball stud.
9. Push up on the lock tab to lock the adjuster body in the correctly adjusted position. Be sure locator tab is properly seated in the bracket. Make sure shift cable is clipped to floorpan at white cable mark and cable is routed into tunnel.
10. Remove safety stands and lower vehicle.
11. Adjust shift indicator pointer while transmission (7003) is still in the (D) position.
12. Remove the 1.4 kg (3 lb.) weight from the shift control selector lever.
13. After adjustment, check for P (PARK) engagement. Check the shift control selector lever in all positions with the engine (6007) running to make sure that transmission/detent action is correct. Verify that the vehicle starts in Park/Neutral and back-up lamps illuminate in Reverse. If not, verify digital transmission range (DTR) adjustment in Neutral. Readjust if required. Refer to Section 07-01A or Section 07-01B.

Shift Indicator Cable

1. Remove tilt wheel handle and shank (3F609).
2. Remove ignition switch lock cylinder (11582). Refer to Section 11-04A or Section 11-04B .
3. Remove upper and lower steering column shrouds (3530).
4. Place gearshift lever (7210) in (D) (OVERDRIVE) position. A weight of 1.4 kg (3 lbs.) should be hung on the gearshift lever to make sure the gearshift lever is located firmly against the (D) detent.
5. Adjust shift cable (with adjustment wheel on PRNDL cable) until shift indicator completely covers (D) and calibration dots show no red.
6. Cycle gearshift lever through all of the positions and check that the shift indicator completely covers the proper letter or number in each position.
7. Install upper and lower steering column shrouds.
8. Install ignition switch lock cylinder. Refer to Section 11-04A or Section 11-04B .
9. Install tilt wheel handle and shank.

Transfer Case, Chain-Driven

CAUTION: Consult the vehicle owner guide before towing any 4x4. There are speed and distance restrictions that vary from vehicle to vehicle.

The Borg-Warner 13-54 is a chain-driven transfer case (7A195) in which the shifts may be activated electrically or mechanically. The basic functions of this system are much the same as any other 4x4 transfer case. By turning the control switch on the instrument panel, the driver can select either 2- or 4-wheel high and 4-wheel low. With the mechanical shift design, speed selection is controlled by a single-lever shift mechanism that provides neutral, 2-high, 4-high and 4-low.

The Borg-Warner 13-54 is a three-piece aluminum part-time transfer case. It transfers power from the transmission (7003) to the rear axle and, when actuated, also the front drive axle. The unit is lubricated by a gerotor oil pump that channels oil flow through drilled holes in the rear output shaft. The pump turns with the rear output shaft and allows towing of the vehicle at maximum legal road speeds for extended distances without disconnecting the front or rear driveshaft (4602).

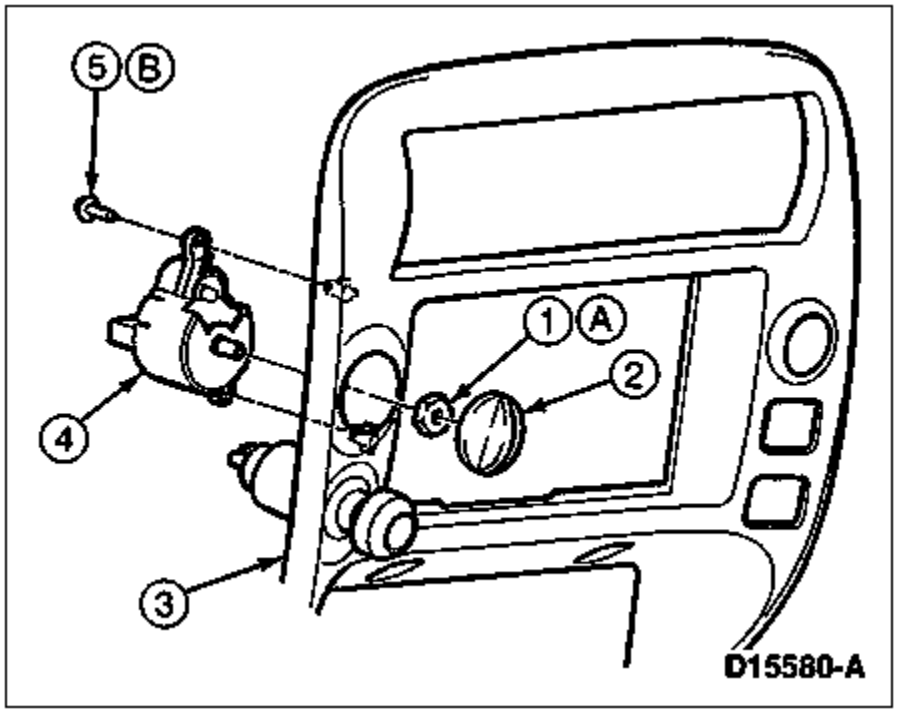
tomsn048@gmail.com

Transfer Case, Electronic Shift (Ranger)

NOTE: It is important to remember that the electronic shift transfer case (7A195) does not have a selectable neutral position. Because of this, if vehicles equipped with electronic shift are to be towed for long distances, the rear driveshaft (4602) should be disconnected. If this is not done, the transfer case (which is protected by positive lubrication) will drive the transmission (7003) (which is not lubricated under these conditions), and may cause damage to the transmission.

This feature allows for the electronic shifting of the vehicle transfer case between 2WD, 4WD HIGH and 4WD LOW. The system mode is selected by the operator through a three-position rotary switch on the instrument panel.

4x4 Mode Selector Switch, Ranger



Item	Part Number	Description
1	N803442-S36	Nut
2	—	Knob Assembly
3	—	Center Finish Panel
4	72155	4x4 Mode Selector Switch
5	385754-S36B	Screw
A	—	Tighten to 6-8 Nm (53-70 Lb-In)
B	—	Tighten to 2.1-2.9 Nm

tomsn048@gmail.com

		(19-24 Lb-In)

The operator is informed which mode the system is in by two cluster indicator lamps, one for 4WD HIGH and one for 4WD LOW (in 4WD LOW, both lamps are on). The module accomplishes shifts between different system modes by interpreting inputs from 4x4 selector switch, the vehicle speed signal, and the transfer case contract plates. Based on these inputs, two relays (L2H and H2L directional control), the transfer case motor, and an output for the transfer case electric clutch, are used to shift into 2WD, 4WD HIGH, or 4WD LOW. The module will not allow shifts into 4WD LOW unless the brake is depressed, the vehicle is in NEUTRAL (with automatic transmission vehicles), the clutch is pressed (in manual transmission vehicles), and the speed is less than 3 mph.

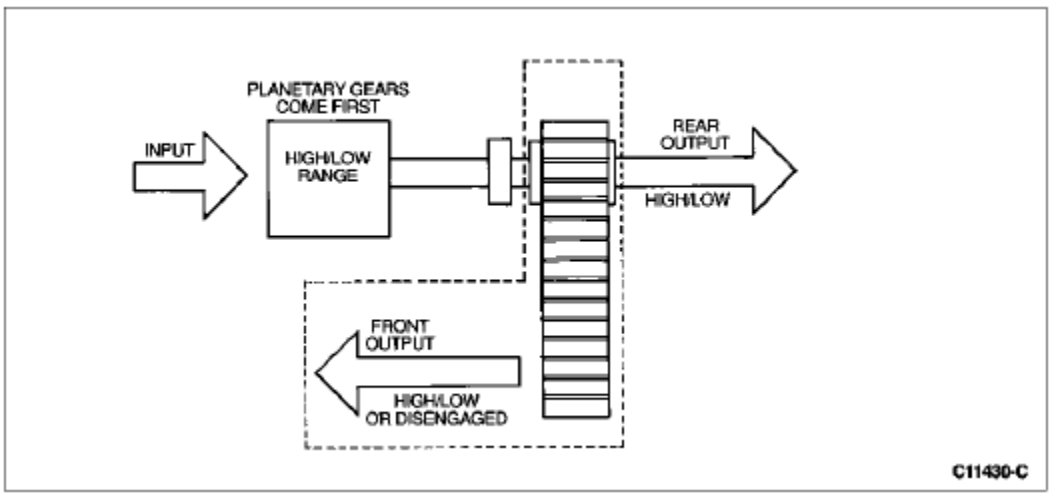
Chain-Drive Advantages



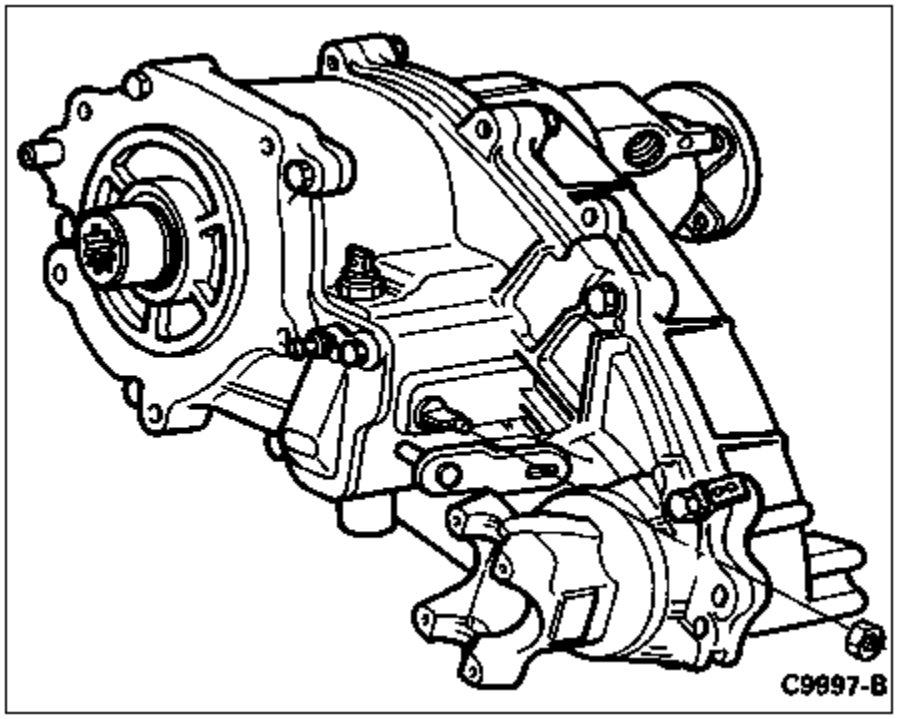
tomsn048@gmail.com

Mechanical Operation, Ranger

In the 4x2 mode, torque from the transmission (7003) is transferred to the input shaft (7017), which in turn drives the output shaft that drives the rear axle (4001).

The 2W-4W shift is accomplished when the 2W-4W shift fork moves the 2W-4W lockup sleeve to engage the drive sprocket on the rear output shaft splines. The drive sprocket turns the chain which turns the front output shaft driven sprocket on the front output shaft and the front driveshaft (4602).

Mechanical Shift Transfer Case



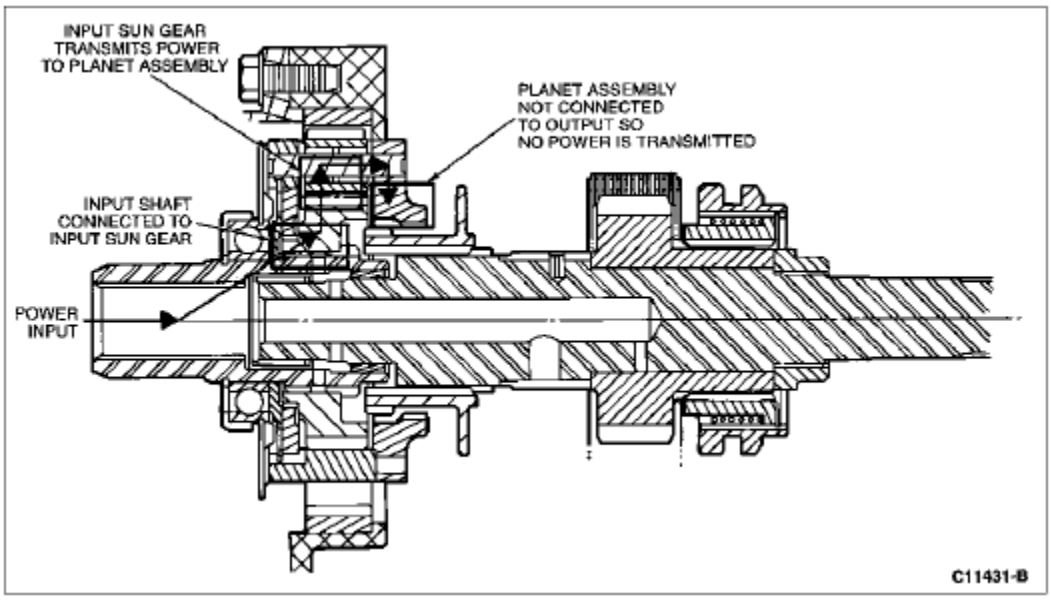
The high-low shift is accomplished when the high-low shift fork moves the high-low collar to engage the front planet (7A398) to the output shaft. Torque for the input shaft is then transmitted through the sun gear, which then turns the front planet. The front planet, which is now engaged to the output shaft, provides a reduction.

Neutral

With the shift selector in neutral, no power is transmitted to either front or rear axle. All the planetary gears turn freely with the input shaft, and the chain sprocket floats freely on the output shaft.

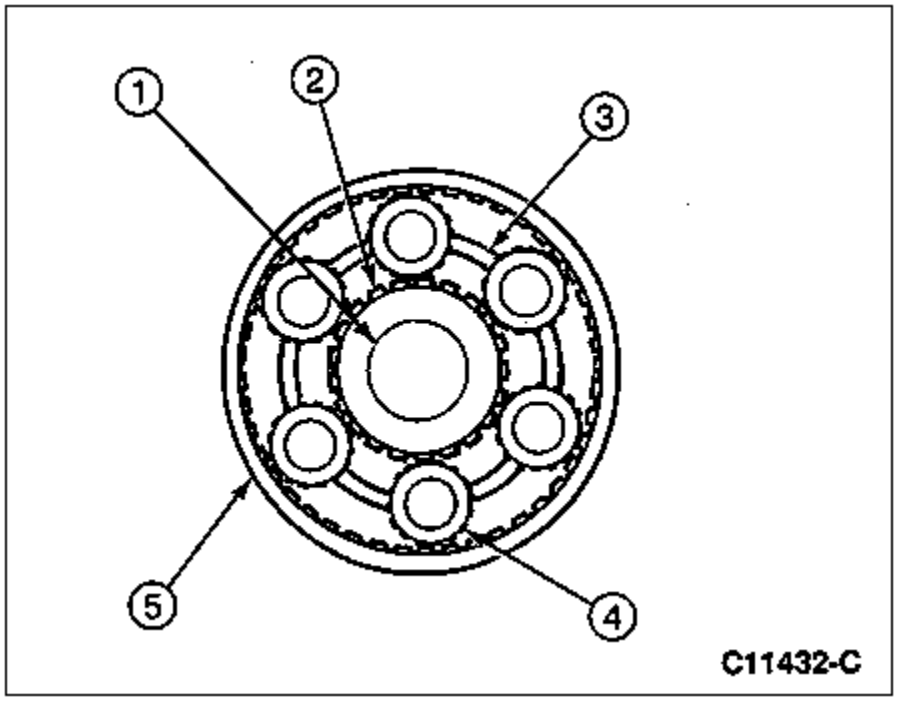
Power Flow in Neutral

tomsn048@gmail.com



The following illustration shows a cross section of the front planet. At the center, attached to the input shaft, is the sun gear. This sun gear meshes with gears that surround it like planets (which is why this component is called a front planet). In turn, the gears mesh with an outer gear called the ring gear (7A153).

As the sun gear turns, the six planetary gears attempt to rotate. If the output shaft is locked to the front planet (as it is in low gear), the planetary gears "walk" around the inside of the annulus providing a gear reduction. If the output shaft is locked to the sun gear (as in high gear), the input shaft and output shaft rotate as a single unit.



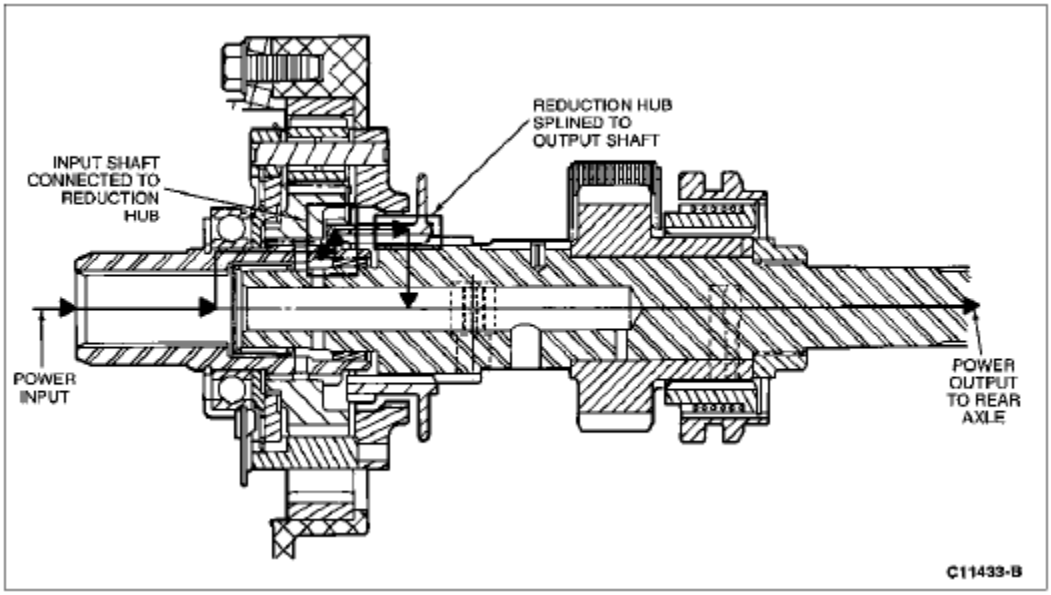
Item	Part Number	Description
1	7061	Input Shaft

tomsn048@gmail.com

2	7D063	Sun Gear
3	7A398	Planetary Carrier
4	—	Planetary Gear (Part of 7A398)
5	7A153	Annulus (Ring Gear)

2-Wheel Drive, High Range

Power Flow in 2H

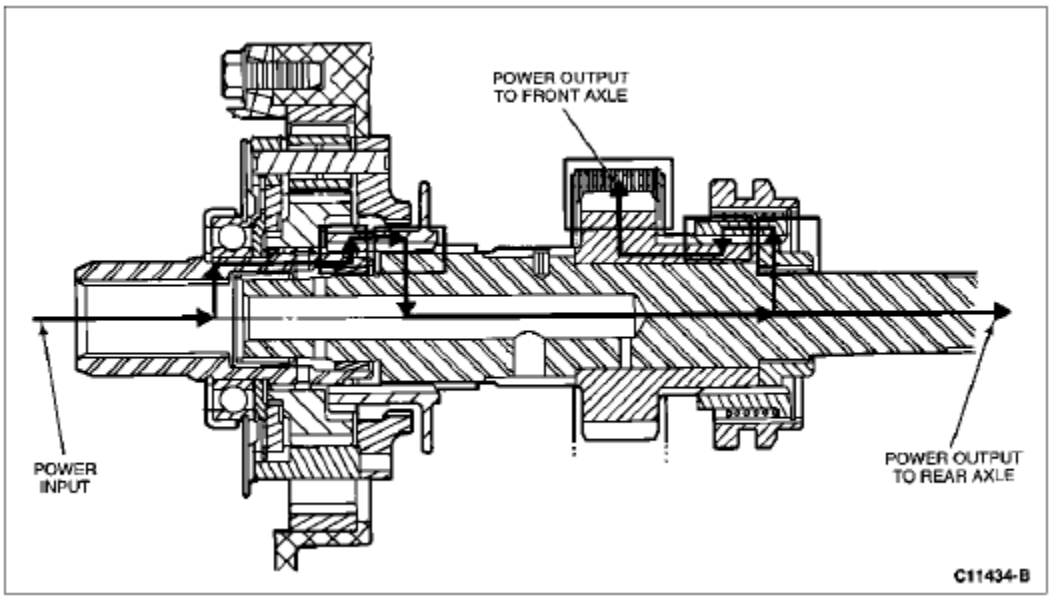


When the driver selects 2H, the high-low collar inside the front planet slides forward, putting the transfer case (7A195) into the high speed range (direct drive). The input shaft and the rear output shaft are locked together. This results in direct drive, straight through to the rear driveshaft. In addition, the 4-wheel drive lockup sleeve is disengaged so none of the 4WD components turn.

4-Wheel Drive, High Range

Power Flow in 4H

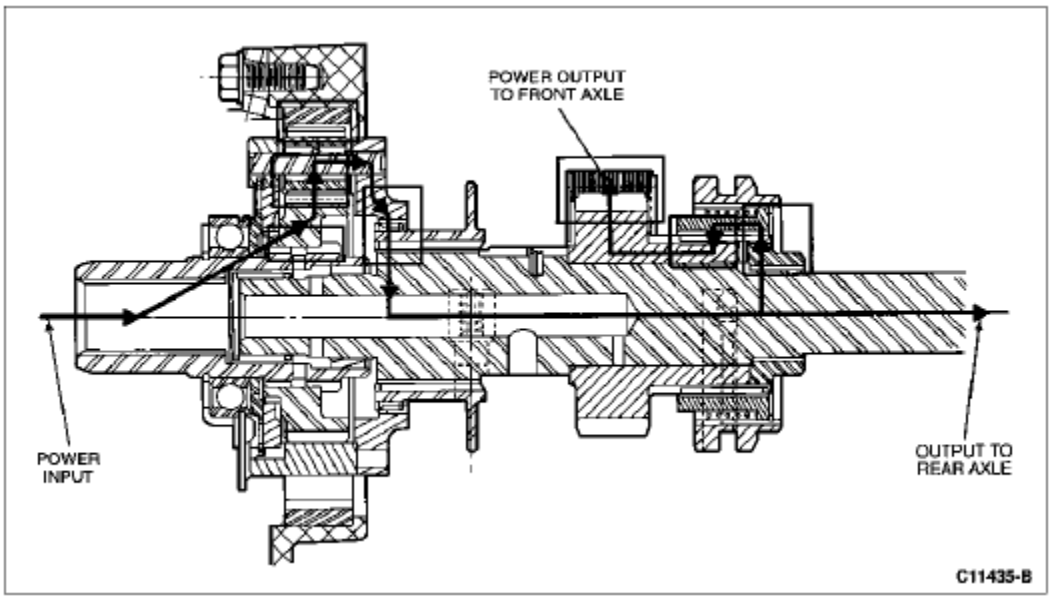
tomsn048@gmail.com



In 4-wheel drive, high range (4H), the front planet stays where it was in the 2H shift. The action of the shift lever causes the 4-wheel drive lockup hub to move rearward, locking the chain sprocket to the rear output shaft. Now, both the rear and the front wheels are being driven in the high range.

4-Wheel Drive, Low Range

Power Flow in 4L



To get maximum pulling power, the driver selects 4L. When this happens, the high-low collar moves rearward, and the front planet is locked to the output shaft. With the ring gear unable to turn, the planetary gears "walk" around the inside. The result is that the front planet now turns slower than the input shaft. Because the front planet is now locked to the output shaft, the output shaft rotates at a slower speed than

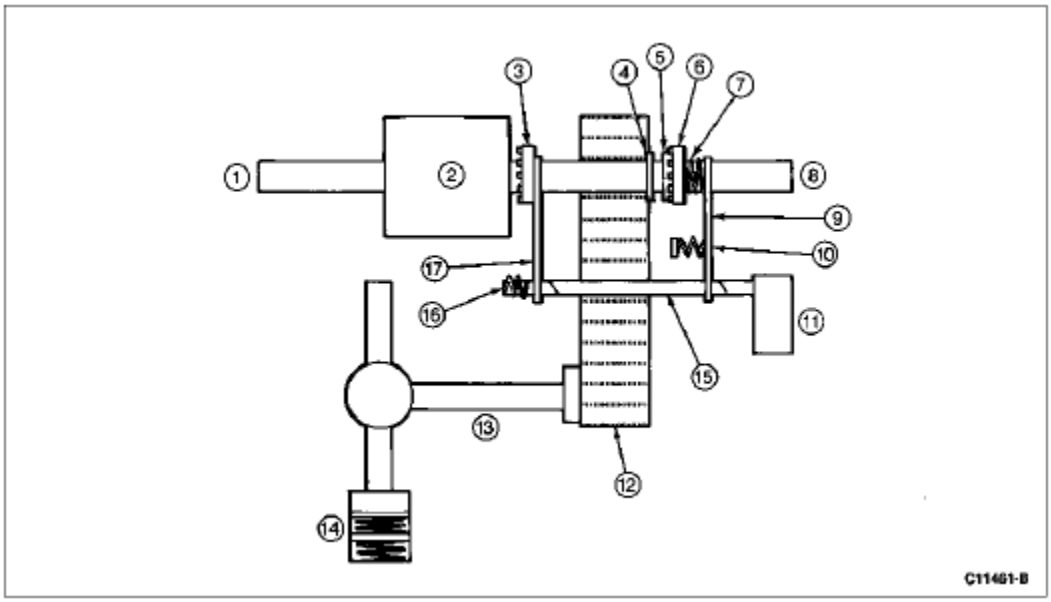
tomsn048@gmail.com

the input shaft. This action increases the pulling power available to the wheels.

tomsn048@gmail.com

Electronic Shift Operation, Ranger

Electronic Shift Transfer Case



Item	Part Number	Description

15	7N095	Shift Shaft

tomsn048@gmail.com

16	7W074	Range Shift Spring
17	7289	Shift Fork, Range

The transfer case (7A195) is equipped with a magnetic clutch, similar to an air conditioning compressor clutch, which is located inside the transfer case adjacent to the lockup sleeve. The clutch is used to spin up the front drive system from zero to vehicle speed in milliseconds. This spin-up allows the shift between 2H and 4H to be made at vehicle speeds listed in the vehicle owner's guide. The spin-up engages the front lock hubs. When the transfer case rear and front output shaft reach synchronous speed, the spring-loaded shift collar mechanically engages the mainshaft lockup hub to the chain-drive sprocket and the magnetic clutch is then deactivated. Shifts between 4H and 4L can only occur with the transmission safety switches closed. The vehicle's speed must also be within specified limits as determined by the Generic Electronic Module (GEM).

The electronic shift control system consists of a rotary switch control system, a GEM, a transfer case shift motor (7G360) with an integral shift position sensor, a clutch pedal position switch or digital transmission range (DTR) sensor, and a brake signal input switch.

There is a control switch located on the instrument panel for fingertip shift control.

Switch Control System

When the switch on the instrument panel is turned, there is a one second delay, then the electronic control module verifies the transfer case positions (2H, 4H or 4L). Next, the GEM looks at the shift position sensor and the digital transmission range (DTR) sensor or clutch pedal position switch (depending on transmission type) and brake pedal switch. If all conditions are correct to allow the desired shift, the electronic control module will tell the transfer case shift motor to execute the shift. After the shift has been made and the transfer case shift motor is off, the control module again looks at the shift position sensor to make sure the proper shift has been accomplished. Finally, the dash indicator light on the control panel will be illuminated by a signal from the GEM indicating the desired shift has been completed.

GEM

The generic electronic module controls the operation of the transfer case in response to inputs to the rotary control by the vehicle operator, the shift position sensor, the transmission range sensor and the brake pedal switch.

Vehicle Speed Sensor (VSS)

The vehicle speed sensor (VSS) (9E731) generates an AC signal which is sent to the instrument cluster (10849). The signal is used as input to the powertrain control module (PCM) and the transmission control module (TCM).

Shift Position Sensor

The shift position sensor, an integral part of the electric shift motor, tells the GEM module the shift position of the transfer case.

Electric Shift Motor

The electric shift motor, mounted externally at the rear of the transfer case, drives a rotary helical cam which moves the 2W-4W shift fork and 4H-4L reduction shift fork to the selected vehicle drive position.

tomsn048@gmail.com

tomsn048@gmail.com

4-Wheel Drive Operation

Locking Hubs, Ranger

There are two types of front hubs available for 4x4 vehicles.

- Manual (or free-running) that require the driver to get out of the cab to either lock or unlock them.
- Automatic locking which lock automatically when the axle shaft begins to turn.

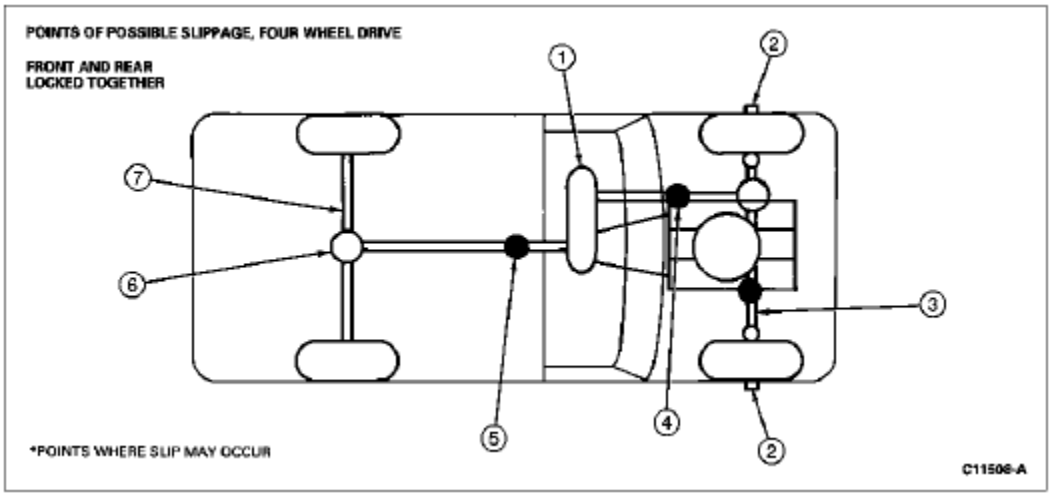
Manual (free-running) hubs feature seals that prevent entry of dirt and moisture and are very simple to operate. Automatic locking hubs use the front axle shaft rotation to actuate a cam that locks and unlocks the hub. Locking hubs may be locked at any time, and can be left in the locked position all the time, if desired.

On vehicles equipped with a manual shift transfer case (7A195) and manual locking hubs, low range can be selected when the vehicle's front hubs are unlocked. This is useful for short distances if very low, creeper gearing (but not 4WD) is needed. Refer to Section 05-03B for diagnosis, testing and repair procedures.

In 4WD, the front hubs are locked (either automatically or manually). As a result, the front wheels are **no longer free to turn independently** . The front and rear driveshafts (4602) are also now locked together and must turn as one. What's going to happen when the vehicle turns? That's a very important question.

In 4WD, just as in 2WD, each front wheel travels further than the rear wheel on its side. But this time, the front wheels aren't free to turn independently of the rear wheels. They are linked to the drivetrain by the transfer case and front driveshaft.

Points of Possible Slippage, Four-Wheel Drive



Item	Part Number	Description
1	7A195	Transfer Case
2	3B396	Locking Hub
3	3001	Front Axle

tomsn048@gmail.com

4	4841	Driveshaft Slip Yoke Front
5	4841	Driveshaft Slip Yoke Rear
6	4026	Differential
7	4001	Rear Axle

Even though the difference between the inner and outer front wheels is compensated for by a front differential, torsional windup is still going to occur. Anytime one driveline component travels further than another, there will be driveline or torsional windup that must be released.

4WD in a 4x4 provides increased drive traction and performance in off-road situations and when driving on snow or ice. **It is not** designed for operation on dry surfaces and when traction is good. **It is not** suitable on dry paved roads or dry parking lots. Where 4WD should and shouldn't be used gives us the answer as to what releases the driveline or torsional windup.

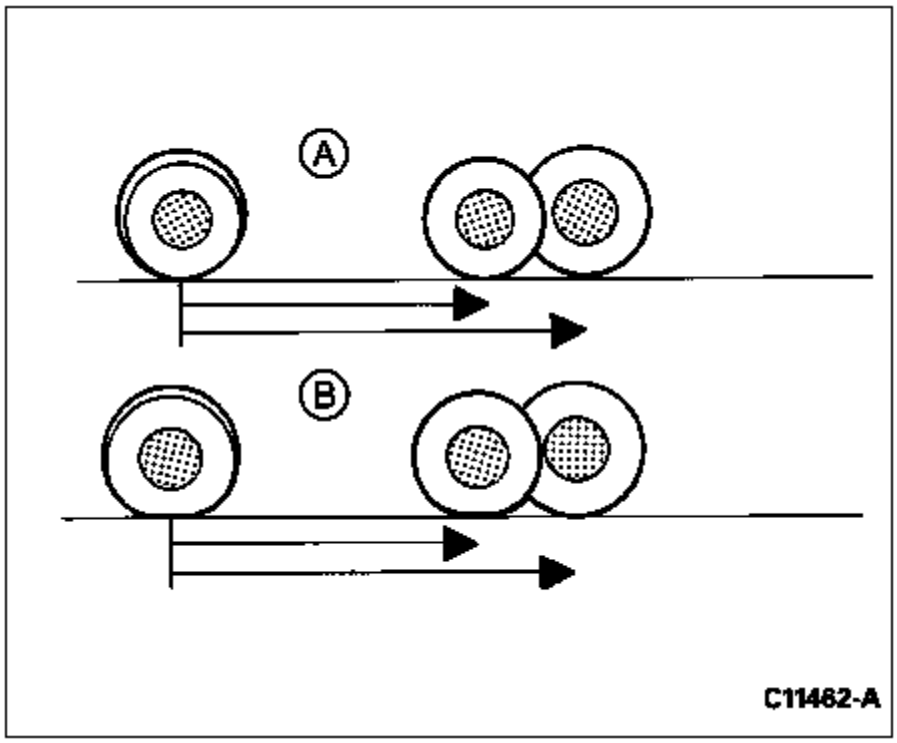
When a 4x4 is driven off-road in 4WD, the wheels are in contact with dirt, sand and sometimes mud. The vehicle is also likely to bounce over bumps and ruts. In turns under these conditions, driveline or torsional windup will occur. If it does, the loose dirt, sand, or the slippery mud will allow wheels to slip a little, limiting the windup. Tension is also relieved when the wheel bounces in the air going over a bump. Snow and ice will also allow the wheels to slip and limit the windup.

When operating in 4WD on dry hard pavement, even more torsional windup occurs, which is not easily released. When the windup becomes great enough, the driver will feel the vehicle hop, skip or bounce. This is caused by the front or rear wheels slipping as the windup is released. Whichever wheels have the least traction are the ones that will slip. The tighter the turn, or the greater the traction, the greater the hop, skip or bounce. This torsional driveline windup is the cause of many owner complaints concerning the performance of their 4x4 vehicles.

Remember the effect of tire size, inflation, wear and loading. The following illustration shows that tires of even slightly different sizes roll different distances every revolution. The same effect is true for tires that are the same size but inflated or loaded differently. Operating a 4x4 in 4WD with tires of different size or inflation will produce driveline or torsional windup, even when driving straight ahead. If the vehicle is being driven in 4WD on dry, hard pavement, the driver will notice drag and may experience the hop, skip, bounce effect as the front or rear wheels release the windup.

Tire Rolling Differences Due to Size and Inflation Pressure

tomsn048@gmail.com



tomsn048@gmail.com

4x4 Vehicle Driveline Windup

Driveline windup does more than just produce hop, skip and bounce. It can also cause delays in shifting out of 4WD. Vehicles with electronic shift transfer case (7A195) permit shifting from 2WD to 4WD and back on the fly. The vehicle must be stopped and the automatic transmission range selector lever put in neutral (not park) or the manual transmission clutch depressed in order to shift from 4H to 4L or back.

tomsn048@gmail.com

Windup and Delay, Shifting Out of 4-Wheel Drive, Ranger

NOTE: To determine if driveline windup is causing delayed shifts to 2WD, jack the vehicle or lift it on a hoist with the wheels free to rotate. This should release the driveline windup, if it is present, and the transfer case (7A195) will complete its shift.

NOTE: Vehicles vary in terms of how "tight" they are. Some vehicles have a lot of "give" in the system. Softness in suspension and mounts will allow the driveline to absorb more windup before it affects performance. If driveline windup occurs, the system will tighten like a giant rubber band until the tires start slipping. A "tight" vehicle will signal the windup sooner, usually by a lot of chattering noises.

A delay or a failure to shift out of 4WD may be the result of driveline windup or extremely cold temperatures. In 4WD, windup can develop, especially if the vehicle is operated on hard, dry surfaces or in tight turns. The driver may select 2WD, but the shift doesn't take place even though the 4WD light goes out. Also, as long as the transfer case doesn't shift, the hubs remain locked and the vehicle remains in 4WD. If windup in the transfer case is severe, even backing up may not release it.

In order to return to 2WD under these conditions, two things must happen. First, if the transfer case doesn't shift right away, the vehicle will have to be driven in 4WD until the windup is relieved or the drive axle warms up. Second, when it does make the shift, the driver will have to stop the vehicle and go straight in the reverse direction for at least 3 meters (10 feet) to unlock the hubs.

Inspection and Verification

NOTE: If the area of concern is indicated to be other than the transfer case (7A195), refer to the specific section or sections of the appropriate shop manual.

1. **NOTE: Owner driving habits as well as road and weather conditions should be noted.**

   Road test the vehicle to verify the concern, noting road speed, engine speed, speed range where the vehicle problem is evident.

2. Raise the vehicle on a hoist and position suitable safety floor stands under the vehicle.

3. Run the vehicle at the road speed and in the axle drive mode (4WD/2WD) where concern exists. Verify concern area:

   - Engine
   - Clutch/Transmission (7003)
   - Transfer Case
   - Front/Rear Driveline Components
   - Front/Rear Drive Axles
   - Front/Rear Brake Systems
   - Front Axle Locking Hubs
   - Front/Rear Wheels and/or Tires

4. Refer to the appropriate owner guide for operating data, if the concern is verified to be driveline or torsional windup, before servicing the transfer case.

5. If the 4WD system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points. Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will indicate where the slippage is taking place or where to look for broken parts, if any.

   a. On vehicles with auto hubs, find a suitable place where the vehicle can be tested. Mark the components, then drive vehicle without backing up. Stop and check the marks to see if they are in the same relationship to each other. If the vehicle is backed up before checking these marks, the hubs may re-index and not reveal the problem.

6. Check tires and vehicle loading if the concern is clearly driveline windup and not broken parts.

7. If the transfer case shift motor (7G360) operates properly and nothing happens, or if a manual shift lever fails to shift the transfer case , it will have to be serviced. Be sure driveline windup has been eliminated as a cause.

8. Driveline noise may be experienced if a vehicle is operated in 2WD with the hubs locked. This occurs because the 4WD components are in motion instead of at rest (the normal condition in 2WD with the hubs unlocked). However, it is important to remember that excessive noise may be a sign of a serious condition.

NOTE: It is important not to run for long periods with dirt and water in the hubs.

tomsn048@gmail.com

Maintenance of the hubs is important. Easy shifting from one operating position to the other requires smooth movement of the inner clutch ring. This ring slides on splines which must be clean and well lubricated. To prevent dirt and water from entering the hub unit, the oil seals must be very carefully installed. If the vehicle is operated where the hub is constantly submerged in water or mud, the hubs should be serviced more frequently. The important thing is not to run for long periods with dirt and water in the hubs. Start with a short service interval and check for water and dirt. Stretch out the interval as experience shows how dirty they are actually getting.

Symptom Chart — Electronic Shift Transfer Case Diagnosis, Ranger

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 with Rotunda Terminal Adapter Kit 105-00025 or equivalent to perform electrical pinpoint test.

ELECTRONIC SHIFT TRANSFER CASE DIAGNOSIS, RANGER

Condition	Possible Source	Action
• Cannot Change the 4WD Mode	• DTC P1812, P1815 self test and continuous.	• GO to Pinpoint Test A .
	• DTC P1803 self test, P1802 continuous.	• SHORT to battery between the neutral safety switch and GEM Circuit 463 (R/W) or OPEN circuit.
	• DTC B1483 continuous. DTC B1485 self test and continuous.	• GO to Pinpoint Test Step **A6** .
• Cannot Change 4WD Gears	• DTC P1820 self test and continuous.	• GO to Pinpoint Test Step **B1** .
	• DTC P1822 self test and continuous.	• GO to Pinpoint Test Step **B5** .
	• DTC P1824 self test and continuous.	• GO to Pinpoint Test Step **B9** .
	• DTC P1826 self test and continuous.	• GO to Pinpoint Test Step **B10** .
	• DTC P1820, P1828 self test and continuous.	• GO to Pinpoint Test Step **B12** .
	• DTC 1828 self test and continuous.	• GO to Pinpoint Test Step **B13** .
	• DTC P1830 self test and continuous.	• GO to Pinpoint Test Step **B19** .
	• DTC P1838 continuous.	• GO to Pinpoint Test Step **B37** .
	• DTC P1846, P1867 self test.	• GO to Pinpoint Test Step **B31** .
	• DTC P1850 self test; P1850, P1867 continuous.	• GO to Pinpoint Test Step **B33** .
	• DTC P1854, P1867 self test.	• GO to Pinpoint Test Step **B35** .
	• DTC P1858, P1867 self test.	• GO to Pinpoint Test Step **B37** .

tomsn048@gmail.com

	• DTC P1862 self test and continuous. • DTC P1864 self test. • DTC P1848 self test and P1866 continuous. • DTC P1852 self test and P1866 continuous. • DTC P1856 self test and P1866 continuous. • DTC P1860 self test and P1866 continuous.	• GO to Pinpoint Test Step **B39**. • GO to Pinpoint Test Step **B41**. • GO to Pinpoint Test Step **B43**. • GO to Pinpoint Test Step **B44**. • GO to Pinpoint Test Step **B45**. • GO to Pinpoint Test Step **B46**.
• 4WD HIGH Indicator Lamp Never Illuminates	• DTC P1804 self test and continuous. • DTC P1806 self test and continuous.	• GO to Pinpoint Test Step **C1**. • GO to Pinpoint Test Step **C5**.
• 4WD HIGH Indicator Lamp Is Always On	• DTC P1804 self test and continuous.	• SERVICE Circuit 783 (GY) for short open or to ground between GEM module C3-14 and indicator lamp.
• 4WD LOW Indicator Lamp Never Illuminates	• DTC P1808 self test and continuous. • DTC P1810 self test and continuous.	• GO to Pinpoint Test Step **D1**. • GO to Pinpoint Test Step **D5**.
• 4WD LOW Indicator Lamp Is Always On	• DTC P1808 self test and continuous.	• SERVICE Circuit 784 (LB/BK) for short or open to ground between GEM module C3-10 and indicator lamp.
• 4WD System Drains Battery	• Defective wiring.	• SHORT to battery Circuit 705 (LG/O) to the H2L relay.
• 4WD Mode Switch Does Not Illuminate With Headlamp Switch ON	• Open circuit, short to ground, defective 4WD mode switch.	• REFER to Section 13-00.
• Transfer Case Makes Noise	• Incorrect tire inflation pressures or incorrect size tires and wheels. • Excessive tire tread wear. • Internal components.	• MAKE SURE that all tires and wheels are the same size, and that inflation pressures are correct. • CHECK tire tread wear to see if there is more than 0.06 inch difference in tread wear between front and rear. INTERCHANGE one front and one rear wheel. REINFLATE tires to specification. • OPERATE vehicle in all

tomsn048@gmail.com

		transmission gears with transfer case in 2HI, or High range. • If there is noise in transmission in neutral gear, or in some gears and not in others, REFER to Section 07-01A or Section 07-01B . • If there is noise in all gears, OPERATE vehicle in all transfer case ranges. If noisy in all ranges or High range only, DISASSEMBLE transfer case. CHECK input gear, intermediate and front output shaft gear for damage. REPLACE as required. If noisy in Low range only, INSPECT intermediate gear and sliding gears for damage. REPLACE as required.
• Early or Delayed Shifts	• DTC P1781 self test and P1729 continuous.	• GO to Pinpoint Test **E1** .
• 4-Wheel Drive Transfer Case Jumps Out of Gear	• Incomplete shift linkage travel. • Loose mounting bolts. • Front and rear driveshaft slip yokes dry or loose. • Internal components.	• ADJUST linkage to provide complete gear engagement. ADJUST shift gearshift lever boot. • TIGHTEN mounting bolts. • LUBRICATE and REPAIR slip yokes as required. TIGHTEN flange yoke attaching nut to specifications. • DISASSEMBLE transfer case. INSPECT sliding clutch hub and gear clutch teeth for damage. REPLACE as required.
• Locking Hubs Will Not Release	• Driveline/vehicle torsional lockup. • Extremely cold ambient temperatures.	• STOP vehicle. DRIVE vehicle in reverse for 3 meters (10 feet). • DRIVE vehicle 16 km (10 miles) to warm axle, then try to DISENGAGE hub locks.
• Driveline/Torsional Windup. Vehicle Hop, Wheel/Tire Bounce, Vehicle Skip	• Incorrect tire inflation pressures or incorrect size tires and wheels. • Excessive tire tread wear. • Driving vehicle on hard surface/dry surface roads or areas. Driving vehicle in tight turns.	• MAKE SURE that all tires and wheels are the same size, and that inflation pressures are correct. • REFER to vehicle owner guide for correct usage of vehicle. ADVISE owner.
• Delayed Shifts to 2WD	• Driveline/torsional windup.	• SHIFT transmission into neutral. JACK the vehicle or lift on hoist

tomsn048@gmail.com

	• Extremely cold ambient temperatures.	with wheels free to rotate. Windup will be released and transfer case will complete its shift. • DRIVE vehicle 16 km (10 miles) to warm axle, then try to DISENGAGE hub locks.
• Automatic Transmission Delayed Shifts in 4x4 L	• Transfer case in 4x4 H.	• Place transfer in 4x4 L. Diagnose and REPAIR. REFER to Section 07-01A or Section 07-01B .
• Early shifts in 4x2 or 4x4 H	• Transfer case in 4x4L or indicating 4x4L • Failed fuse.	• DIAGNOSE and REPAIR. REFER to Section 07-01A or Section 07-01B .

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: CANNOT CHANGE 4WD MODE, DTC P1812, P1815

A1 CHECK 4X4 SWITCH

- Remove and disconnect 4WD mode switch.
- Inspect wiring and connector for damage.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, test Circuits 465 (W/LB) and 359 (GY/R) for resistance values in listed positions below:
- 2WD — 3.4K-4.3K, A4WD/4WD High — 1K-1.2K, 4W Low — 320K-400K

Are the values correct?

Yes	No
GO to **A2** .	REPLACE 4WD mode switch. CLEAR all DTCs and RETEST system.

A2 CHECK CIRCUIT 465 (W/LB) FOR OPEN

- Gain access to the generic electronic module connector C3.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, measure resistance of Pin 08, Circuit 465 (W/LB) between GEM module and 4WD mode switch.

Is resistance less than 5 ohms?

Yes	No
GO to **A3** .	SERVICE Circuit 465 (W/LB) for open. RECONNECT and CLEAR all DTCs and RETEST system.

A3 CHECK CIRCUIT 465 (W/LB) FOR SHORT TO BATTERY

- Reconnect GEM connector C3.
- Key ON.
- Measure for voltage on Circuits 465 (W/LB) and 359 (GY/R).

Is B+ present?

tomsn048@gmail.com

Yes	No
SERVICE battery short RECONNECT switch. CLEAR all DTCs and RETEST system.	GO to A4 .

A4 CHECK CIRCUIT 465 (W/LB) FOR SHORT TO GROUND

- Disconnect GEM connector C3.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check C3 Pin 08 for continuity to a known ground.

Is continuity present?

Yes	No
SERVICE Circuit 465 (W/LB) for short to ground. Clear all DTCs and RETEST system.	GO to A5 .

A5 CHECK CIRCUIT 359 (GY/R) FOR OPEN

- Remove GEM connector C1.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 359 (GY/R) between 4x4 switch and GEM Connector C1 Pin 21 for continuity.

Is continuity present?

Yes	No
Circuit OK. RECONNECT GEM connector. CLEAR all DTCs and RETEST system.	SERVICE Circuit 359 (GY/R) for open. CLEAR all DTCs and RETEST system.

A6 READ PID BOO-GEM STATUS

- Connect NGS.
- Read PID BOO-GEM.
- Press brake pedal.

Does status change?

Yes	No
Switch OK.	GO to A7 .

A7 CHECK CIRCUIT 511 (LG) FOR SHORT TO GROUND DTC B1483

- Gain access to GEM connector C3-13, using Rotunda 73 Digital Multimeter 051-00051.
- Key OFF.

tomsn048@gmail.com

- Check Circuit 511 (LG) for continuity to ground.

Is continuity present?

Yes	No
SERVICE Circuit 511 (LG) for short to ground, CLEAR all DTCs and RETEST system.	GO to **A8** .

A8 CHECK CIRCUIT 511 (LG) FOR OPEN

- With GEM removed, use Rotunda 73 Digital Multimeter 051-00051.
- Disconnect brake on/off (BOO) switch connector.
- Check for continuity between BOO switch and GEM connector C3-13.

Is continuity present?

Yes	No
GO to **A9** .	REPAIR open in Circuit 511 (LG). CLEAR all DTCs and RETEST system.

A9 CHECK CIRCUIT 511 (LG) FOR BATTERY SHORT DTC B1485

- Gain access to GEM connector C3-13, using Rotunda 73 Digital Multimeter 051-00051.
- Key OFF.
- Brake pedal not depressed.
- Check Circuit 511 (LG) for battery voltage.

Is B+ present?

Yes	No
SERVICE Circuit 511 (LG) for battery short. CLEAR all DTCs and RETEST system.	System OK. REFER to symptom chart.

PINPOINT TEST B: CANNOT CHANGE 4WD GEARS DTCS P1820, P1822, P1824,P1826, P1828, P1830, P1838, P1846, P1867, P1850, P1854, P1858, P1862, P1864, P1848, P1866, P1852, P1856, P1860

B1 CHECK FUSE 27 FOR OPEN

- Key OFF.
- Check fuse 27 15A for open.

Is fuse open?

tomsn048@gmail.com

Yes	No
GO to **B2** .	GO to **B3** .

B2 CHECK CIRCUIT 339 (GY) FOR OPEN

- Key OFF.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, measure for continuity between GEM connector C3, Pin 16 and the transfer case relay module connector Pin 08, Circuit 339 (GY).

Is continuity present?

Yes	No
GO to **B3** .	SERVICE Circuit 339 (GY) for open. RECONNECT all connectors. CLEAR all DTCs and RETEST system.

B3 CHECK CIRCUIT 339 (GY) FOR SHORT TO GROUND

- Gain access to GEM connector C3.
- Using Rotunda 73 Digital Multimeter or equivalent, check C3 Pin 16, Circuit 339 (GY) for short to ground.

Is continuity present?

Yes	No
SERVICE Circuit 339 (GY) for short to ground. REPLACE fuse 27. CLEAR all DTCs and RETEST system.	GO to **B4** .

B4 CHECK TRANSFER CASE RELAY MODULE

- Key OFF.
- Disconnect transfer case relay module connector.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for continuity between Pin 08 and Pin 01.

Is continuity present?

Yes	No
REPLACE transfer case relay module. CLEAR all DTCs and RETEST system.	GO to **B5** .

B5 CHECK TRANSFER CASE RELAY MODULE FOR OPEN

tomsn048@gmail.com

- Key OFF.
- Disconnect transfer case relay module.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, measure resistance between Pins 08, 05 of relay module.

Is resistance between 85-140 ohms?

Yes	No
GO to **B6** .	REPLACE transfer case relay module. CLEAR all DTCs and RETEST system.

B6 CHECK CIRCUIT 339 (GY) FOR BATTERY SHORT

- Key OFF.
- Remove transfer case relay module.
- Key ON.
- Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent, measure for voltage at Pin 08 of the transfer case relay module.

Is B+ present?

Yes	No
SERVICE Circuit 339 (GY) for short to battery. CLEAR all DTCs and RETEST system.	GO to **B7** .

B7 CHECK TRANSFER CASE RELAY MODULE

- Key OFF.
- Remove transfer case relay module.
- Measure resistance of relay module Pin 09 and Pin 05.

Is resistance between 85-140 ohms?

Yes	No
GO to **B8** .	REPLACE transfer case relay module. CLEAR all DTCs and RETEST system.

B8 CHECK CIRCUIT 275 (Y) FOR SHORT TO GROUND

- Key OFF.
- Remove GEM connector C3.
- Remove clutch transfer case relay.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Pin 15 for continuity to ground.

Is continuity present?

tomsn048@gmail.com

Yes	No
SERVICE Circuit 275 (Y) for short to ground. CLEAR all DTCs and RETEST system.	GO to **B9** .

B9 CHECK CLUTCH TRANSFER CASE RELAY FOR INTERNAL SHORT

- Remove the clutch transfer case relay.
- Measure the resistance between clutch transfer case relay terminals 3 and 5.

Is continuity present?

Yes	No
REPLACE clutch transfer case relay. CLEAR all DTCs and RETEST system.	GO to **B10** .

B10 CHECK CIRCUIT 275 (Y) FOR OPEN

- Remove GEM connector C3.
- Remove clutch transfer case relay.
- Measure circuit 275 (Y) for resistance between GEM C3-15 and clutch transfer case relay connector.

Is resistance less than 5 ohms?

Yes	No
GO to **B11** .	SERVICE Circuit 275 (Y) for open. RECONNECT connectors. CLEAR all DTCs and RETEST system.

B11 CHECK CIRCUIT 275 (Y) FOR BATTERY SHORT

- Remove clutch transfer case relay.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 275 (Y) for B+.

Is B+ present?

Yes	No
SERVICE Circuit 275 (Y) for battery short. CLEAR all DTCs and RETEST system.	System OK. RECONNECT relay. CLEAR all DTCs and RETEST system.

B12 CHECK IP FUSE 27 FOR OPEN

Is fuse OK?

tomsn048@gmail.com

Yes	No
GO to **B13** .	GO to **B16** .

B13 CHECK CIRCUIT 513 (BR/PK) FOR SHORT TO GROUND

- Key OFF.
- Transfer case relay module disconnected.
- Remove GEM connector C3.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check circuit 513 (BR/PK) for continuity to ground.

Is continuity present?

Yes	No
SERVICE circuit 513 (BR/PK) for short to ground. RECONNECT, CLEAR all DTCs and RETEST system.	GO to **B14** .

B14 CHECK CIRCUIT 513 (BR/PK) FOR OPEN

- Key OFF.
- Transfer case relay module disconnected.
- Remove GEM connector C3.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for continuity between transfer case relay module Pin 09 and GEM connector C3, Pin 17 for continuity.

Is continuity present?

Yes	No
GO to **B15** .	SERVICE Circuit 513 (BR/PK) for open. CLEAR all DTCs and RETEST system.

B15 CHECK CIRCUIT 705 (LG/O) AND CIRCUIT 704 (DG/LG) FOR SHORT TO GROUND

- Remove fuse 27 and fuse 16.
- Key OFF.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check circuit 705 (LG/O) and 704 (DG/LG) for short to ground.

Is continuity present?

Yes	No
SERVICE Circuit 705 (LG/O) or 704 (DG/LG) for short to ground. CLEAR all DTCs and RETEST system.	GO to **B16** .

tomsn048@gmail.com

B16 CHECK TRANSFER CASE RELAY MODULE

- Transfer case relay module disconnected.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity between Pins 06, 10 and 03, 10.

Is continuity present?

Yes	No
REPLACE transfer case relay module. CLEAR all DTCs and RETEST system.	GO to **B17** .

B17 CHECK CIRCUIT 705 (LG/O) FOR OPEN

- Key OFF.
- Transfer case relay module disconnected.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity between transfer case relay module connector Pin 05 and IP, fuse 27 Circuit 705 (LG/O).

Is continuity present?

Yes	No
REPLACE 15A IP fuse 27. CLEAR all DTCs and RETEST system. If fuse fails again, GO to **B18** .	SERVICE Circuit 705 (LG/O) for open. CLEAR all DTCs and RETEST system.

B18 CHECK CIRCUIT 401 (PK) FOR SHORT TO GROUND

- Key OFF.
- Remove Fuse 27.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check IP fuse 27, Circuit 401 (PK) for continuity to ground.

Is continuity present?

Yes	No
SERVICE Circuit 401 (PK) for short to ground. REPLACE 15A fuse 27. CLEAR all DTCs and RETEST system.	System is OK.

B19 CHECK CIRCUIT 513 (BR/PK) FOR BATTERY SHORT

- Gain access to the transfer case relay module.
- Disconnect transfer case relay module.

tomsn048@gmail.com

- Gain access to GEM connector C3 and disconnect connector.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Pin 17, Circuit 513 (BR/PK) for battery voltage.

Is battery voltage present?

Yes	No
REPAIR short to battery on Circuit 513 (BR/PK). CLEAR all DTCs and RETEST.	REPLACE transfer case relay module. CLEAR all DTCs and RETEST system.

B20 CHECK 4X4 FUSES

- Check power distribution box 20A fuse 16 for open fuse.

Is fuse open?

Yes	No
GO to **B16** .	GO to **B21** .

B21 CHECK CLUTCH TRANSFER CASE RELAY

- Disconnect clutch transfer case relay.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check resistance of relay.

Is the resistance between 85-140 ohms?

Yes	No
GO to **B22** .	REPLACE damaged relay. CLEAR all DTCs and RETEST system.

B22 CHECK CIRCUIT 778 (O) FOR SHORT TO GROUND

- Disconnect transfer case relay module.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 778 (O) for continuity to a known ground.

Is continuity present?

Yes	No
SERVICE Circuit 778 (O) for short to ground. CLEAR all DTCs and RETEST system.	GO to **B23** .

B23 CHECK CIRCUIT 778 (O) FOR BATTERY SHORT

tomsn048@gmail.com

- Transfer case relay module disconnected.
- Key ON.
- Check for battery voltage on Circuit 778 (O).

Is battery voltage present?

Yes	No
SERVICE Circuit 778 (O) for battery short. CLEAR all DTCs and RETEST system.	GO to **B24** .

B24 CHECK CIRCUIT 778 (O) FOR OPEN

- With transfer case relay module disconnected, disconnect electric transfer case shift motor connector.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 778 (O) for continuity between transfer case relay module and transfer case shift motor connector Circuit 778 (O).

Is continuity present?

Yes	No
GO to **B25** .	REPAIR open in Circuit 778 (O). CLEAR all DTCs and RETEST system.

B25 CHECK CIRCUIT 779 (BR) FOR BATTERY SHORT

- Disconnect transfer case relay module.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 779 (BR) for battery voltage.

Is battery voltage present?

Yes	No
SERVICE Circuit 779 (BR) for battery short. RECONNECT and CLEAR all DTCs and RETEST system.	GO to **B26** .

B26 CHECK CIRCUIT 779 (BR) FOR OPEN

- Key OFF.
- With clutch transfer case relay disconnected, disconnect transfer case shift motor connector.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for continuity between clutch transfer case relay connector Circuit 779 (BR) and transfer case shift motor connector Circuit 779 (BR) for open.

Is less than 5 ohms of resistance present?

Yes	No

tomsn048@gmail.com

GO to **B27** .	SERVICE Circuit 779 (BR) for open. RECONNECT, CLEAR all DTCs and RETEST system.

B27 CHECK CIRCUIT 779 (BR) FOR SHORT TO GROUND

- Key OFF.
- With clutch transfer case relay and transfer case shift motor disconnected, check Circuit 779 (BR) for continuity to a known good ground.

Is continuity present?

Yes	No
SERVICE Circuit 779 (BR) for short to ground. RECONNECT, CLEAR all DTCs and RETEST system.	GO to **B28** .

B28 CHECK CIRCUIT 777 (Y) FOR SHORT TO GROUND

- Disconnect transfer case relay module.
- Key OFF.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 777 (Y) for continuity to ground.

Is continuity present?

Yes	No
SERVICE Circuit 777 (Y) for short to ground. RECONNECT, CLEAR all DTCs and RETEST system.	GO to **B29** .

B29 CHECK CIRCUIT 777 (Y) FOR BATTERY SHORT

- Transfer case relay module disconnected.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 777 (Y) for battery voltage.

Is battery voltage present?

Yes	No
SERVICE Circuit 777 (Y) for battery short. RECONNECT, CLEAR all DTCs and RETEST system.	GO to **B30** .

tomsn048@gmail.com

B30 CHECK CIRCUIT 777 (Y) FOR OPEN

- Key OFF.
- With transfer case relay module disconnected, disconnect transfer case shift motor connector.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for continuity between relay module Circuit 777 (Y) and transfer case shift motor connector.

Is continuity present?

Yes	No
System OK. CLEAR all DTCs and RETEST system.	REPAIR open in Circuit 777 (Y). CLEAR all DTCs and RETEST system.

B31 CHECK CIRCUIT 771 (P/Y) FOR SHORT TO GROUND

- Key OFF.
- Remove GEM connector C3.
- Disconnect transfer case shift motor.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 771 (P/Y), Pin C3-21 for continuity to ground.

Is resistance greater than 100K ohms?

Yes	No
GO to **B32** .	SERVICE Circuit 771 (P/Y) for short to ground. RECONNECT all connectors. CLEAR all DTCs and RETEST system.

B32 CHECK CIRCUIT 771 (P/Y) FOR OPEN

- Key OFF.
- GEM connector C3 and transfer case shift motor connector disconnected.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check between connector on Circuit 771 (P/Y) for resistance.

Is resistance less than 5 ohms?

Yes	No
REPLACE transfer case shift motor. RECONNECT all connectors. CLEAR all DTCs and RETEST system.	SERVICE Circuit 771 (P/Y) for open. CLEAR all DTCs and RETEST system.

B33 CHECK CIRCUIT 770 (W) FOR SHORT TO GROUND

- Key OFF.

tomsn048@gmail.com

- Remove GEM connector C3.
- Disconnect transfer case shift motor.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 770 (W), Pin C3-20, for continuity to ground.

Is resistance greater than 100K ohms?

Yes	No
GO to **B34** .	SERVICE Circuit 770 (W) for short to ground. RECONNECT all connectors. CLEAR all DTCs and RETEST system.

B34 CHECK CIRCUIT 770 (W) FOR OPEN

- With both connectors still removed, using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 770 (W) for continuity.

Is continuity less than 5 ohms?

Yes	No
REPLACE transfer case shift motor. CLEAR all DTCs and RETEST system.	SERVICE Circuit 770 (W) for open. CLEAR all DTCs and RETEST system.

B35 CHECK CIRCUIT 764 (BR/W) FOR SHORT TO GROUND

- Key OFF.
- Gain access to GEM.
- Disconnect GEM connector C3.
- Disconnect transfer case shift motor.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Pin C3-19 for continuity to ground.

Is continuity present?

Yes	No
SERVICE Circuit 764 (BR/W) for short to ground. CLEAR all DTCs and RETEST system.	GO to **B36** .

B36 CHECK CIRCUIT 764 (BR/W) FOR OPEN

- With both connectors still removed, check Circuit 764 (BR/W) for continuity between connectors using Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Is continuity present?

Yes	No

tomsn048@gmail.com

REPLACE transfer case shift motor. RECONNECT all connectors. CLEAR all DTCs and RETEST system.	SERVICE Circuit 764 (BR/W) for open. RECONNECT all connectors. CLEAR all DTCs and RETEST system.

B37 CHECK CIRCUIT 763 (O/W) FOR SHORT TO GROUND

- Key OFF.
- Gain access to GEM.
- Disconnect GEM connector C3.
- Disconnect transfer case shift motor.
- Using Rotunda 73 Digital Multimeter 105-R0051, check Pin C3-18 for continuity to ground.

Is continuity present?

Yes	No
SERVICE Circuit 763 (O/W) for short to ground. RECONNECT all connectors. CLEAR all DTCs and RETEST system.	GO to **B38** .

B38 CHECK CIRCUIT 763 (O/W) FOR OPEN

- With both connectors still disconnected, using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for continuity between connectors on Circuit 763 (O/W).

Is continuity present?

Yes	No
REPLACE transfer case shift motor. RECONNECT all connectors. CLEAR all DTCs and RETEST system.	SERVICE Circuit 763 (O/W) for open. RECONNECT all connectors. CLEAR all DTCs and RETEST system.

B39 CHECK CIRCUIT 762 (Y/W) FOR SHORT TO GROUND

- Key OFF.
- Gain access to GEM.
- Remove GEM connector C3 and disconnect transfer case shift motor connector.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 762 (Y/W) for continuity to ground.

Is continuity present?

Yes	No
SERVICE Circuit 762 (Y/W) for short to ground. RECONNECT all connectors. CLEAR all DTCs and RETEST system.	GO to **B40** .

tomsn048@gmail.com

B40 CHECK CIRCUIT 762 (Y/W) FOR OPEN

- With both connectors still disconnected, using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for continuity between connectors on Circuit 762 (Y/W).

Is continuity present?

Yes	No
REPLACE transfer case shift motor. RECONNECT all connectors. CLEAR all DTCs and RETEST system.	SERVICE Circuit 762 (Y/W) for open. RECONNECT all connectors. CLEAR all DTCs and RETEST system.

B41 CHECK CIRCUIT 762 (Y/W) FOR BATTERY SHORT

- Key OFF.
- Remove GEM connector C3.
- Disconnect transfer case shift motor.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for voltage on Circuit 762 (Y/W), C3-12.

Is battery voltage present?

Yes	No
SERVICE Circuit 762 (Y/W) for battery short. RECONNECT, CLEAR all DTCs and RETEST system.	GO to **B42** .

B42 CHECK CIRCUIT 762 (Y/W) FOR TRANSFER CASE MOTOR SHORT

- Key OFF.
- Reconnect transfer case shift motor.
- Reconnect GEM connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 with Rotunda Terminal Adapter Kit 105-00025 or equivalent, back probe C3-12 for battery voltage to ground.

Is battery voltage present?

Yes	No
REPLACE transfer case shift motor. CLEAR all DTCs and RETEST system.	CLEAR all DTCs and RERUN self test.

B43 CHECK CIRCUIT 771 (P/Y) FOR BATTERY SHORT

tomsn048@gmail.com

- Remove GEM Connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 with Rotunda Terminal Adapter Kit 105-00025 or equivalents, check Circuit 771 (P/Y) for battery voltage.

Is battery voltage present?

Yes	No
DISCONNECT transfer case shift motor connector. RECHECK for voltage. If voltage still exists, SERVICE Circuit 771 (P/Y) for battery short. If voltage does not exist, REPLACE transfer case shift motor. RECONNECT, CLEAR all DTCs and RETEST system.	REFER to Section 18-04A .

B44 CHECK CIRCUIT 770 (W) FOR BATTERY SHORT

- Remove GEM connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 with Rotunda Terminal Adapter Kit 105-00025 or equivalents, check Circuit 770 (W) for battery voltage.

Is battery voltage present?

Yes	No
DISCONNECT transfer case shift motor connector. RECHECK for voltage. If voltage still exists, SERVICE Circuit 770 (W) for battery short. If voltage does not exist, REPLACE transfer case shift motor. RECONNECT, CLEAR all DTCs and RETEST system.	REFER to Section 18-04A .

B45 CHECK CIRCUIT 764 (BR/W) FOR BATTERY SHORT

- Remove GEM connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 with Rotunda Terminal Adapter Kit 105-00025 or equivalents, check Circuit 764 (BR/W) for battery voltage.

Is battery voltage present?

Yes	No
DISCONNECT transfer case shift motor connector. RECHECK for voltage. If voltage still exists, SERVICE Circuit 764 (BR/W) for battery short. If voltage does not exist, REPLACE transfer case shift motor. RECONNECT, CLEAR all DTCs and RETEST system.	REFER to Section 18-04A .

tomsn048@gmail.com

B46 CHECK CIRCUIT 763 (O/W) FOR BATTERY SHORT

- Remove GEM connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 with Rotunda Terminal Adapter Kit 105-00025 or equivalents, check Circuit 763 (O/W) for battery voltage.

Is battery voltage present?

Yes	No
DISCONNECT transfer case shift motor connector. RECHECK for voltage. If voltage still exists, SERVICE Circuit 763 (O/W) for battery short. If voltage does not exist, REPLACE transfer case shift motor. RECONNECT, CLEAR all DTCs and RETEST system.	REFER to Section 18-04A .

PINPOINT TEST C: 4WD HIGH INDICATOR LAMP NEVER ILLUMINATES, DTC P1804, P1806

C1 CHECK IP FUSE 11 FOR OPEN

- Remove and inspect IP fuse 11.

Is fuse open?

Yes	No
REFER to Section 17-02 .	GO to **C2** .

C2 CHECK 4WD HIGH INDICATOR LAMP

- Remove instrument cluster.
- Inspect 4WD high indicator lamp.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check resistance of bulb.

Is resistance between 3-8 ohms?

Yes	No
Bulb Ok, GO to **C3** . If sent from C5, GO to **C4** .	REPLACE faulty bulb. REINSTALL connectors and RETEST system. CLEAR all DTCs. REINSTALL instrument cluster. INSPECT instrument cluster ribbon for damage. REPLACE as necessary. RECONNECT connectors.

tomsn048@gmail.com

C3 CHECK CIRCUIT 783 (GY) FOR OPEN

- Remove instrument cluster.
- Gain access to GEM.
- Disconnect GEM connector C3 and Instrument Cluster connector C1.
- Using Rotunda 73 Digital Multimeter 105-R0051 and Rotunda Terminal Adapter Kit 105-00025 or equivalents, check for continuity between GEM connector C3-14 and Instrument Cluster connector C1-14 Circuit 783 (GY).

Is continuity present?

Yes	No
GO to **C5** .	SERVICE Circuit 783 (GY) for open. RECONNECT connectors. CLEAR all DTCs and RETEST system.

C4 CHECK CIRCUIT 484 (O/BK) FOR BATTERY VOLTAGE

- Instrument Cluster connector C1 disconnected.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 484 (O/BK) Connector C1, Pin 12 for battery voltage.

Is battery voltage present?

Yes	No
System OK. CLEAR all DTCs and RETEST system.	SERVICE Circuit 484 (O/BK) for open. REINSTALL connectors and CLEAR all DTCs. RETEST system.

C5 CHECK CIRCUIT 783 (GY) FOR BATTERY SHORT

- Remove GEM connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 783 (GY), Pin C3-14 for battery voltage.

Is battery voltage present?

Yes	No
SERVICE Circuit 783 (GY) for battery short. RECONNECT and CLEAR all DTCs. RETEST system.	GO to **C2** .

PINPOINT TEST D: 4WD LOW INDICATOR LAMP NEVER ILLUMINATES, DTC P1808, P1810

tomsn048@gmail.com

D1 CHECK IP FUSE 11 FOR OPEN

- Remove and inspect IP fuse 11.

Is fuse open?

Yes	No
REFER to Section 17-02.	GO to **D2**.

D2 CHECK 4WD LOW INDICATOR LAMP

- Remove instrument cluster.
- Inspect 4WD low indicator lamp.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check resistance of bulb.

Is resistance between 3-8 ohms?

Yes	No
Bulb OK. GO to **D3**. If sent from **D5**, GO to **D4**.	REPLACE faulty bulb. REINSTALL connector and RETEST system. CLEAR all DTCs. REINSTALL instrument cluster. INSPECT instrument cluster ribbon for damage. REPLACE as necessary. RECONNECT connectors.

D3 CHECK CIRCUIT 784 (LB/BK) FOR OPEN

- Remove instrument cluster.
- Gain access to GEM.
- Disconnect GEM connector C3 and Instrument Cluster connector C1.
- Using Rotunda 73 Digital Multimeter 105-R0051 and Rotunda Terminal Adapter Kit 105-00025 or equivalents, check for continuity between GEM connector C3-10 and Instrument Cluster connector C1-15 Circuit 784 (LB/BK).

Is continuity present?

Yes	No
GO to **D4**.	SERVICE Circuit 784 (LB/BK) for open. RECONNECT connectors. CLEAR all DTCs and RETEST system.

D4 CHECK CIRCUIT 484 (O/BK) FOR BATTERY VOLTAGE

- Instrument Cluster connector C1 disconnected.

tomsn048@gmail.com

- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 484 (O/BK) connector C1, Pin 12 for battery voltage.

Is battery voltage present?

Yes	No
System OK. CLEAR all DTCs and RETEST system.	SERVICE Circuit 484 (O/BK) for open. REINSTALL connectors and CLEAR all DTCs. RETEST system.

D5 CHECK CIRCUIT 784 (LB/BK) FOR BATTERY SHORT

- Remove GEM Module connector C3.
- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check Circuit 784 (LB/BK), Pin C3-10 for battery voltage.

Is battery voltage present?

Yes	No
SERVICE Circuit 784 (LB/BK) for battery short. RECONNECT and CLEAR all DTCs. RETEST system.	GO to **D2** .

PINPOINT TEST E: EARLY OR DELAYED SHIFTS, DTC P1729, P1781

E1 VERIFY 4x4L POSITION

Diagnosis trouble code (DTC) P1729 indicates 4x4L switch failure either open or shorted. DTC P1781 indicates 4x4L position (closed) during KOEO Quick Test. Refer to Section 07-01A or Section 07-01B .

NOTE: The digital transmission range (DTR) sensor must indicate NEUTRAL position before 4x4L shift.

Possible causes:

- Damaged 4x4L switch.
- 4x4L harness open or shorted.
- Damaged GEM (shift on the fly) or transfer case position switch (manual 4WD system).
- Damaged PCM.

Is the selection 4x2 or 4x4H during Quick Test?

Yes	No
GO to **E2** .	VERIFY transmission shift lever in NEUTRAL position. SELECT 4X2 OR 4X4H. RETEST

tomsn048@gmail.com

	system.

E2 CHECK FOR INTERMITTENT CIRCUIT FAULT

- Key off.
- Scan tool connected.
- Access 4x4L PID.
- Key on, engine off.
- Cycle the 4x4L switch to 4x2.
- Grasp the vehicle harness starting at the transfer case vehicle harness connector. Shake and bend a small section of the harness all the way to the GEM (shift on the fly) or transfer case position switch (manual 4WD system).
- Tap the vehicle harness connector at the transfer case.
- Shake and bend a small section of the harness between the GEM (shift on the fly) or transfer case position switch (manual 4WD system).

Is the voltage on the Scan Tool fluctuating?

Yes	No
ISOLATE fault and SERVICE as necessary. COMPLETE PCM Reset to clear DTCs (REFER to Section 2A, Powertrain Control Module (PCM) Reset). RETEST system.	GO to **E3** .

E3 CHECK 4x4L SIGNAL FROM MODULE

- Key off.
- Disconnect PCM.
- Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary.
- Install breakout box, leave PCM disconnected.
- Key on, engine off.
- Observe voltage between Test Pin 14 and Test Pin 24 at the breakout box while cycling the 4x4L switch.

Does the voltage cycle?

Yes	No
REPLACE PCM. REMOVE breakout box. RECONNECT all components. RETEST system.	GO to **E4** .

E4 CHECK CONTINUITY OF 4x4L WIRE

- Key off.
- Breakout box installed, PCM disconnected.
- Disconnect the GEM (shift on the fly) or transfer case position switch (manual 4WD system).

tomsn048@gmail.com

- Inspect for damaged or pushed out pins, corrosion, loose wires, etc. Service as necessary.
- Measure resistance between Test Pin 14 at the breakout box and the same 4x4L pin at the GEM (shift on the fly) or transfer case position switch (manual 4WD system) vehicle harness connectors.

Are the resistances less than 5.0 ohms?

Yes	No
GO to **E5** .	SERVICE open circuit. REMOVE breakout box. RECONNECT all components. RETEST system.

E5 CHECK FOR SHORT TO POWER AND GROUND

- Key off.
- Breakout box installed, PCM disconnected.
- GEM (shift on the fly) or transfer case position switch (manual 4WD system) connected.
- Measure resistance between Test Pin 14 and Test Pin 24 at the breakout box.
- Measure resistance between Test Pin 14 and Test Pin 71 at the breakout box.

Is each resistance greater than 10,000 ohms?

Yes	No
REFER to Symptom Chart .	SERVICE short circuit. REMOVE breakout box. RECONNECT all components. RETEST system.

tomsn048@gmail.com

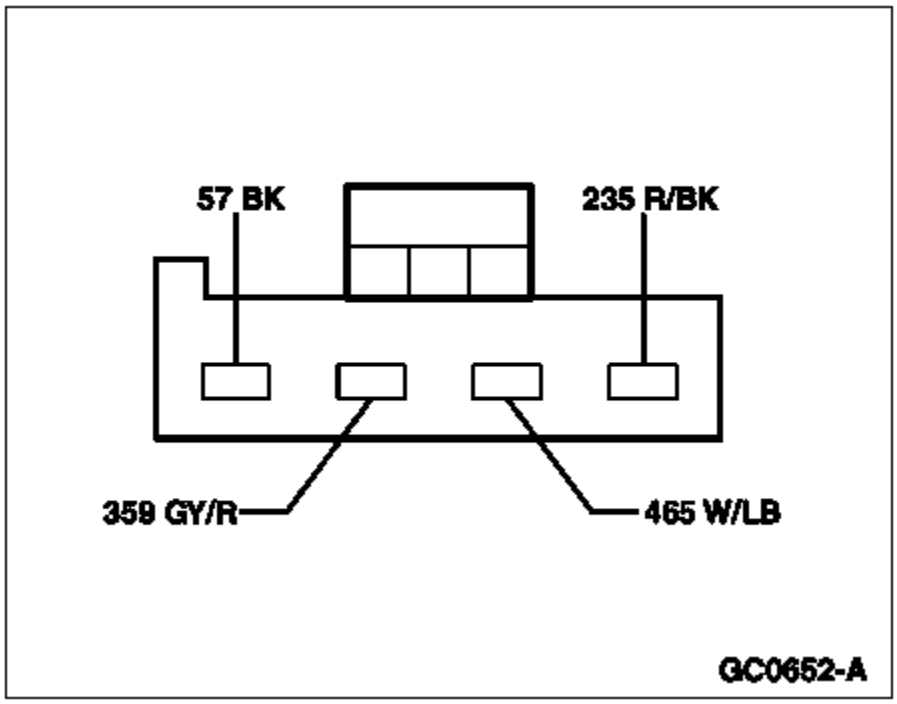
Component Tests

4x4 Mode Switch — Ranger

A variable resistance switch that signals the generic electronic module (GEM) to operate the "Select Drive" (Ranger 4x4), Four-wheel drive system in 2WD, 4WD High and 4WD Low range. The switch is checked as follows:

Measure resistance between Circuits 354 (GY/R), 465 (W/LG) using Rotunda 73 Digital Multimeter 105-R0051 (see diagram and table below for terminal location and resistance values).

4-Wheel Drive Mode Switch Connector



SWITCH RESISTANCE

Mode Switch Position	Resistance (Ideal Ranges)
OPEN	> 8.8K
Two-Wheel Drive	8.7K to 2.0k Ohms
4WD High/Auto	1.9K to 700 Ohms
4WD Low	600 Ohms to 150 Ohms
Short to Ground	< 150 Ohms

tomsn048@gmail.com

Brake Signal Input to the GEM

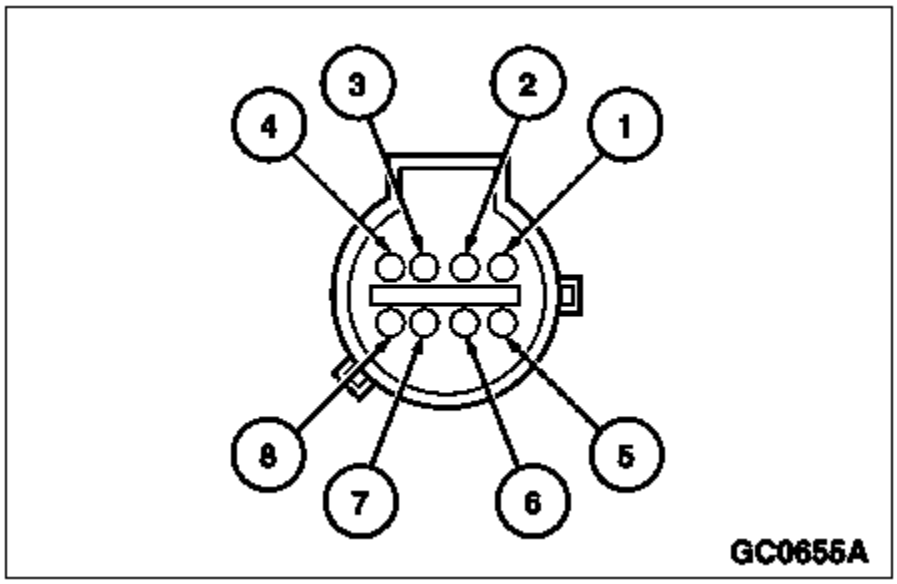
The brake signal input to the GEM is required to shift in and out of 4WD/Low. To verify the signal, gain access to generic electronic module (GEM), refer to Section 18-04A . Remove GEM Connector C3. Measure voltage at C3-13 harness side. With brake pedal depressed, voltage should be battery voltage.

Transfer Case Shift Motor

The transfer case shift motor allows shifting between 2WD, 4WD high and 4WD low .

The motor has a unique connector. The position of the motor may be verified using the table below along with the associated diagram.

Transfer Case Shift Motor Connector



Continuity is measured between transfer case shift motor Connector Pin 6 and the pins listed below.

Connector Pin	Sensor Position Feeds to the GEM								
	Mech Stop	L2H Stop	2H	2H E [a]	N E [a]	N	4L E [a]	4L	H2L Stop
5	1	1	1	1	1	0	0	0	1
1	0	0	0	1	1	1	1	1	1
2	0	1	1	1	1	1	1	0	0
3	0	0	1	1	0	0	1	1	1

[a] I - Ground
O - Open
E - Edge Transitional State (Non-Driveable)

Sensors

tomsn048@gmail.com

Check the three sensors with the ignition on. The transfer case sensors (manual or automatic) should be closed with the clutch in or the transmission range selector lever in neutral. The speed sensor should show 225-275 ohms with the vehicle stopped. Check at the module connection.

Shift Switch Checks

If the concern is not in the sensors or the transfer case shift motor (7G360), check the control panel switches. Make this check with the ignition on. Disconnect the "B" and "C" connections to the sensors, so that their data won't confuse the diagnosis. Now check power at the C1 connection at the module. There should be 5 volts coming from the GEM to the 4H and 4L switch. Check C1, C2, and C3 for short to ground.

Check the switches themselves by disconnecting C1 and checking continuity across C1 to C2 and C1 to C3. If current passes when the switch buttons are pushed, the switches are OK.

Finally, check for a short between C2 and C3 by bridging between them and activating the 4H and 4L switch. There are situations where wiring harnesses get crushed in such a way that two wires are crushed together and short, even though there is no short to ground.

No Range Shift Checks

If the vehicle will not shift into 4L, check the speed sensor brake switch input transmission interlocks (neutral or clutch in), clutch pedal position (CCP) sensor, and digital transmission range (DTR) sensor. For diagnosis and testing of the DTR sensor, refer to Section 07-01A or Section 07-01B . Also check the 4L switch (C3) to see if the module is getting a signal. Check for corroded connections.

If the vehicle won't shift back to 4H, follow the proper sequence of being stopped and having the vehicle in neutral (or clutch in) when pushing the switch. Check the 4L switch and the motor position sensor.

Shifting on the Fly Is Not Smooth and May Require Stopping to Complete Shift

Look for concerns with the electromagnetic clutch. If the ratcheting or grinding goes on for more than four seconds, there may be a problem with power to the clutch from the GEM, the clutch ground or the clutch itself. Check the wiring harness as well.

Indicator Lamps Check

To check the lamps, turn the ignition on and ground C3 Pin 14 and C3 Pin 10 at the GEM. On manual shift vehicles, ground Circuit 783 (GY) and 784 (LB/BK) at the transfer case position switch. The lamps should light.

Indicator Lights Do Not Register the Correct Information

Ranger has indicator lights in two locations. There are lights on the instrument panel and LED indicator lights in the switches. If the instrument panel lights don't respond, look for no power or a burned-out bulb.

If the lights are on all the time, look for a short to ground. Check to see if the generic electronic module is activating them all as this is a malfunction.

If the button lights remain on all the time but the dash lights are not on, this means the dash lights have burned out. The button lights are on because a low current is still passing across, enough to light the LED.

tomsn048@gmail.com

If no lights illuminate as you go through the shifts and ground power and bulbs are good, then the GEM is at fault or the transfer case shift motor has stopped at an intermediate point.

tomsn048@gmail.com

Inspection and Verification

NOTE: If the area of concern is indicated to be other than the transfer case (7A195), refer to the specific section or sections of the appropriate shop manual.

1. **NOTE: Owner driving habits as well as road and weather conditions should be noted.**

   Road test the vehicle to verify the concern, noting road speed, engine speed, speed range where the vehicle problem is evident.

2. Raise the vehicle on a hoist and position suitable safety floor stands under the vehicle.

3. Run the vehicle at the road speed and in the axle drive mode (4WD/2WD) where concern exists. Verify concern area:

   - Engine
   - Clutch/Automatic Transmission/Transaxle (A/T) (7000)
   - Transfer Case
   - Front/Rear Driveline Components
   - Front/Rear Drive Axles
   - Front/Rear Brake Systems
   - Front Axle Locking Hubs
   - Front/Rear Wheels and/or Tires

4. Refer to the appropriate owner's guide for operating data, if the concern is verified to be driveline or torsional windup, before servicing the transfer case.

5. If the 4WD system slips under load, find what has broken or is slipping. To locate where slip is taking place, put marks at various possible slip points. Test drive the vehicle, then check to see if marks at different points are still in the same relationship to each other. This will indicate where the slippage is taking place or where to look for broken parts, if any.

   a. On vehicles with auto hubs, find a suitable place where the vehicle can be tested. Mark the components, then drive vehicle without backing up. Stop and check the marks to see if they are in the same relationship to each other. If the vehicle is backed up before checking these marks, the hubs may re-index and not reveal the problem.

6. Check tires and vehicle loading if the concern is clearly driveline windup and not broken parts.

7. If the transfer case shift motor (7G360) operates properly and nothing happens, or if a manual shift lever fails to shift the transfer case, it will have to be serviced. Be sure driveline windup has been eliminated as a cause.

8. Driveline noise may be experienced if a vehicle is operated in 2WD with the hubs locked. This occurs because the 4WD components are in motion instead of at rest (the normal condition in 2WD with the hubs unlocked). However, it is important to remember that excessive noise may be a sign of a serious condition.

NOTE: It is important not to run for long periods with dirt and water in the hubs.

tomsn048@gmail.com

Maintenance of the hubs is important. Easy shifting from one operating position to the other requires smooth movement of the inner clutch ring. This ring slides on splines which must be clean and well lubricated. To prevent dirt and water from entering the hub unit, the oil seals must be very carefully installed. If the vehicle is operated where the hub is constantly submerged in water or mud, the hubs should be serviced more frequently. The important thing is not to run for long periods with dirt and water in the hubs. Start with a short service interval and check for water and dirt. Stretch out the interval as experience shows how dirty they are actually getting.

tomsn048@gmail.com

E-4WD Transfer Case, Aerostar

Continuous Engagement, Transfer Case Clutch

Excessive NVH and wheel hop that occurs while driving straight or during a tight to moderate turn may be caused by the electronic clutch in the transfer case (7A195). The control module (located under the driver's seat) disengages the clutch every 1-3 seconds. Normally, the clutch releasing in a turn is what the driver is feeling. If the clutch is not disengaging, then a binding condition occurs that causes tire chirping and an excessive NVH condition. Refer to the following steps to correct this condition.

Initial Checks

1. Rear axle must be 3.73 ratio.

2. Check to see if any aftermarket electrical devices that have been added to the vehicle have caused wiring harness damage. If they have caused harness damage, then disconnect aftermarket component and repair wiring harness damage.

3. Check the following electrical plug connections:

    a. Control module 14-pin plug under driver's seat.
    b. 8-pin (8-way) plug at the transfer case.
    c. Two sensor plug locations (front and rear pickups) on the transfer case.
    d. Clutch wiring plug on the transfer case.

Determining and Servicing the Root Cause

1. If wheel hop condition can be made to happen again, then unplug the control module under the driver's seat. If the wheel hop condition STOPS, the problem is an electrical concern in the wiring, plug connectors or sensors.

2. Recheck wires and plug connections; drive vehicle to test if the problem has been corrected.

3. Replace sensors. Replace front sensor, then drive the vehicle to check if the problem has been corrected; if not, replace the rear sensor. If replacing both sensors does not correct the problem, repeat all of the steps listed above in the initial checks.

4. If wheel hop condition can be made to happen again, then unplug the control module under the driver's seat. If the wheel hop condition continues, the problem is a grounded/shorted wire from the dash to the control module, a mechanical problem in the front suspension, or an internal transfer case problem. Inspect these areas further.

5. If wheel hop condition CANNOT be made to happen again, then check the wiring and plugs and replace both sensors on the transfer case and return the vehicle to the customer. If the customer returns the vehicle for service with the same complaint, the problem could be intermittent wire short or plug connection.

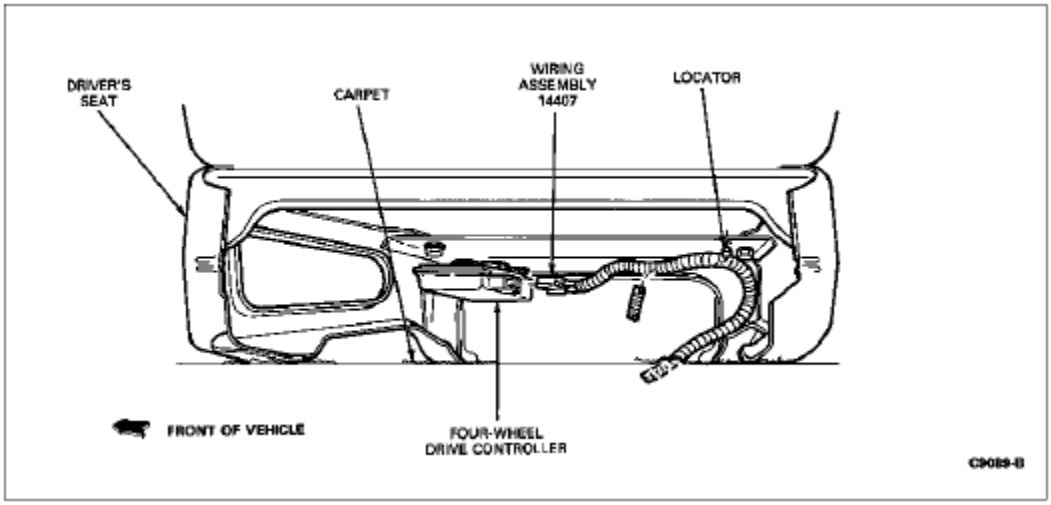
6. If the wheel hop occurs after two or more hours of driving, the primary failure possibility is the sensors on the transfer case. Repeat previous Step 5.

If a problem is detected by the control module, a code will be selected and sent to the electronic four-wheel

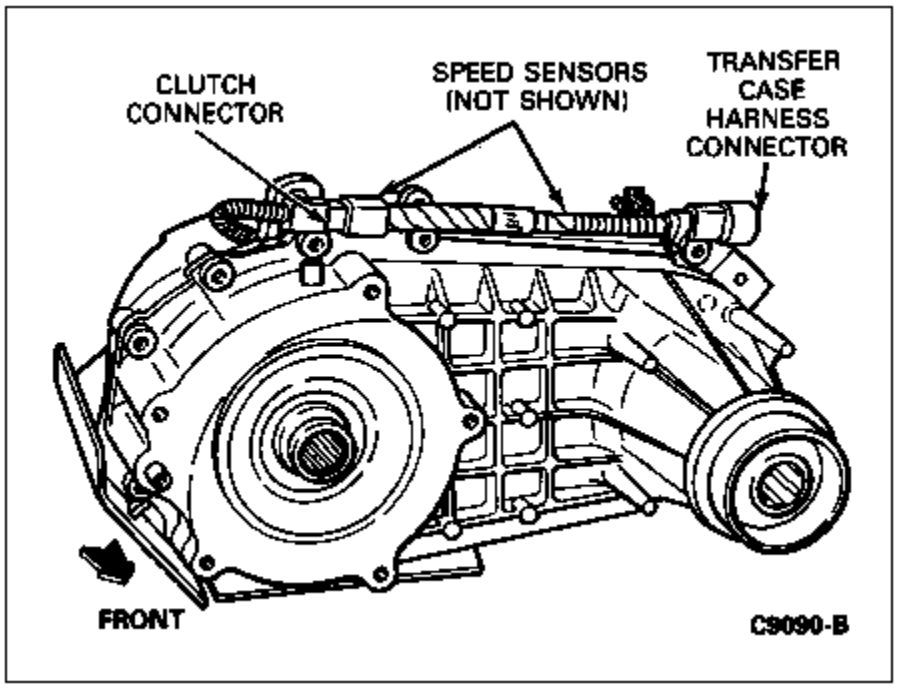
tomsn048@gmail.com

drive Malfunction Indicator Lamp located on the dash. The vehicle operator or service technician needs to count the flashes that occur between the pauses and refer to the Diagnostic Flash Code Chart in this section.

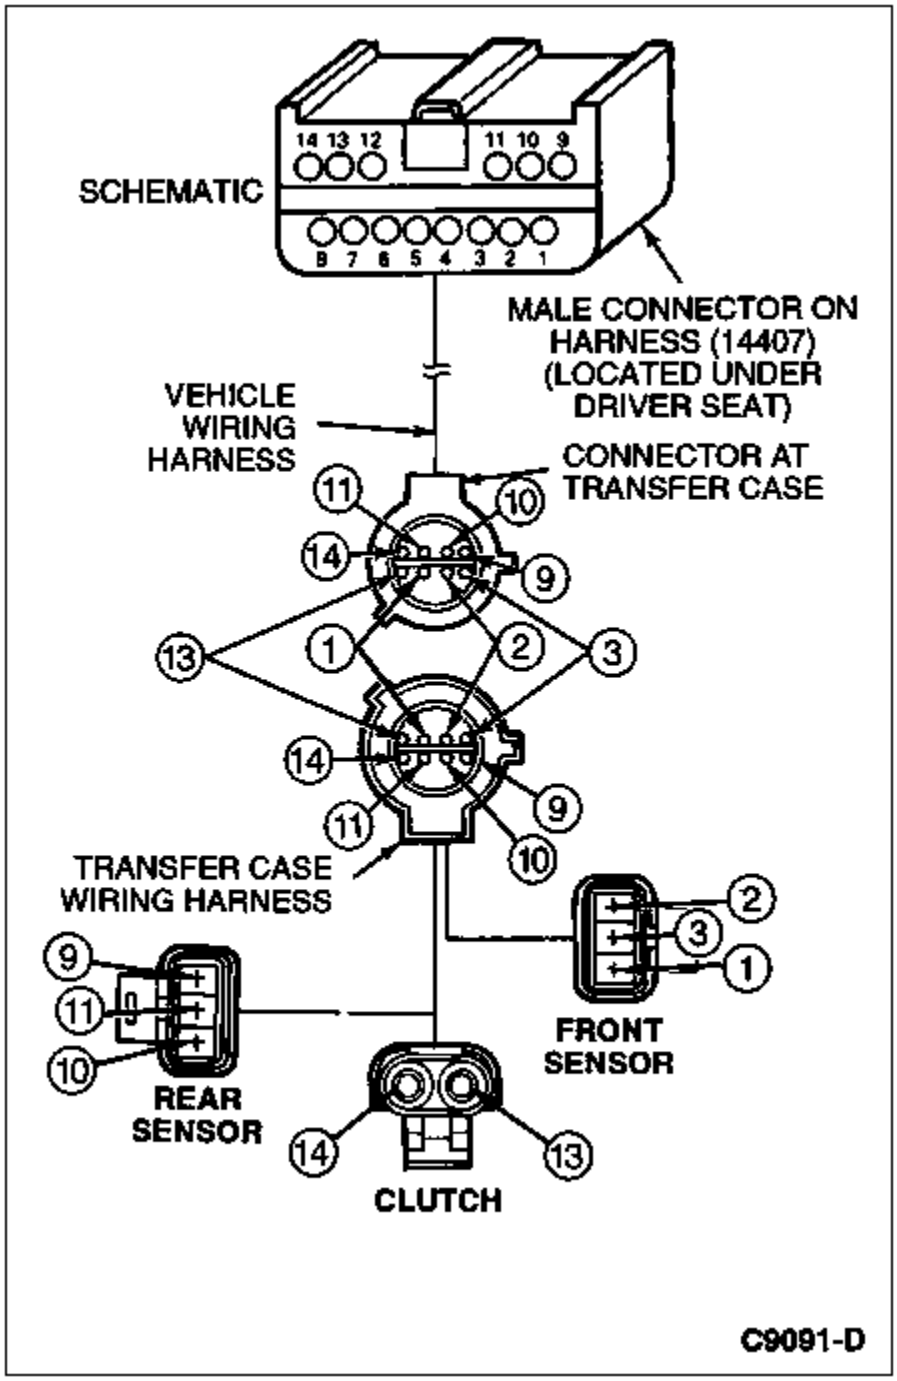
Control Module Location



Connector Locations at Transfer Case



tomsn048@gmail.com



Pin Number	Circuit Function
01	Front Sensor Negative (-)
02	Front Sensor Signal (S)

tomsn048@gmail.com

Diagnostic Flash Code Information

NOTE: The following flash codes 1 through 16 are On-Board Diagnostic (OBD) codes generated by the control module. If a system fault is detected, the control module will "flash out" the corresponding fault code on the electronic four-wheel drive Malfunction Indicator Lamp (MIL) on the instrument panel. Also, notice that all the codes that can be generated pertain only to the speed sensors, the clutch coil and clutch with the exception of the first flash code.

The electronic four-wheel drive system also includes the brake switch input, digital transmission range (DTR) sensor, one power and two ground lines, along with the E-4WD MIL. The following pinpoint tests include testing on every electronic four-wheel drive circuit and not just those covered by the flash codes.

DIAGNOSTIC FLASH CODE CHART

Flash Code	Description	Action to Take
	—Inoperative or Erratic System Errors.	Complete Tests AA through DD.
1	Microprocessor RAM (Random Access Memory) access error.	Replace Control Module.
2	Clutch connector or clutch coil has discontinuity.	GO to Step EE1.
3	Front output speed sensor connector or internal circuitry of sensor has discontinuity.	Go to Step DD1.
4	Rear output speed sensor connector or internal circuitry of sensor has discontinuity.	Go to Step DD1.
5	Both front and rear speed sensor connectors and/or internal circuitry of sensors have discontinuity.	Go to Step DD1.
6	Clutch and front sensor connectors and/or clutch coil and/or internal circuitry of sensor have discontinuity.	First see Step EE1, then Step DD1.
7	Clutch and rear sensor connectors and/or clutch coil and/or internal circuitry of sensor have discontinuity.	First see Step EE1, then Step DD1.
8	Clutch and both sensor connectors and/or clutch coil and/or internal circuitry of sensors have discontinuity.	First see Step EE1, then Step DD1.
9	Mechanical problem that allows clutch plates to slip during clutch engagement (or faulty sensor output signal).	First see Step EE1, then Step DD1.
10	Both Code 9 and Code 2.	See action for Code 9.
11	Both Code 9 and Code 3.	See action for Code 9.
12	Both Code 9 and Code 4.	See action for Code 9.
13	Both Code 9 and Code 5.	See action for Code 9.
14	Both Code 9 and Code 6.	See action for Code 9.
15	Both Code 9 and Code 7.	See action for Code 9.
16	Both Code 9 and Code 8.	See action for Code 9.

tomsn048@gmail.com

Regeneration (Recovery) of Flash Codes

If the ignition is turned OFF and the code is lost, the ignition will have to be turned ON again to regenerate codes 1 through 8, if the condition or conditions still exist. To regenerate codes 9 through 16, the vehicle must be driven again.

tomsn048@gmail.com

Pinpoint Test Information

The pinpoint tests are labeled AA through EE and are arranged in a logical test order. If the system fault is not specific, then testing should begin at Pinpoint Test AA and follow order until the fault has been identified.

PINPOINT TEST INDEX, E-4WD

ELECTRONIC 4-WHEEL DRIVE PINPOINT TESTING	
Pinpoint Test	**Pinpoint Test Application**
AA	**Power and Grounds**
AA1	Bad or Intermittent Power to Control Module
AA2	Faulty Controller Ground
BB	**Electronic 4 Wheel Drive Malfunction Indicator Lamp**
BB1	Electronic 4 Wheel Drive Malfunction Indicator Lamp Not Functioning Properly
BB2	Electronic 4 Wheel Drive Malfunction Indicator Lamp Not Functioning
BB3	Electronic 4 Wheel Drive Malfunction Indicator Lamp Open or Shorted
CC	**Brake Switch Input**
CC1	Stoplamp Operation
CC2	Bad or Intermittent Brake Switch Input
D **Refer to Section 07-01A or Section 07-01B**	**Digital Transmission Range (DTR) Sensor**
DD	**E4WD Speed Sensors**
DD1	Speed Sensor Power Supply
DD2	Continuity Testing of the Speed Sensor Lines
DD3	Short to Ground Testing of Speed Sensor Lines
EE	**E4WD Clutch**
EE1	Bad or Intermittent Power to Clutch Circuit
EE2	Clutch Circuit Short to Ground
EE3	Continuity Testing of the Clutch Circuit
EE4	Verify the Clutch Coil Engages

tomsn048@gmail.com

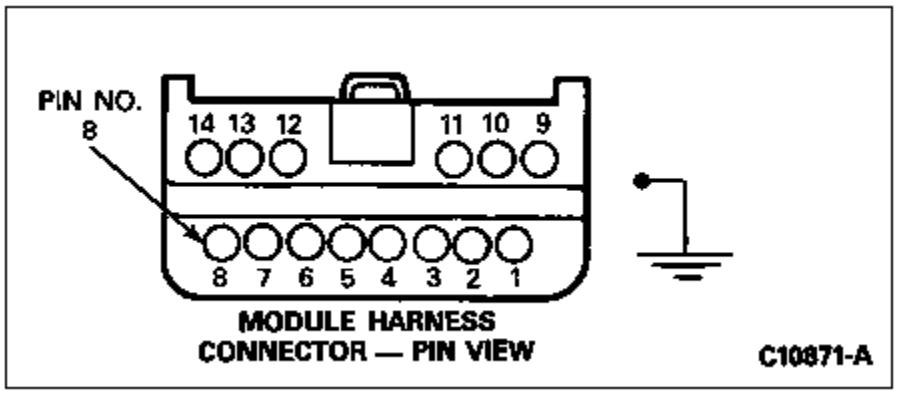
Pinpoint Tests

PINPOINT TEST AA: POWER AND GROUNDS

AA1 CHECK FOR OPEN OR INTERMITTENT IN CONTROL MODULE HARNESS CONNECTOR (MHC) PIN 8 (BATTERY +)

- Disconnect the module harness connector from the module.
- Set the voltmeter on the 20 VDC scale.
- Turn the ignition switch to the ON position.
- Check voltage between MHC pin 8 and chassis ground. (If there is no voltage, shake the module harness. Re-check for intermittent voltage.)



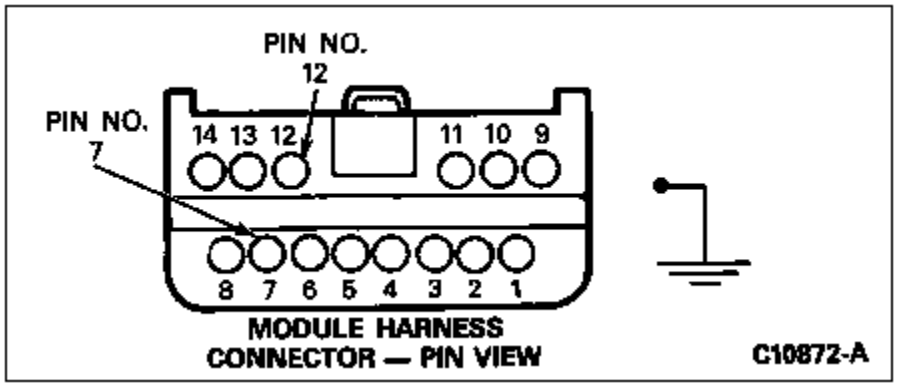
Is voltage steady (not intermittent) and greater than 9V?

Yes	No
GO to **AA2** .	REPAIR break in the B+ line. REFER toEVTM's on Aerostar with Electronic Four-Wheel Drive or the wiring diagrams.

AA2 CHECK FOR AN INTERMITTENT OR POOR CONTROL MODULE GROUND

- Disconnect the battery.
- Set the ohmmeter on the 20 ohm scale.
- Shake the module harness and check the resistance between MHC pin 12 and chassis ground. Repeat for pin 7 to chassis ground.

tomsn048@gmail.com



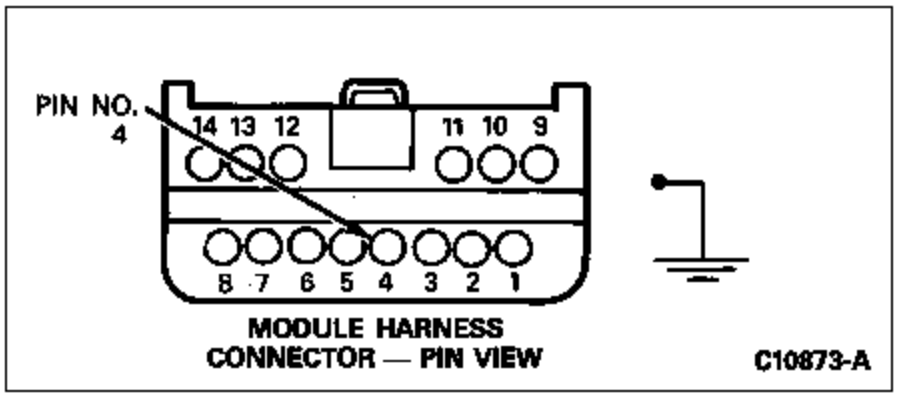
Is resistance steady (not fluctuating) and less than 1 ohm?

Yes	No
REPLACE control module.	REPAIR poor ground circuit(s). REFER to the EVTM's with Electronic Four-Wheel Drive or the wiring diagrams.

PINPOINT TEST BB: ELECTRONIC 4WD MALFUNCTION INDICATOR LAMP

BB1 CHECK FOR VOLTAGE AT CONTROL MODULE HARNESS CONNECTOR PIN 4

- Turn the ignition switch to the OFF position.
- Back-probe the module harness connector at pin 4 with **module connected** .
- Set voltmeter to the 20 VDC scale.
- Check the voltage between pin 4 of the control module and chassis ground with the ignition switch OFF.



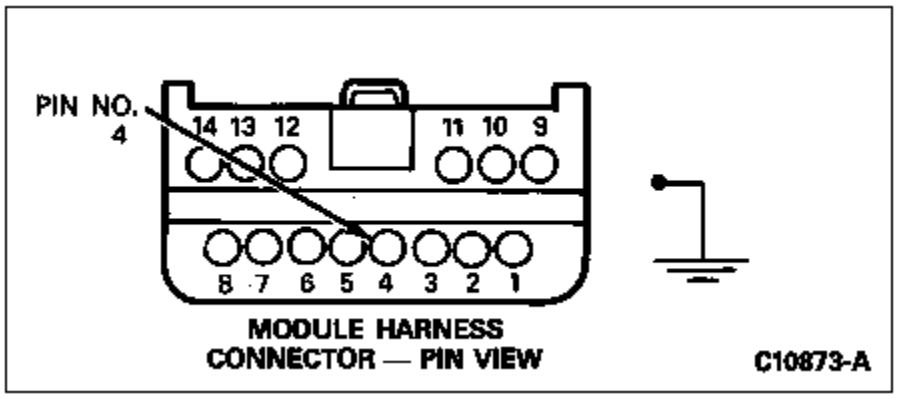
Is voltage less than 3V?

Yes	No
GO to Test **BB2** .	REPAIR short to B+ between control module (pin 4) and the Electronic 4-Wheel Drive Malfunction Indicator Lamp.

tomsn048@gmail.com

BB2 CHECK FOR VOLTAGE AT CONTROL MODULE PIN 4

- Back-probe the module harness connector pin 4 with the controller **module connected** .
- Set the voltmeter to the 20 VDC scale.
- Turn the ignition switch ON.
- Check the voltage between the MHC pin 4 and chassis ground.

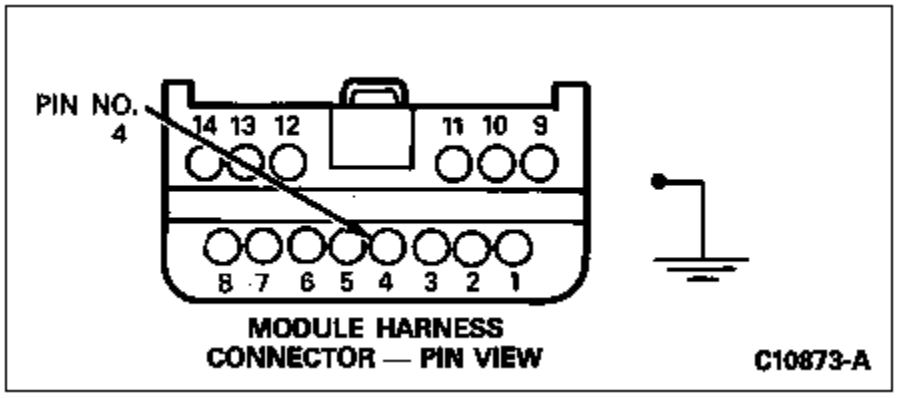


Is voltage steady and greater than 9V?

Yes	No
GO to **BB3** .	REPLACE control module.

BB3 CHECK FOR SHORT OR OPEN BETWEEN CONTROL MODULE HARNESS CONNECTOR PIN 4 AND ELECTRONIC 4-WHEEL DRIVE MALFUNCTION INDICATOR CIRCUIT

- Turn the ignition switch OFF.
- Disconnect the module harness connector from the module.
- Set the ohmmeter to the 20 ohm scale.
- Check the resistance between the module harness connector pin 4 and chassis ground.



Is resistance greater than 15 ohms?

tomsn048@gmail.com

Yes	No
REPLACE the Electronic 4-Wheel Drive Malfunction Indicator Lamp or REPAIR open circuit.	REPAIR short to ground between module harness connector pin 4 and the Electronic 4-Wheel Drive Malfunction Indicator Lamp.

PINPOINT TEST CC: BRAKE SWITCH INPUT

CC1 CHECK FOR STOPLAMP OPERATION

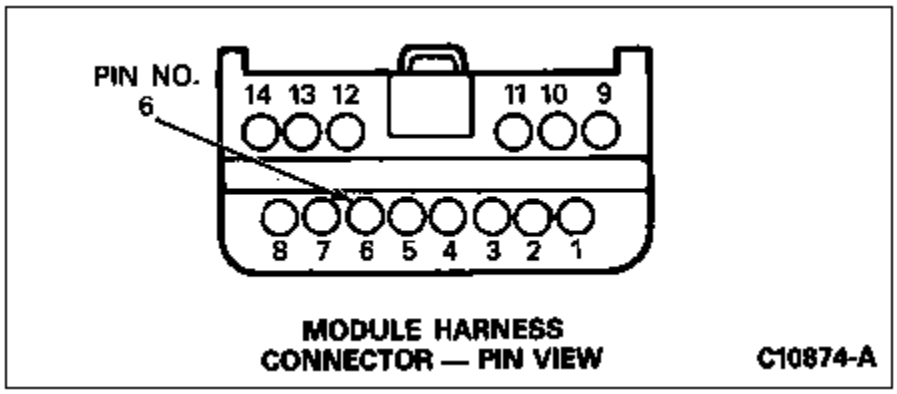
- Apply the service brakes and observe the rear brakelamps.

Do rear stoplamps illuminate with brake pedal depressed?

Yes	No
GO to CC2 .	REPAIR the stoplamp circuit and RE-TEST.

CC2 CHECK FOR INTERMITTENT OPEN IN CONTROL MODULE BRAKE SWITCH CIRCUIT

- Disconnect the module harness connector from the module.
- Set the voltmeter on the 20 VDC scale.
- Check the voltage between the module harness connector pin 6 and chassis ground while the brake pedal is depressed.
- Shake module harness. Recheck for intermittent voltage.



Is voltage steady (not intermittent) and greater than 9V?

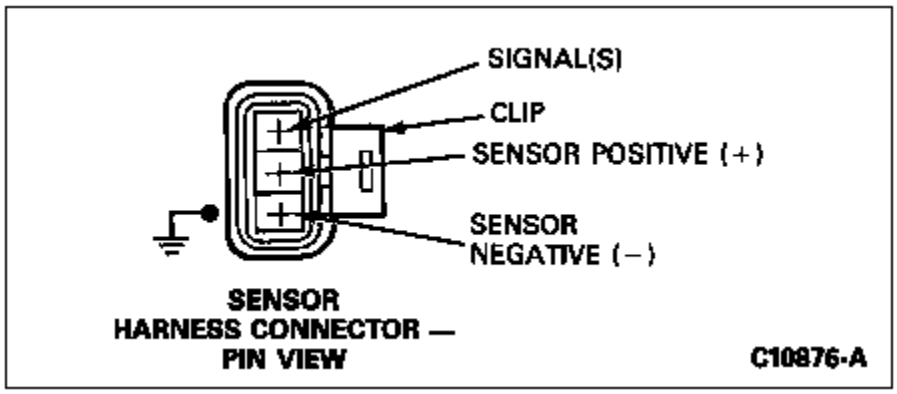
Yes	No
REPLACE control module.	REPAIR break in the module to brake switch circuit. REFER to EVTM's on Aerostar with Electronic Four-Wheel Drive or wiring diagrams.

tomsn048@gmail.com

PINPOINT TEST DD: E4WD SPEED SENSORS

DD1 CHECK FOR VOLTAGE AT SPEED SENSOR POSITIVE (+) LINE

- Remove the speed sensor connector from each speed sensor.
- Set the voltmeter on the 20 VDC scale.
- Turn the ignition switch to the ON position.
- For each sensor, check the voltage between the sensor harness connector positive (+) pin and chassis ground.
- Shake the connector and harness while checking the voltage.



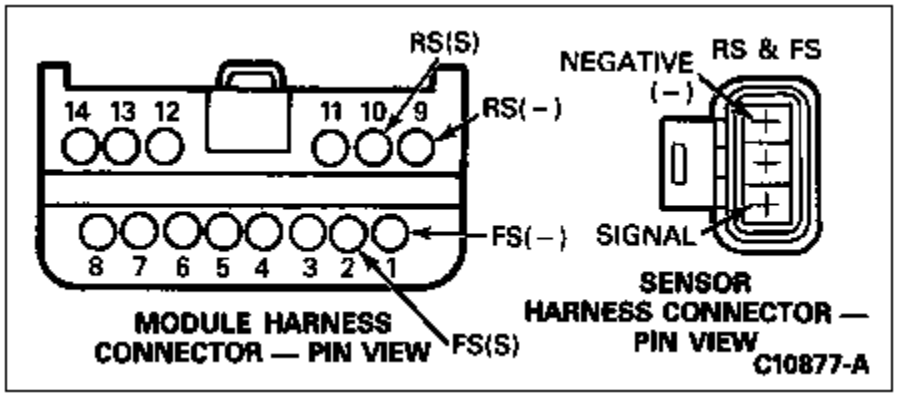
Is voltage steady (not intermittent) and greater than 4V?

Yes	No
GO to **DD2** .	REPAIR open circuit. If fault still occurs REPLACE control module. REFER to the wiring diagrams in this section.

DD2 CHECK CONTINUITY OF SPEED SENSOR SIGNAL AND GROUND LINES

- Turn the ignition key OFF.
- Disconnect the module harness connector from the module.
- Remove the speed sensor connector from the speed sensor.
- Set the ohmmeter to the 20 ohm scale.
- Test the continuity of each wire from the speed sensor connector, from their pins in the sensor harness connector to their corresponding pins in the MHC.

tomsn048@gmail.com

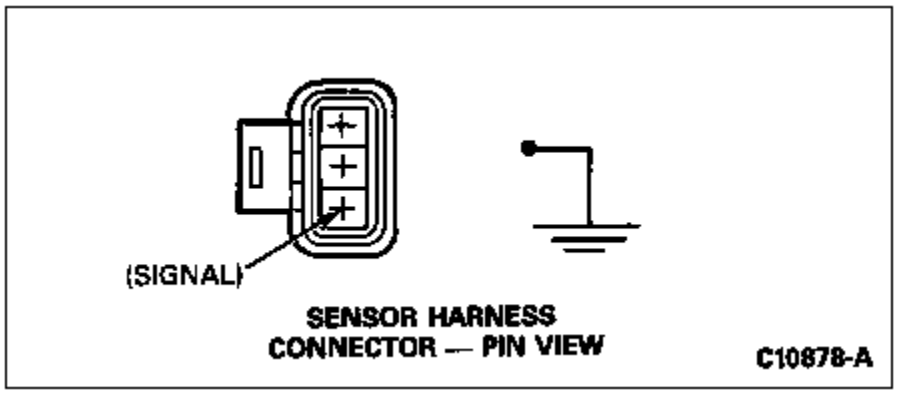


Is resistance greater than 1 ohm?

Yes	No
REPAIR open circuit. REFER to the wiring diagrams in this section.	GO to **DD3** .

DD3 CHECK FOR SHORT-TO-GROUND OR INTERMITTENT IN SPEED SENSOR SIGNAL CIRCUIT

- Turn the ignition switch OFF.
- Disconnect the module harness connector from the module.
- Disconnect the speed sensor connector from the speed sensor.
- Set the ohmmeter on the 20 ohm scale.
- Shake the module harness and sensor harness while checking the resistance between the sensor connector signal pin and chassis ground.



Is resistance below 1 ohm and fluctuating?

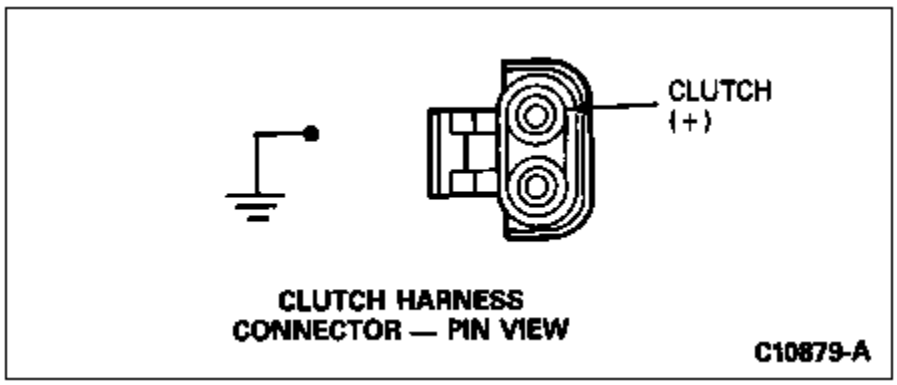
Yes	No
REPAIR short-to-ground in the speed sensor signal circuit. REFER to the wiring diagrams in this section.	REPLACE speed sensor. If the fault still occurs REPLACE controller.

PINPOINT TEST EE: E4WD CLUTCH

tomsn048@gmail.com

EE1 CHECK VOLTAGE AT CLUTCH CONNECTOR

- Disconnect the clutch harness connector from the clutch line on the transfer case housing.
- Set the voltmeter to the 20 VDC scale.
- Turn the ignition switch to ON.
- Shake the clutch harness and check for battery voltage between the clutch connector pin and chassis ground.

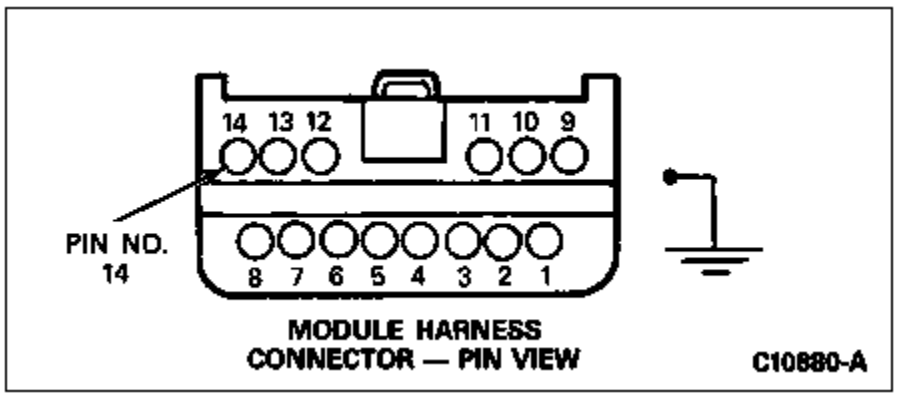


Is voltage present (steady or intermittent)?

Yes	No
REPAIR short to B+ on the clutch circuit or REPLACE control module. REFER to the wiring diagrams in this section.	GO to **EE2** .

EE2 CHECK FOR SHORT-TO-GROUND ON CLUTCH CIRCUIT

- Turn the ignition switch OFF.
- Disconnect the module harness connector from the module.
- Set the ohmmeter to the 20 ohm scale.
- Shake the module harness connector and check the resistance between MHC pin 14 and chassis ground.



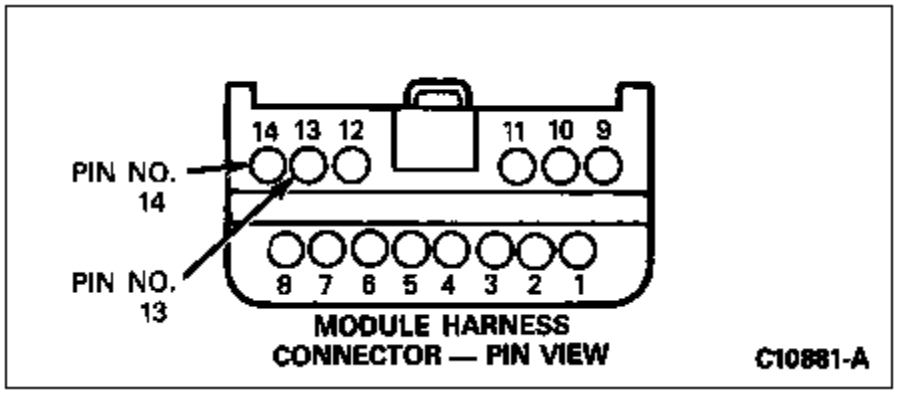
tomsn048@gmail.com

Is resistance intermittent or below 1 ohm?

Yes	No
REPAIR short-to-ground on the clutch circuit. REFER to the wiring diagrams in this section.	GO to **EE3** .

EE3 CHECK FOR AN OPEN ON THE CLUTCH CIRCUIT

- Turn the ignition switch OFF.
- Disconnect the module harness connector from the module.
- Set the ohmmeter to the 20 ohm scale.
- Shake the module harness connector and check the resistance between MHC pin 14 and pin 13.



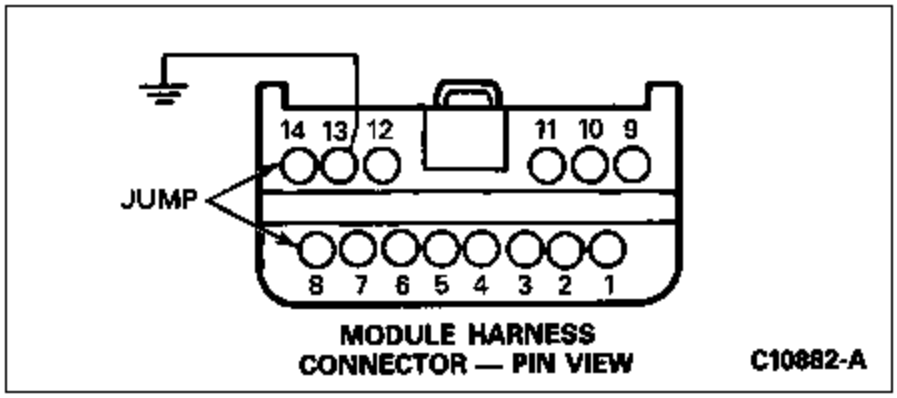
Is resistance between 1.5 and 4 ohms?

Yes	No
GO to **EE4** .	REPAIR open in clutch circuit or REPLACE clutch.

EE4 CHECK CLUTCH BY POWERING CIRCUIT

- Disconnect the module harness connector from the module.
- Connect Clutch Coil Locking Tool D91T-50-CLT or equivalent to the MHC. If tool is not available, ground MHC pin 13 to ground.
- Jumper MHC pin 8 to MHC pin 14.
- Verify clutch engagement by test driving vehicle in tight turns and noticing driveline wind-up (driveline wind-up is noticed through steering wheel feedback or wheel hop).

tomsn048@gmail.com



Does clutch engage (driveline wind-up)?

Yes	No
REPLACE the control module.	REPLACE clutch or look for a mechanical failure in the system.

tomsn048@gmail.com

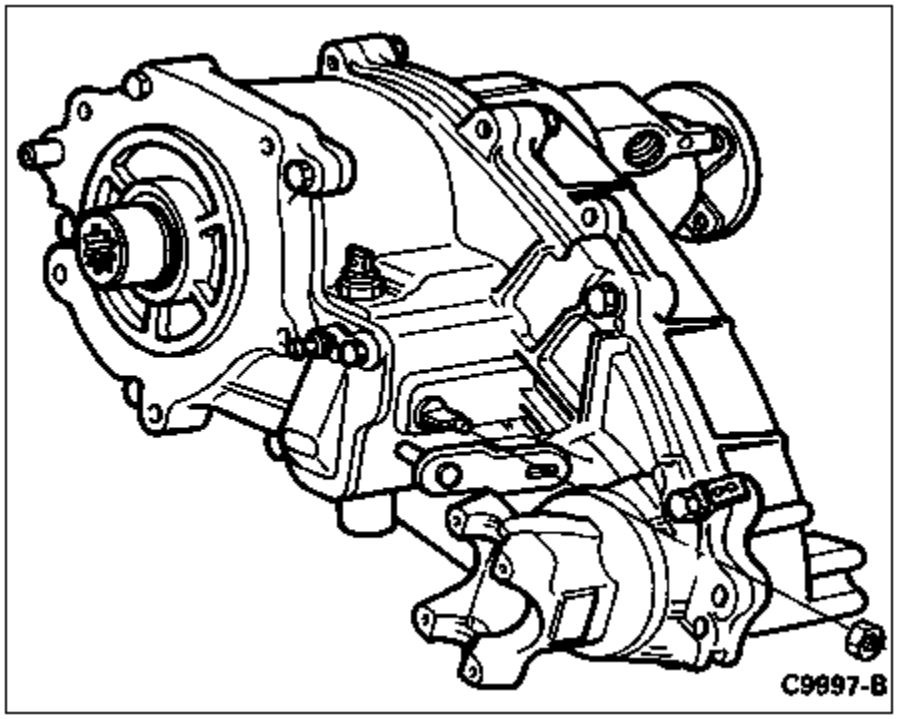
4x4 Mode Selector Switch Screw	2.1-2.9	19-24

tomsn048@gmail.com

Mechanical Shift System

The Borg Warner 13-54 is a three-piece aluminum part-time transfer case (7A195). It transfers power from the transmission (7003) to the rear axle assembly (4006) and, when engaged into 4WD, also the front drive axle. The unit is lubricated by a positive displacement oil pump that channels oil flow through drilled holes in the rear output shaft. The pump turns with the rear output shaft and allows towing of vehicle (neutral position) at maximum legal road speeds for extended distances without disconnecting the front or rear driveshaft.



Transfer Case

CAUTION: The three way catalytic converter (TWC) (5E212) is located beside the transfer case (7A195). Be careful when working around the three way catalytic converter because of the extremely high temperatures generated by the three way catalytic converter.

Removal

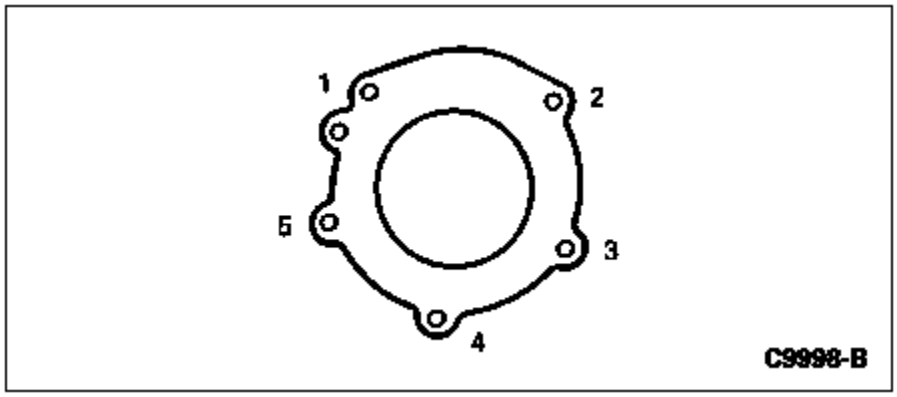
1. Raise the vehicle on a hoist and position suitable safety stands under vehicle.
2. If so equipped, remove the skid plate from the frame (5005).
3. Remove the damper from the transfer case, if so equipped.
4. **NOTE: Drain transfer case only if transfer case disassembly is required.**

   To drain transfer case oil, place a drain pan under transfer case, remove the drain plug and drain fluid from the transfer case.
5. Disconnect the wire connector of the four-wheel drive indicator switch at the transfer case.
6. Disconnect the front driveshaft (4602) from the case yoke (7B214) and wire the driveshaft out of the way.
7. Disconnect the rear driveshaft from the case yoke and wire the driveshaft out of the way.
8. Disconnect the speedometer cable (17260) from the case (7005).
9. Disconnect the transfer case breather tube from the gearshift lever housing.
10. Remove the nut from the shift lever and disconnect the shift lever.
11. Remove the large bolt and the small bolt retaining the shifter to the extension housing (7A039). Remove the gearshift lever (7210) and gearshift lever socket bushing (7335).
12. Support the transfer case with a Hi-Lift Transmission Jack, such as Rotunda 014-00942 (with Transfer Case Adapter 014-00213) or equivalent.
13. Remove the five bolts retaining the transfer case to the transmission (7003) extension housing.
14. Slide the transfer case rearward off the transmission output shaft and lower the transfer case from the vehicle. Remove the gasket from between the transfer case and transmission extension housing. Clean gasket mating surfaces prior to transfer case installation.

Installation

1. Place a new gasket on the front mounting face of the transfer case. If necessary, use a small daub of Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B to hold the gasket down.

2. Raise the transfer case with the Hi-Lift Transmission Jack 014-00942 (with Transfer Case Adapter 014-00213) so that the transmission output shaft aligns with the input shaft (7017). Slide the transfer case forward onto the transmission output shaft and onto the dowel pin. Install the five bolts (7A443) retaining the transfer case to the transmission extension housing. Tighten bolts to 34-48 Nm (25-35 lb-ft) in the sequence shown.



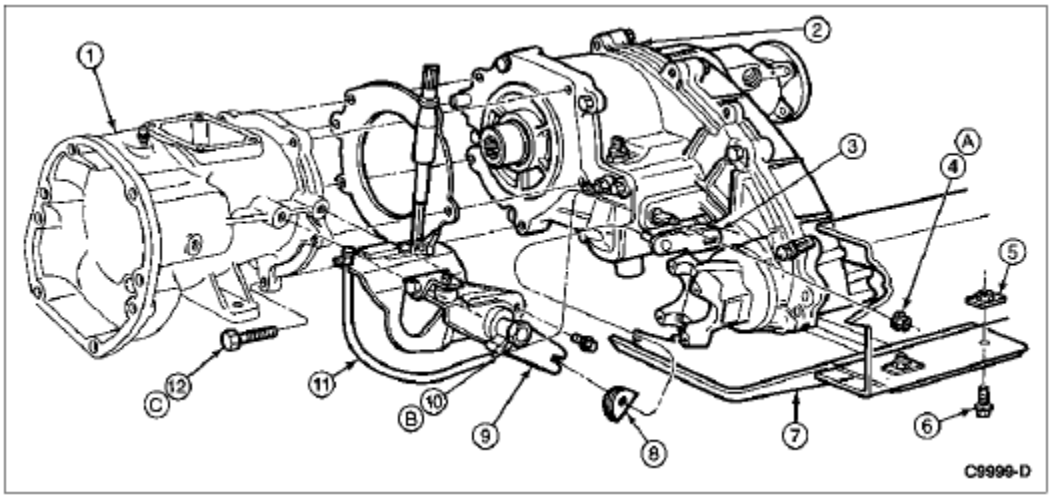
3. Remove the Hi-Lift Transmission Jack 014-00942 (with Transfer Case Adapter 014-00213) from the transfer case.

4. Install and adjust the shifter as outlined in this section.

5. **NOTE: The upper end of the transfer case breather tube should be 19mm (3/4 inch) above the top of the shifter and positioned just below the floor pan.**

   Install the vent assembly so the white marking on the transfer case breather tube is in position in the notch in the shifter.

Transfer Case Installation



Item	Part Number	Description

1	7A039	Extension Housing
2	7A195	Transfer Case
3	7B106	Shift Lever
4	620481	Nut
5	803802	Nut and Retainer
6	N620481-S2	Bolt
7	7E063	Skid Plate
8	7335	Gearshift Lever Socket Bushing
9	7210	Gearshift Lever
10	389240	Bolt
11	7A246	Vent Hose Extension
12	N605804	Bolt
A	—	Tighten to 26-35 Nm (19-26 Lb-Ft)
B	—	Tighten to 94-122 Nm (70-90 Lb-Ft)
C	—	Tighten to 35-48 Nm (26-35 Lb-Ft)

6. Connect the speedometer cable to the case. Tighten the screw to 2-3 Nm (20-25 lb-in).
7. Connect the rear driveshaft to the case yoke. Tighten the bolts to 83-118 Nm (61-87 lb-ft).
8. Connect the front driveshaft to the case yoke. Tighten the bolts to 16-22 Nm (12-16 lb-ft).
9. Connect the top gear indicator switch wire connector at the transfer case.
10. Install the drain plug and tighten to 19-30 Nm (14-22 lb-ft). Remove the fill plug and install Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX equivalent MERCON® fluid to the bottom of the fill hole. Install fill plug and tighten to 19-30 Nm (14-22 lb-ft).
11. Install the damper to the transfer case, if so equipped. Using new damper bolts, or previously removed bolts coated with Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G315-A5 TYPE II, tighten the bolts to 35-48 Nm (26-35 lb-ft).
12. Install the skid plate to frame (if so equipped). Tighten nuts and bolts to 20-27 Nm (15-20 lb-ft).
13. Remove safety stands and lower vehicle from the hoist.

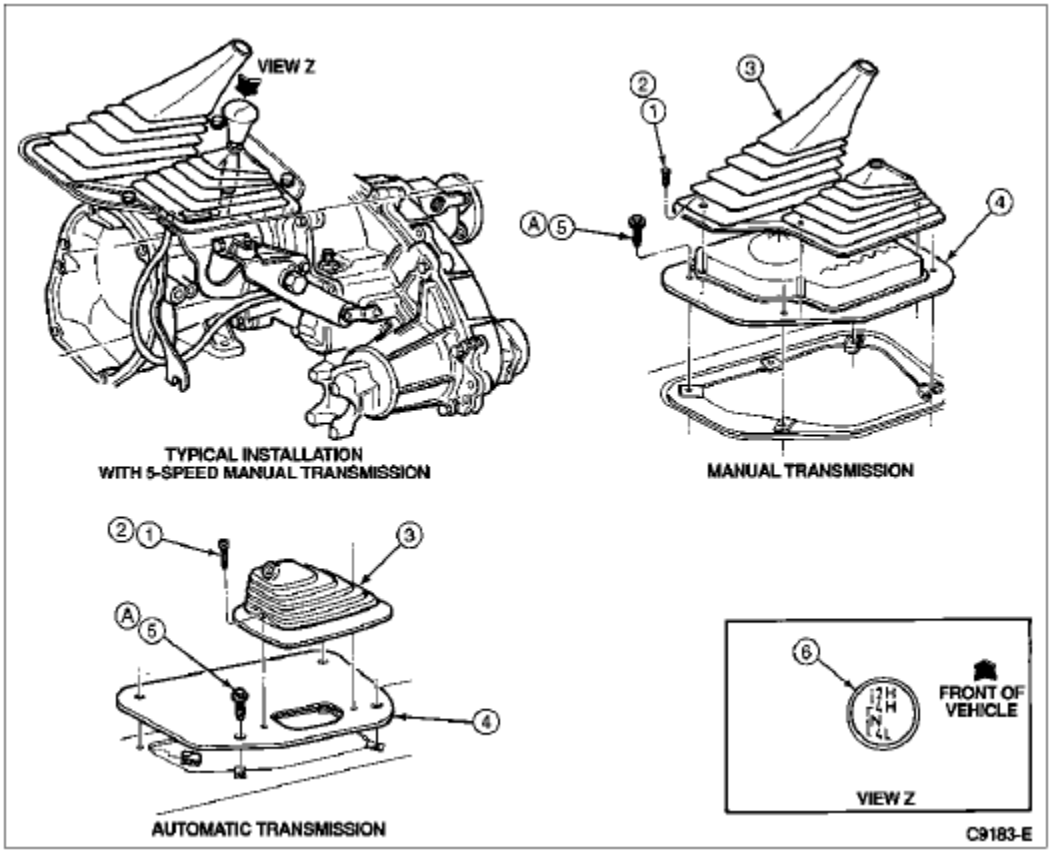
Shift Lever

NOTE: Remove the gearshift lever knob (7213) only if the knob, gearshift lever boot (7277) or gearshift lever (7210) is to be replaced.

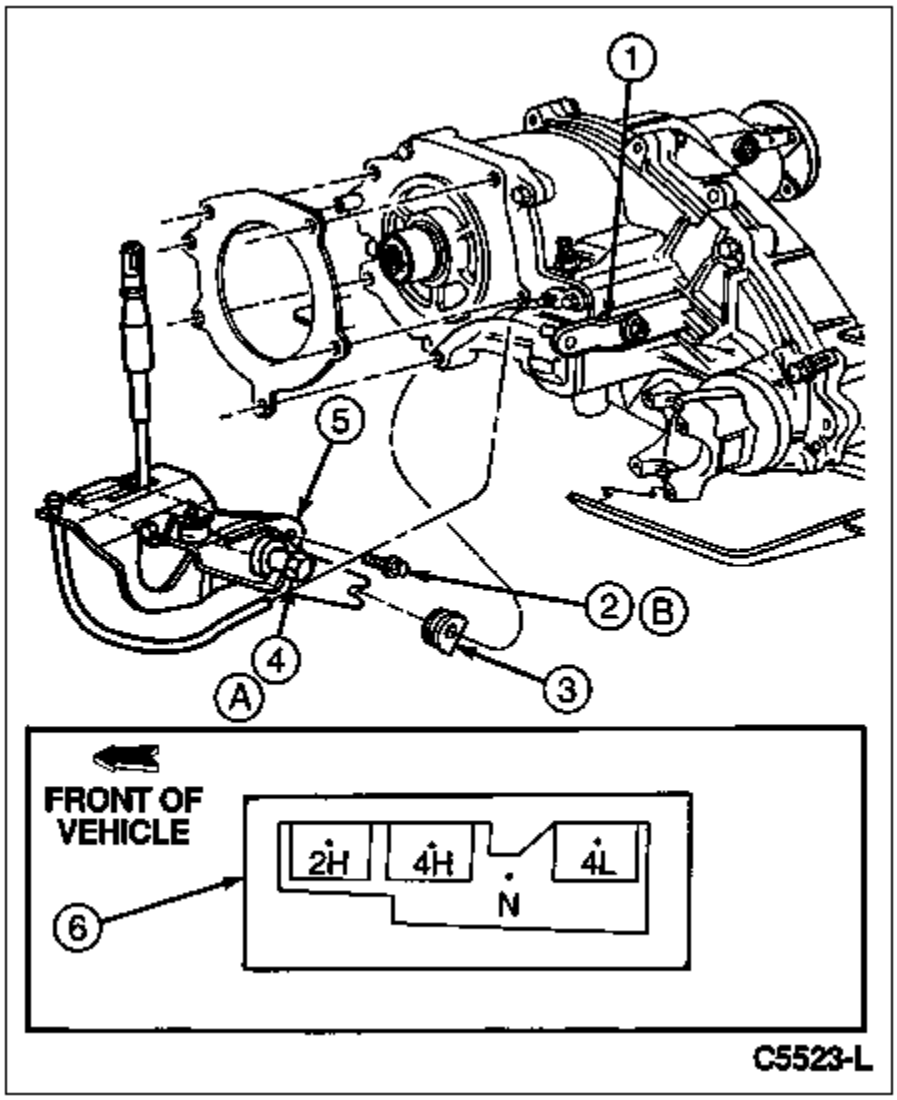
Removal

1. Shift transfer case (7A195) into the 4L position.
2. Remove the plastic shift pattern insert from the gearshift lever knob. Warm the knob with Rotunda Heat Gun 107-R0300 or equivalent to 60-87°C (140-189°F) and knock the knob off the gearshift lever with a U-shaped tool or appropriate size open-end wrench.
3. Remove the gearshift lever boot and floor pan cover.
4. Disconnect the transfer case breather tube from the gearshift lever.
5. Remove the nut and shift lever from the transfer case.
6. Remove the bolts retaining the shifter to the extension housing (7A039). Remove the gearshift lever and gearshift lever socket bushing (7335).

Shifter and Boot Installation



Item	Part Number	Description
1	55929	Screw (Manual Transmission)
2	55930	Screw (Automatic Transmission)
3	7277	Gearshift Lever Boot (Manual Transmission)
4	7C306	Floor Pan Opening Cover
5	N60589-1	Bolt
6	7213	Shift Lever Ball (Transfer Case)
A	—	Tighten to 5-9 Nm (48-78 Lb-In)



Item	Part Number	Description
1	7B106	Transfer Case Shift Lever in 4L Position
2	383107-S100	Bolt
3	7335	Gearshift Lever Socket Bushing
4	389240-S	Bolt
5	7210	Gearshift Lever
6	7F087	Cam Plate
A	—	Tighten to 94-122 Nm (70-90 Lb-Ft)
B	—	Tighten to 43-56 Nm (32-42 Lb-Ft)

Installation

1. Prior to installing the gearshift lever, lubricate the pivot bolt and bushing bore with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

2. Prior to installing the gearshift lever, move the transfer case lever to the 4L position.

3. Install gearshift lever to the extension housing with bolts turned to one turn loose. Install gearshift lever socket bushing to gearshift lever with flat facing out. Install lever to gearshift lever socket bushing and transfer case shift shaft. Tighten nut to 26-35 Nm (19-26 lb-ft).

4. Adjust the linkage as outlined. Always tighten the large bolt (A) retaining the shifter to the extension housing before tightening the small bolt (B).

5. **NOTE: The upper end of the transfer case breather tube should be 19mm (3/4 inch) above the top of the shifter and positioned just below the floor pan.**

   Install the vent assembly so the white marking on the transfer case breather tube is in position in the notch in the shifter.

6. Install the gearshift lever boot and the floor pan cover.

7. **NOTE: The end of the gearshift lever knob should be to the end of the knurl on the upper portion of the shift lever.**

   Warm the gearshift lever knob with Rotunda Heat Gun 107-00300 or equivalent to 60-87℃ (140-189° F) and tap the knob on the lever with a 7/16 socket and a mallet. Install the plastic shift pattern insert.

8. Check the transfer case for proper shifting and operation.

Oil Seal

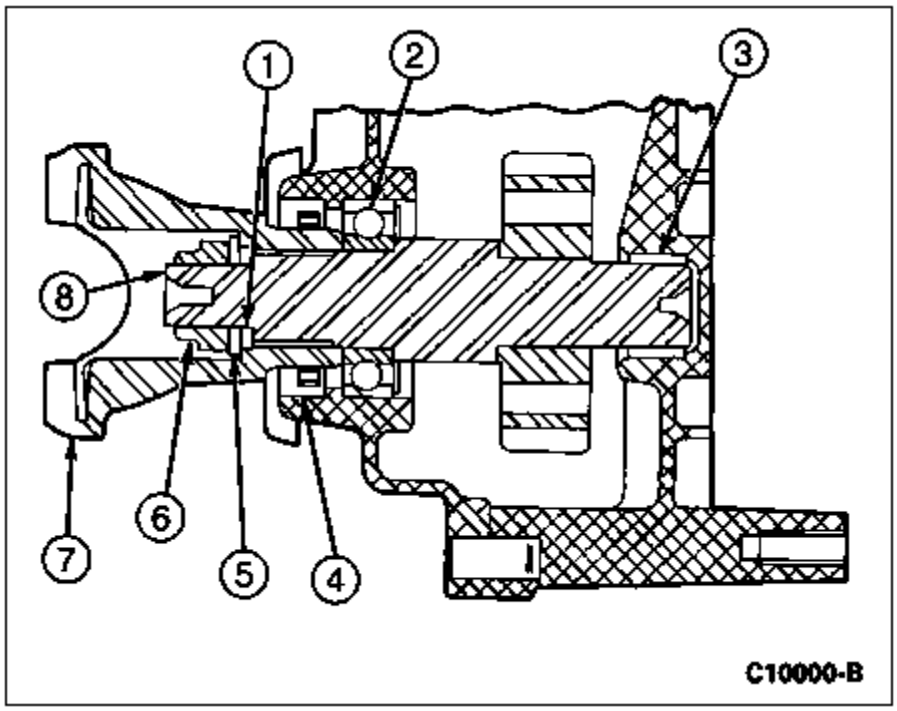
Output Shaft, Front

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T50T-100-A
Driver Handle	T80T-4000-W
Output Shaft Seal Replacer	T83T-7065-B

Removal

1. Place transfer case (7A195) in 4WD, set automatic transmission (7003) in Park, manual transmission in gear.
2. Raise the vehicle on a hoist and position suitable safety stands under vehicle.
3. If equipped, remove the damper from the transfer case and the skid plate from the frame (5005).
4. Place a drain pan under the transfer case, remove the drain plug and drain the fluid from the transfer case.
5. Remove the driveshaft (4602) from the front output shaft and wire the driveshaft out of the way.
6. Using a 30mm thin-wall socket, remove the front output shaft nut, output shaft yoke washer (7B368), rubber seal and front case yoke (7B214).



Item	Part Number	Description
1	7052	Rubber Seal
2	7025	Bearing
3	7127	Needle Bearing, Front
4	7B215	Yoke to Flange Seal
5	7B368	Output Shaft Yoke Washer
6	7045	Shaft Nut
7	7B214	Case Yoke, Front
8	7061	Output Shaft, Front

7. Remove the yoke to flange seal (7B215) from the front output housing bore by prying and pulling on the curved-up lip of the yoke to flange seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.

Installation

1. Make sure the housing face is free from nicks and burrs. Coat the yoke to flange seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Position the seal into the front output housing bore, making sure the seal is not cocked in the bore. Drive the seal into the bore with Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.

2. Install the front case yoke, rubber seal, output shaft yoke washer and the nut. Tighten the nut to 203-244 Nm (150-180 lb-ft).

3. Connect the front driveshaft to the front case yoke. Tighten the bolts to 16-22 Nm (12-16 lb-ft).

4. Install drain plug and tighten to 19-30 Nm (14-22 lb-ft). Remove fill plug and install Motorcraft

MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid to the bottom of the fill hole. Install fill plug to 19-30 Nm (14-22 lb-ft).

5. Install the damper to the transfer case, if so equipped. Using new damper bolts, or previously removed bolts coated with Threadlock and Sealer E0AZ-19554-AA or equivalent meeting Ford specification WSK-M2G315-A5 TYPE II, tighten the bolts to 35-48 Nm (26-35 lb-ft).

6. If equipped, install the skid plate to the frame. Tighten nuts and bolts to 20-27 Nm (15-20 lb-ft).

7. Remove safety stands and lower the vehicle from the hoist.

Output Shaft, Rear

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Driver Handle	T80T-4000-W
Output Shaft Seal Replacer	T83T-7065-B

Removal

1. Raise the vehicle on a hoist and position suitable safety stands under vehicle.

2. Remove the rear driveshaft from the rear case yoke. Wire the driveshaft out of the way.

3. Using a 30mm thin wall socket, first remove the rear output nut, then the output shaft yoke washer, oil seal (7052) and rear case yoke.

4. Remove the yoke to flange seal from the rear output housing bore by prying and pulling on the curved-up lip of the seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.

Installation

1. Make sure the output housing bore and face are free from nicks and burrs. Coat the yoke to flange seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Position the seal into the rear output housing bore, making sure that the seal is not cocked in the bore. Drive the seal into the bore with Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.

2. Install the rear case yoke, rubber seal, output shaft yoke washer and nut on the output shaft. Tighten the nut to 339-380 Nm (250-280 lb-ft).

3. Connect the rear driveshaft to the transfer case and tighten the retaining bolts to 83-118 Nm (61-87 lb-ft).

4. Remove safety stands and lower the vehicle from the hoist.

64	7B362	Pin, Pump

4. Using a 30mm thin wall socket, remove the rear output nut, output shaft yoke washer (7B368), rubber seal and case yoke (7B214).

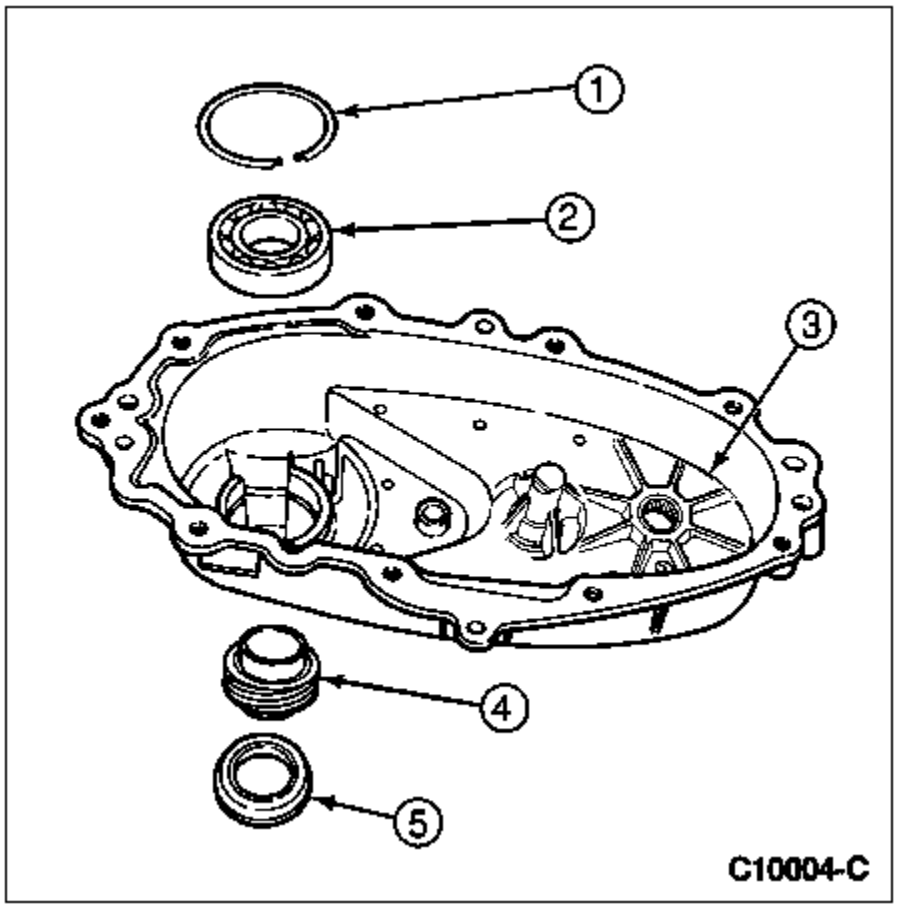
5. Using a 30mm thin wall socket, remove the front output shaft nut, output shaft yoke washer, rubber seal and case yoke.

6. **CAUTION: When removing RTV sealant, take care not to damage the mating surfaces of the aluminum case.**

   Remove the nine 10mm bolts (7A443) which retain the front case (7005) to the rear case. Remove the wiring harness bracket. Insert a 1/2-inch drive breaker bar between the three pry bosses and separate the front case from the rear case. Remove all traces of RTV gasket sealant from the mating surfaces of the front case and rear case.

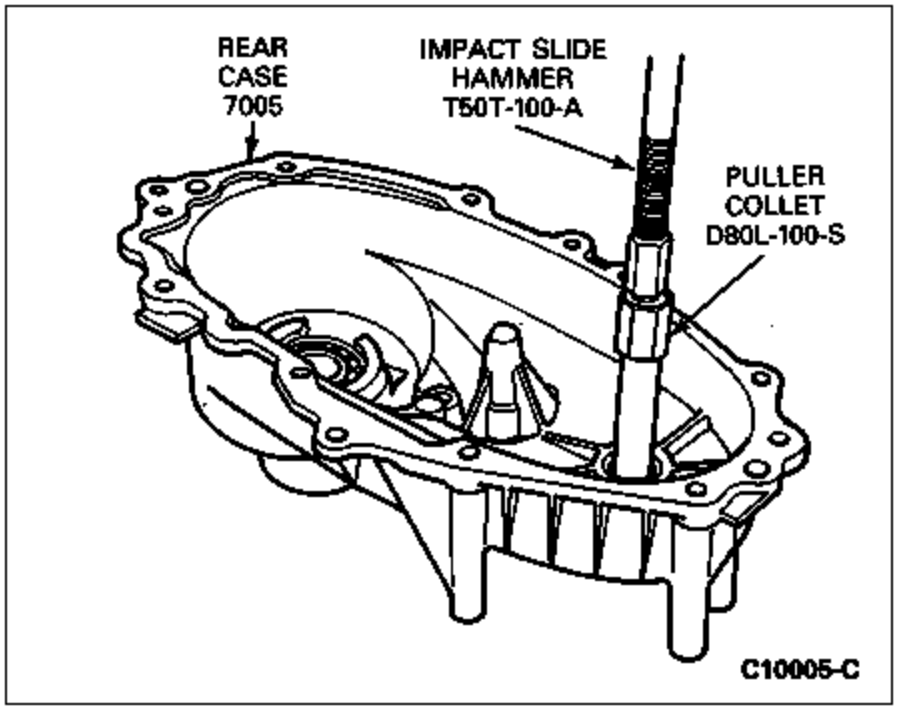
7. If the speedometer drive gear (17285) or bearing (7025) is to be replaced, remove the yoke to flange seal (7B215) by prying and pulling on the curved-up lip of the seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Take care not to damage the bearing, bearing cage or case.

8. Remove the internal snap ring that retains the bearing in the bore. From the outside of the case, drive out the bearing using Step Plate D80L-630-4 or equivalent with a suitable drift.

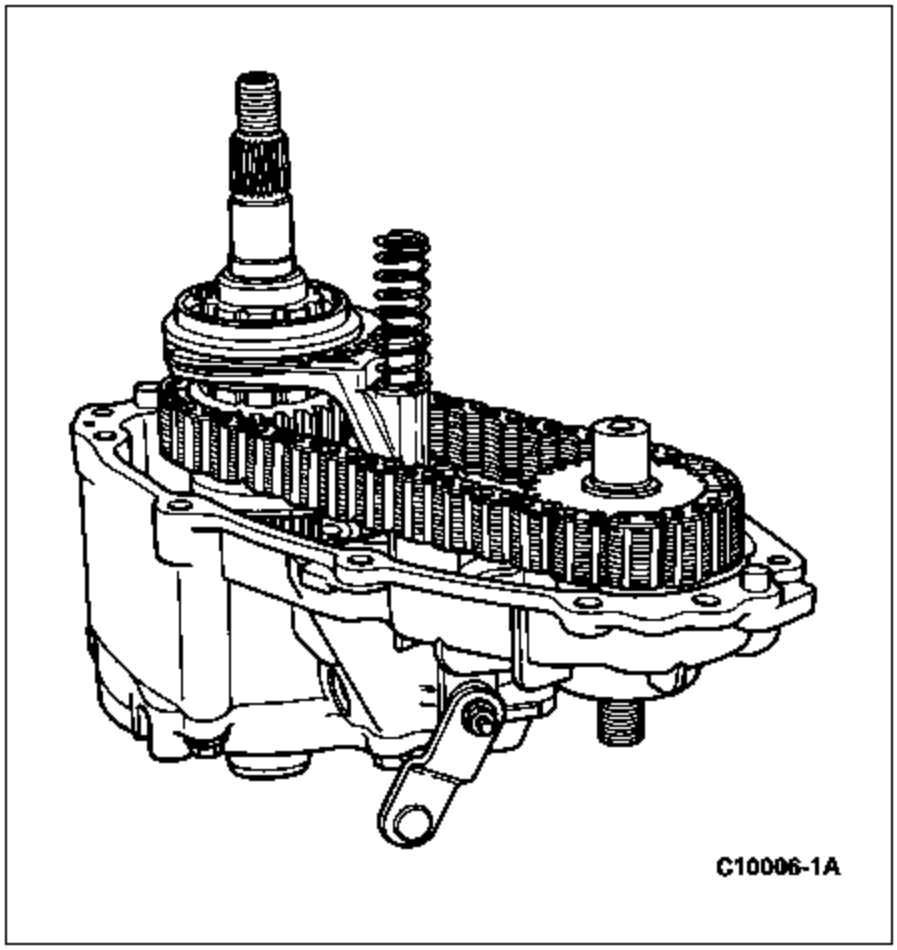


Item	Part Number	Description
1	7917	Snap Ring
2	7025	Bearing
3	7005	Case
4	77285	Speedometer Drive Gear
5	7B215	Yoke to Flange Seal

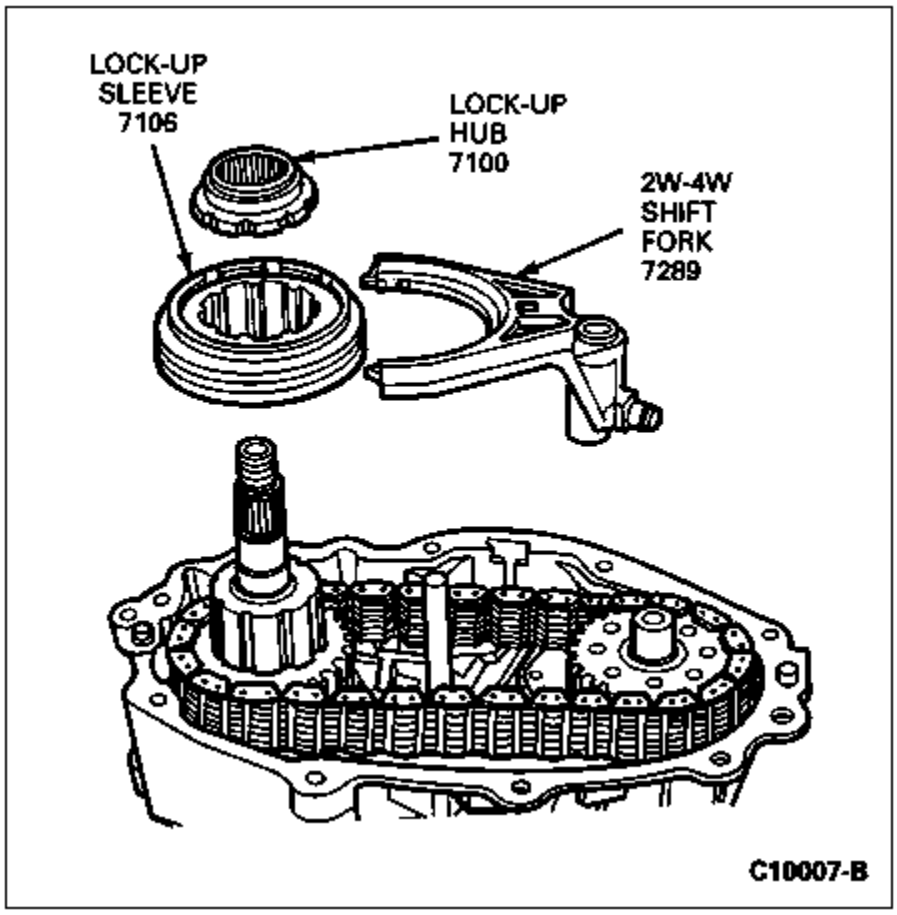
9. If required, remove the front needle bearing from the rear case with Collet D80L-100-S or equivalent and Impact Slide Hammer T50T-100-A.



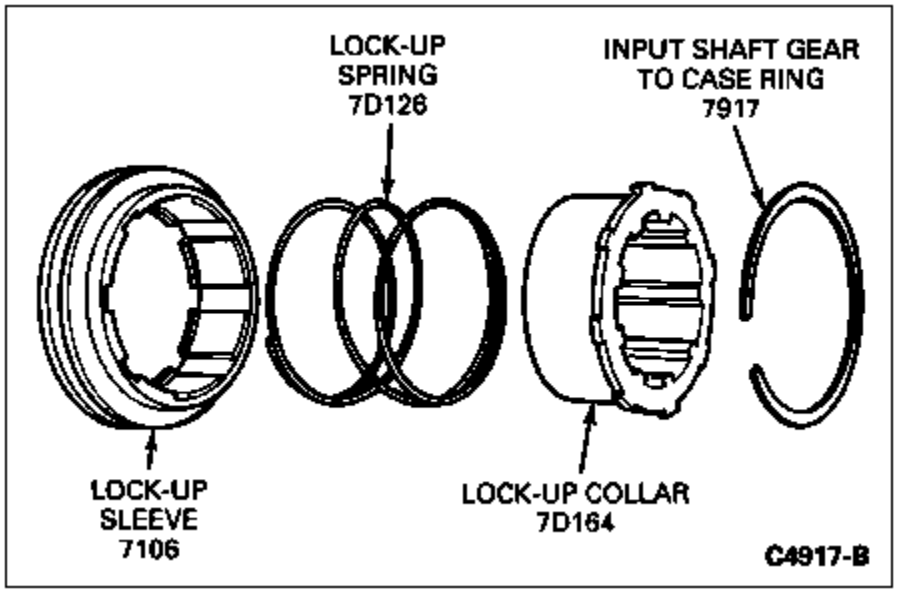
10. Remove the 2W-4W shift fork lockup return spring from the boss on the 2W-4W shift fork.



11. Remove the lockup hub from the output shaft. Remove the 2W-4W lockup and the 2W-4W shift fork together as an assembly. Remove the 2W-4W fork from the 2W-4W lockup assembly.



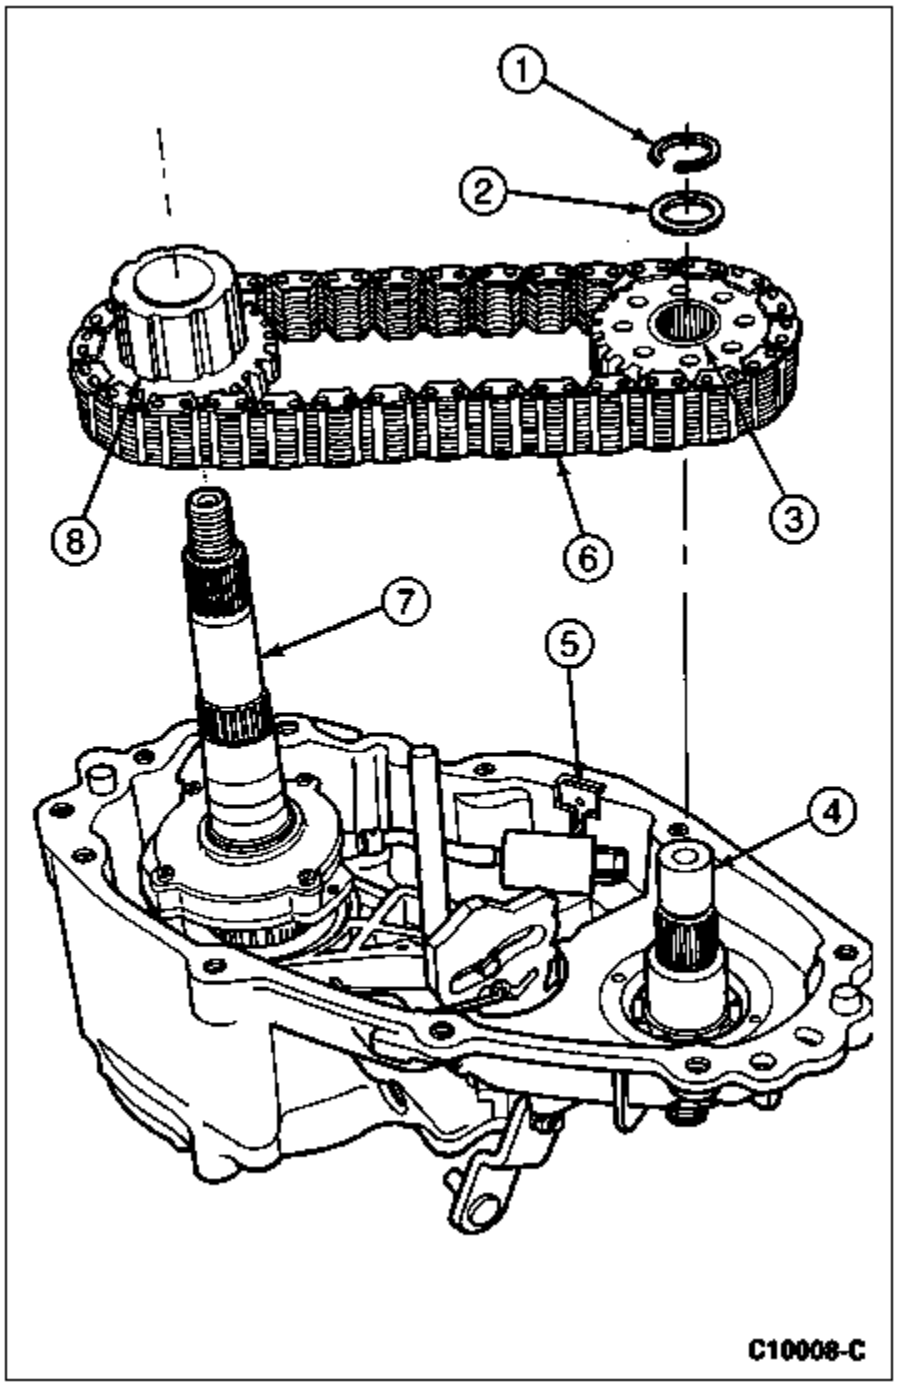
12. If required, disassemble the 2W-4W lockup, remove the internal snap ring and pull the lockup collar and spring from the lockup sleeve.



13. Remove the external snap ring and thrust washer (7119) that retains the driven sprocket to the front

output shaft.

14. Remove the chain, driven sprocket and drive sprocket as an assembly.

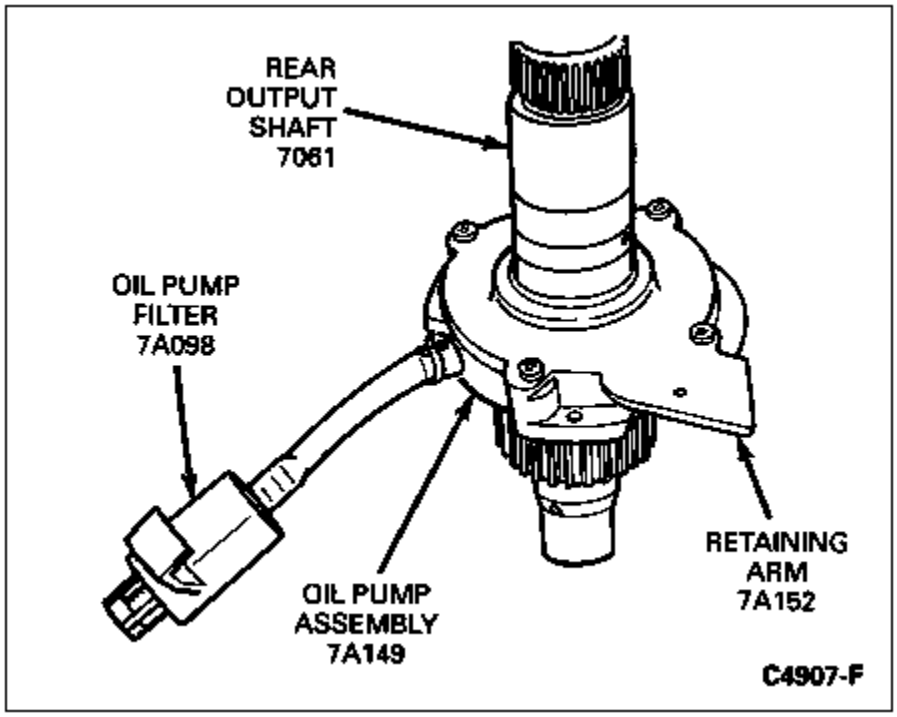


Item	Part Number	Description
1	7917	External Snap Ring
2	7119	Thrust Washer

3	7177	Driven Sprocket
4	7061	Output Shaft (Front)
5	7L027	Oil Pan Magnet
6	7A029	Chain
7	7061	Output Shaft (Rear)
8	7177	Drive Sprocket

15. Remove the oil pan magnet (7L027) from the slot in the front case bottom.

16. Remove the rear output shaft and oil pump as an assembly.



17. **CAUTION: If there is removal resistance, do not pound or use force to disassemble the pump; start over again.**

    If required, rotate the pump to align the cover keyway to shaft pin of the output shaft and pull the pump assembly straight out.

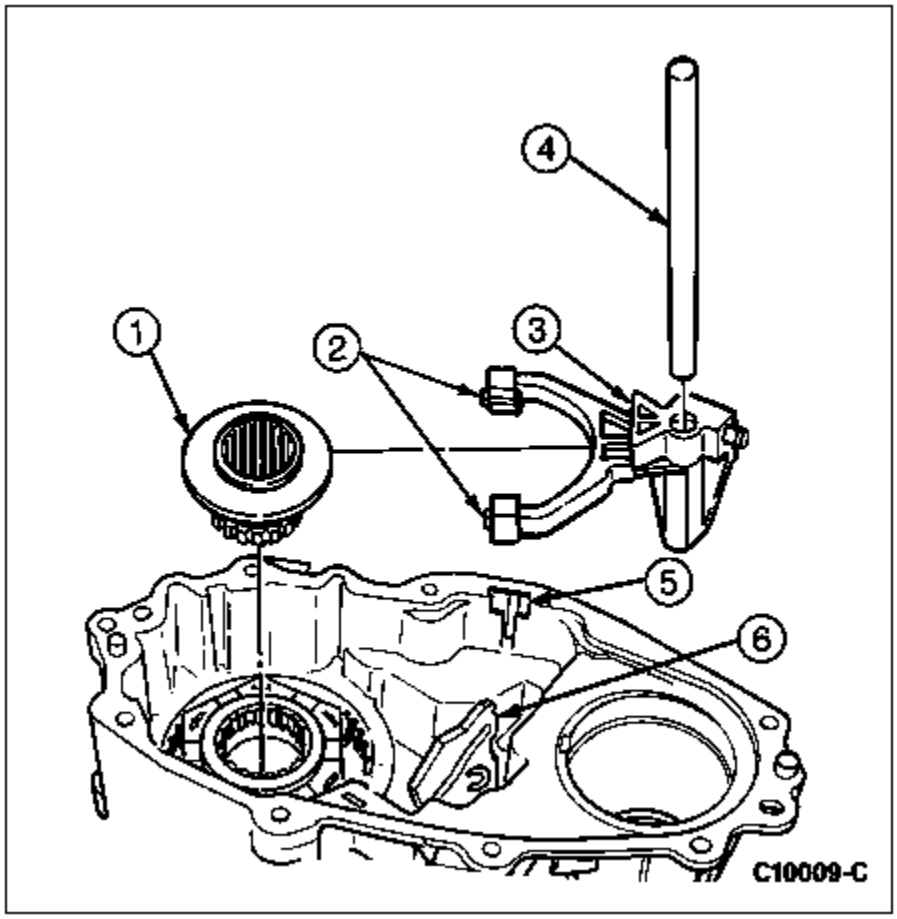
18. If necessary to replace the oil pump drive pin, perform the following.

    - Measure **and record** the drive pin height above the output shaft diameter. This information is required for installing the new drive pin.
    - Remove the drive pin from the output shaft.

19. Remove the front output shaft.

20. Pull out the shift rail.

21. Slip the high-low range shift fork out of the inside track of the shift cam and remove the high-low shift fork and reduction hub together.



Item	Part Number	Description
1	7D164	Reduction Hub
2	—	Nylon Wear Pads (Part of 7289)
3	7289	High-Low Shift Fork
4	7240	Shift Rail
5	7L027	Oil Pan Magnet
6	7F063	Shift Cam

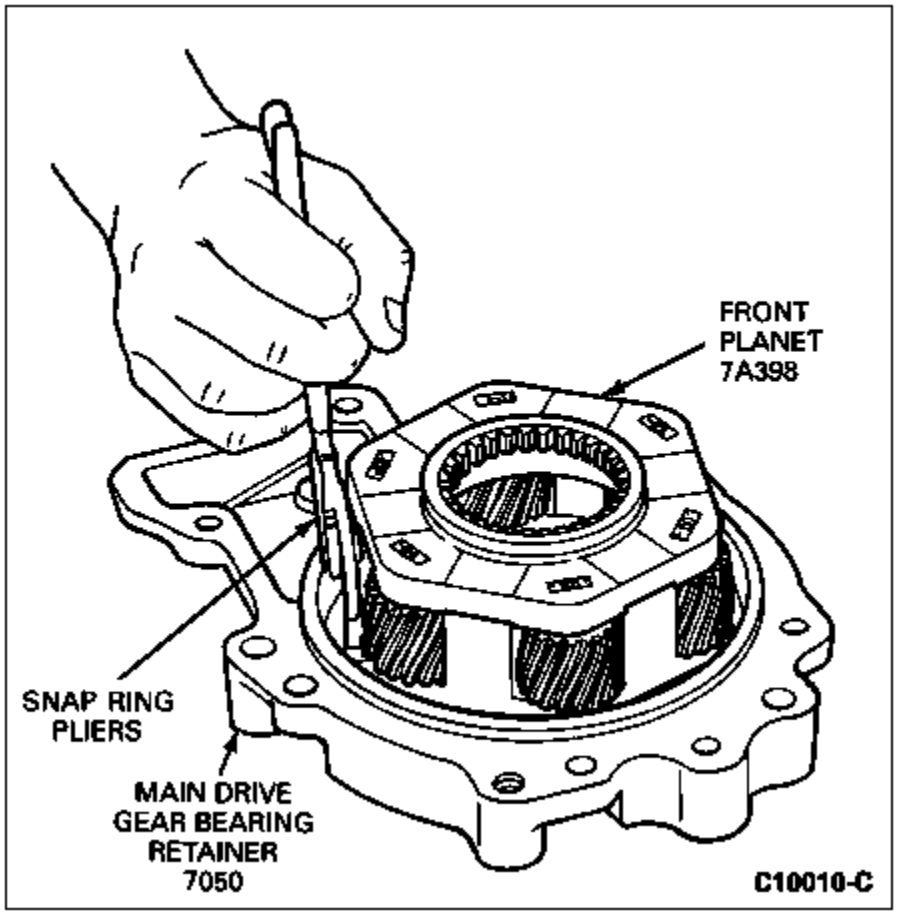
22. Push and pull out the anchor end of the assist spring from the locking post in the front case half. Remove the assist spring and roller out of the shift cam.

23. Turn the front case over and remove the six 10mm bolts retaining the main drive gear bearing retainer (7050) to the front case. Remove the main drive gear bearing retainer, input shaft (7017) and front planet (7A398) as an assembly.

24. Expand the tangs of the large snap ring in the main drive gear bearing retainer. With the input shaft

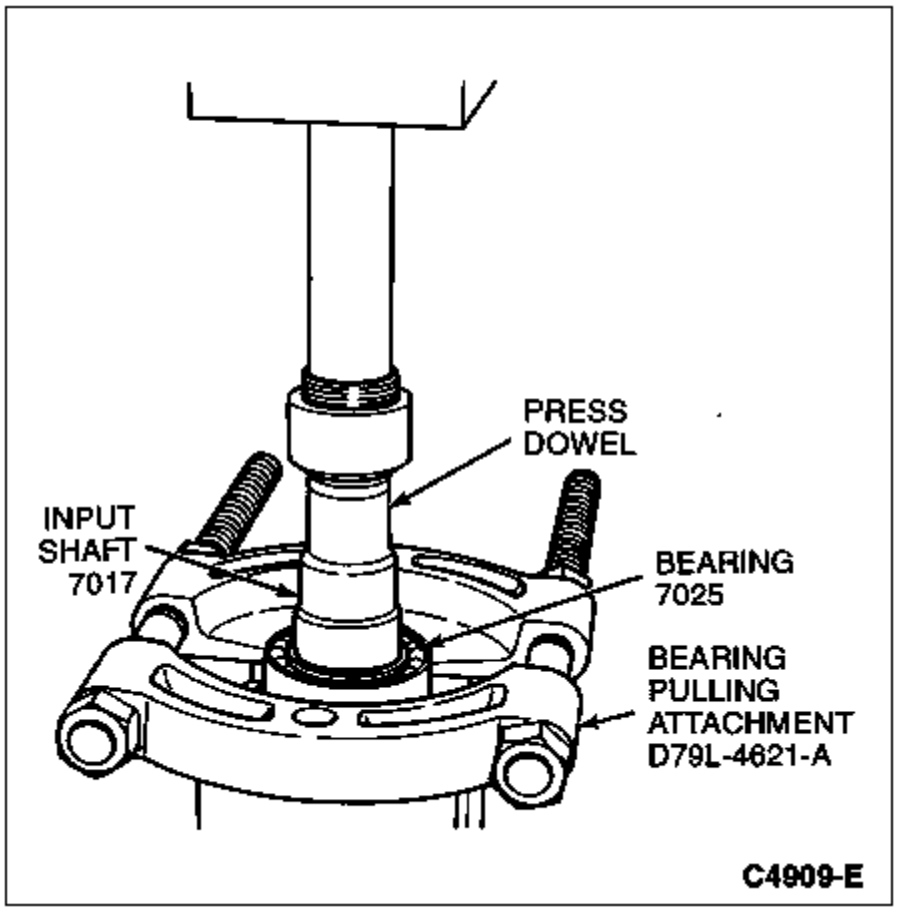
against a bench, push the main drive gear bearing retainer down and slide it off the bearing. Lift the input shaft and front planet from the main drive gear bearing retainer.

25. If required, remove the yoke to flange seal from the main drive gear bearing retainer by prying and pulling on the curved-up lip of the yoke to flange seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.



26. Remove the internal snap ring from the planetary carrier and separate the front planet from the input shaft.

27. Remove the external snap ring from the input shaft. Place the input shaft in a press and remove the bearing from the input shaft using Bearing Pulling Attachment D79L-4621-A or equivalent. Remove the thrust washer, thrust plate and sun gear off the input shaft.

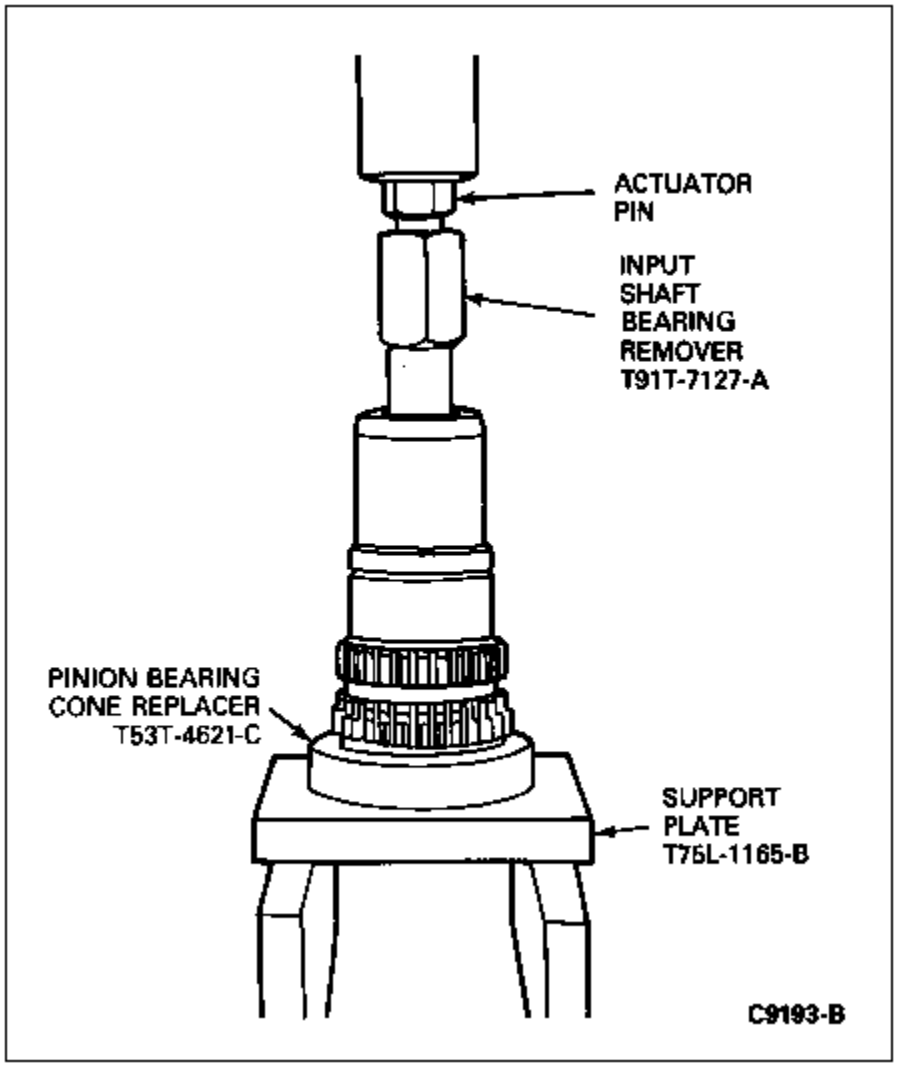


28. Inspect the bushing and needle bearing in the end of the input shaft for wear or damage.

29. **NOTE: Under normal use, the needle bearing and bushing should not require replacement. If replacement is required, the bushing and needle bearing must be replaced as a set.**

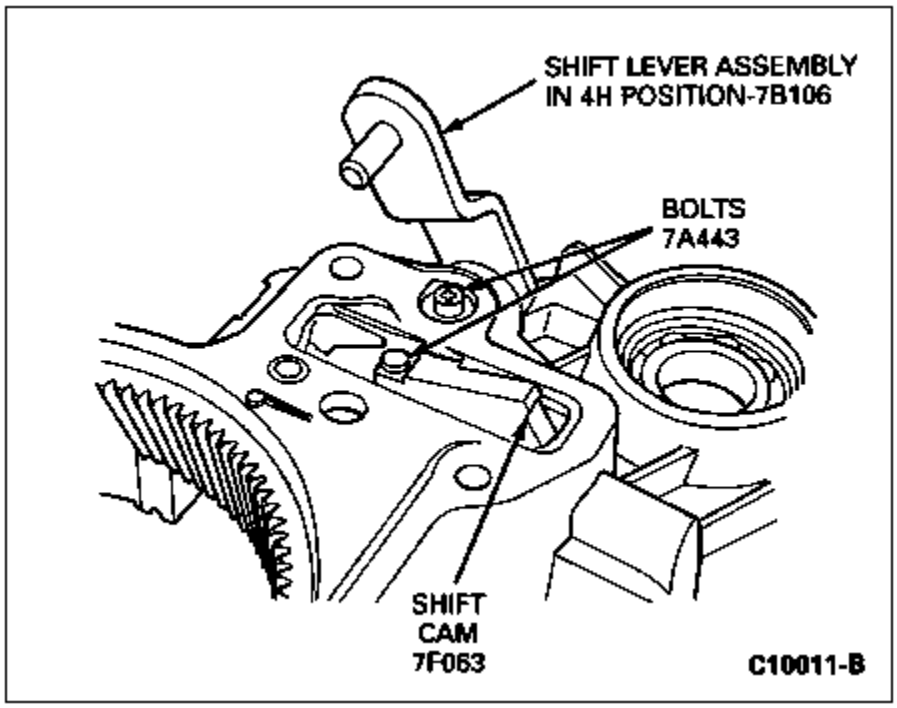
    If replacement of the needle bearing and bushing is required, press the bearing and bushing out as follows:

    a. Position the input shaft on Support Plate T75L-1165-B and Pinion Bearing Cone Replacer T53T-4621-C as a spacer.
    b. Insert Input Shaft Bearing Remover T91T-7127-A into the input shaft so it is resting on top of the bearing cage.
    c. Tighten the actuator pin until it stops, then press the bearing and bushing out together.



30. Move the shift lever by hand down to the 4L position, then up two detents to the 4H position. Mark a line on the outside of the front case using the side of the shift lever and a grease pencil.

31. Remove the two Torx® head bolts from the front case and from shift cam.



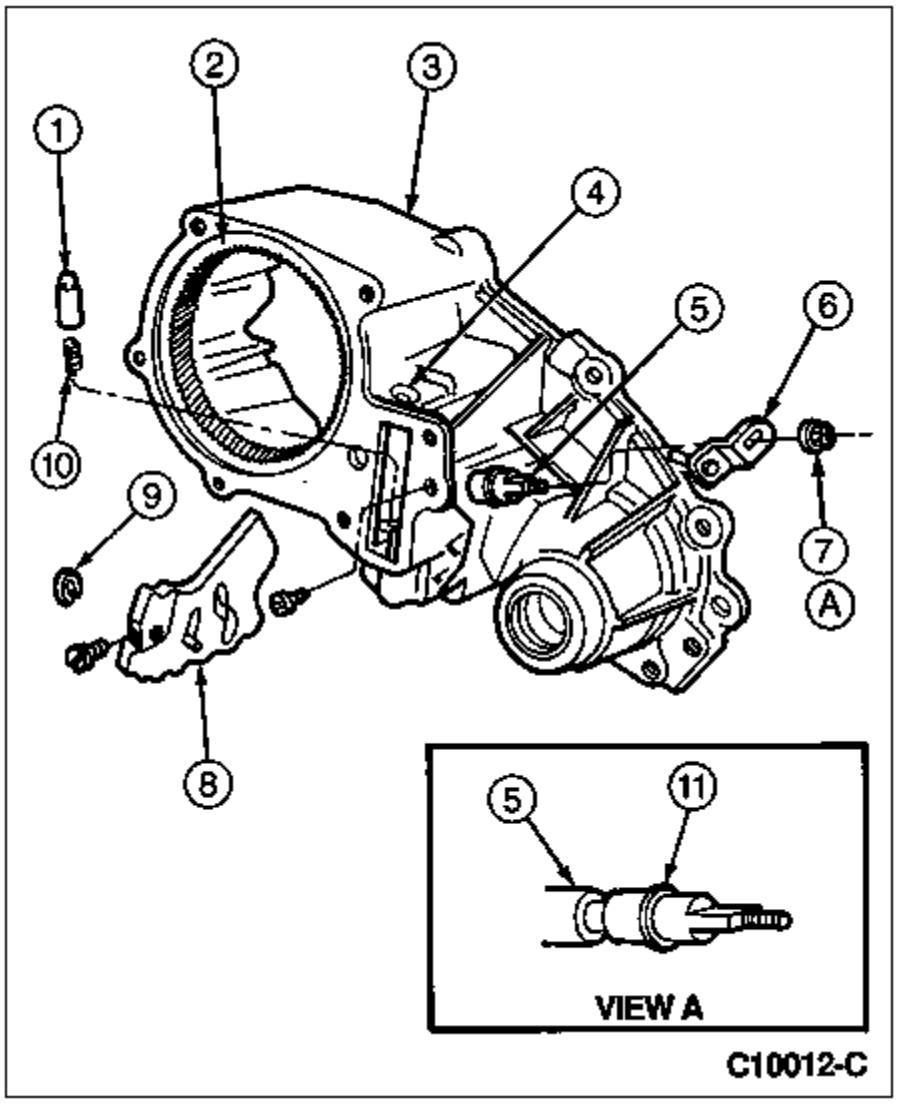
32. **NOTE: Do not pound on the external clip during removal.**

    NOTE: The shift lever and shift cam do not have to be disassembled unless the parts have to be replaced.

    Turn the front case over and remove the C-clip. With the aid of a screwdriver, pry the shift shaft out of the front case and shift cam.

33. Remove the O-ring from the second groove in the shift shaft and discard O-ring.

34. Remove the detent plunger and detent spring from the inside of the front transfer case.

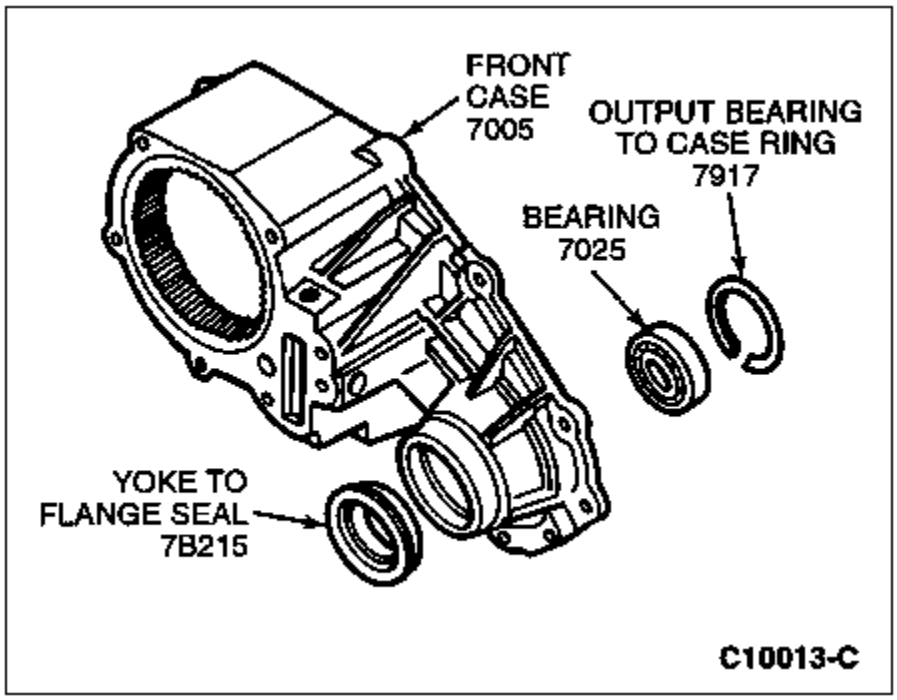


Item	Part Number	Description
1	7233	Detent Plunger
2	7A153	Ring Gear
3	7005	Case (Front)
4	7E440	Four-Wheel Drive Switch
5	7N095	Shift Shaft
6	7B106	Shift Lever
7	N620481-S2	Nut
8	7F063	Shift Cam
9	387949-S	C-Clip
10	7219	Detent Spring
11	7288	Shifter Shaft Seal
A	—	Tighten to 26-35 Nm (19-26 Lb-Ft)

35. If required, remove the ring gear (7A153) from the front case half using press. Note the relationship of the serrations to the chamfered pilot diameter during removal.

36. If required, remove the front yoke to flange seal by prying and pulling on the curved-up lip of the yoke to flange seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.

37. If required, remove the internal snap ring and drive the bearing out of the front case bore using Step Plate D80L-630-A or equivalent with a drift.



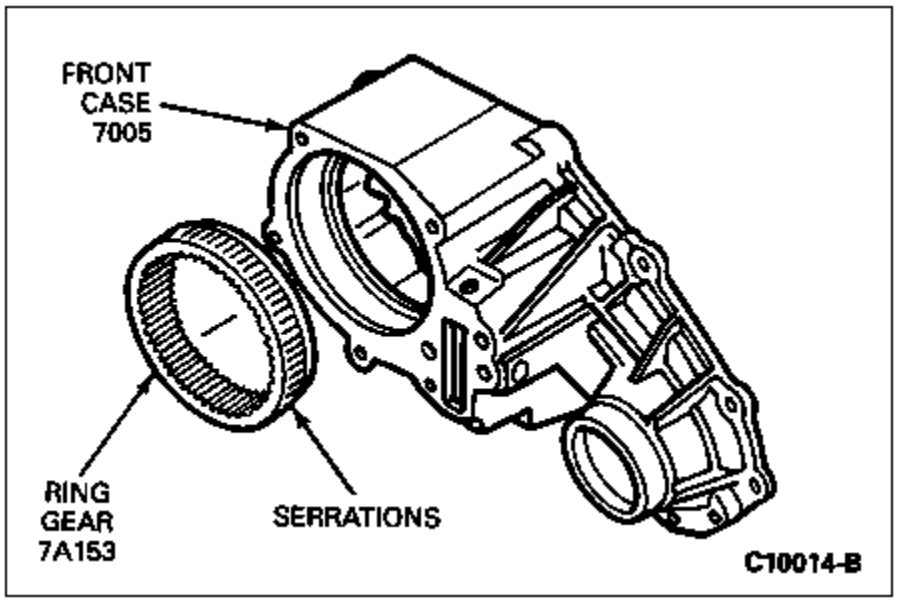
Assembly

Before assembly, lubricate all parts with Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent.

1. If removed, drive the bearing into the front output case bore using Output Shaft Bearing Replacer T83T-7025-B and Driver Handle T80T-4000-W. Drive the bearing in straight, making sure that it is not cocked in the bore. Install the internal snap ring that retains the bearing to the front case.

2. If removed, install the front yoke to flange seal in the front case bore using Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.

3. If removed, install the ring gear in the front case. Align the serrations on the outside diameter of the ring gear to the serrations previously cut in the front case bore. Using a press, start the piloted chamfered end of the ring gear first and press in until it is fully seated. Make sure the ring gear is not cocked in the bore.



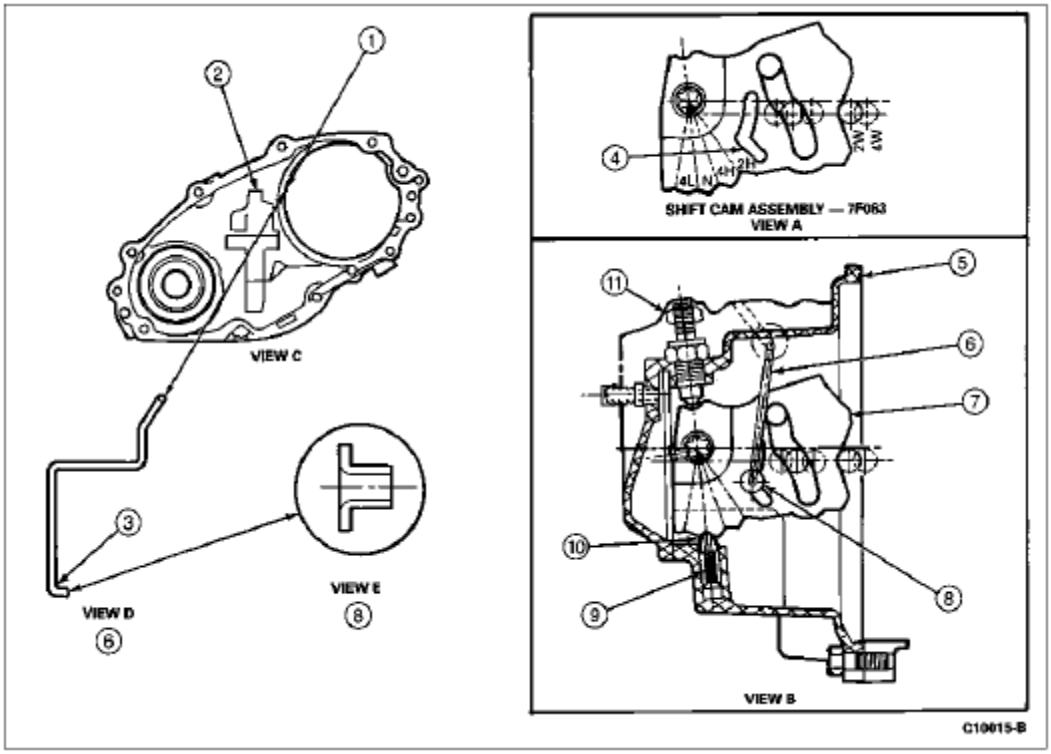
4. Install the detent spring and the detent plunger into the bore from the inside of the front case.

5. **NOTE: Use a rubber band to fill the first groove so as not to cut the O-ring. Discard the rubber band.**

   Fill the second groove of the shift shaft with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B and install a new O-ring.

6. After the shift cam, shift shaft and C-clip have been installed in the front case and with the shift shaft positioned in the 4H detent position, place the assist spring roller into part-position on the 90 degree bent tang of the assist spring (Views D and E) and insert the assist roller into the assist spring/roller slot of the shift cam (Views A and B). Position the middle section of the assist spring into the groove of the front case pivot boss (Views C and D) and push to lock the upper end of the assist spring behind the front case spring anchor tab (Views C and D).

Shift Cam Installation

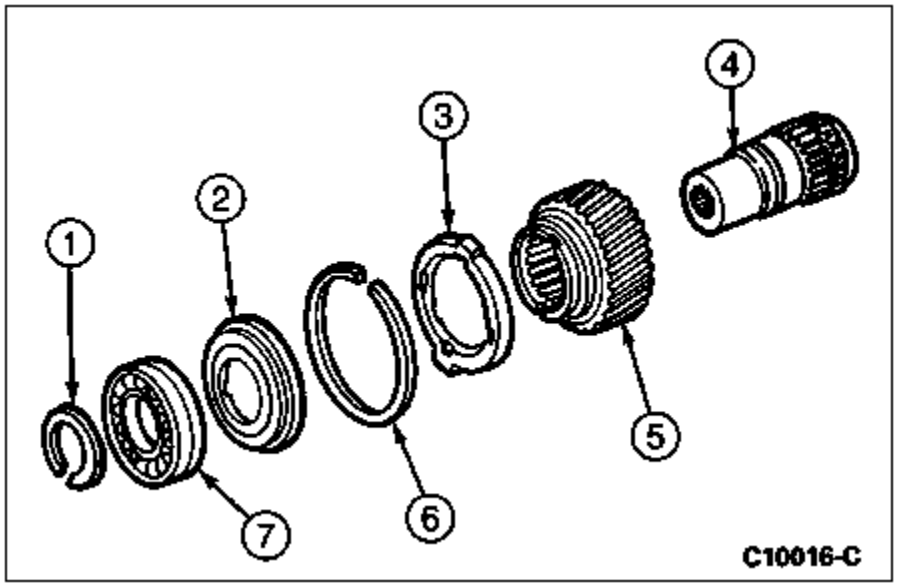


Item	Part Number	Description
1	—	Anchor Tab Assist Spring (Part of 7C349)
2	—	Pivot Boss Assist Spring (Part of 7C349)
3	—	90 Degree Bent Tang (Part of 7C349)
4	—	Assist Spring Roller Slot (Part of 7F063)
5	7005	Case (Front)
6	7C349	Assist Spring
7	7F063	Shift Cam
8	7C191	Roller, 4L Assist
9	7219	Detent Spring
10	7233	Detent Plunger
11	7E440	Four-Wheel Drive Indicator Switch

7. Install the two Torx® head bolts in the front case and in the shift cam. Tighten the screws to 7-10 Nm (60-84 lb-in). Make sure that bolt in the front case is in the first groove of the shift shaft and not bottomed against the shaft itself. The shift shaft should be able to move freely at all detent positions.

8. **NOTE: The sun gear recessed face and the snap ring groove on the bearing outer race should be toward the rear of the transfer case. The stepped face of the thrust washer should face toward the bearing.**

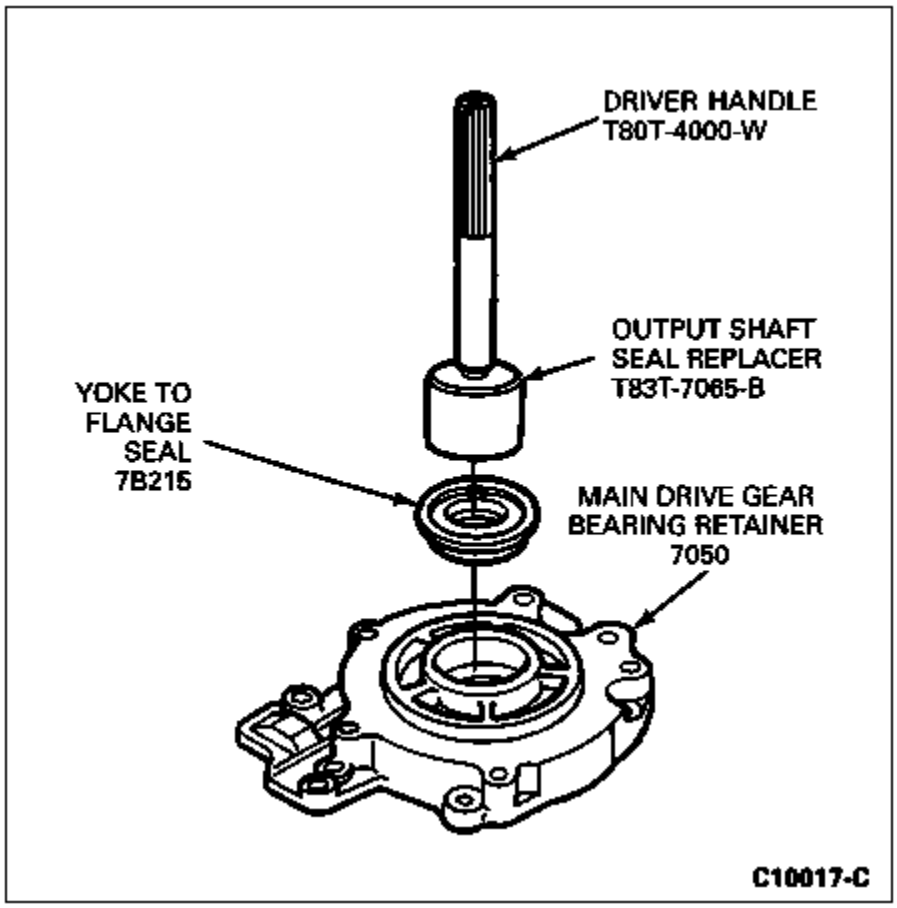
   Slide the sun gear, thrust plate and thrust washer into position on the input shaft. Press the bearing over the input shaft and install the external snap ring to the input shaft.



Item	Part Number	Description
1	7917	External Snap Ring
2	7119	Thrust Washer
3	7B066	Thrust Plate
4	7017	Input Shaft
5	7D063	Sun Gear
6	7064	Snap Ring (Internal)
7	7025	Bearing

9. Install the front planet to the sun gear and input shaft. Install the internal snap ring to the planetary carrier.

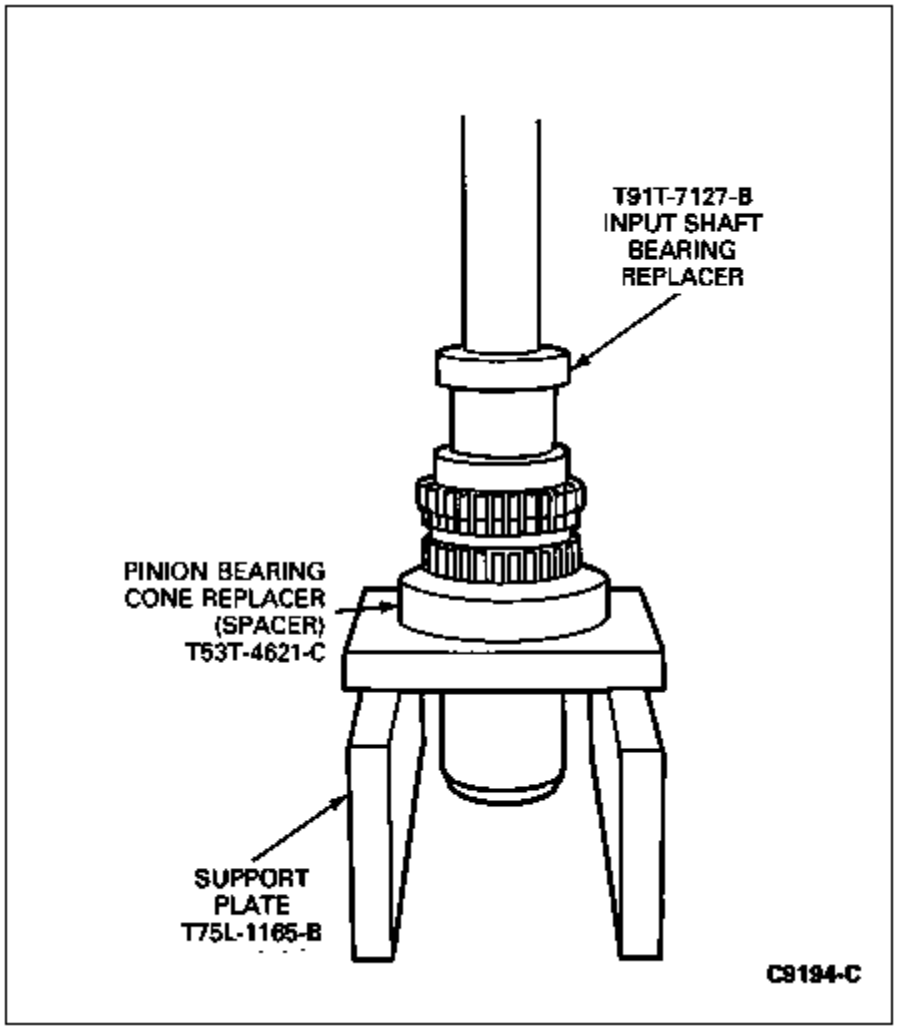
10. If removed, install the yoke to flange seal into the mounting adapter bore using Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.



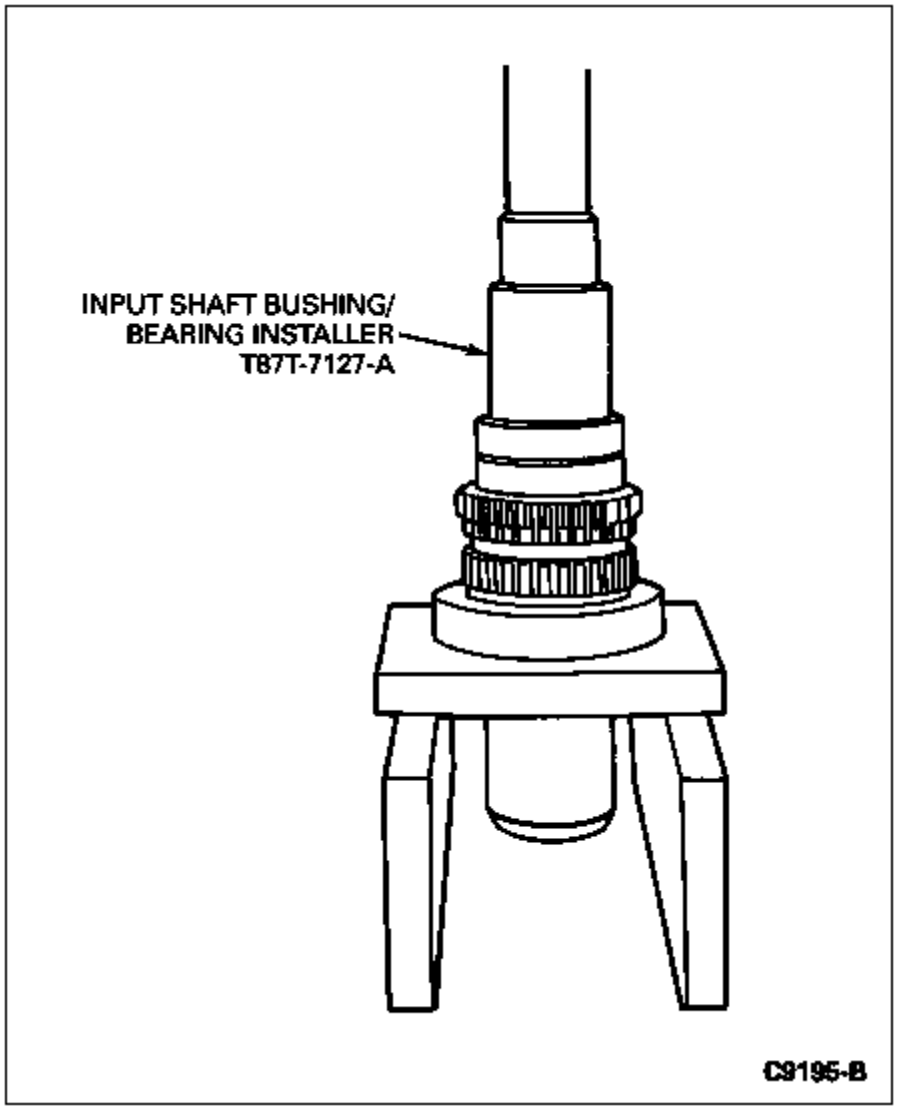
11. **NOTE: If the input shaft needle bearing and bushing were removed, install a new bearing and bushing as detailed in the following steps.**

    Press a new needle bearing, then a new bushing in the input shaft as follows:

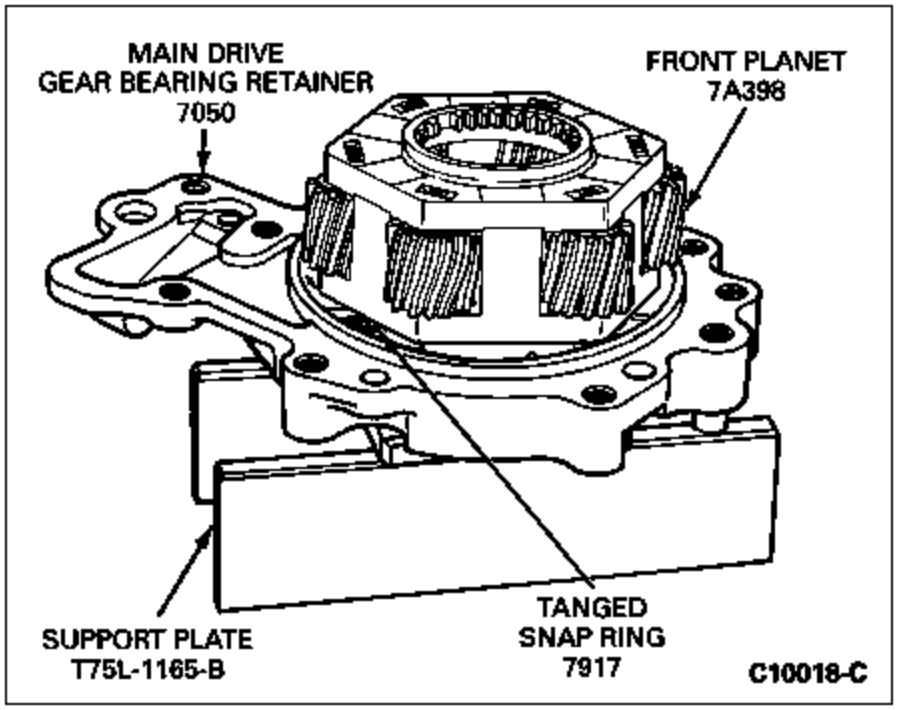
    a. Position the input shaft on Support Plate T75L-1165-B or equivalent and Pinion Bearing Cone Replacer T53T-4621-C as a spacer.
    b. Using Input Shaft Bearing Replacer T91T-7127-B press a new needle bearing into the end of the input shaft until it seats in the input shaft.



c. Press in a new bushing using Input Shaft Bushing Bearing Replacer T87T-7127-A.



12. Place the tanged snap ring in the groove of the main drive gear bearing retainer. Using Support Plate T75L-1165-B, place the input shaft and front planet in the main drive gear bearing retainer and expand the tanged snap ring while pushing inward until the front planet and input shaft are seated in the main drive gear bearing retainer. When properly seated, the tanged snap ring will snap into place. Check installation by holding the main drive gear bearing retainer by hand and carefully tapping the face of the input shaft against a wooden block to make sure that the snap ring is engaged.



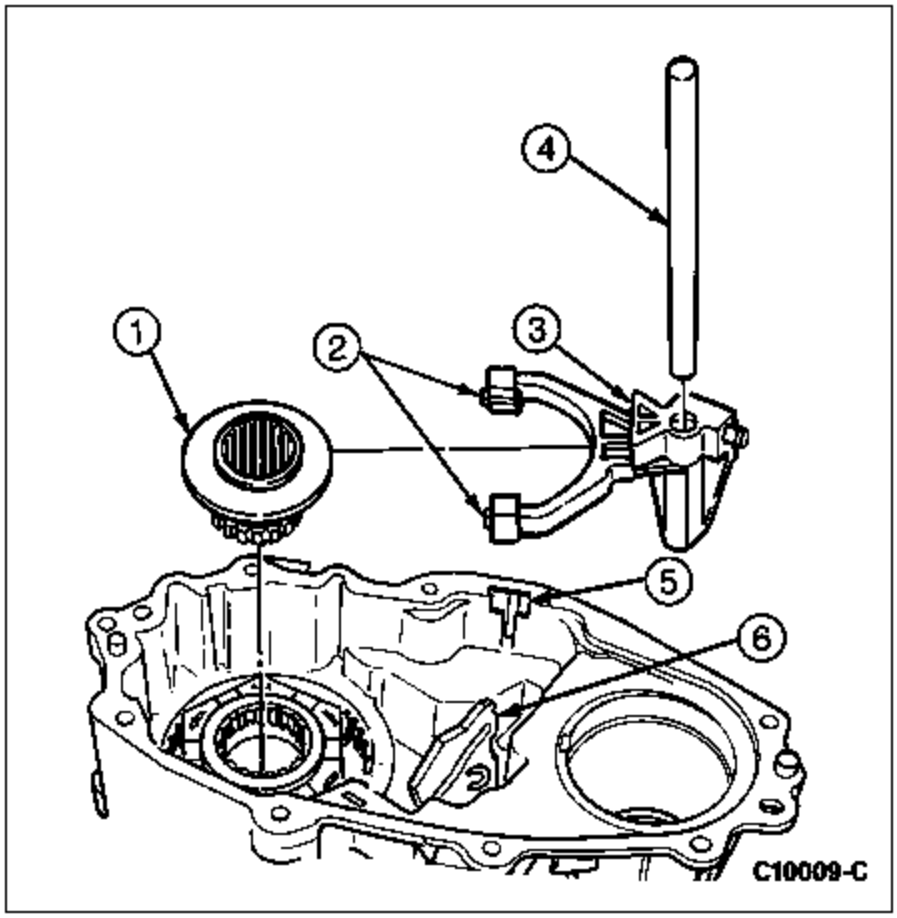
13. Remove all traces of RTV gasket sealant from the mating surfaces of the front case and main drive gear bearing retainer. Install a bead of RTV gasket sealant on the surface of the front case. Use Black Non-Acid Cure Silicone Rubber E7TZ-19562-A or equivalent meeting Ford specification ESL-M4G273-A.

14. Position the main drive gear bearing retainer on the front case. Install six bolts and tighten to 31-41 Nm (23-30 lb-ft).

15. **NOTE: Make sure the nylon wear pads are installed on the shift fork and snapped securely into place.**

    Install the high-low shift fork and reduction hub on the output shaft together, and slip the high-low shift fork roller bushing into the high-low roller track of the shift cam.

16. Install the shift rail through the high-low fork and make sure the shift rail is seated in the bore in the front case. Using the shift lever, position the high-low shift fork in the 4H position.



Item	Part Number	Description
1	7D164	Reduction Hub
2	—	Nylon Wear Pads (Part of 7289)
3	7289	High-Low Range Shift Fork
4	7240	Shift Rail
5	7L027	Oil Pan Magnet
6	7F063	Shift Cam

17. If removed, press a new pin into the rear output shaft pin hole to the same height or 1mm (0.040 inch) (**minimum**) above the diameter of the rear output shaft.

18. **NOTE: Do not disassemble oil pump, as it is serviced only as an assembly.**

    NOTE: Do not remove the plastic insert from the bore of the new pump. Discard it after it slides out during pump installation to the output shaft.

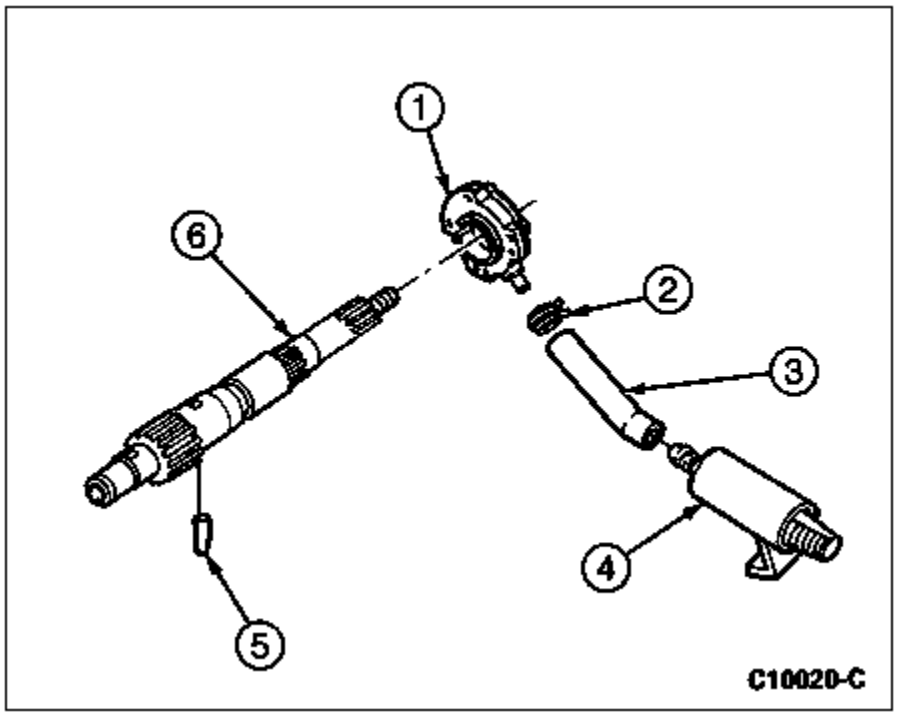
    NOTE: While turning the output shaft, prime the pump through the oil filter pick-up tube or housing inlet hole with clean MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid.

    If pump does not turn freely after installation to the output shaft, re-align the cover keyway to pin of

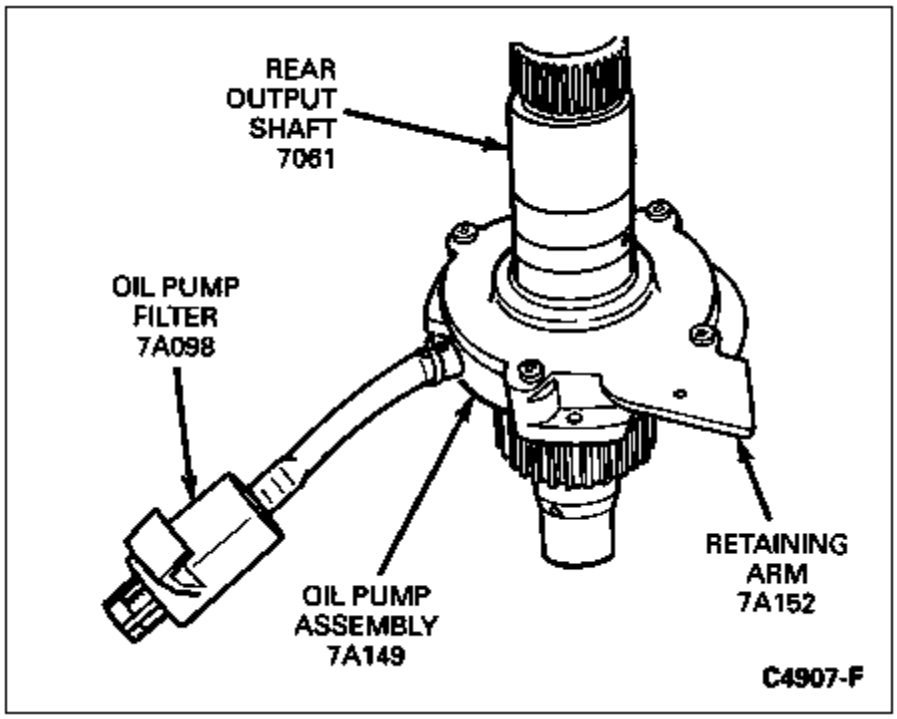
the output shaft and jiggle the pump until it fully seats and rotates freely.

If a new pump is used, slide the pump housing slot onto the pin of the output shaft with the retaining arm of the pump cover toward the rear of the case. If the pump does not rotate freely, follow the direction in the above paragraph.

Inspect outside surfaces and bore of the oil pump. If there is no discoloration in the pump housing, gear or cover, and the pump bore and the lube holes of the output shaft show evidence of oil, the pump is working. Hand align the keyways and the bores of the housing, gear and cover and slide the pump onto the pin of the output shaft with the retaining arm of the cover toward the rear of the case.



Item	Part Number	Description
1	7A149	Pump Body
2	382846-S	Clamp
3	7A210	Hose
4	7A098	Filter/Pickup
5	7A250	Pin
6	7061	Output Shaft (Rear)



19. Install the output shaft and oil pump in the input shaft. Make sure the external splines of the output shaft engage the internal splines of the lockup hub. Make sure the oil pump retainer arm and the oil filter leg are in the groove and notch of the front case.

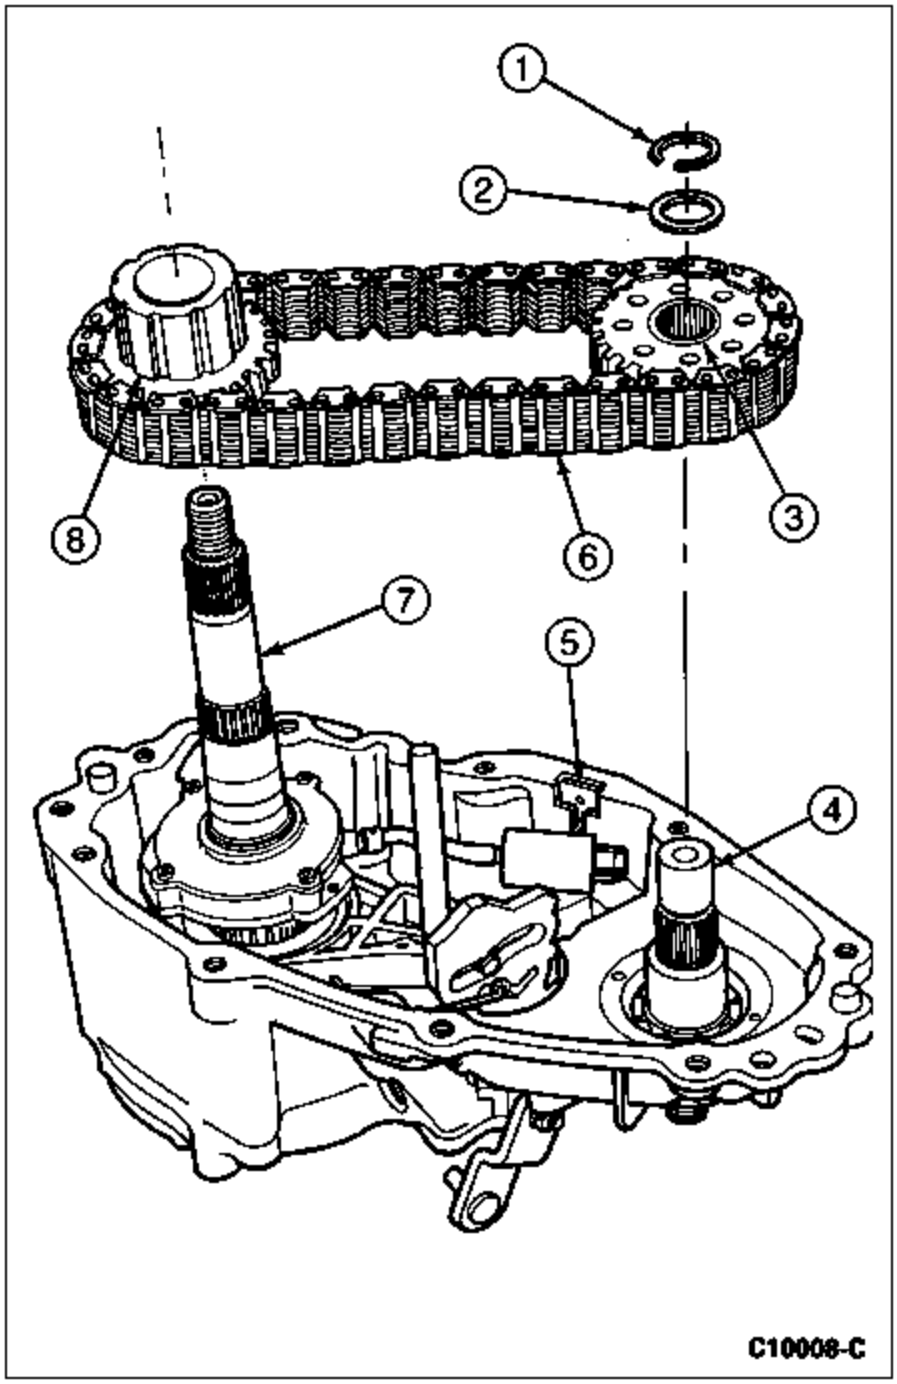
20. Install the oil pan magnet in the slot in the front case just above the oil filter leg.

21. Install the front output shaft in the front case.

22. **NOTE: The driven sprocket (on the output shaft) must be installed with the marking "REAR" facing toward the rear case, if so marked.**

    Install the chain, drive sprocket and driven sprocket as an assembly over the output shafts.

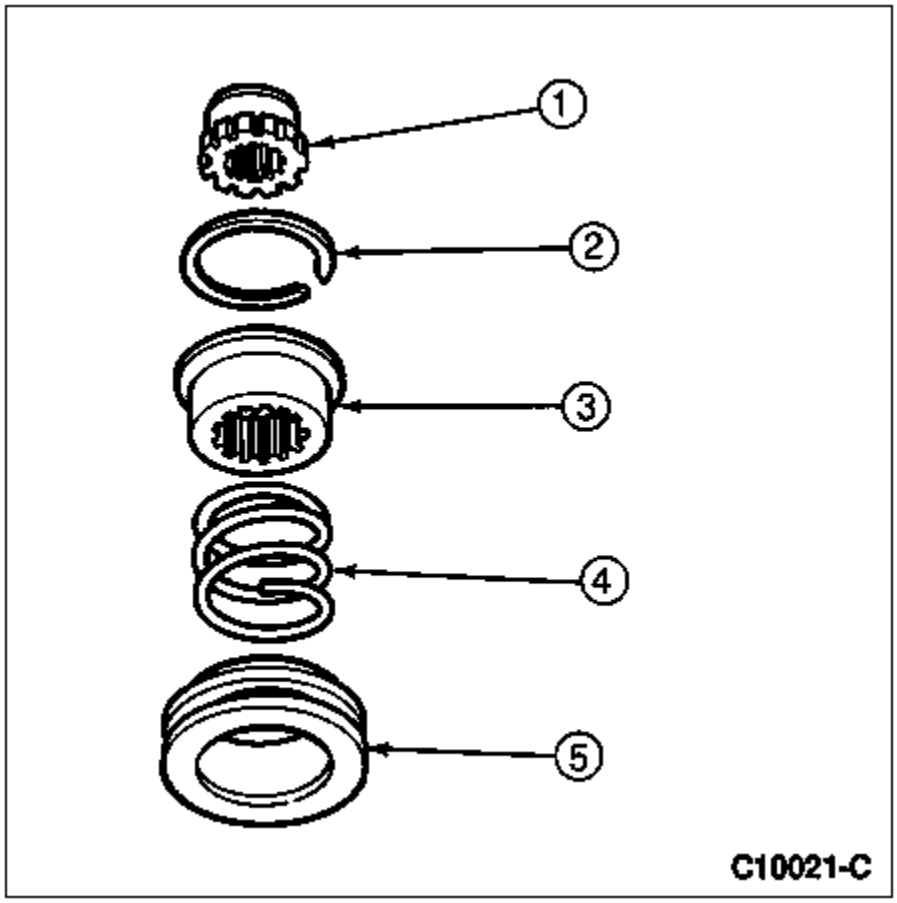
23. Install the thrust washer on the front output shaft and install a new external snap ring over the thrust washer to retain the driven sprocket.



Item	Part Number	Description
1	7917	External Snap Ring
2	7119	Thrust Washer
3	7177	Driven Sprocket
4	7061	Output Shaft Front
5	7L027	Oil Pan Magnet
6	7A029	Chain

7	7061	Output Shaft (Rear)
8	7177	Drive Sprocket

24. If disassembled, assemble the 2W-4W lockup assembly. Install the spring in the lockup sleeve. Place the lockup collar over the spring and engage the lockup collar in the notches in the lockup sleeve. Retain the lockup collar in the lockup sleeve with an internal snap ring.



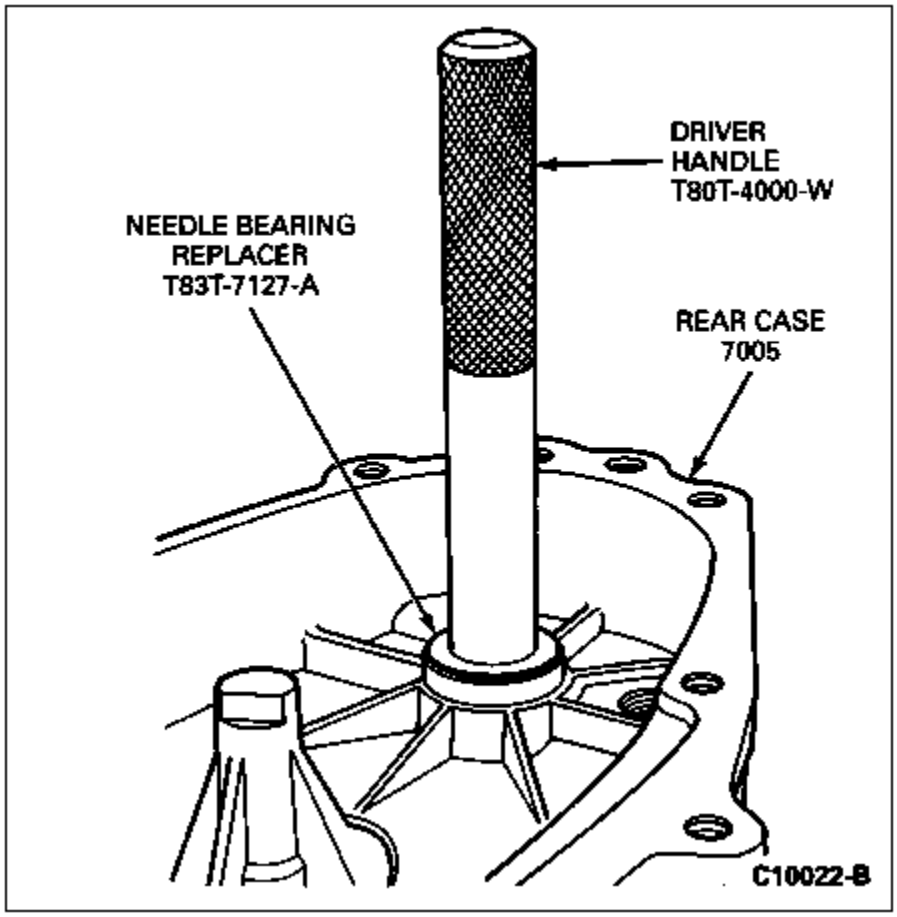
Item	Part Number	Description
1	—	Lockup Hub (Part of 7D164)
2	7917	Snap Ring
3	7D164	Lockup Collar
4	7D126	Lockup Spring
5	7106	Lockup Sleeve

25. Install the 2W-4W shift fork and lockup over the output shaft and onto the shift rail.

26. Install the lockup hub to the output shaft.

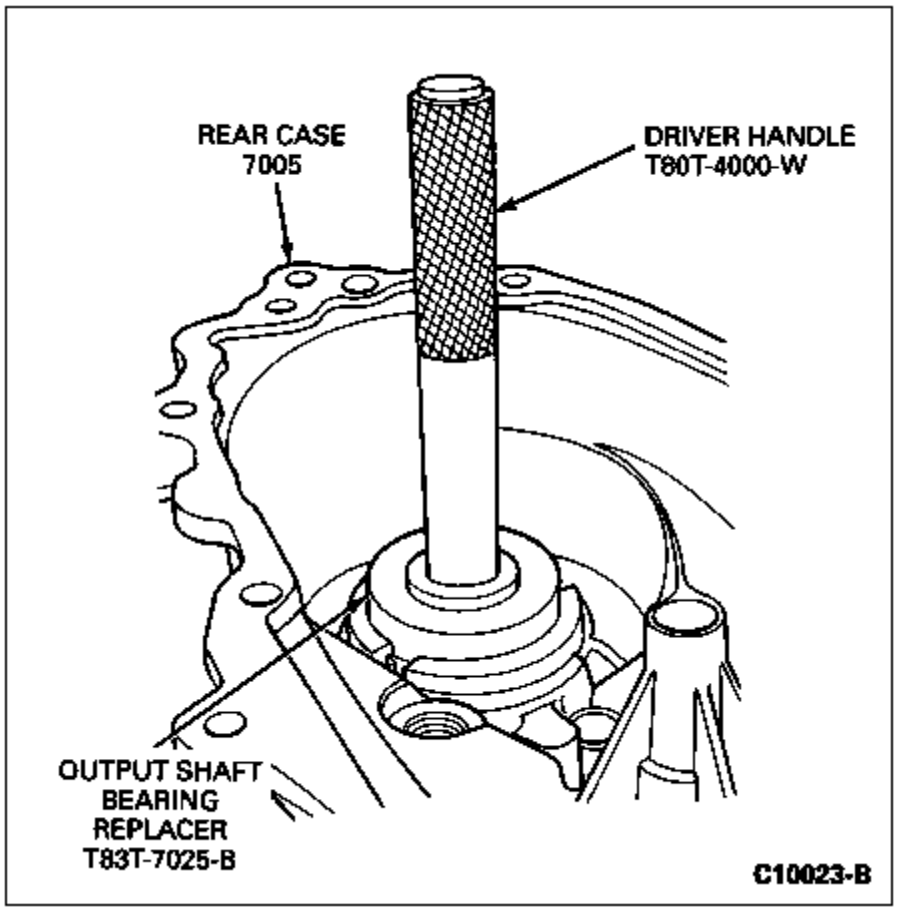
27. If removed, drive the caged needle bearing into the rear case bore with Needle Bearing Replacer

T83T-7127-A and Driver Handle T80T-4000-W.



28. If removed, install the bearing in the rear case bore. Drive the bearing into the rear case bore with Output Shaft Bearing Replacer T83T-7025-B and Driver Handle T80T-4000-W. Make sure the bearing is not cocked in the bore.

29. Install the internal snap ring that retains the bearing to the case.



30. Prior to the final assembly of rear case to front case half, the transfer case shift shaft should be shifted into the 4H detent position to ensure positioning of the shift rail to the rear case.

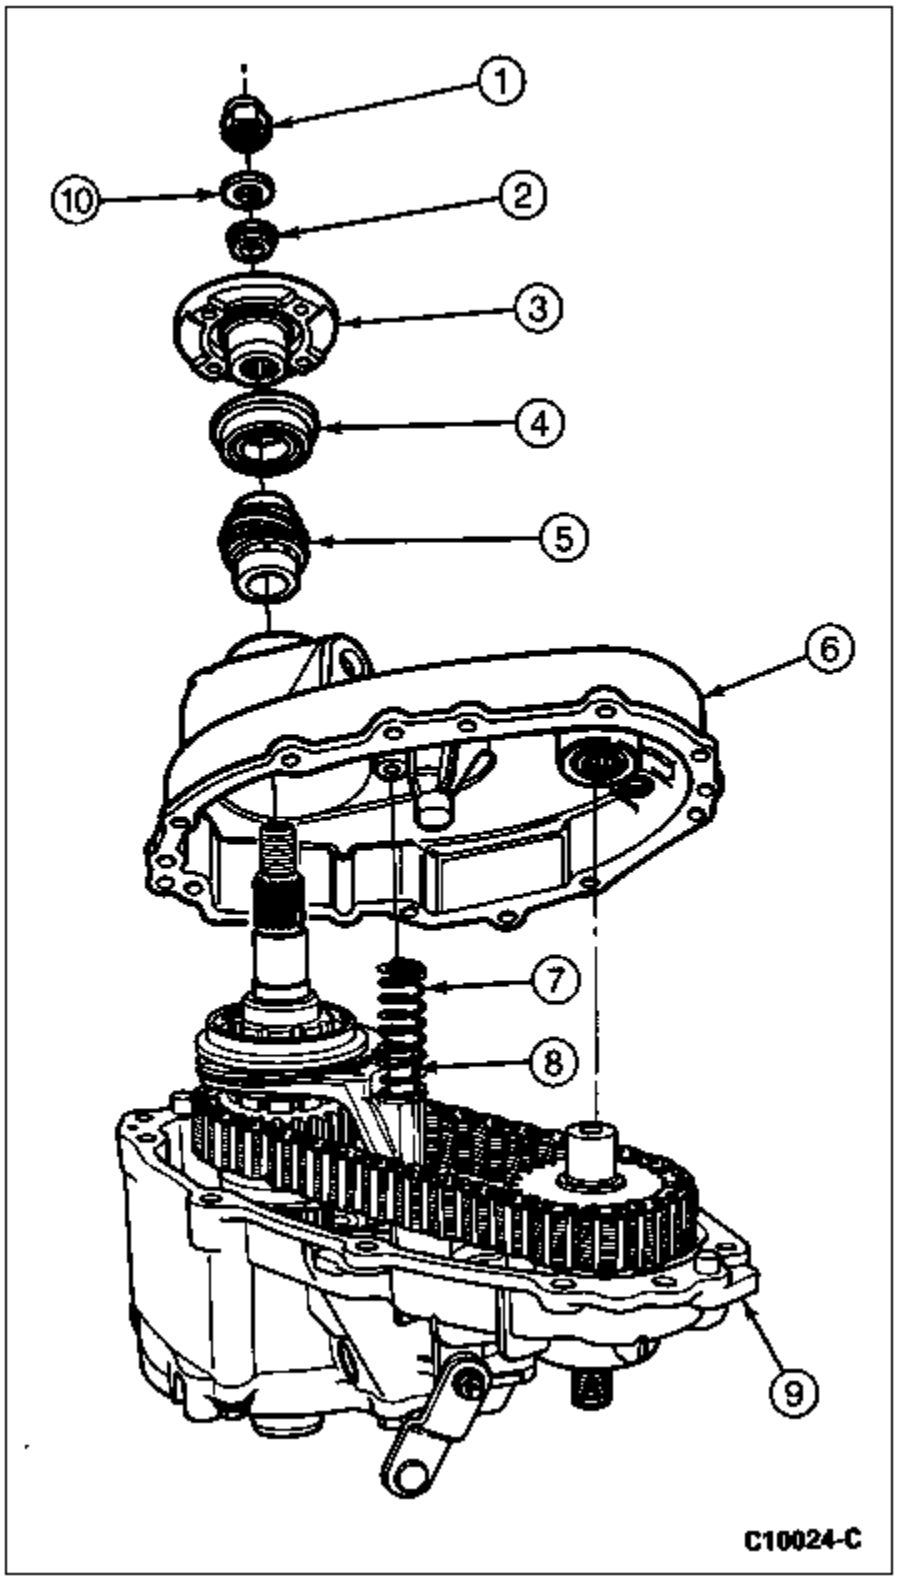
31. Coat the mating surface of the front case with a bead of Black Non-Acid Cure Silicone Rubber E7TZ-19562-A or equivalent meeting Ford specification ESL-M4G273-A.

32. Install the lockup return spring to the shift rail and shift fork with lockup return spring mounted in a vertical position.

33. **NOTE: If the rear case does not seat properly, move the rear case up and down slightly to permit the end of the shift rail to enter the shift rail hole in the rear case boss or tap the output shaft with a sharp blow using a rubber mallet in a direction away from the output shaft while pushing down on the rear case.**

    Position the rear case so that the spring boss engages the lockup return spring and shift rail. Install the nine bolts starting with the bolts on the rear case. Install the wiring harness bracket. Tighten bolts to 31-41 Nm (23-30 lb-ft).

34. Install the speedometer drive gear into the rear case bore. Drive the yoke to flange seal into the rear case bore with the Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.



Item	Part Number	Description
1	7045	Output Shaft Nut
2	7052	Input Shaft Seal

3	7B214	Case Yoke
4	7B215	Yoke to Flange Seal
5	17285	Speedometer Drive Gear
6	7005	Case (Rear)
7	7219	Lockup Return Spring
8	7240	Shift Rail
9	7005	Case (Front)
10	7B368	Output Shaft Yoke Washer

35. Install the rear case yoke on the output shaft. Install the rubber seal, output shaft yoke washer and lock nut. Tighten the nut to 339-380 Nm (250-280 lb-ft).

36. Install the frontcase yoke, rubber seal, output shaft yoke washer and locknut to the output shaft. Tighten nut to 203-244 Nm (150-180 lb-ft).

37. Install the four-wheel drive indicator switch with Teflon® tape and tighten to 35-48 Nm (26-35 lb-ft).

38. Install the drain plug and tighten to 19-30 Nm (14-22 lb-ft).

39. Place a 3/8-inch drive ratchet in the fill plug and remove the plug. Fill the transfer case with 1.2 liters (2.5 U.S. pints) of Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid. Install the fill plug and tighten to 19-30 Nm (14-22 lb-ft).

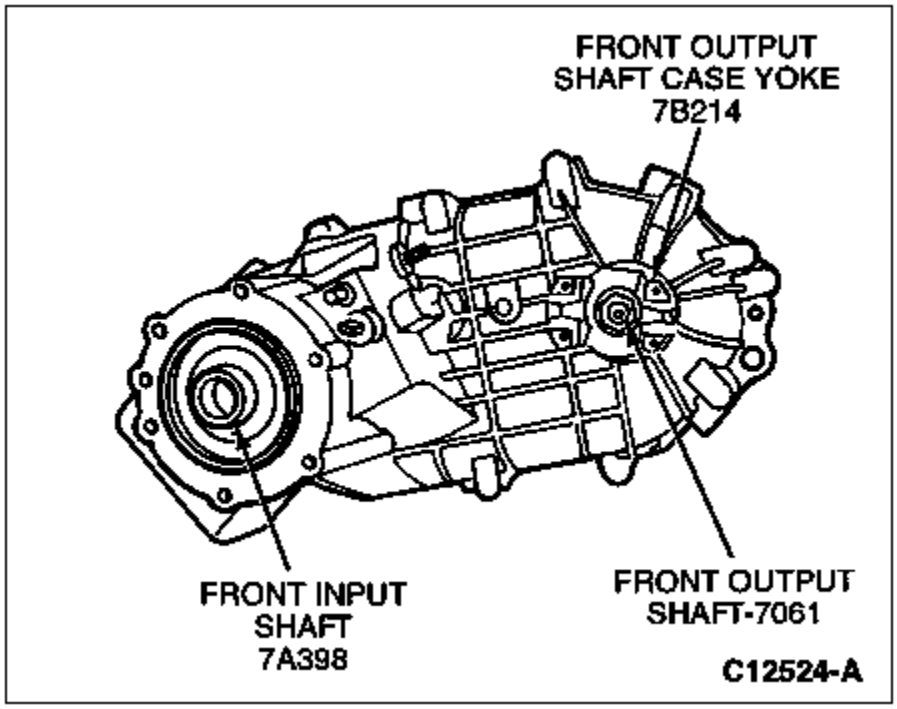
40. Install the transfer case as described in this section.

Fluid Level Check

Transfer Case

Remove the fill plug from the rear transfer case. Fluid level should be just below the fill plug. If the fluid is below the level, fill with Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent MERCON® fluid to correct level.

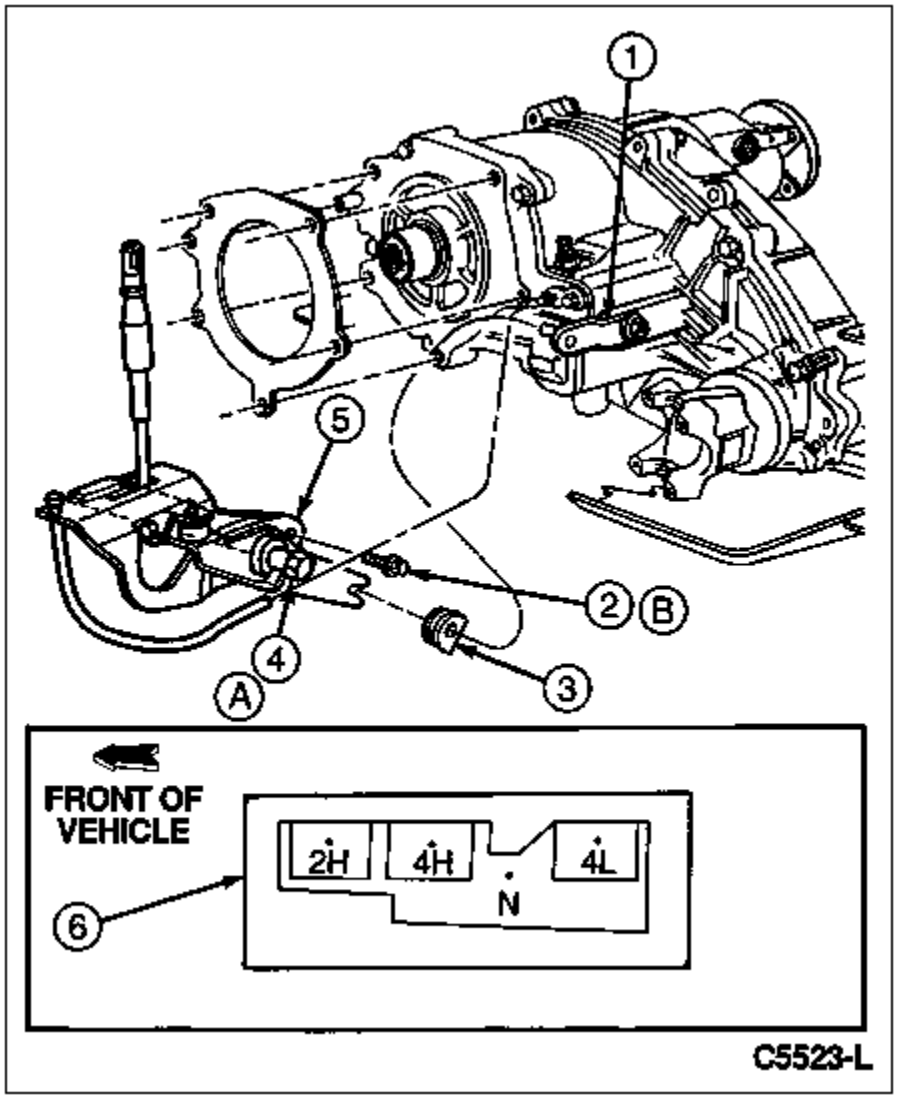
CAUTION: If the proper fill procedures are not followed, transfer case failure could result.



Linkage Adjustment

If partial or incomplete engagement of the transfer case shift lever detent occurs, or should the transfer case control assembly require removal, refer to the following procedure:

1. Raise the shift boot to expose the top surface of the cam plate.
2. Loosen bolts "A" and "B" approximately one turn. Move the transfer case shift lever to the 4L position (lever in rearmost position on cam plate as shown by the arrow).
3. Rotate the cam plate clockwise around bolt "A" until the bottom chamfered corner of the neutral lug just contacts the forward right edge of the shift lever.
4. Hold the cam plate in this position and tighten bolt "A" **first** to 94-122 Nm (70-90 lb-ft). Then tighten bolt "B" to 43-56 Nm (32-42 lb-ft).
5. Move the transfer case in-cab shift lever to all shift positions to check for positive engagement. There should be clearance between the shift lever and cam plate in the "2H" front "4H" rear (clearance not to exceed 3.30mm or 0.13 inch), and "4L" shift positions.
6. Lower the shift boot assembly onto the cam plate.



Item	Part Number	Description
1	7B106	Transfer Case Shift Lever in 4L Position

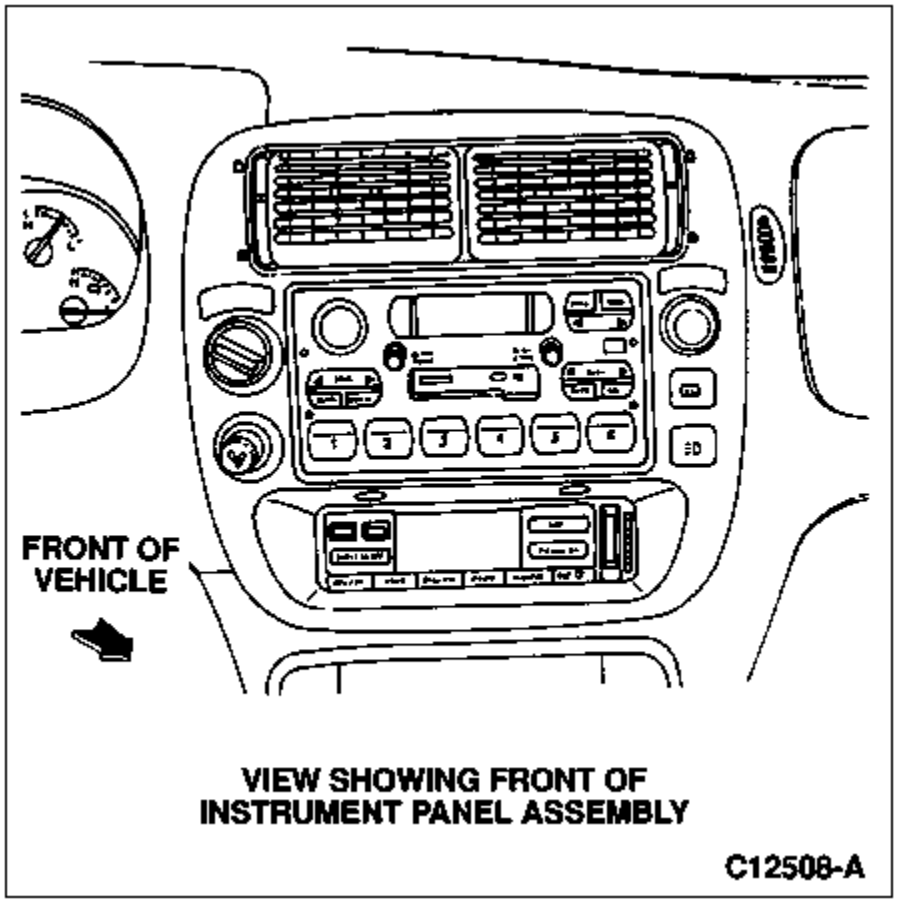
BORG-WARNER 13-54 TRANSFER CASE

Shift Control System, Electronic

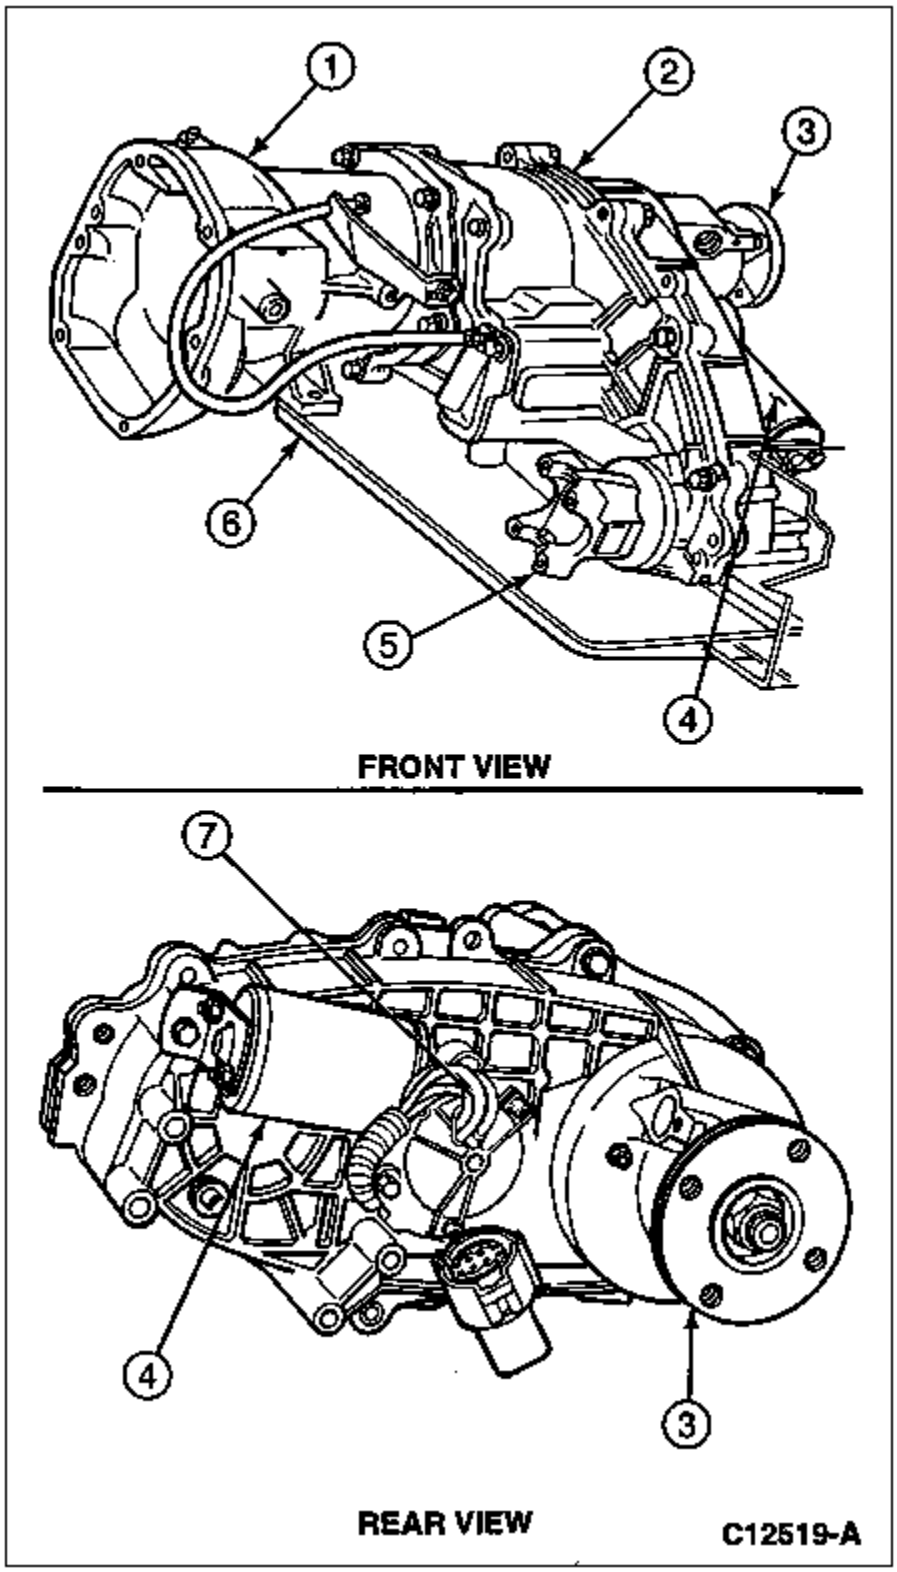
Four-wheel drive mode is selected using a rotary switch located on the instrument panel. With the vehicles ignition on, the on-board controller verifies and matches the transfer case shift motor position (i.e., 2WD, 4WD or 4WD Low) to the switch.

NOTE: To shift in and out of 4WD low, three initial conditions must be met before the shift will occur. The automatic transmission must be in neutral or the manual clutch depressed and the brake must be applied and vehicle speed must be less than 5 km/h (3 mph).



Shift Motor, Electric

The electric shift transfer case shift motor (7G360), mounted externally at the rear of the transfer case (7A195), drives a rotary helical cam which moves the 2W-4W shift fork and 4H-4L reduction shift fork to the selected vehicle drive position. An integral position sensor provides information to the electronic module on current motor position.



Item	Part Number	Description
1	7A039	Extension Housing
2	7A195	Transfer Case

3	7B214	Case Yoke, Rear
4	7G360	Transfer Case Shift Motor
5	7B214	Case Yoke, Front
6	7E063	Skid Plate
7	—	Shift Position Sensor (Part of 7G360)

Transmission Range (TR) Sensor

The TR sensor is transmission-mounted.

The Digital Transmission Range (TR) Sensor is located on the outside of the transmission at the manual lever. The TR sensor completes the start circuit in Park and Neutral, the Back-Up Lamp circuit in Reverse and Neutral Sense circuit (4x4 ONLY) in Neutral. The TR Sensor also sends a Digital Output signal to the Powertrain Control Module (PCM) indicating the position of the manual lever (P, R, N, D, 2, 1).

For diagnosis of the Digital Transmission Range (TR) Sensor, refer to Section 07-01B .

Clutch Pedal Position Switch

The clutch pedal position switch is located on the clutch pedal bracket. On vehicles equipped with manual transmission/transaxles (7002) and electric shift transfer cases, the clutch pedal must be fully depressed with vehicle stopped in order to make a range shift from 4H or 4L, or from 4L to 4H.

Brake Switch

The brake switch is located on the brake pedal. The brake must be depressed in order to make a range shift from 4WD high to 4WD low or back.

Rotary Control Switch

The rotary control switch is located on the instrument panel. The switch consists of a knob with a nighttime illuminated pointer. The switch is used to select 2WD, 4WD high or 4WD low. The dash indicator light will illuminate when the 4WD high or low positions are engaged.

Control Module, Electronic

The electronic control module controls the operation of the transfer case (7A195) in response to inputs from the brake switch, the Transmission Range (TR) sensor clutch interlock switch and electric shift transfer case shift motor (7G360) through driver actuation of the rotary control switch.

Transfer Case

The Borg-Warner 13-54 Shift Transfer Case transfers power from the transmission/transaxle (7002) to the rear axle assembly (4006) and to the front axle when actuated. The 13-54 provides LOW RANGE driving. This system has no selectable neutral.

Mechanical Operation

In the 4x2 mode, torque from the transmission (7003) is transferred to the input shaft (7017) , which in turn drives the rear output shaft that drives the rear axle assembly (4006).

The 2W-4W shift is accomplished through the shifting of 2W-4W lockup collar, to engage the drive sprocket on the rear output shaft. The drive sprocket turns the chain which turns the driven sprocket on the front output shaft and the front driveshaft.

The high-low shift is accomplished when the high-low shift fork moves the high-low reduction collar to engage the front planet (7A398) to the output shaft. Torque from the input shaft is then transmitted through the sun gear, which then turns the front planet. The front planet, which is now engaged to the output shaft, provides a reduction.

Electronic Shift Operation

The transfer case (7A195) is equipped with a magnetic clutch, similar to an air conditioning compressor clutch, which is located inside the transfer case adjacent to the 2W-4W shift collar. The clutch is used to spin up the front drive system from zero to vehicle speed in milliseconds. This spin-up allows the shift between 2-high and 4-high to be made at any vehicle speed. When the transfer case rear and front output shafts reach synchronous speed, the spring-loaded shift collar mechanically engages the hub of the output shaft to the chain drive sprocket and the magnetic clutch is then deactivated. Shifts between 4-high and 4-low can only occur with the clutch interlock switch or digital transmission range (DTR) sensor and the brake switch closed. The vehicle's speed must also be within specified limits as determined by the transfer case speed sensor (5 km/h [3 mph or under]).

When the operator selects the drive combination through the rotary control switch, an electric motor turns a helical-cam, which is linked to the high-low and 2W-4W shift forks through fork-mounted roller and bushing assemblies. As the electric motor turns the helical-cam, the high-low fork bushing rides in a slotted lobe in the cam to make the low-high or high-low range change; and the 2W-4W fork bushing rides on lobes at the end of the cam to make the 2W-4W or 4W-2W shift.

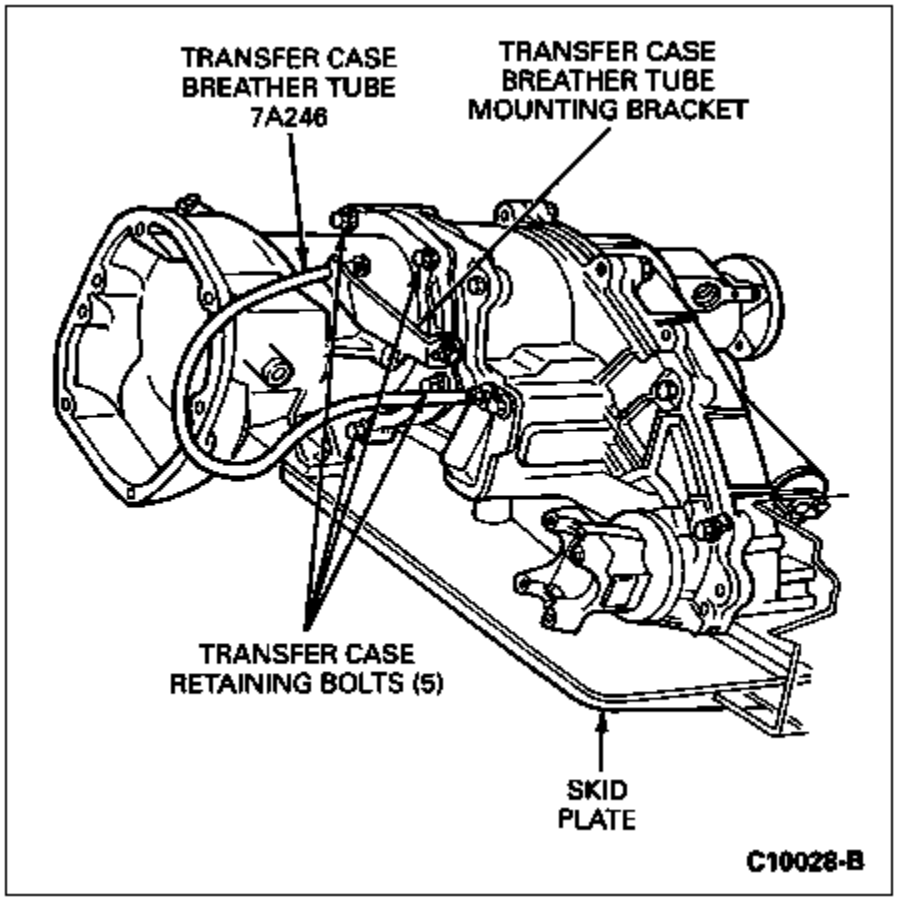
The unit is lubricated by a gerotor oil pump that channels oil through the bore in the transfer case rear output shaft.

Transfer Case, Electronic Shift

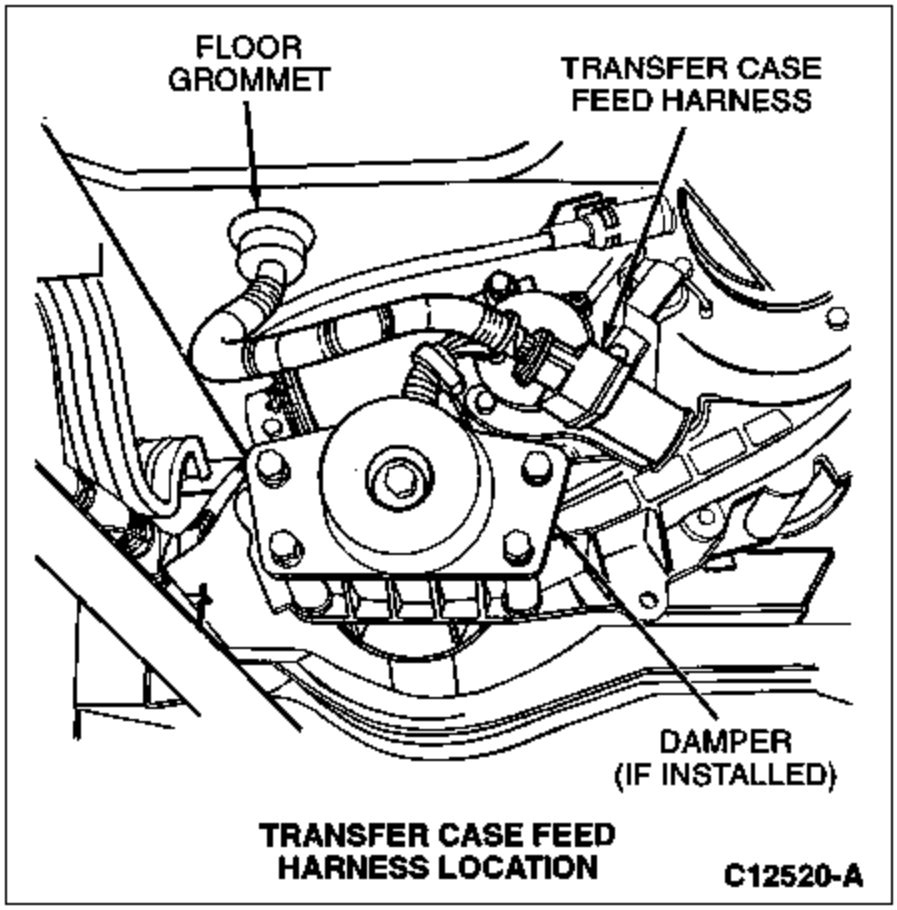
Removal

CAUTION: The three way catalytic converter (TWC) (5E212) is located beside the transfer case (7A195). Be careful when working around the three way catalytic converter because of the extreme high temperatures generated by the three way catalytic converter.

1. Raise the vehicle on a hoist and position suitable safety stands under vehicle.
2. Remove skid plate from frame (5005), if equipped.



3. Remove the damper from the transfer case, if equipped.

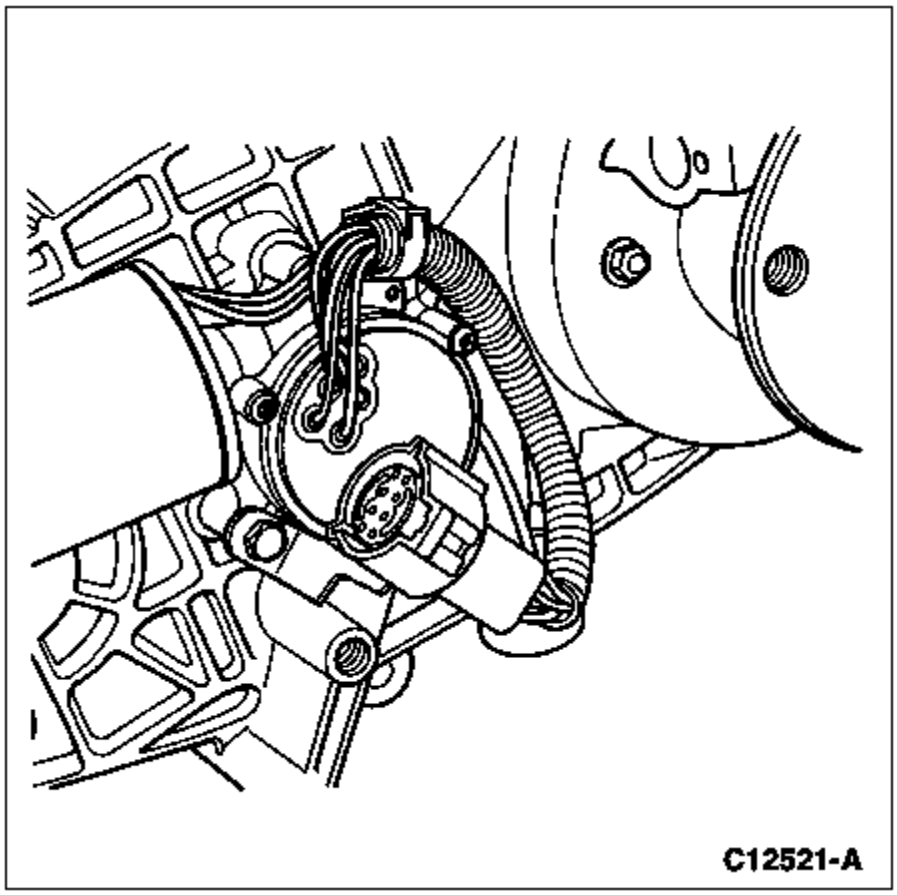


4. **NOTE: Drain transfer case only if transfer case disassembly is required.**

   Place a drain pan under the transfer case. Remove the drain plug and drain the fluid from the transfer case.

5. **CAUTION: Do not pull directly on the wires or pull outwardly on the locking tabs.**

   Remove the wire connector from the feed wire harness at the rear of the transfer case. First squeeze the locking tabs, then pull the connectors apart. Remove the connector for the transfer case shift motor (7G360) from the mounting bracket.



6. **NOTE: For detailed instruction on front and rear driveshaft (4602) removal and installation, refer to Section 05-01 .**

   Disconnect the front driveshaft from the front case yoke (7B214) and wire the driveshaft out of the way.

7. Disconnect the rear driveshaft from the rear case yoke and wire the driveshaft out of the way.

8. Disconnect the speedometer cable from the rear case (7005).

9. Disconnect the transfer case breather tube from the mounting bracket if required.

10. Support the transfer case with Rotunda Hi-Lift Jack 014-00942 (with Transfer Case Adapter 014-00213) or equivalent.

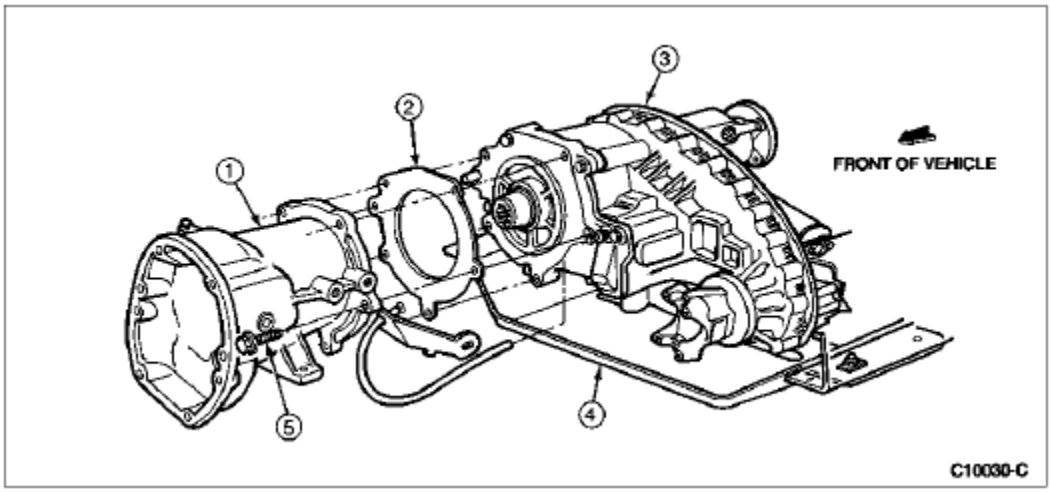
11. Remove the five bolts retaining the transfer case to the transmission (7003) and the extension housing (7A039).

12. Slide the transfer case rearward off the transmission output shaft and lower the transfer case from the vehicle. Remove the extension housing gasket (7086) from the transfer case and transmission case area. Clean gasket surfaces before transfer case is reinstalled.

Installation

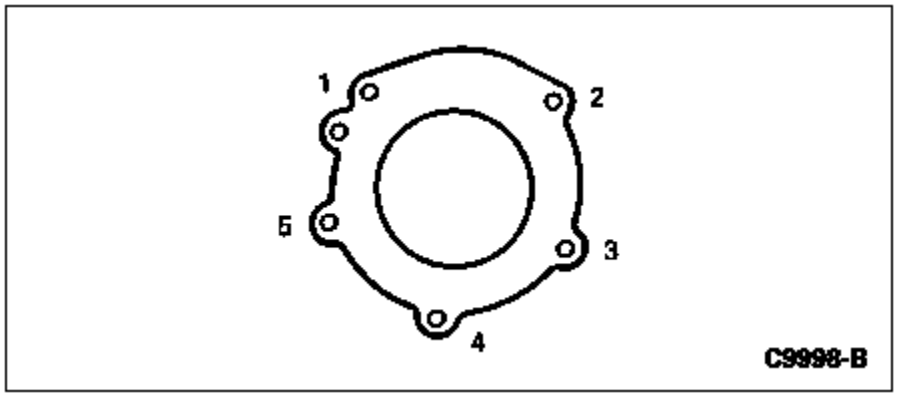
1. Place a new extension housing gasket on the front mounting face of the transfer case. If necessary, apply a small amount of grease to the extension housing gasket to hold it in place during assembly.

Transfer Case, 13-54 Electronic Shift, Installation



Item	Part Number	Description
1	7A039	Extension Housing
2	7086	Extension Housing Gasket
3	7A195	Transfer Case
4	7E063	Skid Plate
5	N605804	Transfer Case Retaining Bolt

2. Raise the transfer case with the Hi-Lift Jack 014-00942 (with Transfer Case Adapter 014-00213) so that the transmission output shaft aligns with the splined input shaft (7017). Slide the transfer case forward onto the transmission output shaft and onto the dowel pin. Install the five transfer case retaining bolts to the extension housing. Tighten the bolts to 34-48 Nm (25-35 lb-ft) in the sequence shown.



3. Remove the transmission jack from the transfer case.
4. If removed, install the transfer case breather tube so that the white marking on the transfer case breather tube aligns with the notch in the mounting bracket.
5. Connect the speedometer cable to the rear case. Tighten the bolt (7A443) to 2-3 Nm (18-27 lb-in).
6. Connect the rear driveshaft to the case yoke. Tighten the bolts to 83-118 Nm (61-87 lb-ft).
7. Connect the front driveshaft to the case yoke. Tighten the bolts to 16-22 Nm (12-16 lb-ft).
8. Attach the connector for the transfer case shift motor to the mounting bracket.
9. Connect the wire connectors on the rear of the transfer case, making sure that the retaining tabs lock.
10. Check transfer case fluid level. If transfer case was drained during removal procedure, install the drain plug and tighten to 19-30 Nm (14-22 lb-ft). Remove the fill plug and install Motorcraft Mercon® Multi-Purpose Automatic Transmission Fluid WSP-M2C185-A or equivalent to the bottom of the fill hole. Install fill plug and tighten to 19-30 Nm (14-22 lb-ft).
11. Install the damper (if so equipped) using new bolts. Tighten the damper bolts to 34-48 Nm (25-35 lb-ft). If new bolts are not available, coat the threads of the used bolts with Ford Threadlock 262 meeting Ford specification WSK-M2G315-A5 Type II or equivalent and install. Tighten bolts to 34-48 Nm (25-35 lb-ft).
12. Install the skid plate, bolts and nuts to the frame and tighten to 20-27 Nm (15-20 lb-ft).
13. Remove safety stands and lower the vehicle.

Oil Seal, Output Shaft, Rear

Removal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T50T-100-A
Output Shaft Seal Replacer	T83T-7065-B
Driver Handle	T80T-4000-W

1. Raise the vehicle on a hoist and position suitable safety stands under vehicle.
2. Remove the rear driveshaft (4602) from the case yoke (7B214). Wire the driveshaft out of the way.
3. Using a 30mm thin-wall socket, first remove the rear output shaft nut. Then remove the output shaft yoke washer (7B368), rubber seal and case yoke.
4. Remove the yoke to flange seal (7B215) from the rear output housing bore using Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.

Installation

1. Make sure the output housing bore and face are free from nicks and burrs. Coat the yoke to flange seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Position the yoke to flange seal into the rear output housing bore, making sure that the yoke to flange seal is not cocked in the bore. Drive the yoke to flange seal into the bore with Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.
2. Install the case yoke, rubber seal, output shaft yoke washer and output shaft nut on the output shaft. Tighten the output shaft nut to 339-381 Nm (250-280 lb-ft).
3. Connect the rear driveshaft to the transfer case (7A195), and tighten the bolts to 83-118 Nm (61-87 lb-ft).
4. Remove safety stands and lower the vehicle from the hoist.

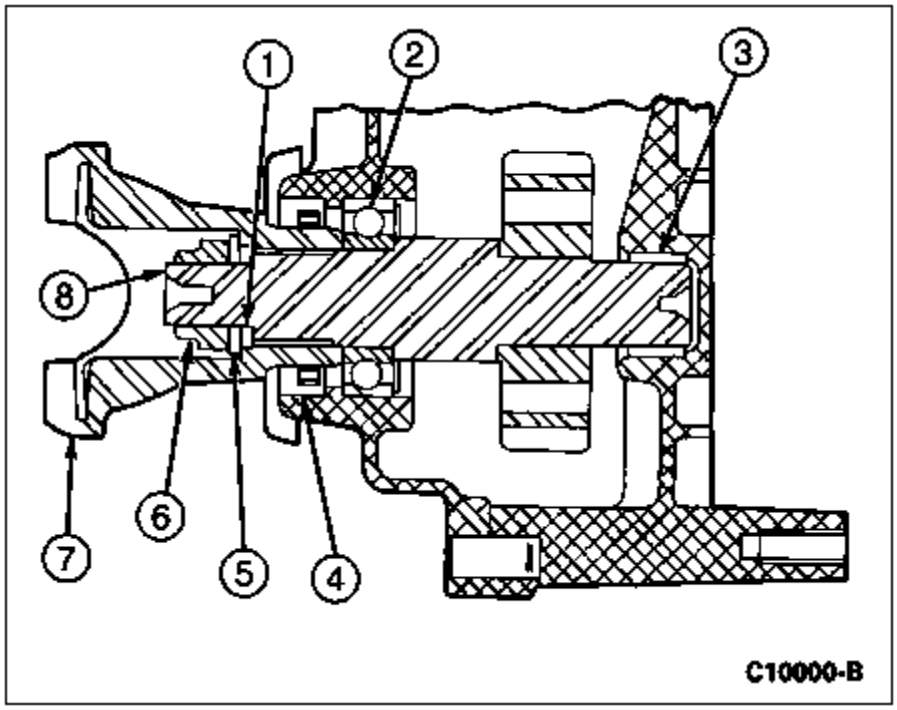
Oil Seal, Output Shaft, Front

Removal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Output Shaft Seal Replacer	T83T-7065-B
Driver Handle	T80T-4000-W
Impact Slide Hammer	T50T-100-A

1. Raise the vehicle on a hoist and position suitable safety stands under vehicle.
2. If so equipped, remove the nut, bolts and skid plate from the frame.
3. Remove the damper from the transfer case (7A195) if so equipped.
4. Place the drain pan under the transfer case, remove the drain plug and drain the fluid from the transfer case.
5. Remove the front driveshaft (4602) from the output shaft. Wire the driveshaft out of the way.
6. Using a 30mm thin-wall socket, remove the output shaft nut, output shaft yoke washer (7B368), rubber seal and front case yoke (7B214).
7. Remove the yoke to flange seal (7B215) from the front output housing bore by prying and pulling on the curved-up lip of the yoke to flange seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.



Item	Part Number	Description
1	7052	Rubber Seal
2	7025	Bearing
3	7127	Needle Bearing, Front
4	7B215	Yoke to Flange Seal
5	7B368	Output Shaft Yoke Washer
6	7045	Shaft Nut
7	7B214	Case Yoke, Front
8	7061	Output Shaft (Front)

Installation

1. Make sure the housing face and bore are free from nicks and burrs. Coat the yoke to flange seal with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B. Position the yoke to flange seal into the front output housing bore, making sure the yoke to flange seal is not cocked in the bore. Drive the yoke to flange seal into the bore with Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.

2. Install the case yoke, rubber seal, output shaft yoke washer and the nut. Tighten the nut to 250-275 Nm (184-203 lb-ft).

3. Connect the front driveshaft to the case yoke. Tighten the yoke bolts to 16-22 Nm (12-16 lb-ft).

4. Install drain plug and tighten to 19-30 Nm (14-22 lb-ft). Remove fill plug and install Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid WSP-M2C185-A or equivalent to the bottom of the fill hole. Install fill plug to 19-30 Nm (14-22 lb-ft).

5. Install the damper, with new bolts, and tighten the bolts to 34-48 Nm (25-35 lb-ft).

6. If equipped, install the skid plate. Tighten the nuts and bolts to 20-27 Nm (15-20 lb-ft). Remove safety stands and lower the vehicle from the hoist.

4x4 Shift Switch

Removal

1. Remove instrument panel finish panel (044D70). Refer to Section 01-12 for removal and installation procedure.
2. Remove shift control knob.
3. Remove two screws retaining shift control switch.
4. Remove shift control switch.

Installation

1. Install shift control switch.
2. Install two screws retaining shift control switch.
3. Install shift control knob.
4. Install instrument panel finish panel.

Transfer Case, Electronic Shift

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Input Shaft Bearing Remover	T91T-7127-A
Impact Slide Hammer	T50T-100-A
Axle Bearing/Seal Plate	T75L-1165-B
Pinion Bearing Cone Replacer	T53T-4621-C
Output Shaft Bearing Replacer	T83-7025-B
Driver Handle	T80T-4000-W
Output Shaft Bearing Replacer	T83T-7065-B
Input Shaft Bearing Replacer	T91T-7127-B
Input Shaft Bushing/Bearing Replacer	T87T-7127-A
Front Shaft Needle Bearing Replacer	T83T-7127-A
Step Plate	D80L-630-3
Puller Collot	D80L-100-S

Disassembly

1. Remove the transfer case (7A195) from the vehicle as outlined, and place on workbench.
2. Using a 30mm thin-wall socket, first remove the rear output nut, case yoke (7B214), yoke to flange seal (7B215), then the output shaft yoke washer (7B368).

Transfer Case, 13-54 Electronic Shift, Disassembled View

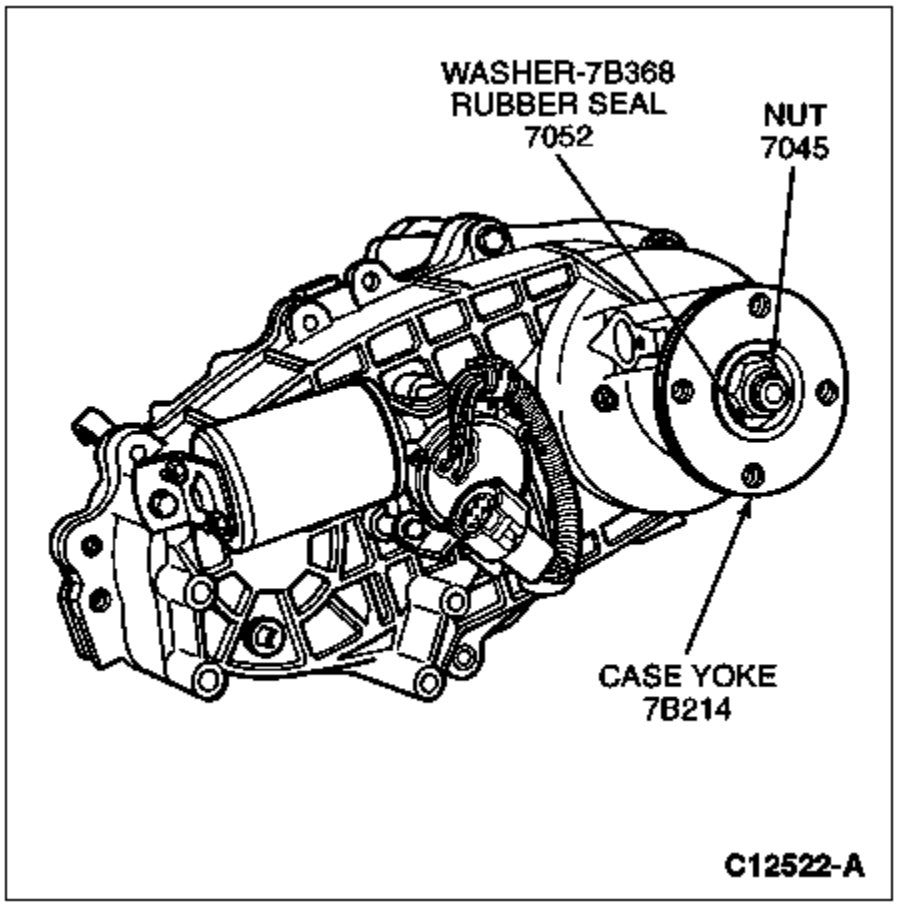
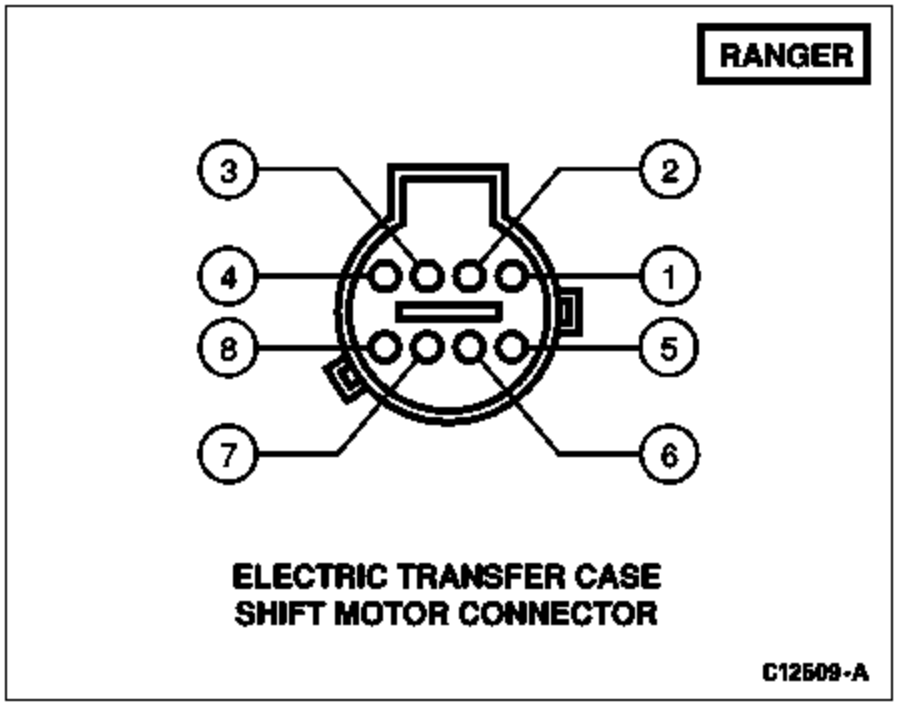
67	7W073	Bearing, Sleeve-Self Lube (1)
68	7B216	Seal, Oil (1)
69	7127	Bearing, Needle Front Output (1)

3. Using a 30mm thin-wall socket, remove the front output nut, then the output shaft yoke washer, rubber seal and case yoke.



4. Remove the two bolts from the connector bracket and remove the bracket.



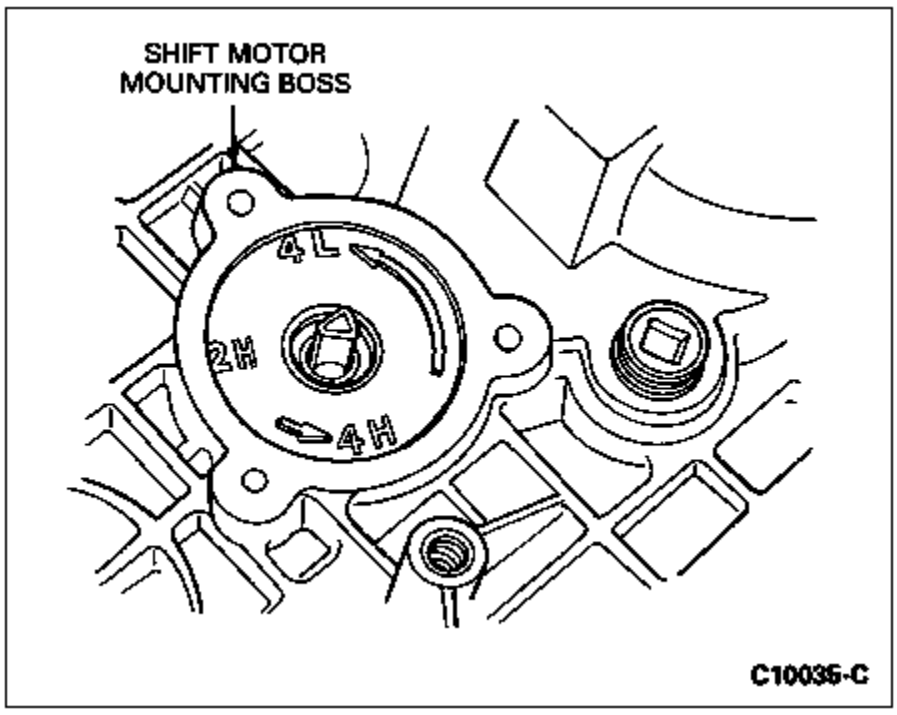
Pin Number	Circuit	Circuit Function
1	770 (W)	Electrical Shift 4x4 Module to Motor Position B
2	764 (BR/W)	Electrical Shift 4x4 Module to Motor Position C
3	763 (O/W)	Electrical Shift 4x4 Module to Motor Position D
4	777 (Y)	Electrical Shift 4x4 Module to Motor Control Counterclockwise
5	772 (P/Y)	Electrical Shift 4x4 Module to Motor Position A
6	762 (Y/W)	Electrical Shift 4x4 Module to Motor Position Return
7	778 (O)	Electrical Shift 4x4 Module to Motor Control Clockwise
8	779 (BR)	Electrical Shift 4x4 Module to Electric Clutch

5. Remove the brown wire from the No. 8 position in the connector by grasping the back plate of the connector body and pulling.

6. Remove the remaining bolt retaining the transfer case shift motor (7G360) to the rear case (7005) and remove the transfer case shift motor. Note the position of the triangular shaft extending out of the rear case and the triangular slot in the transfer case shift motor.

7. **CAUTION: When removing the RTV sealant, use care not to damage the mating surfaces of the rear case and motor mounting face.**

   Remove all traces of RTV gasket sealant from the mating surfaces of the rear case and the motor mounting face.

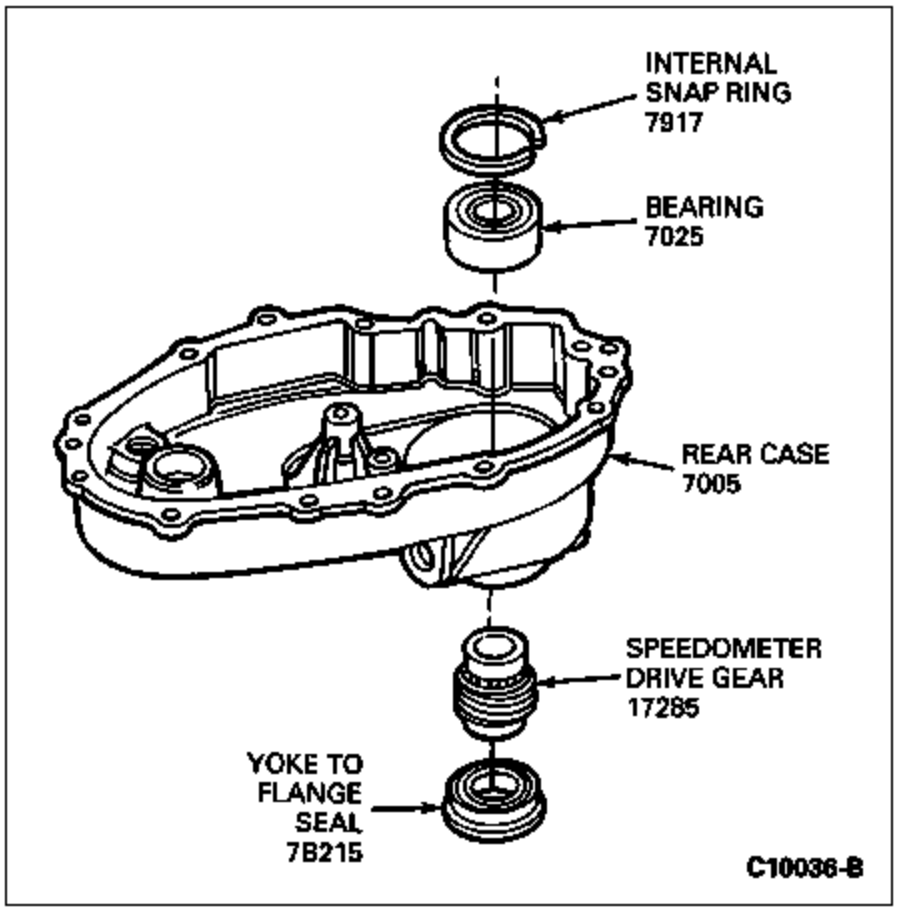


8. **CAUTION: The transfer case shift motor is serviced as a complete assembly. Do not remove the screws that secure the rear case to the motor gear housing.**

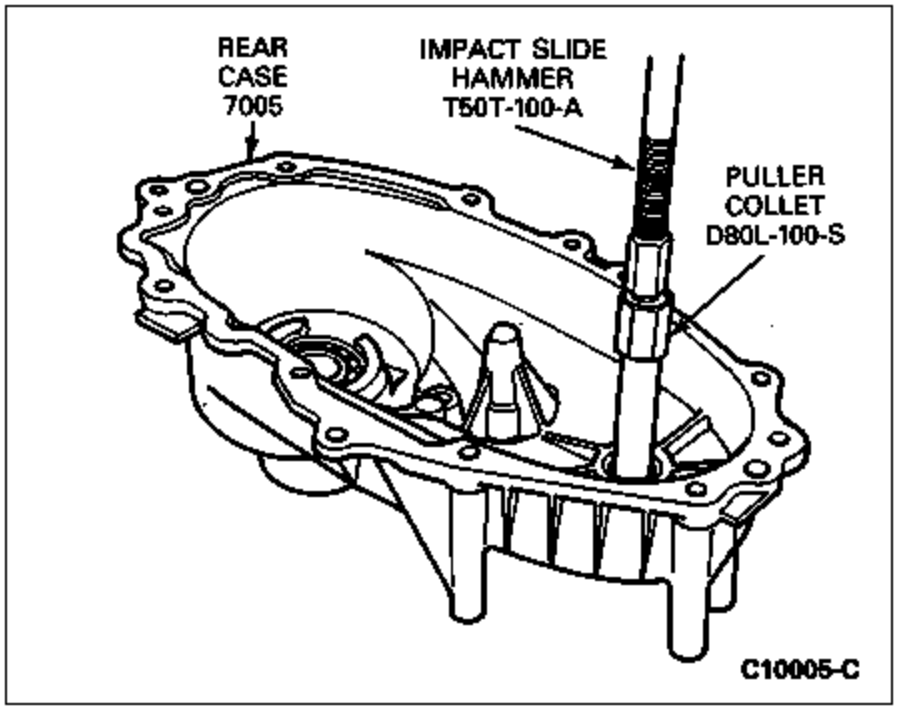
   Remove the nine bolts that retain the front case to the rearcase. Make sure that the front case is facing downward so that the rear cover is facing upwards. Insert a breaker bar between the pry bosses and separate the front case from the rear case. Remove all traces of RTV Gasket Sealant from the mating surfaces of the front case and rear case.

9. If the speedometer drive gear (17285) is to be replaced, first remove the yoke to flange seal by prying and pulling the yoke to flange seal or use the Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case. Remove the speedometer drive gear.

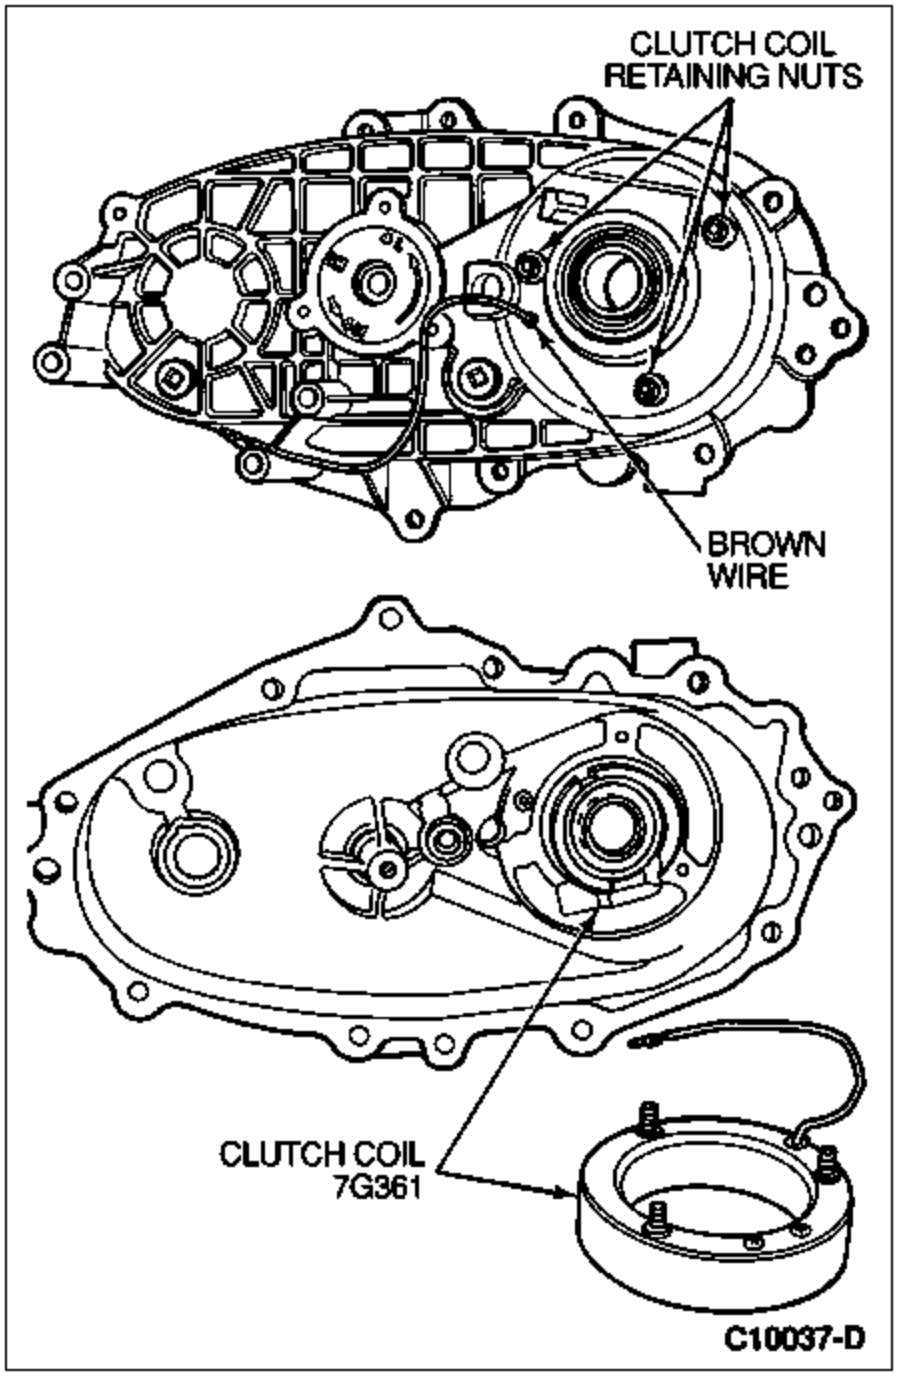
10. If the rear output shaft bearing (7025) requires replacing, remove the internal snap ring that retains the bearing in the bore. From the outside of the case, drive out the bearing using Step Plate D80L-630-3 or equivalent and a drift.



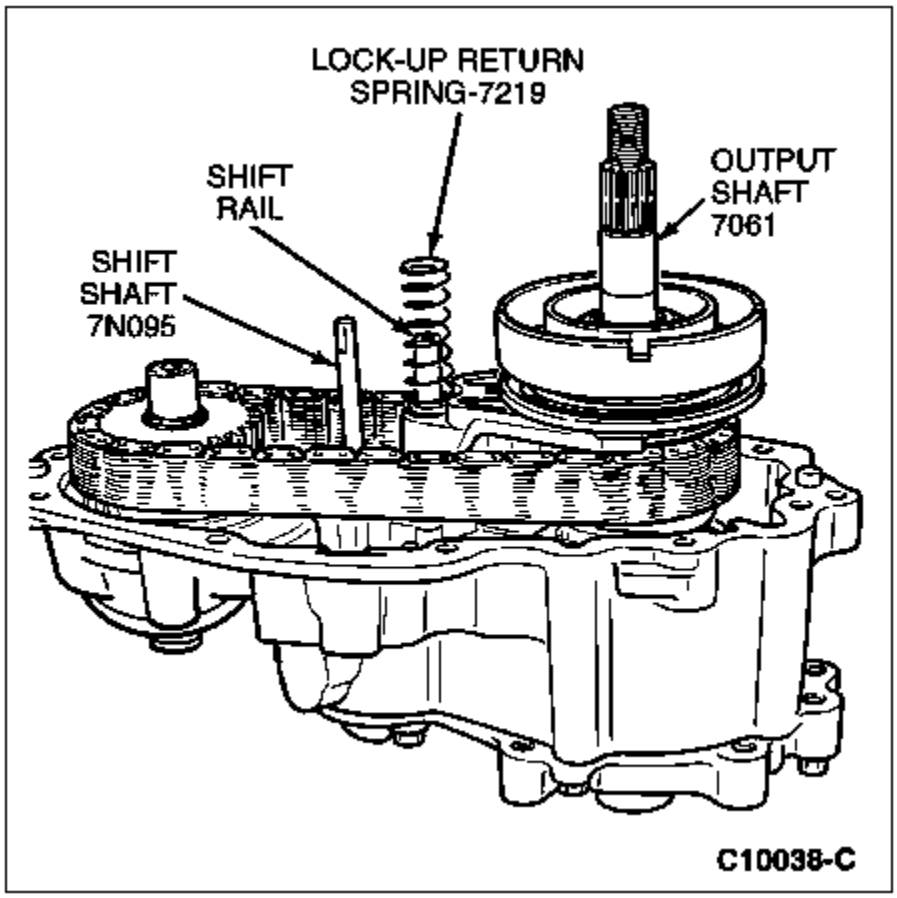
11. If required, remove the front output needle bearing from the rear case with Puller Collet D80L-100-S or equivalent and Impact Slide Hammer T50T-100-A.



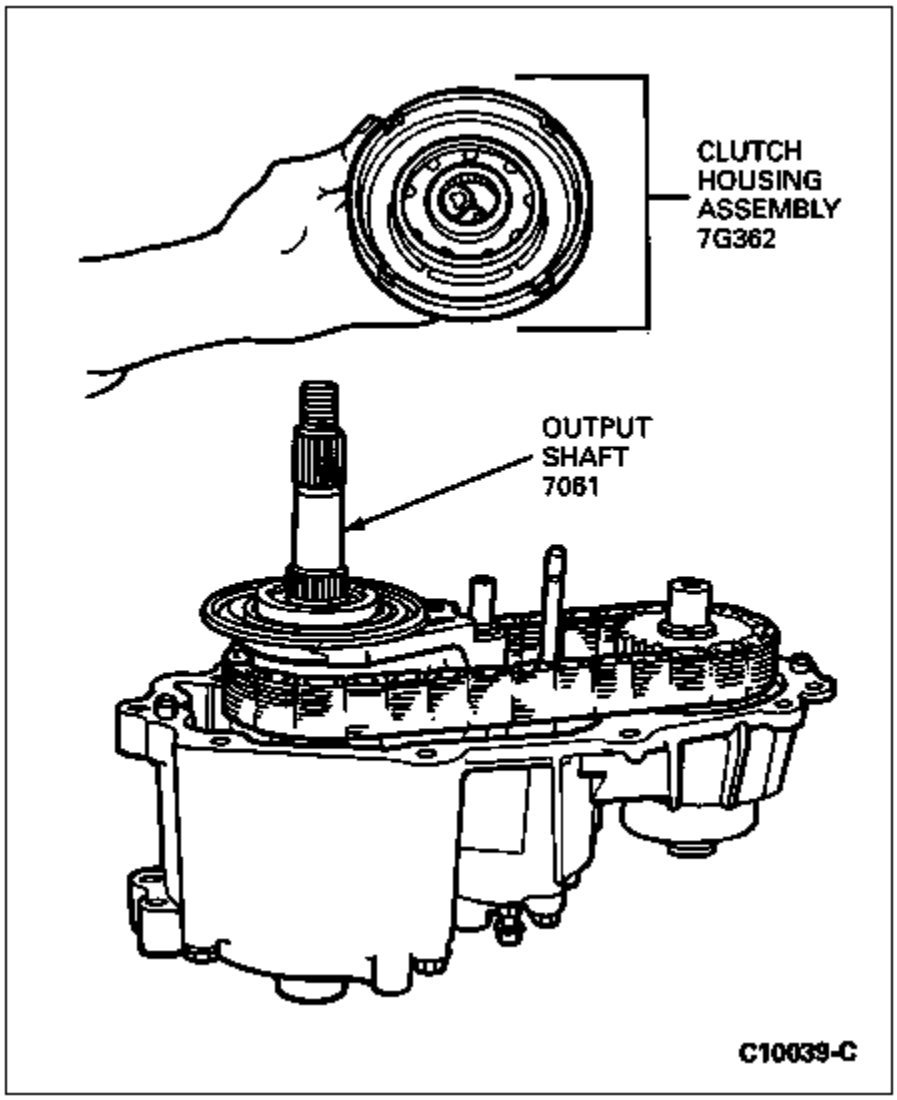
12. Remove the three nuts retaining the clutch coil assembly to the rear case. Pull the assembly, along with the O-rings and brown wire, from the case.



13. Remove the Lock-up return spring from the boss on the fork.

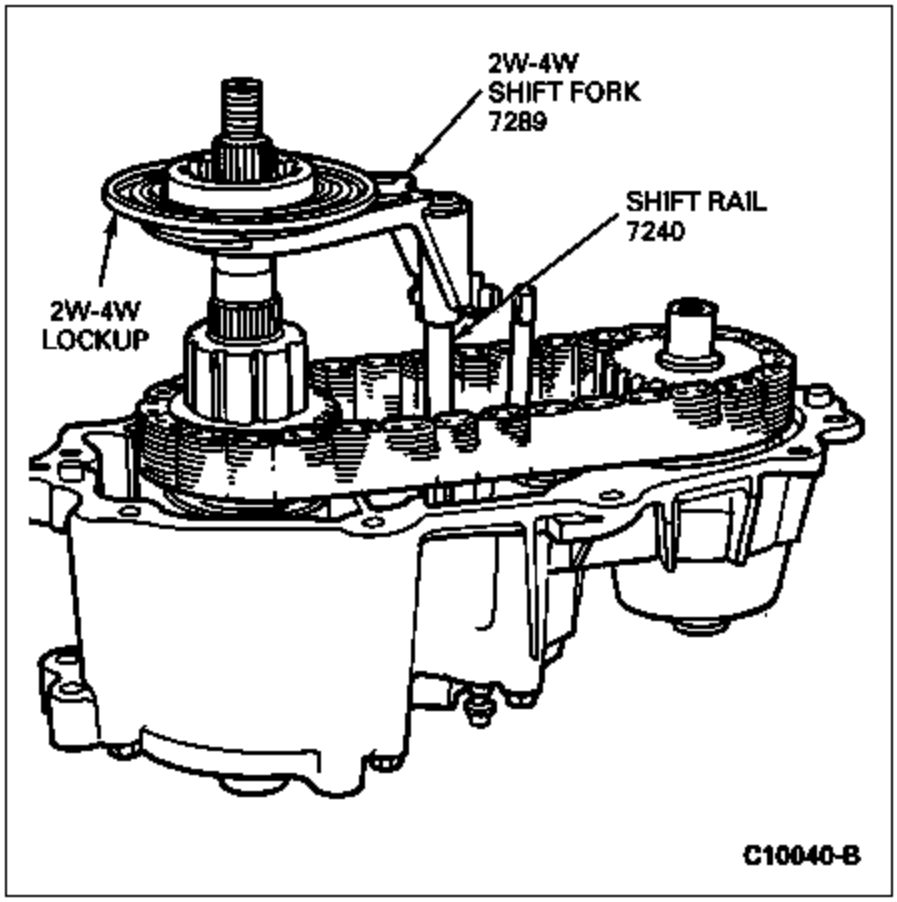


14. Remove the clutch housing from the output shaft.

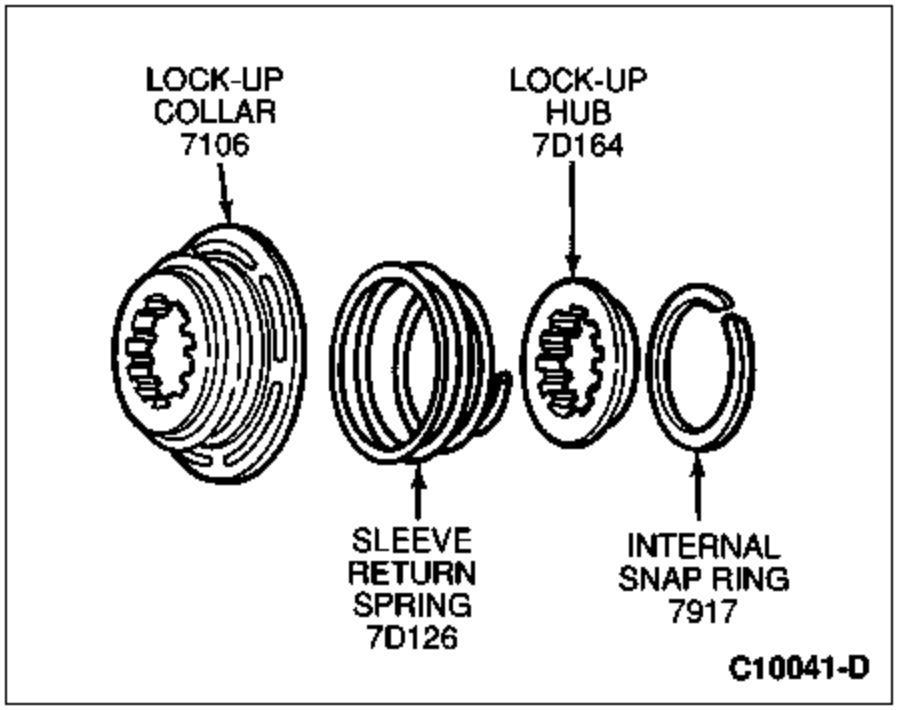


15. Remove the 2W-4W lockup and the 2W-4W shift fork as an assembly. Remove the shift fork from the lockup.

16. Pull out the shift rail.

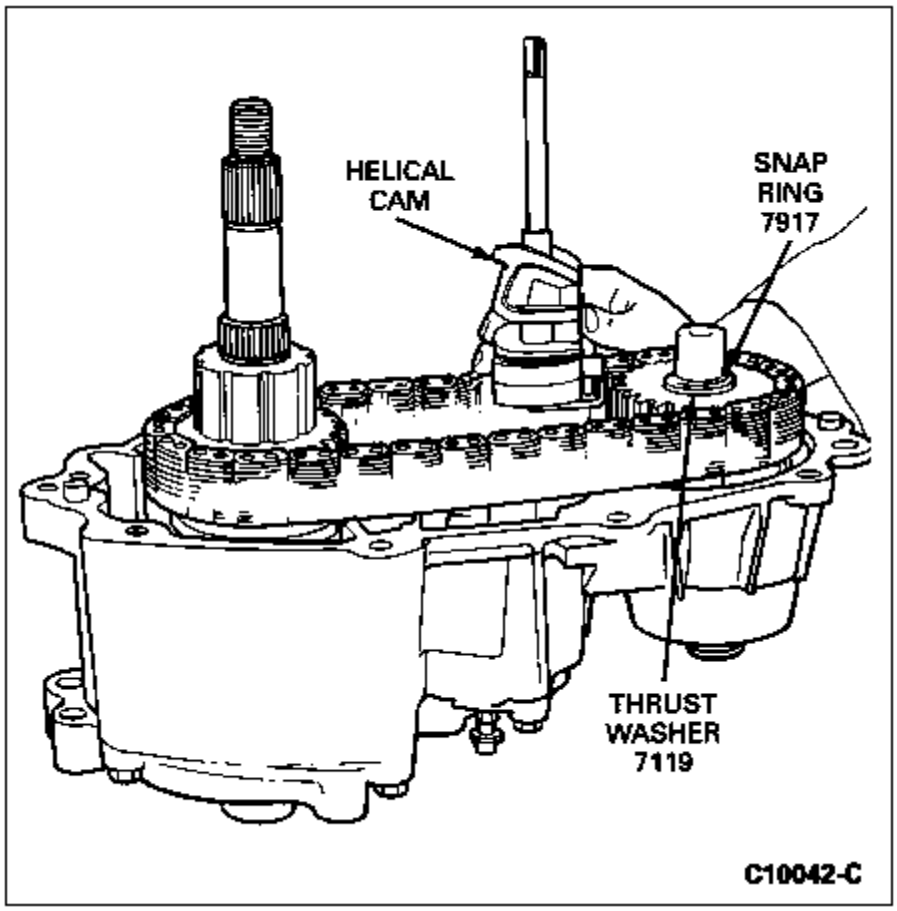


17. If disassembly of the 2W-4W lock-up is required, remove the internal snap ring and pull the lock-up hub and sleeve return spring from the lock up collar.

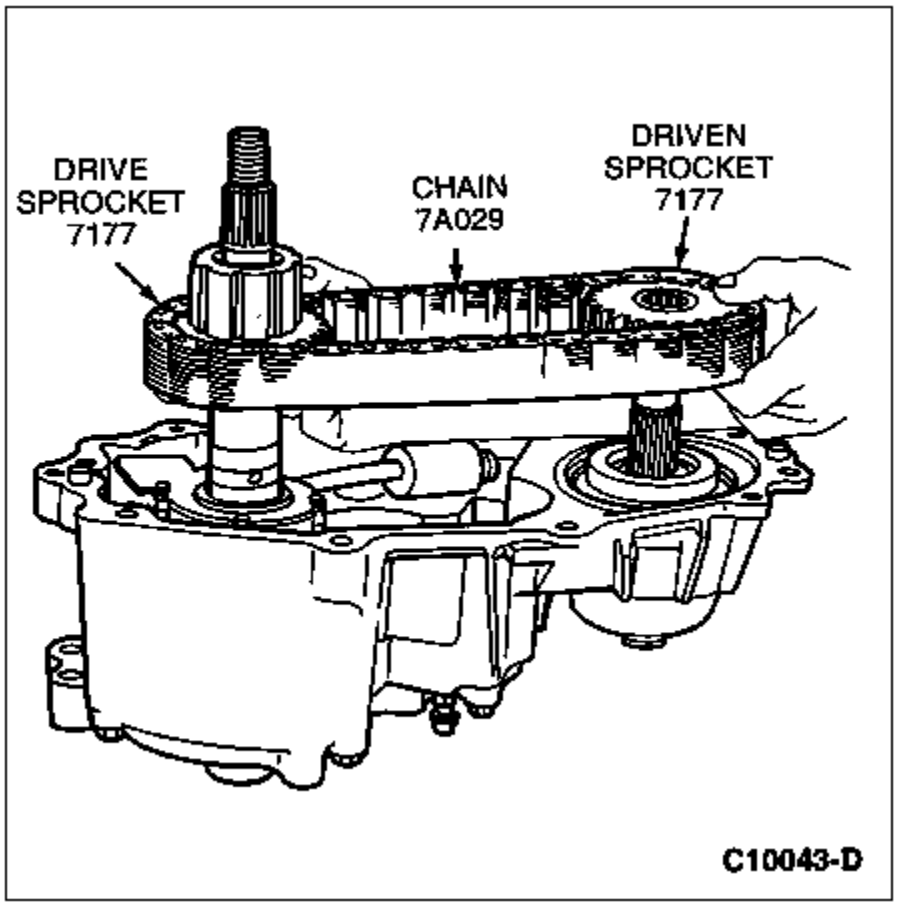


18. Remove the helical cam from the front case. If required, remove the helical cam, torsion spring and sleeve from the shaft.

19. Remove the external snap ring and thrust washer (7119) that retains the driven sprocket to the front output shaft.

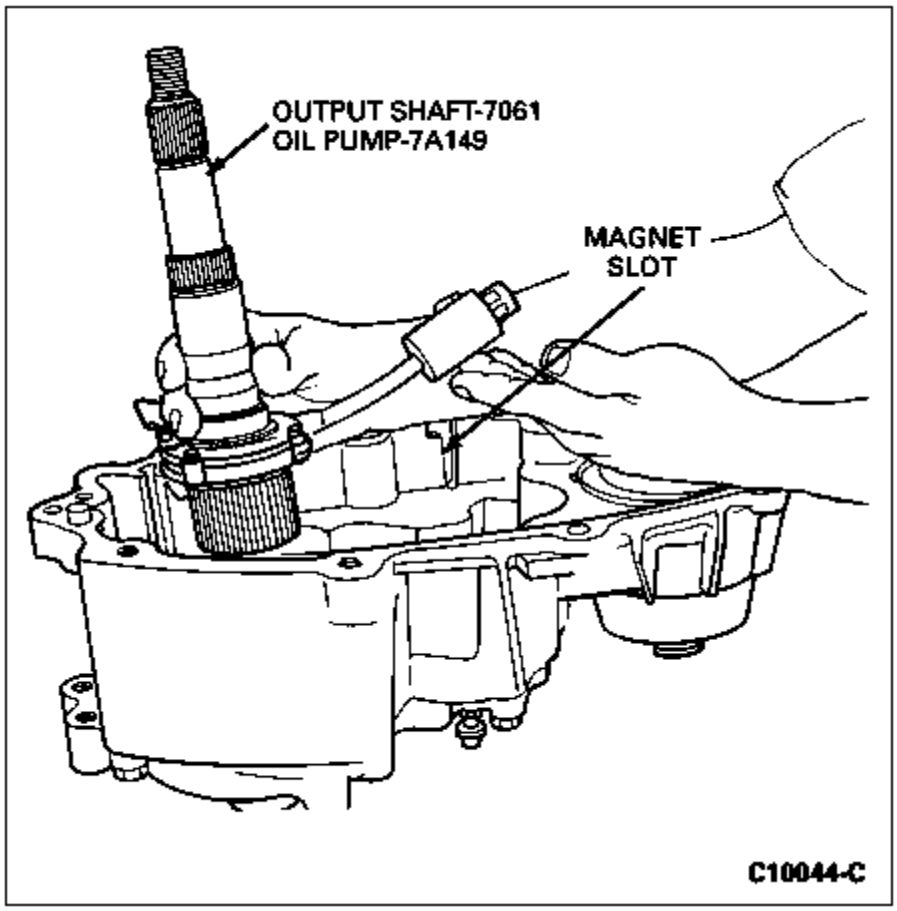


20. Remove the chain, driven sprocket and drive sprocket as an assembly.



21. **CAUTION: If there is removal resistance, do not pound or use force to disassemble the pump; start over again.**

Remove the oil pan magnet (7L027) from the slot in the front of the case bottom. Remove the output shaft and oil pump as an assembly.



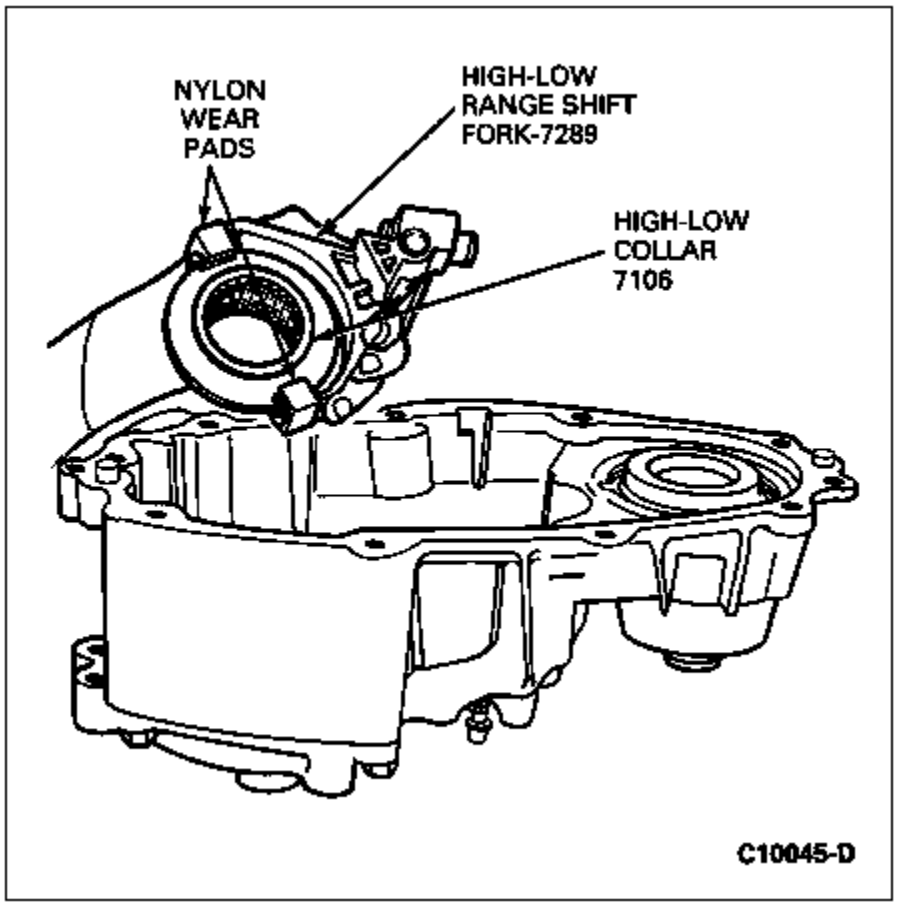
22. If required, rotate the pump to align the cover keyway to pin of the output shaft and pull the pump straight out.

23. If required to replace the oil pump drive pin, perform the following.

    a. Measure **and record** the drive pin height above (sticking out from) the diameter of the output shaft. This information will be required during installation.
    b. Remove the drive pin from the output shaft.

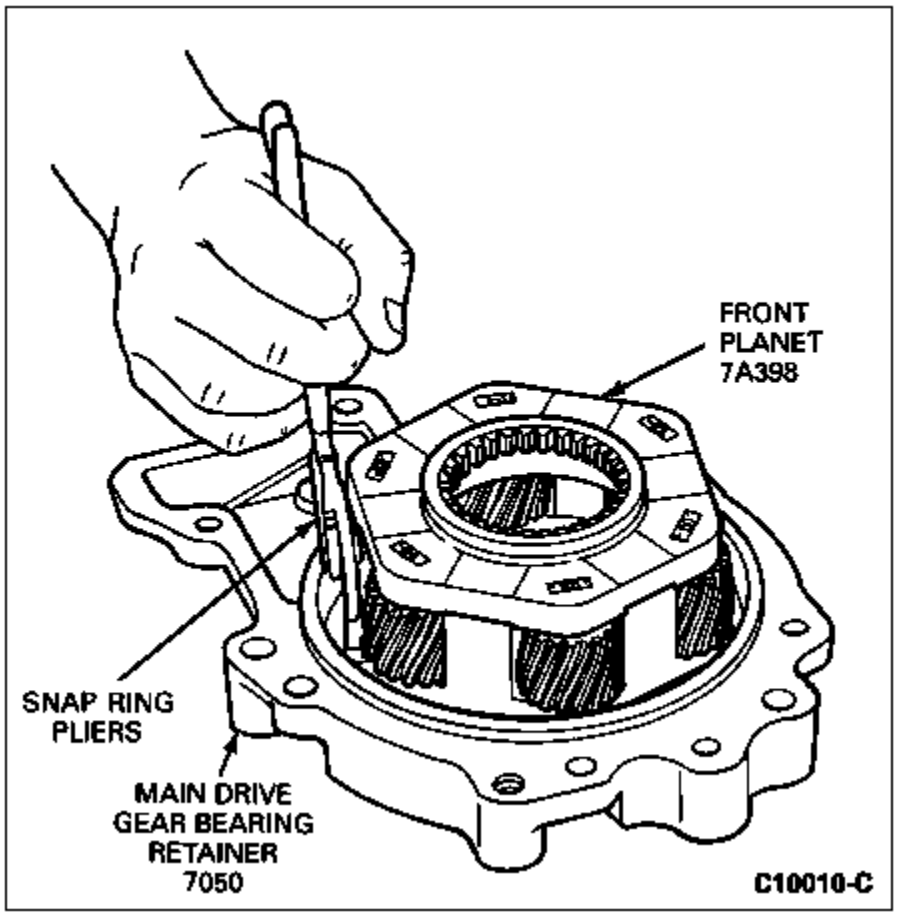
24. Remove the front output shaft.

25. Remove the high-low range shift fork and collar as an assembly.



26. Turn the front case over and remove the six bolts (7A443) retaining the main drive gear bearing retainer (7050) to the front case. Remove the main drive gear bearing retainer, input shaft (7017) and front planet (7A398) as an assembly.

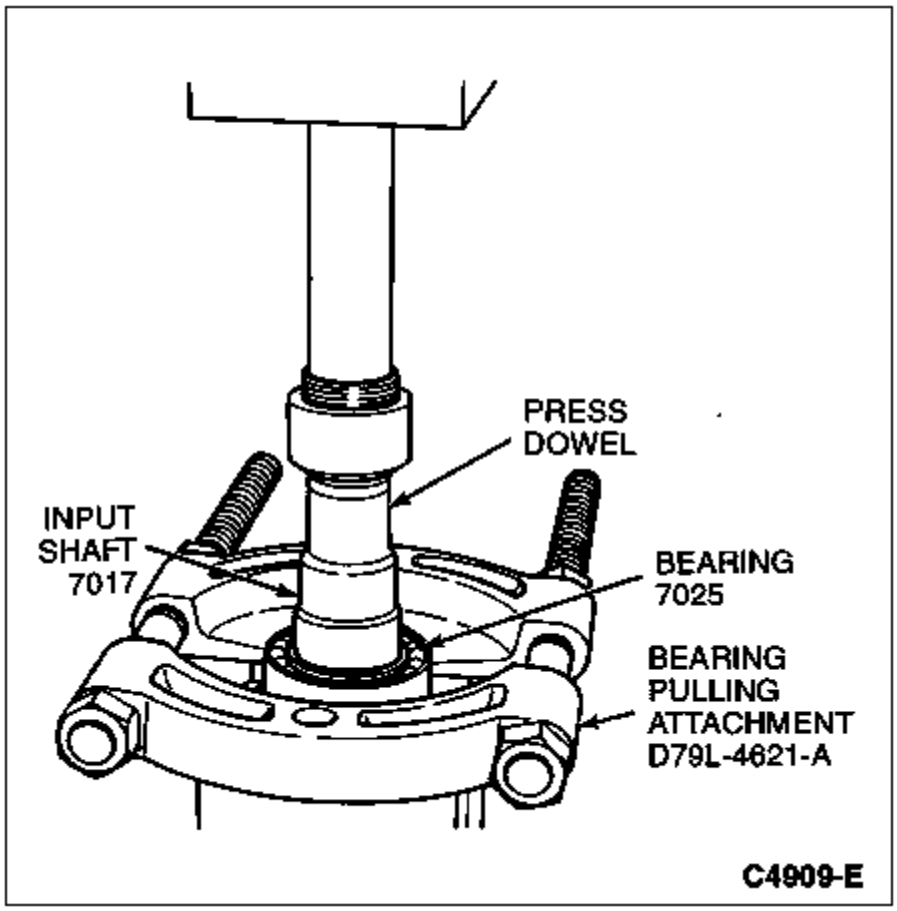
27. Expand the tangs of the large snap ring in the main drive gear bearing retainer. With the input shaft against a bench, push the main drive gear bearing retainer down and slide the main drive gear bearing retainer off the bearing. Lift the input shaft and front planet from themain drive gear bearing retainer.



28. If required, remove the input yoke to flange seal from the main drive gear bearing retainer using Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.

29. Remove the internal snap ring from the planetary carrier and separate the front planet from the input shaft.

30. Remove the external snap ring from the input shaft. Place the input shaft in a vise and remove the bearing with Bearing Pulling Attachment D79L-4621-A or equivalent. Remove the thrust washer, thrust plate and the sun gear off the input shaft.

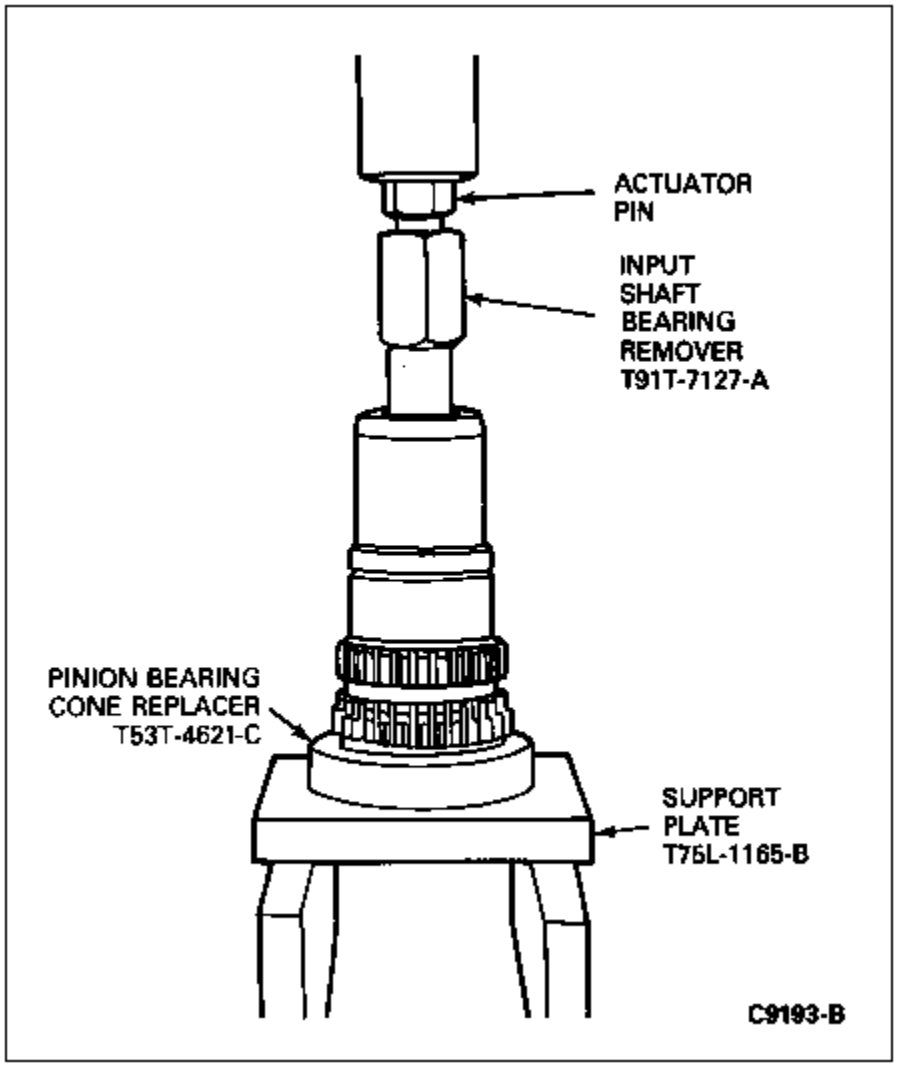


31. **NOTE: Under normal use, the needle bearing and bushing should not require replacement. If replacement is required, the bushing and needle bearing must be replaced as a set.**

    Inspect the bushing and needle bearing in the end of the input shaft for wear or damage.

32. If replacement of the needle bearing and bushing is required, press the bearing and bushing out as follows:

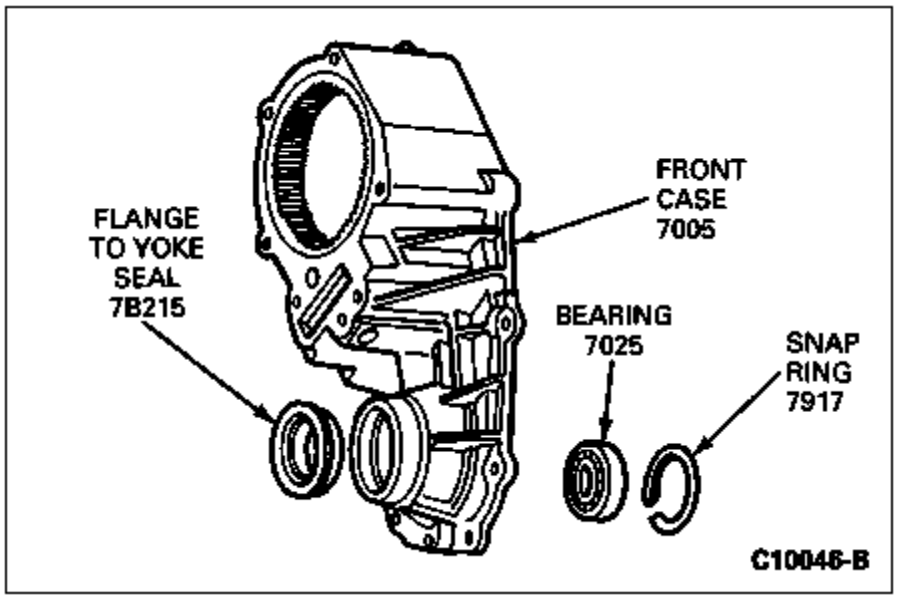
    a. Position the input shaft on Axle Bearing/Seal Plate T75L-1165-B or equivalent, and using Pinion Bearing Cone Replacer T53T-4621-C as a spacer.
    b. Insert Input Shaft Bearing Remover T91T-7127-A into the input shaft so it is resting on top of the bearing cage.
    c. Tighten the actuator pin until it stops, then press the bearing and bushing out together.



33. If required, remove the ring gear (7A153) from the front case half using a press. Note the relationship of the serrations to the chamfered pilot diameter during removal.

34. If required, remove the front yoke to flange seal using Impact Slide Hammer T50T-100-A to pop off the yoke to flange seal. Do not damage the bearing, bearing cage or case.

35. If required, remove the internal snap ring retaining the front output shaft ball bearing and remove the bearing using Step Plate D80L-630-3 or equivalent with a drift.



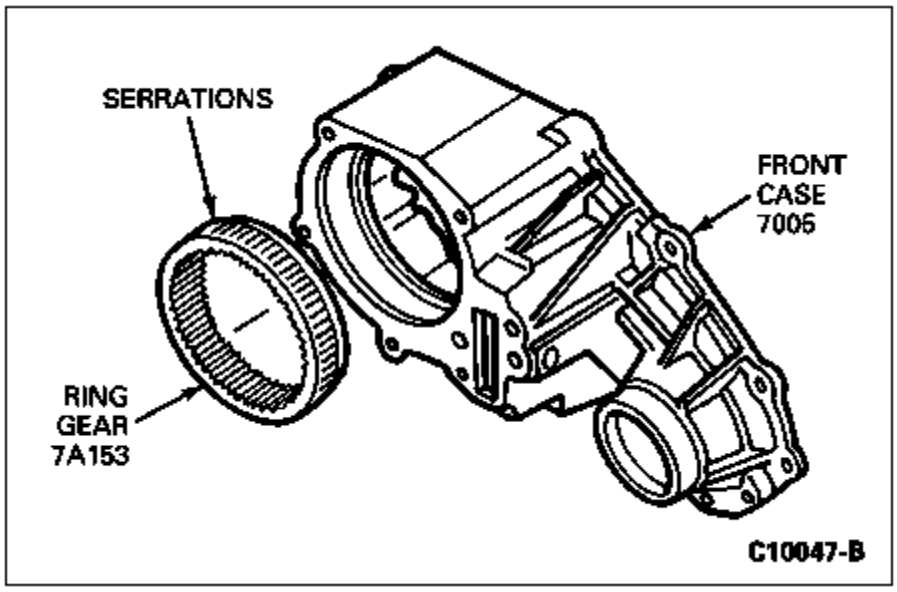
Assembly

Before assembly, lubricate all parts with MERCON® Multi-Purpose Automatic Transmission Fluid WSP-M2C185-A or equivalent.

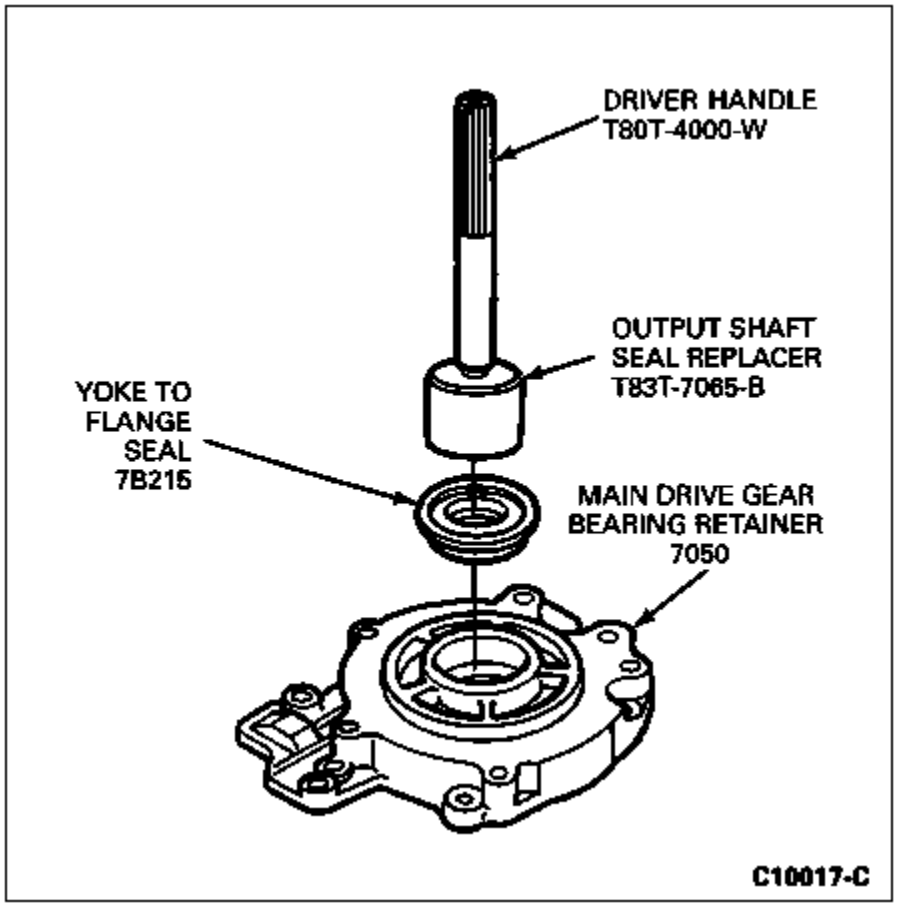
1. If removed, drive the bearing into the front output case bore using Output Shaft Seal Replacer T83T-7025-B and Driver Handle T80T-4000-W. Drive the bearing in straight, making sure it is not cocked in the bore. Install the internal snap ring that retains the bearing to the front case.

2. If removed, install the front yoke to flange seal in the front case bore using Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.

3. If removed, install the ring gear in the front case. Align the serrations on the outside of the ring gear to the serrations previously cut in the front case bore. Using a press, start the piloted chamfered end of the ring gear first and press in until it is fully seated. Make sure that the ring gear is not cocked in the bore.



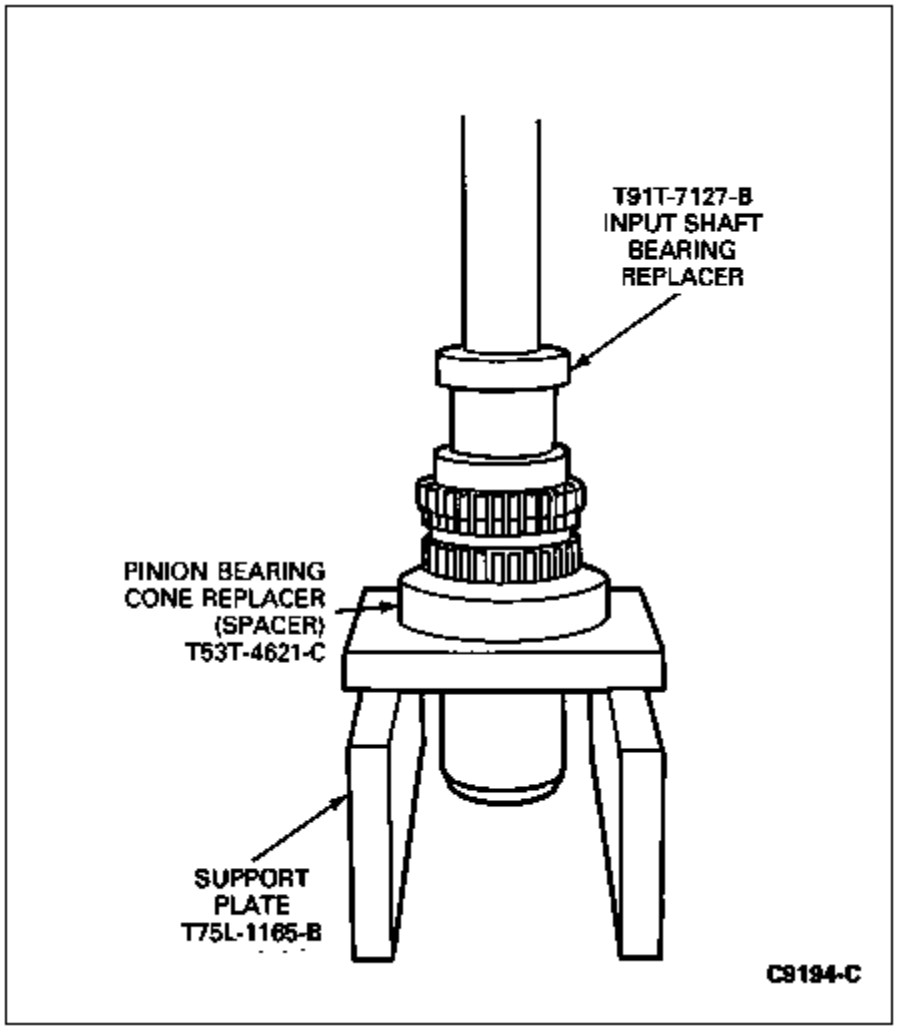
4. If removed, install the input yoke to flange seal into the mounting adapter bore. Use Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.



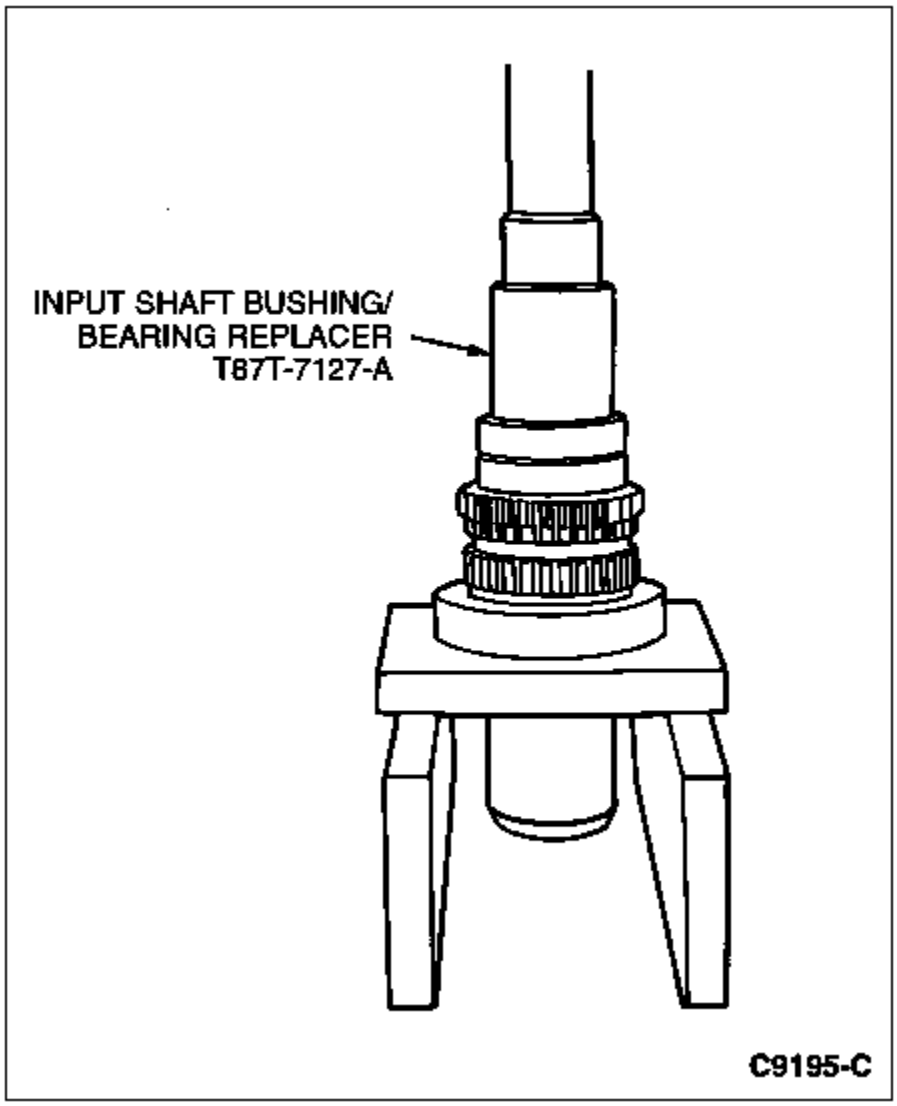
5. **NOTE: If the input shaft needle bearing and bushing were removed, install a new bearing and bushing as detailed in the following steps:**

Press a new needle bearing, then a new bushing in the input shaft as follows:

a. Position the input shaft on Axle Bearing/Seal Plate T75L-1165-B or equivalent, and Pinion Bearing Cone Replacer T53T-4621-C as a spacer.
b. Using Input Shaft Bearing Replacer T91T-7127-B, press a new needle bearing into the end of the input shaft until it seats in the input shaft

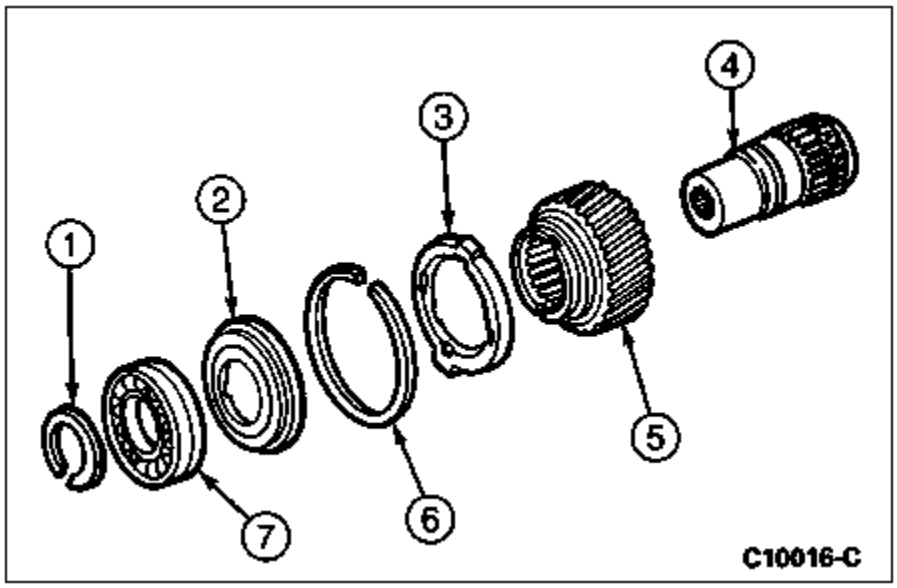


c. Press in a new bushing using Input Shaft Bushing/Bearing Replacer T87T-7127-A.



6. **NOTE: The recessed face of the sun gear and the snap ring groove on the bearing outer race should be toward the rear of the transfer case. The stepped face of the thrust washer should face toward the bearing.**

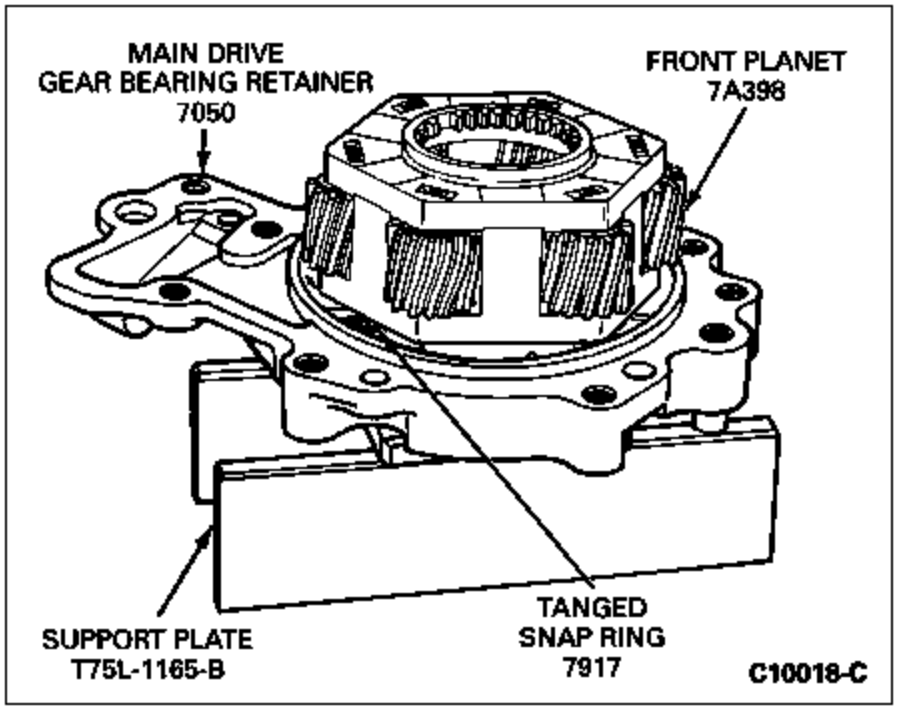
   Slide the sun gear, thrust plate and thrust washer into position on the input shaft. Press the bearing over the input shaft. Install the external snap ring to the input shaft.



Item	Part Number	Description
1	7917	External Snap Ring
2	7A385	Thrust Washer
3	7B066	Thrust Plate
4	7017	Input Shaft
5	7D063	Sun Gear
6	7C122	Internal Snap Ring
7	7025	Bearing

7. Install the front planet to the sun gear and input shaft. Install the internal snap ring to the planetary carrier.

8. Place the tanged snap ring in the mounting adapter groove. Using Axle Bearing/Seal Plate T75L-1165-B place the input shaft and front planet in the main drive gear bearing retainer and expand the tanged snap ring while pushing inward until the front planet and input shaft are seated in the main drive gear bearing retainer. When properly seated, the tanged snap ring will snap into place. Check installation by holding the main drive gear bearing retainer by hand and carefully tapping the face of the input shaft against a wooden block to make sure that the snap ring is engaged.

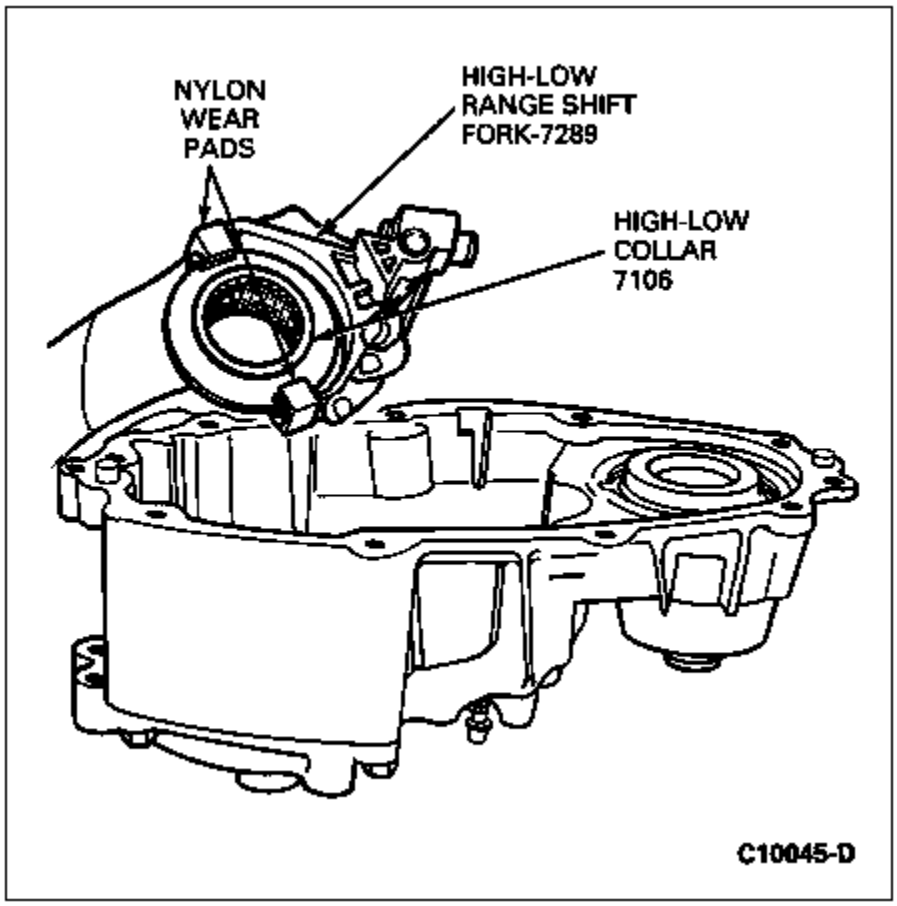


9. Remove all traces of RTV Gasket Sealant from the front case and mounting adapter mating surfaces. Install a bead of RTV Gasket Sealant on the surface of the front case. Use Non-Acid Cure Silicone Rubber E7TZ-19562-A or equivalent meeting Ford specification ESL-M4G273-A.

10. Position the main drive gear bearing retainer on the front case. Install the six bolts and tighten to 31-41 Nm (23-30 lb-ft).

11. **NOTE: Make sure that the nylon wear pads are installed on the shift fork and snapped securely into place.**

    Install the high-low shift fork and high-low collar as an assembly into the front planet.



12. If removed, press the pin into the rear output shaft pin hole to the same height or 1mm (0.040 inch) **minimum** above the diameter of the output shaft.

13. **NOTE: Do not disassemble oil pump. It is serviced only as an assembly.**

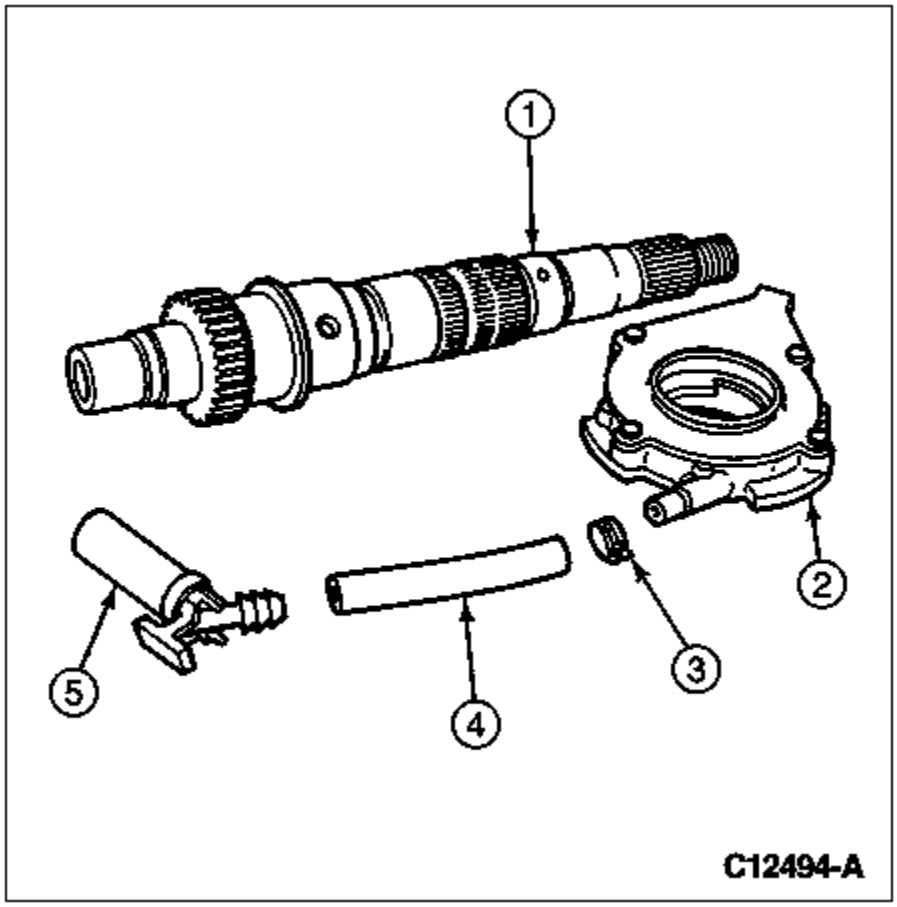
    NOTE: Do not remove the plastic insert from the bore of the new pump. Discard it after it slides out during pump installation to the rear output shaft.

    NOTE: While turning the output shaft, prime the pump through the oil filter pickup tube or housing inlet hole with clean Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid XT-2-QDX or -DDX or equivalent.

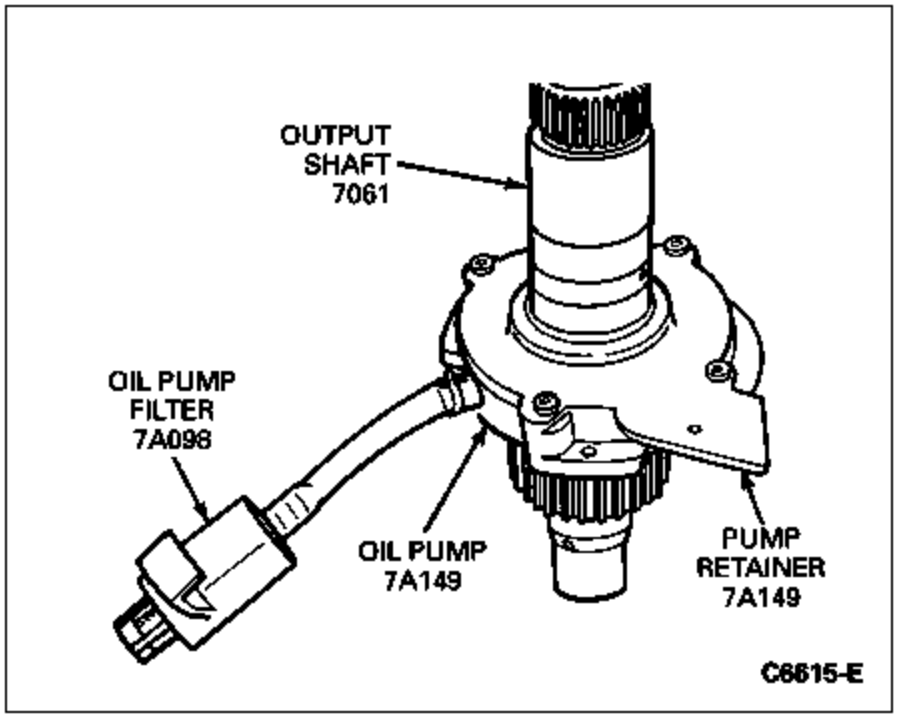
    If the pump does not turn freely after installation to the rear output shaft, realign the cover keyway to the pin of the rear output shaft and jiggle the pump until it fully seats and rotates freely.

    If new pump is used, slide the pump housing slot onto the pin of the output shaft with the retaining arm of the cover toward the rear of the case. If the pump does not turn freely, follow the instructions as listed in the previous paragraph.

    Inspect the outside surfaces and bore of the oil pump. If there is no discoloration in the pump housing, gear or cover, and the pump bore and the lube holes of the output shaft show evidence of oil, the pump is working. Hand align the keyways and bores of the housing, gear and cover and slide the pump onto the rear output and fifth gear driveshaft pin with the retaining arm of the cover toward the rear of the case.

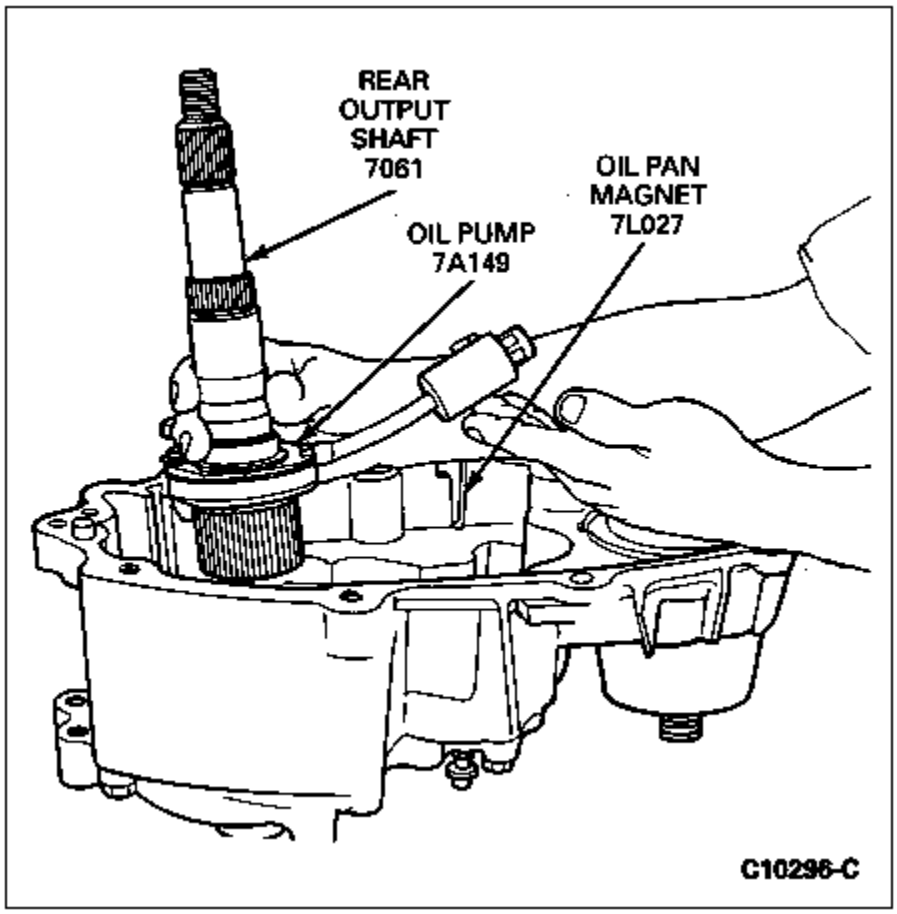


Item	Part Number	Description
1	7061	Output Shaft Rear
2	7A149	Pump Body
3	382846	Clamp
4	7A210	Hose
5	7A098	Filter/Pickup



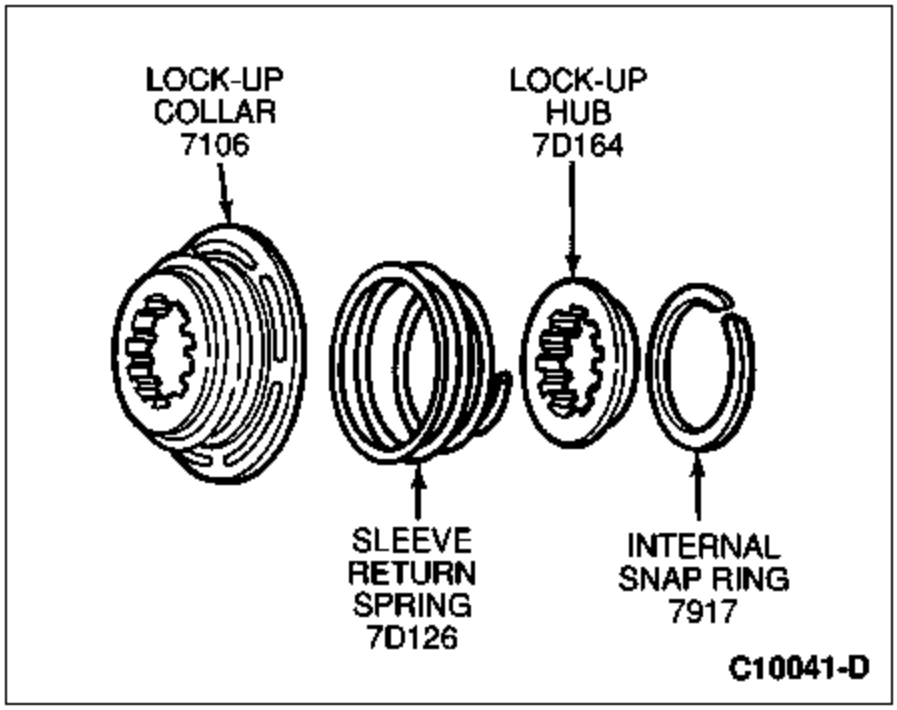
14. Install the output shaft and oil pump in the input shaft. Make sure that the internal splines of the output shaft engage the internal splines of the high-low shift collar. Make sure that the oil pump retainer arm and oil filter leg are in the groove and slot of the front case.

15. Install the oil pan magnet in the slot in the front case just above the oil filter leg.



16. Install the front output shaft in the front case.

17. If disassembled, assemble the 2W-4W lockup assembly. Install the sleeve return spring into the bore of the lockup collar with the large end installed first. Place the lockup hub over the spring and install the lockup hub into the lockup collar. Install the internal snap ring.

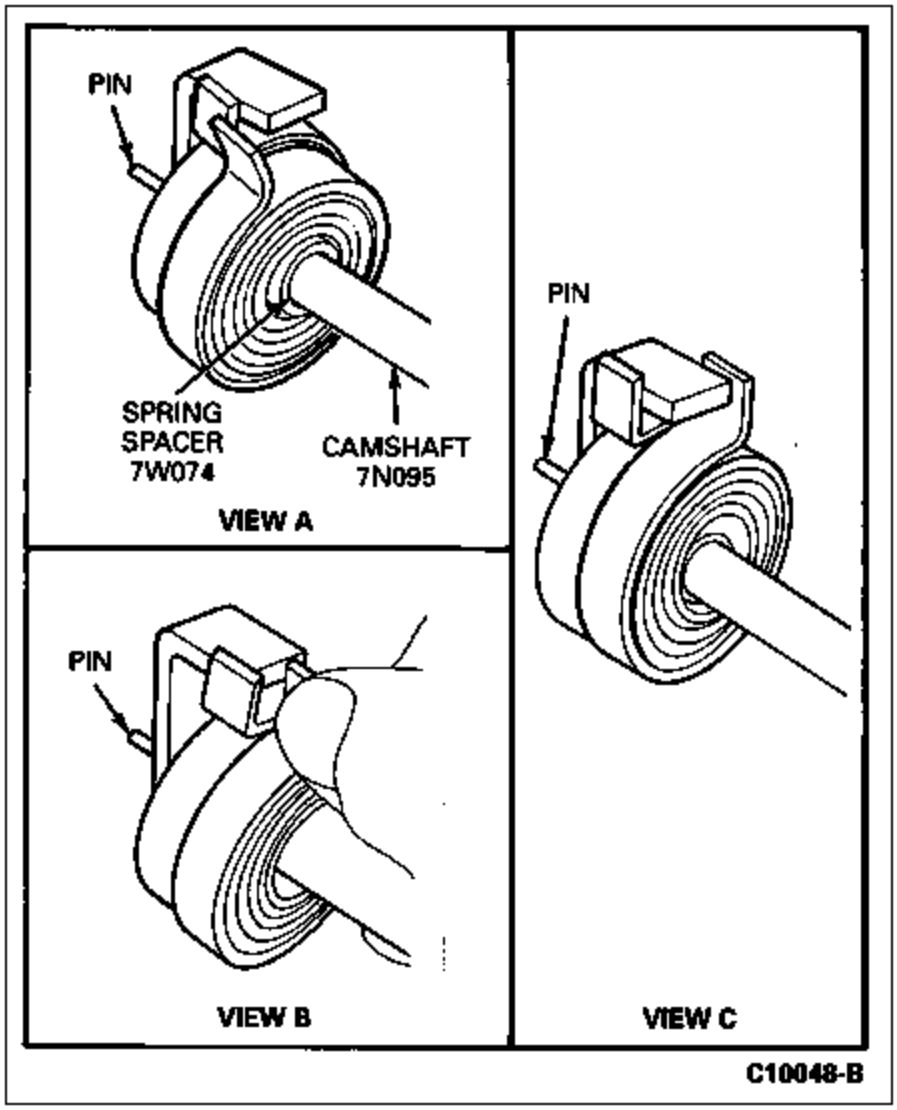


18. **NOTE: The driven sprocket (on the front output shaft) must be installed with the marking REAR facing toward the rear case, if so marked.**

    Install the chain, drive sprocket and driven sprocket as an assembly over the output shaft.

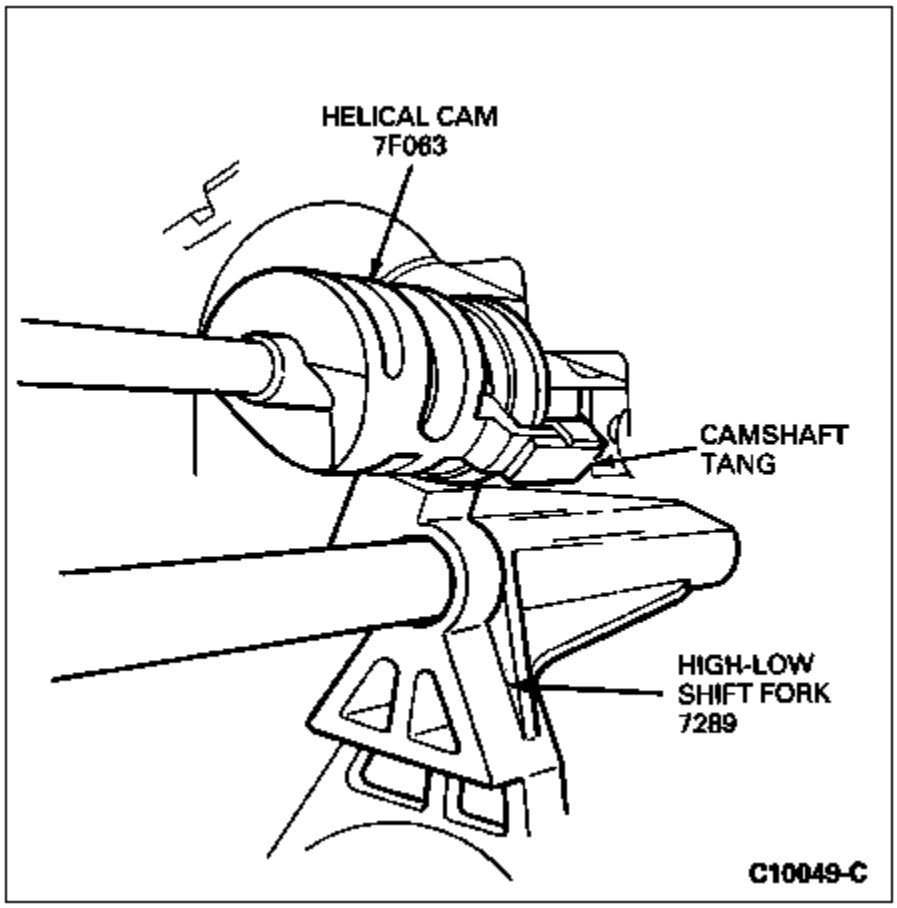
    Install the thrust washer on the front output shaft and install the external snap ring over the thrust washer to retain the driven sprocket.

19. Slide the spring spacer on the camshaft and position it beneath the drive tang. Place the torsion spring on the camshaft. Position the first spring tang to the left of the camshaft drive tang (View A). Wind the second spring tang clockwise past the drive tang (View B). Push the torsion spring and sleeve in as far as it will go (View C). This will seat the second spring tang on the right side of the drive tang. Install the helical cam and slide the drive tang between the torsion spring tangs as far as it will go.



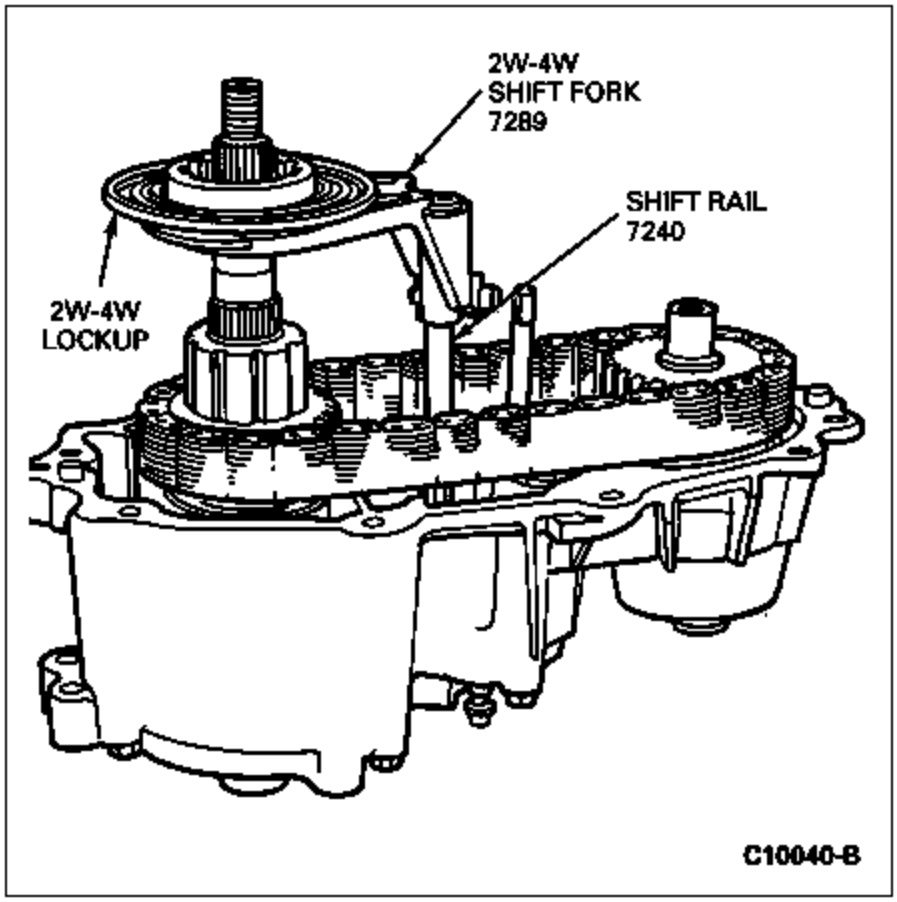
20. **CAUTION: Do not bend the helical cam during installation to the front case because of possible damage to the pin at the tang end of the motor shaft.**

Install the pin on the tang end of the helical cam into the hole in the front case. Position the torsion spring tangs so that they are pointing toward the top side of the transfer case and just touching the high-low shift fork.



21. Install the shift rail through the high-low shift fork and make sure that the shift rail is seated in the front case bore.

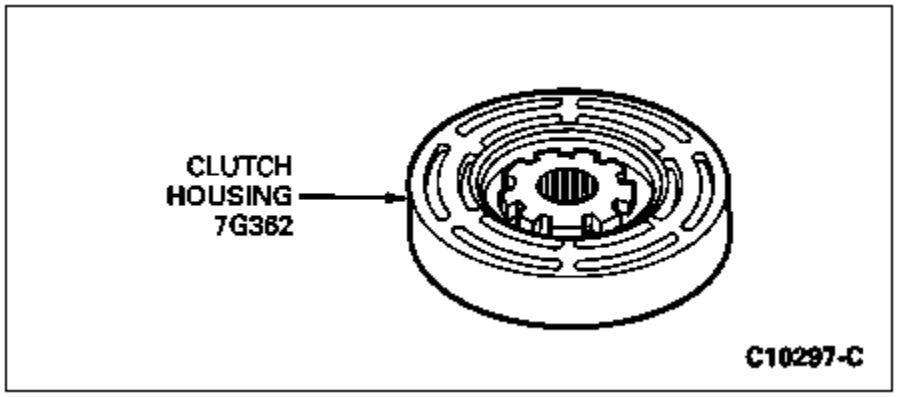
22. Install the 2W-4W shift fork to the 2W-4W lockup. Install the 2W-4W lockup and shift fork over the output shaft and onto the shift rail.



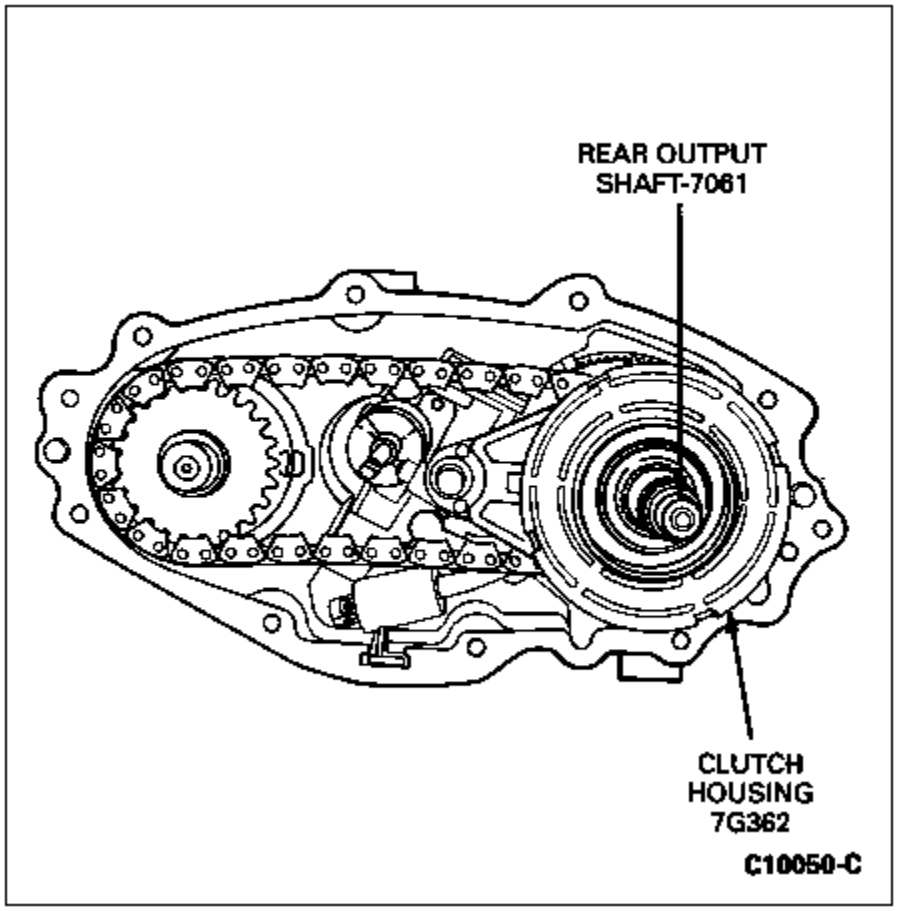
23. **NOTE: After the 2W-4W shift fork is released, the 2W-4W fork roller bushing should rest on the top surface of the helical cam and not into an inside track.**

    NOTE: The triangular shaft will be in the two wheel high (2H) position at final assembly.

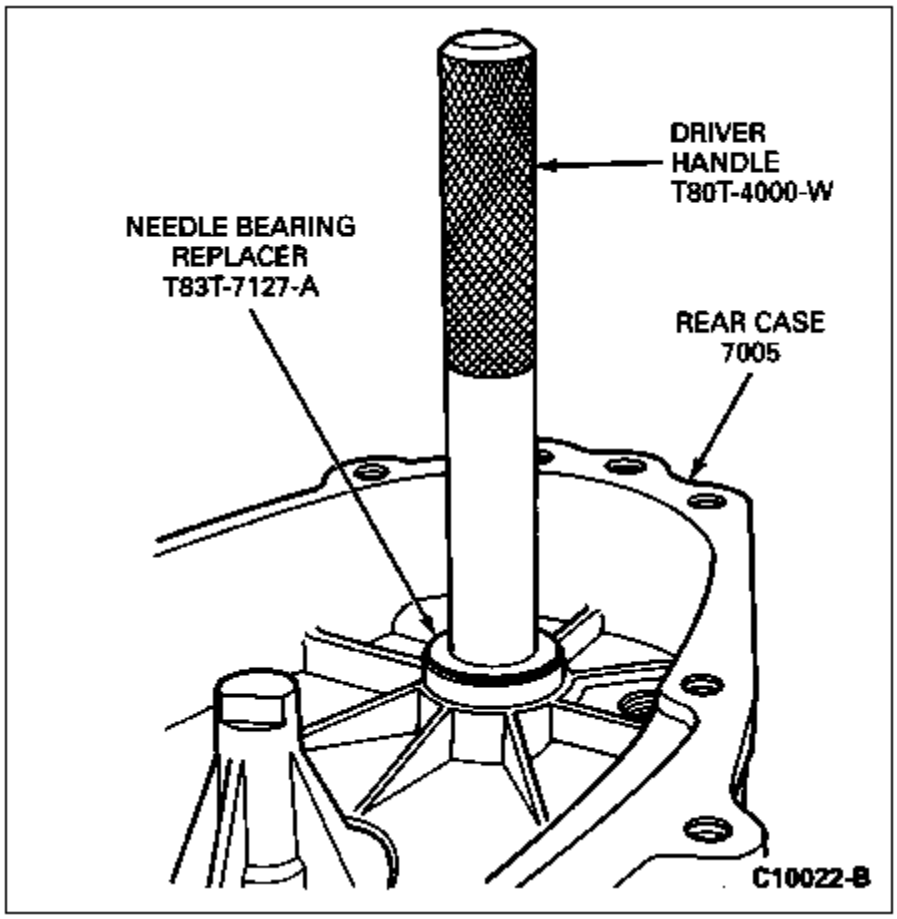
    Lift the 2W-4W shift fork slightly while holding the shift rail down and rotate the helical cam track into the high-low fork roller bushing by turning the helical cam.



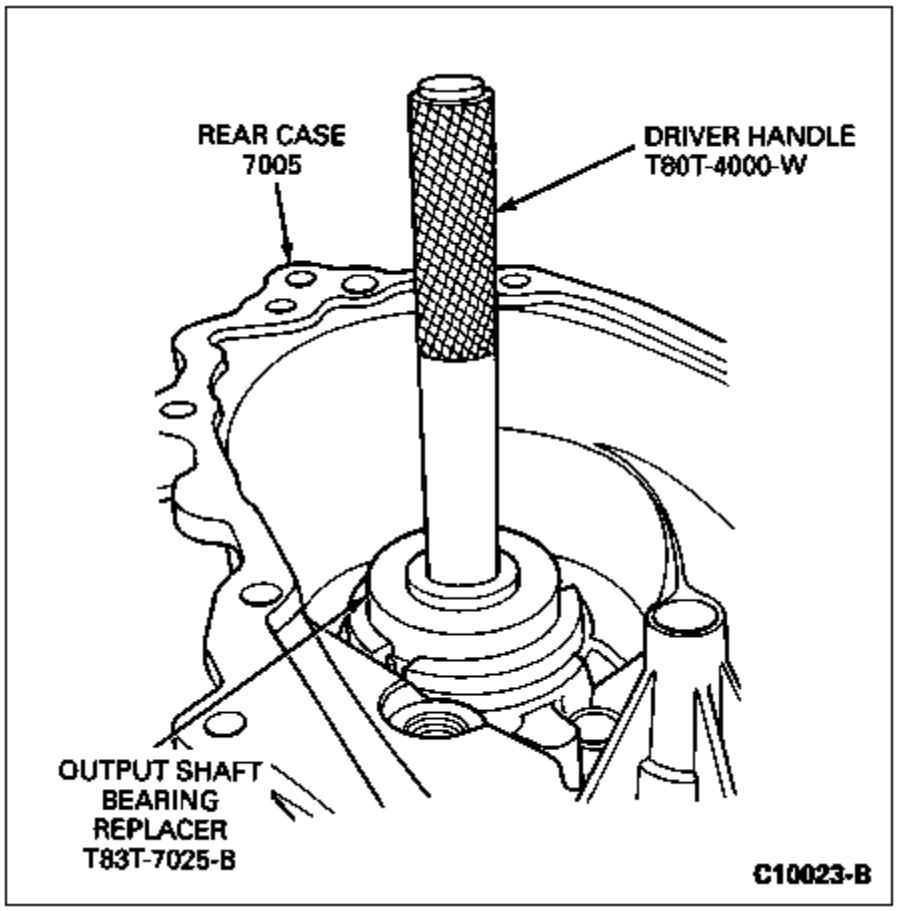
24. Install the clutch housing on the output shaft with the cavity side or notches facing the rear case.



25. If removed, drive the front output shaft needle bearing into the rear cover bore with Front Shaft Needle Bearing Replacer T83T-7127-A and Driver Handle T80T-4000-W.

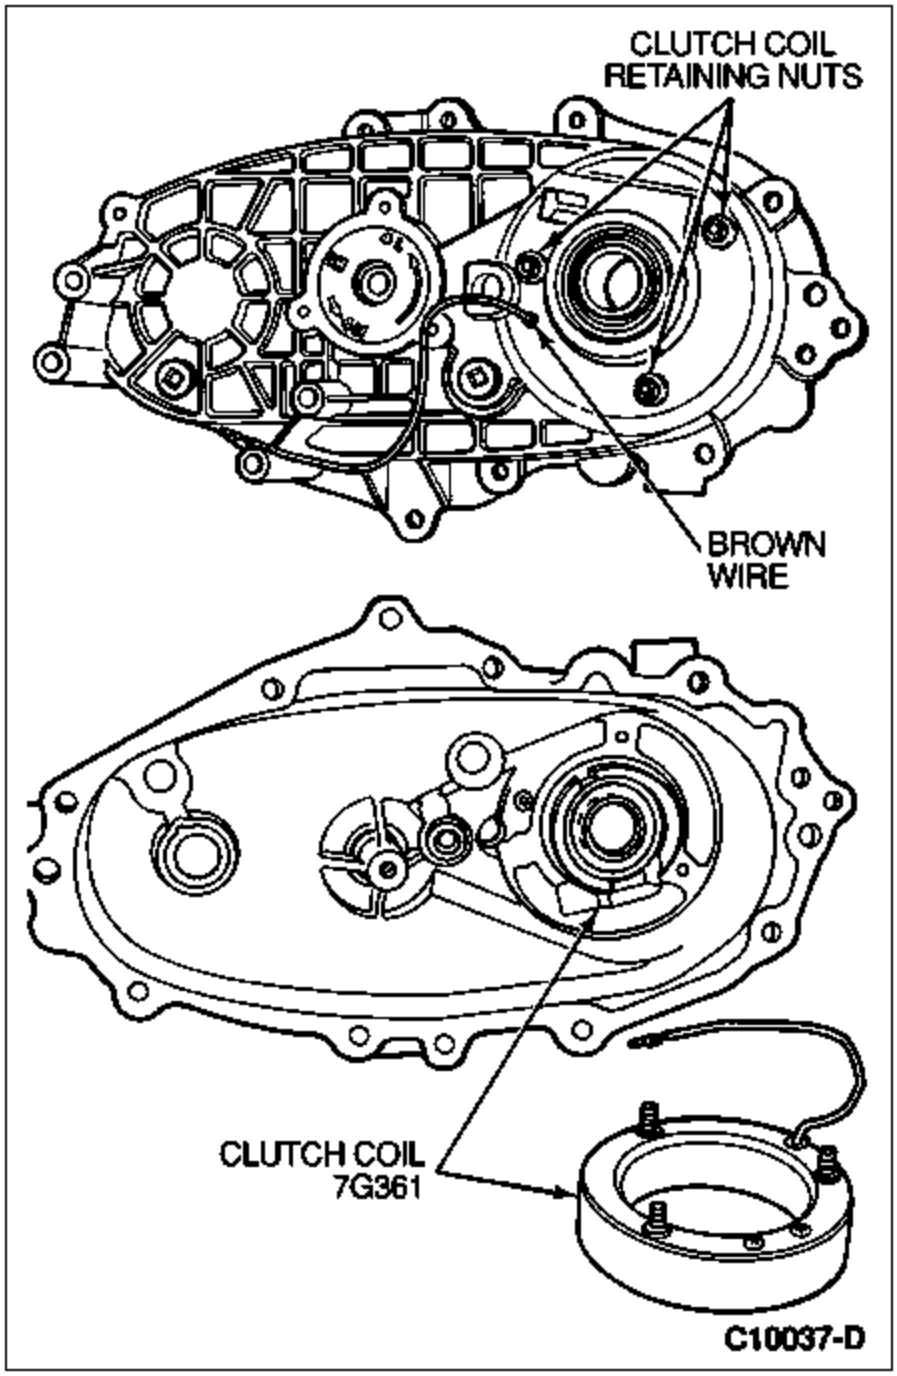


26. If removed, install the rear output bearing in the rear case bore. Drive the bearing into the rear case bore with Output Shaft Bearing Replacer T83T-7025-B and Driver Handle T80T-4000-W. Make sure that the bearing is not cocked in the bore. Install the internal snap ring that retains the bearing to the rear case.



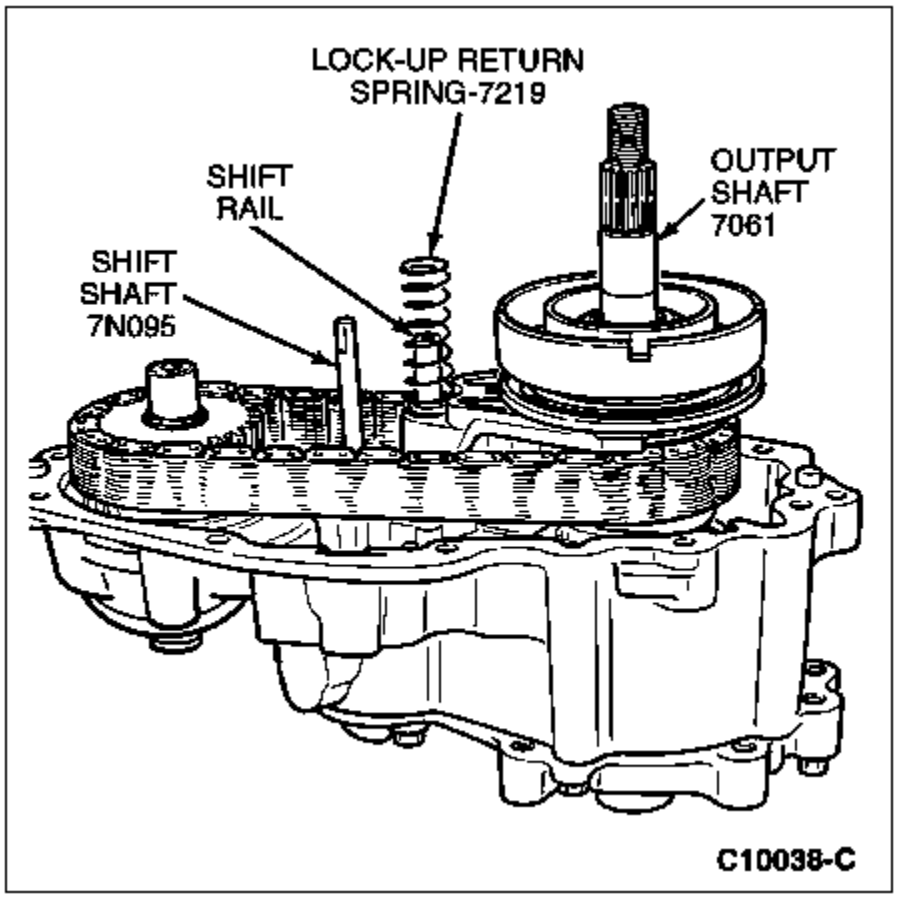
27. **CAUTION: Do not kink or trap the wire while seating the clutch coil to the case.**

Apply a bead of Non-Acid Cure Silicone Rubber E7TZ-19562-A or equivalent meeting Ford specification ESL-M4G273-A to the base of the clutch coil studs and grommet. Install the clutch coil from inside the rear case until the wire and studs extend through the cover. Install the nuts and tighten to 8-11 Nm (71-97 lb-in).



28. Coat the mating surface of the front case with a bead of Non-Acid Cure Silicone Rubber E7TZ-19562-A or equivalent meeting Ford specification ESL-M4G273-A.

29. Install the lockup return spring to the shift rail and shift fork with the spring mounted in a vertical position.



30. The following procedure must be followed prior to installing the rear case onto the front case half:

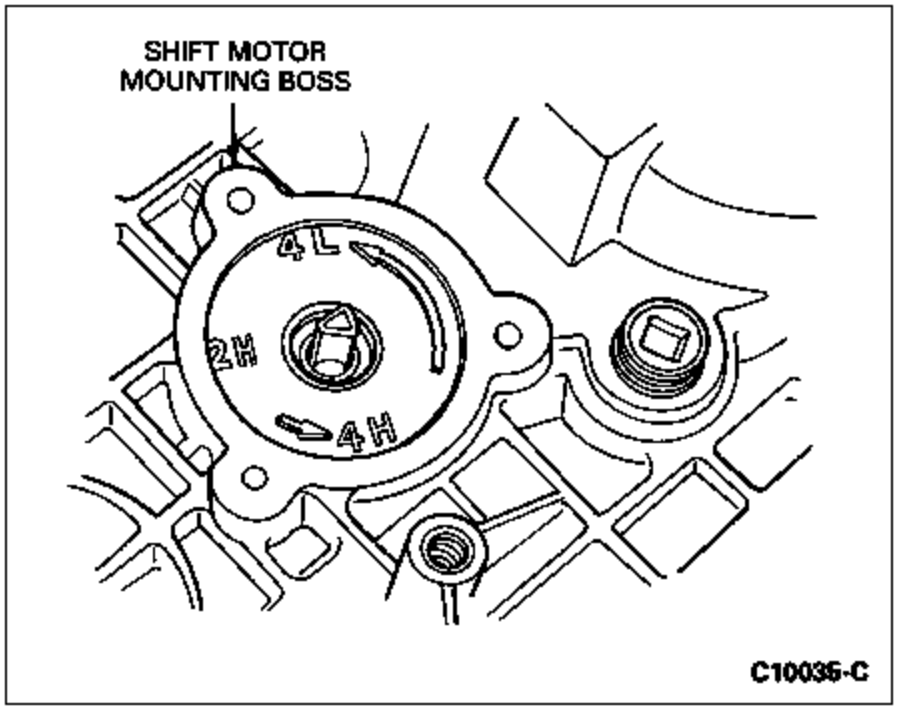
    a. Align the output shaft with the rear case output shaft bore.
    b. Align the helical cam with the rear case motor bore.
    c. Align the rear case so that the spring boss engages the lockup return spring and shift rail.

    If difficulty is encountered with seating the rear case, tap the rear output shaft with a sharp blow using a rubber mallet in a direction away from the triangular shaft while pushing down on the rear case.

31. Install the bolts retaining the case halves and tighten to 31-41 Nm (23-30 lb-ft).

32. **NOTE: If the shaft will not stay in the 4H position, rotate the shaft clockwise to the 2H position. During motor installation, rotate the transfer case shift motor counterclockwise until the transfer case shift motor is aligned with the mounting holes.**

    Using pliers equipped with soft jaws, rotate the triangular shaft so it is aligned with the triangular slot in the transfer case shift motor.



33. **NOTE: Do not loosen the two nuts or studs that attach the motor end cap to the motor housing.**

    Slightly loosen the two nuts that attach the slotted support bracket to the end of the motor house.

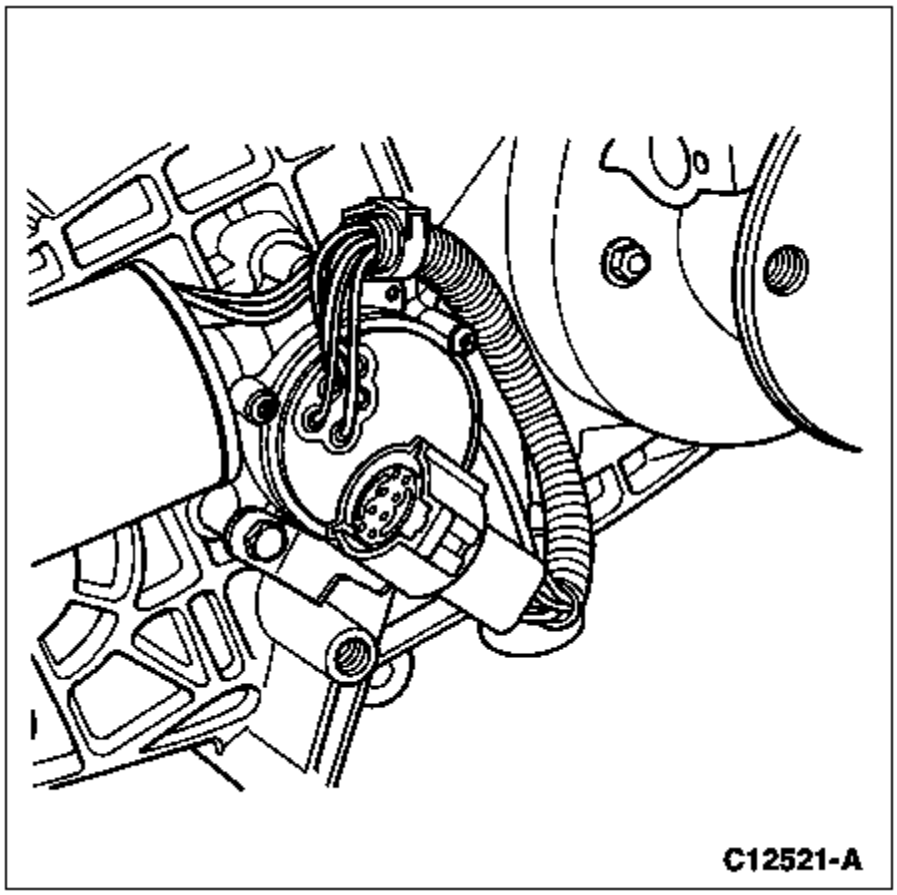
34. Apply Black Non-Acid Cure Silicone Rubber E7TZ-19562-A meeting Ford specification ESL-M4G273-A to motor housing base and install on transfer case.

35. **NOTE: The wire harness must be routed as shown to provide clearance and to prevent the wire harness from grounding the damper.**

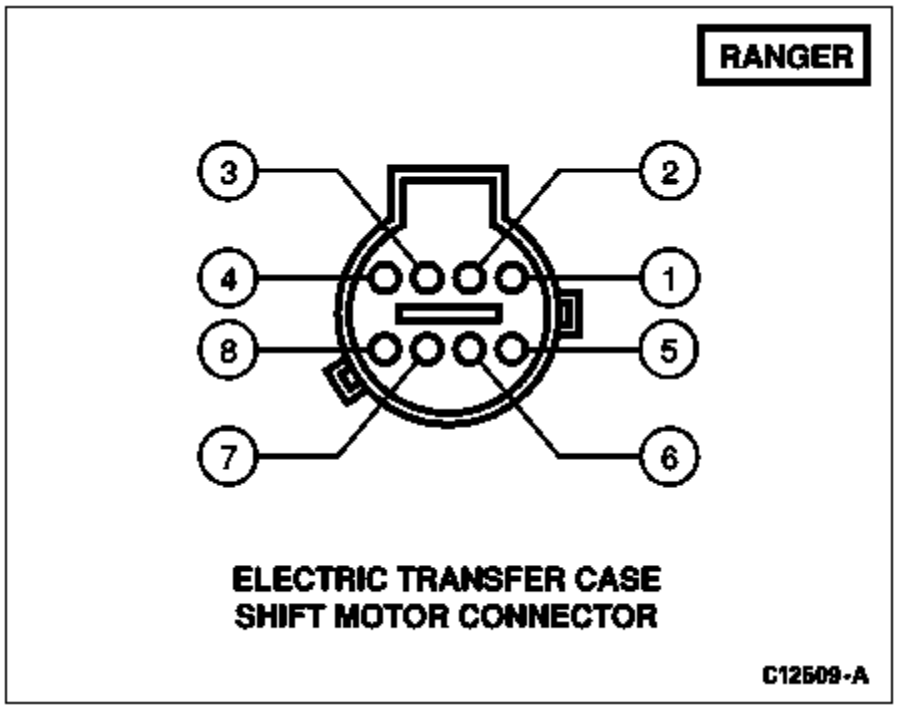
    Install the transfer case shift motor and three bolts. Tighten to 8-11 Nm (71-97 lb-in).

36. Holding the slotted support bracket tight against the motor housing end, secure the bracket to the transfer case, tightening the bolt with lockwasher to 8-11 Nm (71-97 lb-in).

37. Retighten the two nuts that attach the slotted support bracket to the end of the motor to 3-4 Nm (27-35 lb-in).



38. Install the brown clutch coil wire to the No. 8 terminal. Install the red locking sleeve.



Pin Number	Circuit	Circuit Function
1	770 (W)	Electrical Shift 4x4 Module to Motor Position No. 4
2	764 (BR/W)	Electrical Shift 4x4 Module to Motor Position No. 3
3	763 (O/W)	Electrical Shift 4x4 Module to Motor Position No. 2
4	777 (Y)	Electrical Shift 4x4 Module to Motor Control Counterclockwise
5	771 (P/Y)	Electrical Shift 4x4 Module to Motor Position No. 5
6	762 (Y/W)	Electrical Shift 4x4 Module to Motor Position No. 1
7	778 (O)	Electrical Shift 4x4 Module to Motor Control
8	779 (BR)	Electrical Shift 4x4 Module to Electric Clutch

39. Install the speedometer drive gear to the rear case bore. Drive the yoke to flange seal into the rear case bore with Output Shaft Seal Replacer T83T-7065-B and Driver Handle T80T-4000-W.

40. Install the rear case yoke on the output shaft. Install the rubber seal, output shaft yoke washer and nut. Tighten the nut to 339-381 Nm (250-280 lb-ft).

41. Install the drain plug and tighten to 19-30 Nm (14-22 lb-ft).

42. Install the front case yoke, rubber seal, output shaft yoke washer and the nut to front output shaft. Tighten the nut to 250-275 Nm (184-203 lb-ft).

43. Place a 3/8-inch drive ratchet in the fill plug and remove the plug. Fill the transfer case with 1.2 liters (2.5 U.S. pints) of Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid WSP-M2C185-A or equivalent.

44. Install the fill plug and tighten to 19-30 Nm (14-22 lb-ft).

45. Install the Transfer Case as outlined in the installation portion of this section.

Fluid Level Check

Remove the fill plug from the rear case (7005). Fluid level should be just below the fill plug hole. If the fluid level is below this level, fill with Motorcraft MERCON® Multi-Purpose Automatic Transmission Fluid WSP-M2C185-A or equivalent to the correct fill level. Reinstall the fill plug and tighten to 19-30 Nm (14-22 lb-ft).

Clutch System

The primary function of the clutch system is to couple and uncouple engine power to the transmission upon driver command. For additional information, refer to Section 08-01 and Section 08-02 .

Engine output is coupled to the transmission input shaft (7017) by friction existing between the clutch disc facings and the flywheel (6375)/ clutch pressure plate (7563) assembly. The extent of this friction is directly related to the composition of the facing material and the magnitude of the clamping forces exerted by the clutch pressure plate and flywheel on the facings. These factors limit the amount of torque that can be transmitted without slippage.

The clamping force is obtained from a diaphragm spring contained within the clutch pressure plate assembly. This force is developed during the attachment of the clutch pressure plate assembly to the flywheel.

Disengagement of the clutch by depressing the clutch pedal (7519) is accomplished when the release fingers are fully displaced toward the flywheel. This displacement removes the Belleville spring load from the clutch pressure plate and eliminates the coupling friction between the engine and the transmission.

The release fingers are moved by the clutch release hub and bearing (7548), which receives its motion through a control system from the clutch pedal. The partial finger displacement does not release the clutch but results in lower coupling friction which can cause slippage under load.

The secondary function of the clutch pressure plate and clutch disc (7550) assemblies is to aid in isolating engine power pulses from the remainder of the powertrain.

The weight of the clutch pressure plate assembly adds to that of the flywheel and improves its function as a vibration damper.

Contained within the clutch disc assembly are several coil springs. These springs, along with a controlled amount of friction between the hub and the drive plates, also absorb engine pulsations.

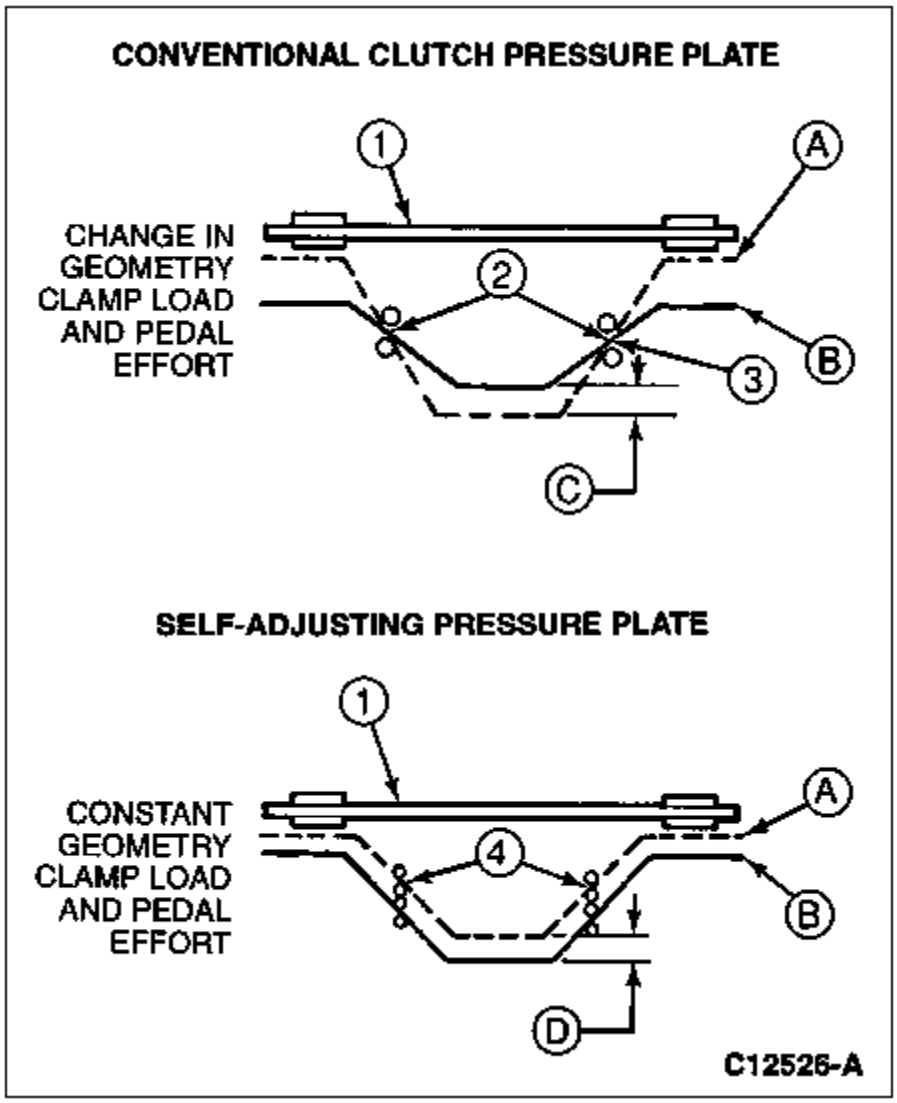
The spring and friction characteristics are tailored to each engine/powertrain/vehicle application. Therefore, only specified clutch discs should be used for replacement.

This system uses a self-adjusting clutch system operated by hydraulic pressure. The clutch release fingers are actuated by a constantly running, self-centering clutch release hub and bearing.

The new 2.3/3.0L engine pressure plate utilizes a moving fulcrum point. The fulcrum point moves corresponding to disc wear. The reason for this is to keep consistent finger geometry to maintain constant pedal effort over the life of the clutch disc.

Pedal efforts of conventional clutches increase because of geometry changes in the pressure plate diaphragm spring.

tomsn048@gmail.com



Item	Part Number	Description
1	7550	Clutch Disc
2	—	Fixed Fulcrum (Part of 7563)
3	7563	Clutch Pressure Plate
4	—	Adjustable Fulcrum
A	—	Worn Disc Portion
B	—	New Disc Portion
C	—	10mm (0.3937-Inch) Movement
D	—	2mm (0.07874-Inch) Movement

NOTE: The clutch release hub and bearing is a constant-run, full-angular contact, self-aligning design that will not necessarily require replacement every time the clutch is serviced. The clutch release hub and bearing can be reused and should not be replaced unless roughness, binding or any other service condition is noted.

tomsn048@gmail.com

For more information, refer to Section 08-01 and Section 08-02 .

tomsn048@gmail.com

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the clutch system to duplicate the condition.
2. Check for obvious damage to any accessible mechanical components.
3. Check transmission fluid level and check fluid for specified lubricant.
4. Check the vehicle for signs of brake fluid leakage from clutch system. Refer to Section 08-02 for an illustration of the clutch systems.
5. If the concern(s) remain after the inspection, determine the symptoms and proceed to the Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Clutch System

CLUTCH SYSTEM

Condition	Possible Source	Action
• Clutch Slippage	• Sticking clutch pedal. • Damaged or weakened diaphragm spring. • Damaged clutch pressure plate. • Worn clutch disc facing. • Hardened or oiled clutch disc facing surface. • Residual pressure in hydraulic system. (Open bleed screw to verify.) • Loose or missing clutch cover to flywheel attachment bolts.	• GO to Pinpoint Test A .
• Clutch Chatter or Shudder **NOTE: A light chatter or shudder in the vehicle when engaging the clutch at low engine rpm is a normal occurrence. Therefore, drivetrain components, particularly the clutch disc and the clutch pressure plate, should not be replaced or rebuilt in an attempt to eliminate this condition.**	• Loose or worn engine mount. • Oil on clutch disc facing. • Damaged clutch pressure plate or has excessive runout. • Hardened or worn clutch disc facing. • Damaged or hardened flywheel surface. • Loose or missing clutch cover to flywheel attachment bolts.	• GO to Pinpoint Test B .

tomsn048@gmail.com

• Clutch Drag/Hard Shifting	• Insufficient brake fluid. • Leakage of brake fluid. • Air in system. • Cracked diaphragm spring. • Excessive runout or damaged clutch disc. • Rusted or worn clutch disc or input shaft splines. • Oil on facing. • Damaged clutch release hub and bearing. • Manual transmission concern.	• GO to Pinpoint Test C .
• Clutch Pedal Pulsation	• Clutch and brake pedal pivot shaft not properly lubricated. • Excessive flywheel runout. • Uneven pressure plate finger heights.	• GO to Pinpoint Test D .
• Clutch-Related Vibrations	• Engine component grounding against frame. • Accessory drive belt loose or damaged. • Loose flywheel bolts. • Excessive flywheel runout. • Imbalanced clutch pressure plate. • Loose pressure plate bolts.	• GO to Pinpoint Test E .
• Fluid Leakage	• Clutch master cylinder. • Clutch slave cylinder. • Hydraulic lines (tubes and connections).	• GO to Pinpoint Test F .
• Excessive Noise	• Damaged clutch release hub and bearing. • Poor lubrication of	• GO to

tomsn048@gmail.com

	clutch release hub and bearing sleeve. • Damaged or worn pilot bearing. • Excessive crankshaft end play.	Pinpoint Test G .

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: CLUTCH SLIPPAGE

A1 VERIFY CLUTCH SLIPPAGE

- Block the wheels and set the parking brake.
- Start the engine, shift into fourth gear and increase engine speed to 2,000 rpm.
- Slowly release the clutch pedal.

Does the engine stall within five seconds?

Yes	No
Clutch is not slipping. RETURN to the Symptom Chart .	GO to **A2** .

A2 INSPECT CLUTCH PEDAL

- Inspect the clutch pedal pivot point for proper lubrication.

Is the clutch pedal pivot point properly lubricated?

Yes	No
GO to **A3** .	LUBRICATE the clutch pedal pivot point.

A3 INSPECT FOR RESIDUAL PRESSURE

- Open bleeder screw.

Is there pressure?

Yes	No
REPLACE master cylinder.	GO to **A4** .

A4 INSPECT CLUTCH ASSEMBLY (DISC/PRESSURE PLATE)

- Remove transmission.

tomsn048@gmail.com

- Inspect clutch disc for oil or grease.

Is clutch disc contaminated with oil, grease or fluid?

Yes	No
CHECK and REPAIR source of grease, fluid or oil leak. REPLACE clutch disc. REFER to Section 08-01 .	INSPECT clutch disc, clutch pressure plate, and flywheel for wear. REFER to Clutch Pressure Plate or Flywheel Runout Check in this section. REPLACE as necessary. REFER to Section 08-01 for replacement procedures.

PINPOINT TEST B: CLUTCH CHATTER OR SHUDDER

B1 VERIFY CLUTCH CHATTER OR SHUDDER

- Start the engine.
- Depress the clutch pedal and shift the vehicle into first gear.
- Increase the engine speed to between 1,200 and 1,500 rpm.
- Slowly release the clutch pedal and observe the clutch operation.
- Shift the vehicle into REVERSE and repeat test.

Does the vehicle shudder?

Yes	No
GO to **B2** .	No clutch chatter or shudder present. RETURN to the Symptom Chart .

B2 CHECK ENGINE OR TRANSMISSION MOUNTS

- Inspect all engine and transmission mounts for looseness. Refer to Section 02-03 if necessary.

Were any engine or transmission mounts loose or damaged?

Yes	No
TIGHTEN or REPLACE the engine or transmission mounts.	GO to **B3** .

B3 INSPECT CLUTCH PRESSURE PLATE

- Remove the clutch pressure plate. Refer to Section 08-01 .
- Inspect the clutch pressure plate for wear. Check for warping and discolored surface.

Are there any signs of wear present on the clutch pressure plate.

tomsn048@gmail.com

Yes	No
REPLACE the clutch pressure plate.	GO to **B4** .

B4 CHECK CLUTCH DISC

- Perform the Clutch Disc Inspection procedure in this section.

Is the clutch disc OK?

Yes	No
INSPECT the flywheel for damage (warpage or discoloring from excessive heat). REFER to the Flywheel Runout Check in this section. INSPECT clutch release hub and bearing. REFER to Section 08-02 .	REPLACE the clutch disc.

PINPOINT TEST C: CLUTCH DRAG/HARD SHIFTING

C1 CHECK HIGH SHIFTING EFFORTS

- Set parking brake.
- With shift control selector in reverse, clutch disengaged and engine idling, move shift lever to a position halfway between reverse and neutral.
- Slowly engage clutch.
- Gear clash can now be heard if an attempt is made to shift into reverse with clutch engaged, and reserve can now be measured.
- While maintaining light pressure on shift selector, slowly press clutch pedal toward the floor. At a point in the travel of the clutch pedal the gear clash will stop and the shift selector will slide easily into reverse position. The amount of travel remains until the pedal touches the floor is defined as reserve. If pedal is all the way to the floor before stopping gear clash, clutch pedal reserve is not adequate.

Is there adequate clutch pedal reserve?

Yes	No
Clutch system OK.	GO to **C2** .

C2 CHECK FOR CLUTCH DRAG

- Start engine, press clutch pedal and shift into first gear.
- With clutch pedal still pressed, shift into neutral.
- Wait five seconds and shift into reverse.

Are gears clashing or dragging?

tomsn048@gmail.com

Yes	No
GO to **C3** .	RETURN to Symptom Chart .

C3 CHECK HYDRAULIC CLUTCH FLUID LEVEL

- Engine off.
- Inspect the fluid level in the clutch master cylinder reservoir.

Is the fluid level full?

Yes	No
GO to **C4** .	ADD brake fluid and CHECK for leaks in the clutch hydraulic system.

C4 CHECK FLUID BYPASS

- Remove cap and seal from clutch reservoir.
- Actuate clutch pedal.

Does fluid level go up and down?

Yes	No
REPLACE clutch master cylinder.	GO to **C5** .

C5 CHECK FOR AIR IN CLUTCH

- Actuate clutch pedal.

Does pedal feel spongy?

Yes	No
Bench BLEED system. REFER to procedure in this section.	REPLACE clutch disc, clutch pressure plate, clutch release hub and bearing. INSPECT splines on input shaft for wear.

PINPOINT TEST D: CLUTCH PEDAL PULSATION

D1 CHECK CLUTCH PEDAL PULSATION

- With vehicle in neutral, start engine and slowly press clutch pedal.

tomsn048@gmail.com

Does clutch pedal pulsate?

Yes	No
GO to **D2** .	RETURN to Symptom Chart .

D2 CHECK PRESSURE PLATE

- Remove transmission.
- Check pressure plate finger heights.

Are heights even?

Yes	No
GO to **D3** .	REPLACE pressure plate. REFER to Section 08-01 .

D3 CHECK FLYWHEEL RUNOUT

- Remove transmission. Inspect flywheel for excessive runout. Refer to procedure in this section.

Is flywheel runout excessive?

Yes	No
REPLACE as necessary. REFER to Section 08-01 .	INSPECT clutch disc for excessive runout.

PINPOINT TEST E: CLUTCH-RELATED VIBRATIONS

E1 CHECK FOR ENGINE COMPONENT GROUNDING

- Raise the vehicle on a hoist.
- Check the engine mount interlocks for grounding.
- Check the exhaust manifold or other engine component grounding on the body or frame.

Is there evidence of grounding on body or frame?

Yes	No
REPAIR the components as necessary.	GO to **E2** .

E2 CHECK FOR RELEASE BEARING NOISE

- Start the engine.

tomsn048@gmail.com

Is a whirring, grating or grinding noise present?

Yes	No
REPLACE the clutch release hub and bearing. REFER to Section 08-02 .	GO to **E3** .

E3 INSPECT FLYWHEEL

- Remove the transmission.
- Inspect for loose flywheel bolts.
- Perform the flywheel runout check in this section.

Is the flywheel OK?

Yes	No
REFER to Section 03-00 to DIAGNOSE the engine vibration concerns.	TIGHTEN or REPLACE the flywheel.

PINPOINT TEST F: FLUID LEAKAGE

F1 INSPECT CLUTCH MASTER CYLINDER

- Inspect clutch master cylinder (from underneath dash also).
- Check all tube connections.
- Inspect clutch slave cylinder.

Is clutch hydraulic system leaking?

Yes	No
REPLACE parts as necessary. REFER to Section 08-01 and Section 08-02 . BLEED system. REFER to Bleed Procedure in this section.	Clutch hydraulic system OK.

PINPOINT TEST G: EXCESSIVE NOISE

G1 CHECK HYDRAULIC CLUTCH FLUID LEVEL

- Check the fluid level in the clutch master cylinder.

Is the fluid level full?

tomsn048@gmail.com

Yes	No
GO to **G2** .	ADD brake fluid and CHECK clutch hydraulic system for leaks. BLEED system.

G2 CHECK RELEASE HUB AND BEARING

- Remove the transmission. Refer to Section 07-03 .
- Inspect the clutch release hub and bearing for wear or loss of lubrication.

Are there any signs of wear or loss of lubrication?

Yes	No
REPLACE the clutch release hub and bearing.	GO to **G3** .

G3 CHECK PILOT BEARING

- Inspect the pilot bearing for damage. Refer to the Inspection procedures in this section.

Is the pilot bearing OK?

Yes	No
GO to **G4** .	REPLACE the pilot bearing. REFER to Section 08-01 .

G4 CHECK TORSION SPRING

- Inspect the torsion spring for fatigue.

Are there any signs of fatigue?

Yes	No
REPLACE the clutch disc. REFER to Section 08-01 .	INSPECT the crankshaft end play. REFER to Section 03-00 .

tomsn048@gmail.com

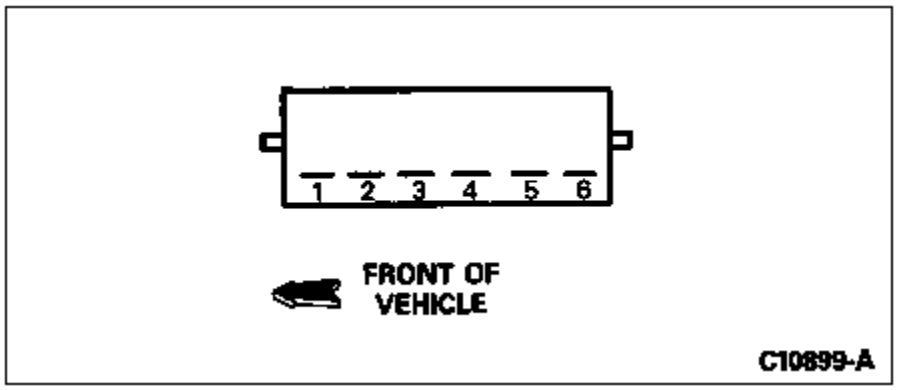
tomsn048@gmail.com

Component Tests

Clutch Pedal Position Switch Operation

1. To check the clutch pedal position switch (CPP) (11A152) for proper starting function, disconnect the wiring harness from the clutch pedal position switch.

2. Using an ohmmeter, probe Pins 1 and 2 for continuity. The indicator should read OPEN while moving the pedal from a full up position to within approximately 25mm (1 inch) of full travel. Measurement beyond this point should be a CLOSED reading (0 ohms).



tomsn048@gmail.com

Dowels, Flywheel Housing to Block

Removal and Installation

1. Remove the transmission. Refer to the procedure in Section 07-03 .

2. **NOTE: Flywheel housing to block dowels (6397) should be pulled or driven from their seat. Do not damage surface area around the flywheel housing to block dowel.**

   Use a drift pin on through holes and vice grip pliers or a similar tool on blind holes to remove flywheel housing to block dowels.

3. **NOTE: Drive flywheel housing to block dowel squarely into place until fully seated. Do not damage the surrounding surface area.**

   Install all solid type flywheel housing to block dowels by driving into place using a brass or plastic mallet.

tomsn048@gmail.com

Dowels, Flywheel

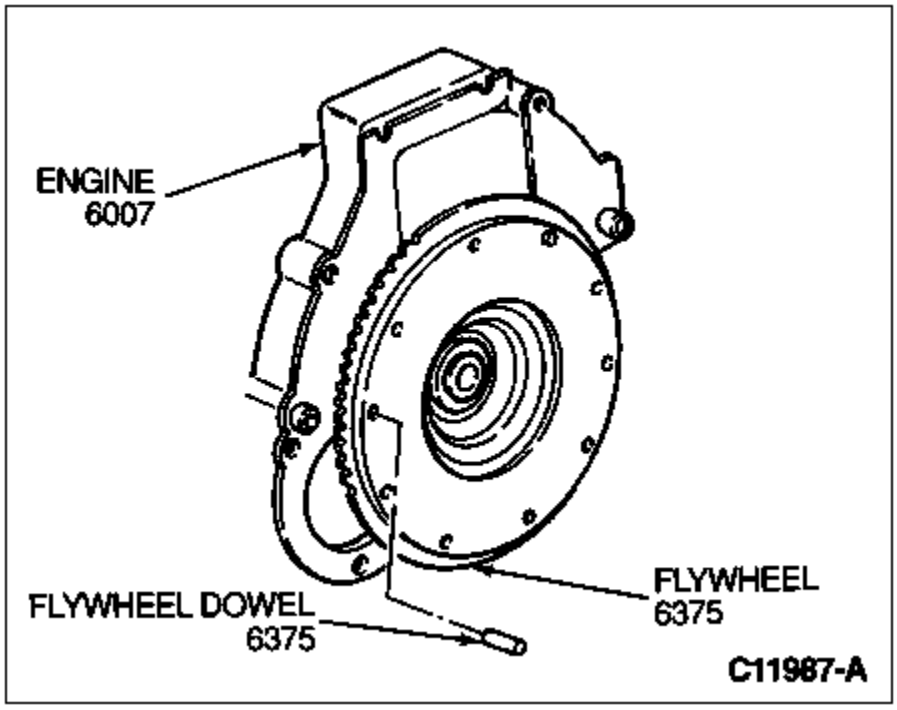
Removal

Prior to dowel removal, you must remove the clutch pressure plate. Refer to Section 08-01 for procedure.

Dowels can be removed by using a drift pin where the dowel is installed in a drilled hole and vise grip pliers where the dowel is installed in a blind hole. They should be pulled or driven from their seat, taking care not to damage dowel hole or surface area around dowel during removal.

Installation

All dowels can be installed by driving them into place using a brass or plastic mallet. Care should be exercised to drive the dowel squarely into place until fully seated and not to damage surrounding surface areas.



tomsn048@gmail.com

tomsn048@gmail.com

Clutch Pressure Plate

1. **CAUTION: Do not use cleaners with a petroleum base, and do not immerse the clutch pressure plate (7563) in the solvent.**

   NOTE: The Belleville design clutch pressure plates do not need to be lubricated.

   Clean clutch pressure plate and flywheel (6375) with a suitable commercial alcohol base solvent so surfaces are free from any oil film.

2. Inspect surface of clutch pressure plate for burn marks, scores, flatness or ridges.

3. If the clutch pressure plate is badly heat-checked or deeply scored, replace clutch pressure plate and cover assembly.

4. Check clutch pressure plate finger heights with pressure plate installed.

5. If a substantial difference in finger wear exists, the heavily worn finger is binding. Replace the clutch pressure plate.

tomsn048@gmail.com

Clutch Disc

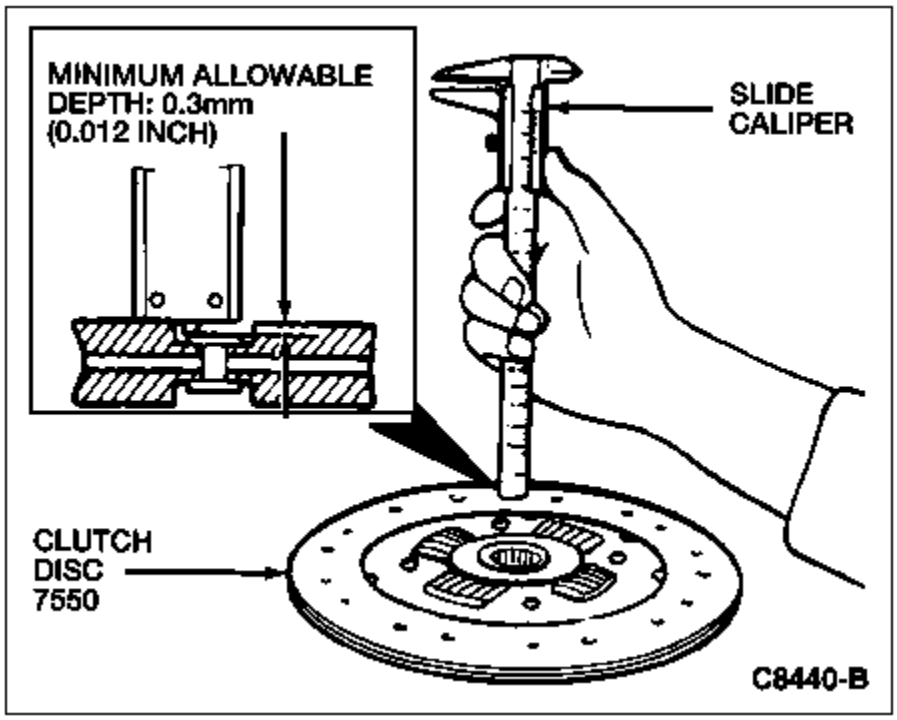
1. **NOTE: Replace clutch disc (7550) if any of these conditions are present. When installing a new clutch disc, do not drop or contaminate with oil or grease.**

   Inspect the clutch disc facings for oil or grease. Eliminate the source of any oil or grease before replacing the clutch disc.

   - An excessive amount of grease on the clutch release hub and bearing (7548) will find its way to the clutch disc facings.
   - Too much lubricant in the transmission or a plugged transmission vent will force the transmission lubricant out the input shaft (7017) and onto the disc facings.
   - Leaking rear engine seals or loose or unsealed flywheel housing attaching bolts allows engine oil to flow onto the disc facings.

2. **NOTE: Use emery cloth to remove minor imperfections in the clutch disc lining surface.**

   Check for worn clutch disc lining. Measure the depth to the rivet heads with a slide caliper or depth micrometer. The minimum allowable depth is 0.3mm (0.012 inch).



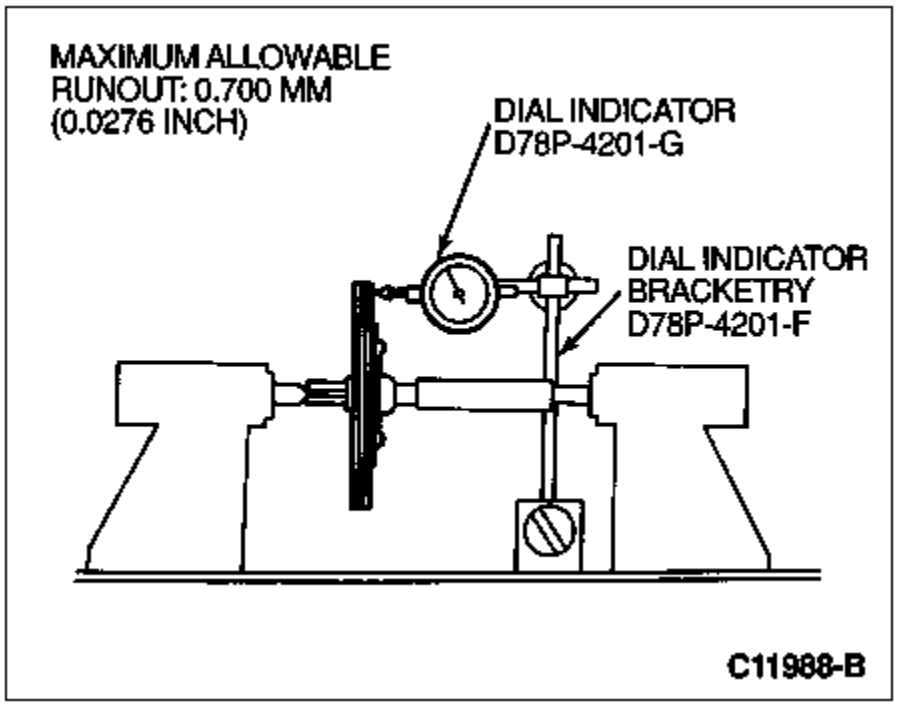
3. Inspect the clutch disc for worn or loose facings.

4. Check the clutch disc for warpage and for loose rivets at the hub.

tomsn048@gmail.com

5. Check for broken springs.

6. Check the runout of the clutch disc using Dial Indicator D78P-4201-G and Dial Indicator Bracketry D78P-4201-F or equivalent. The maximum allowable runout is 0.700mm (0.0276 inch).



7. Check for wear or rust on the splines and remove with an emery cloth.

tomsn048@gmail.com

Flywheel

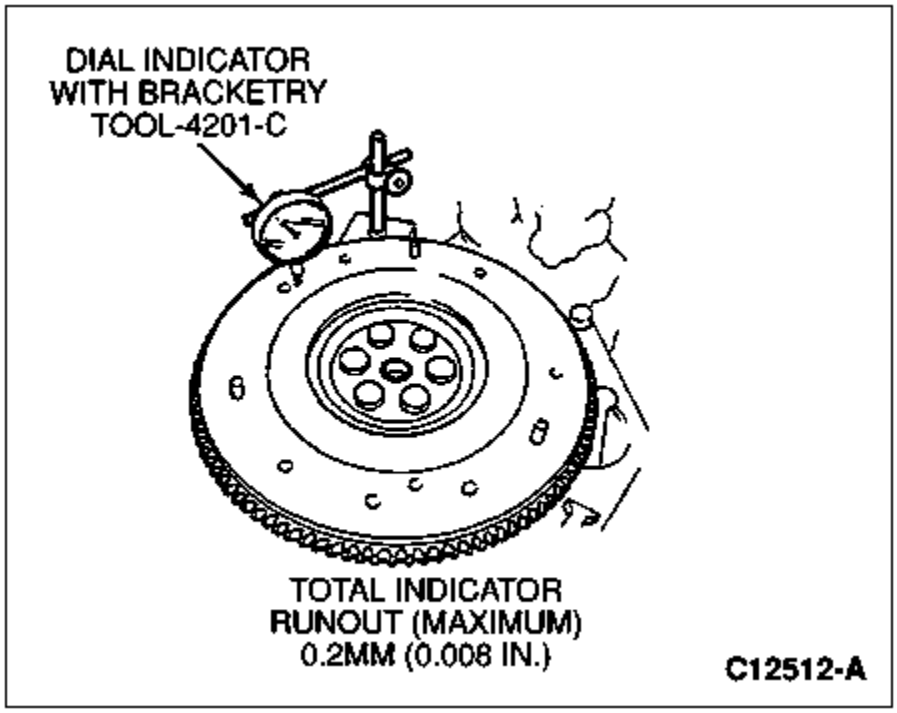
1. Inspect flywheel (6375) for cracks, heat checks or other damage.
2. Machine friction surface of flywheel if scored or worn.
3. If more than 1.143mm (0.045 inch) of stock from original thickness of flywheel needs to be removed, replace flywheel.

tomsn048@gmail.com

Flywheel Runout Check

1. Install Dial Indicator D78P-4201-G and Dial Indicator Bracketry D78P-4201-F or equivalent so that the indicator point contacts the flywheel (6375) face. Turn the flywheel, making sure to hold it in the full forward or rearward position so that the crankshaft end play will not be indicated as flywheel runout.

2. If the clutch face runout exceeds specification, remove the flywheel and check for burrs between the flywheel and face of the crankshaft mounting flange. If no burrs exist, check the runout of the crankshaft mounting flange. Replace the flywheel or crankshaft (6303) if the mounting flange runout exceeds the specification of 0.2mm (0.008 inch).



3. Check for damaged or worn ring gear teeth.

tomsn048@gmail.com

tomsn048@gmail.com

Pilot Bearing

Needle Type

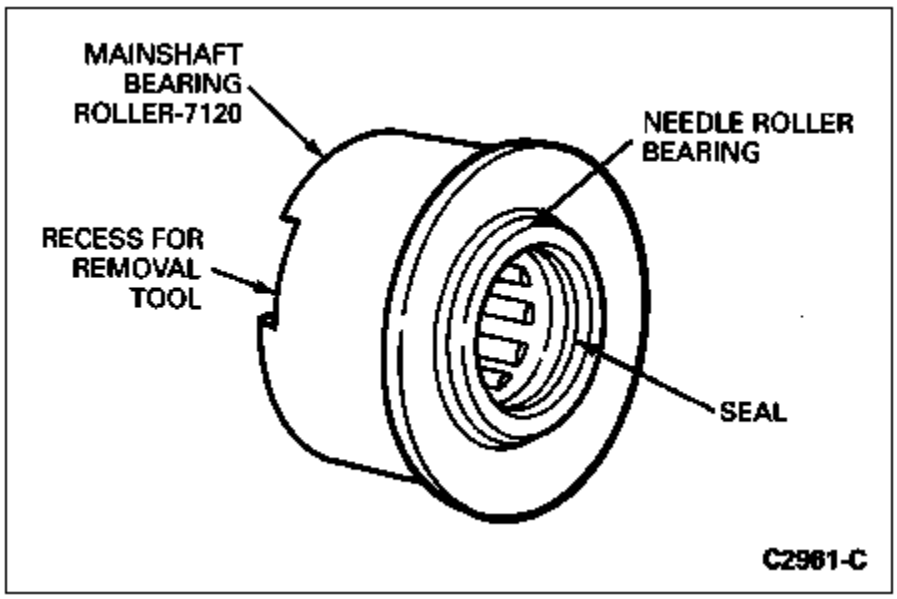
1. **NOTE: Pilot bearing is pressed into crankshaft and should not be loose.**

   Check pilot bearing fit in crankshaft bore.

2. Check the pilot bearing (needle type) for misalignment and press fit condition in crankshaft (6303).

3. Visually inspect the needle rollers and transmission input shaft (7017) for scoring, worn or broken rollers, inadequate grease and discoloration due to heating.

4. Check the condition of the pilot bearing seal. There should be no visible grease leakage on the pilot bearing retainer or the crankshaft. Refer to Section 08-01 .



tomsn048@gmail.com

tomsn048@gmail.com

Clutch Pedal

Check the clutch pedal (7519) for the following conditions:

- Worn or damaged clutch pedal
- Twisted or bent pedal
- Worn or damaged pedal pad

tomsn048@gmail.com

Clutch Master Cylinder

1. **CAUTION: Clean all rubber clutch master cylinder parts with specified brake fluid.**

   Clean all of the clutch master cylinder components.

2. Check the clutch master cylinder (7A543) for damage to any reservoir components.

tomsn048@gmail.com

Cylinder Clutch Slave

1. Clean all of the cylinder clutch slave components.

2. Check the clutch slave cylinder (7A508) for the following conditions:

   - Weak spring
   - Worn or damaged piston cup
   - Worn or damaged boot
   - Leaking fluid

3. Check for traces of fluid inside the clutch housing portion of the case (7005). If fluid is visible, replace clutch slave cylinder. Refer to Section 08-02 .

tomsn048@gmail.com

Clutch Pedal

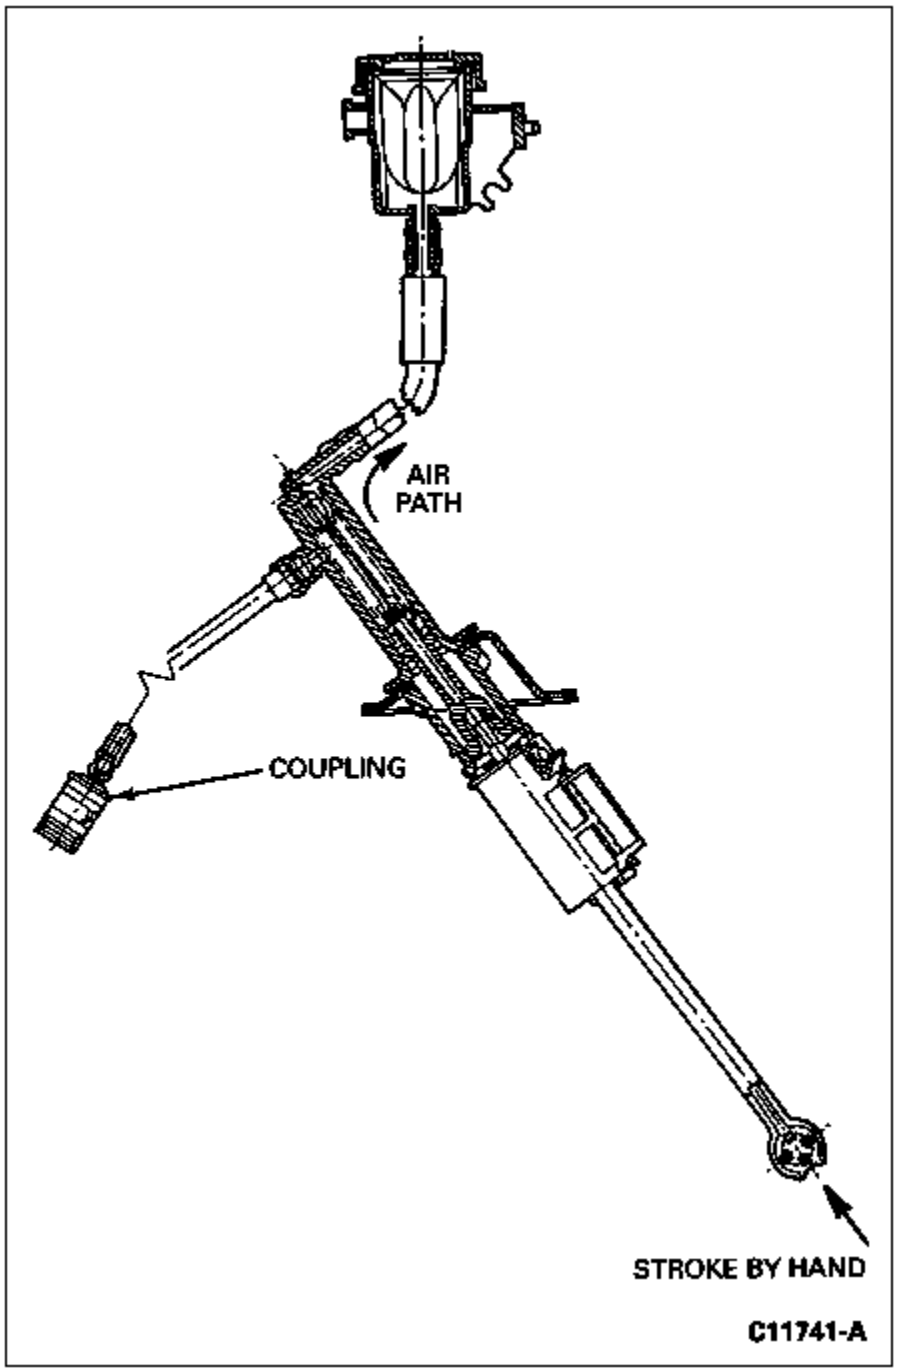
The clutch pedal (7519) is self-adjusting. Whenever the clutch system is serviced the clutch pedal must be pumped at least five times to set tension.

Bench Bleed

The downward angle of the clutch master cylinder (7A543) makes it difficult for air to escape up into the reservoir. Therefore, if the clutch master cylinder is removed from the vehicle and bled while held in a vertical orientation (a bench bleed), air can escape much more efficiently.

Clutch Master Cylinder

tomsn048@gmail.com



1. Start with tube and reservoir attached to clutch master cylinder, but system removed from vehicle. Lightly clamp reservoir is a vise.

2. Hold the clutch master cylinder vertically with reservoir feed hose in the highest position on the body.

3. Fill reservoir and extend above clutch master cylinder and make sure the quick connect on clutch line is below the clutch master cylinder.

4. Using a small screwdriver, depress the internal mechanism of the male quick connect coupling to open the valve.

tomsn048@gmail.com

5. Stroke and hold master cylinder push rod.
6. Close quick connect valve.
7. Release master cylinder push rod.
8. Fill reservoir.
9. Repeat Steps 4 through 8 four more times.
10. With the clutch master cylinder still being held with the outlet tube and reservoir feed tube ends high, quick connect closed and the reservoir full, push the push rod into the body several times quickly to expel any remaining air. (If remote reservoir, pinch supply hose with fingers two or three times to help move air into reservoir.)
11. When the movement of the push rod is 4mm (.160 inch) or less when stroked in Step 10 above, the clutch master cylinder may be reinstalled into the vehicle and coupled to the concentric clutch slave cylinder.

---

tomsn048@gmail.com

Bleed Procedure

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Coupling Tool	T88T-70522-A

1. Disconnect the coupling at the transmission with Clutch Coupling Tool T88T-70522-A by sliding the white plastic sleeve toward the clutch slave cylinder (7A508) while applying a slight tug on the clutch tube.
2. Clean dirt and grease from around the reservoir cap.
3. Remove cap and diaphragm and fill reservoir to the step with Ford High Performance DOT 3 Brake C6AZ-19542-AB or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A. By hand, apply 22-33 kg (10-15 lbs.) to clutch pedal (7519); if pedal is hard (6-13mm [.25-.50-inch] movement), skip to Step 9. If pedal is spongy, proceed to next step.
4. Using a small screwdriver, depress the internal mechanism of the male coupling to open the valve. While continuing to hold the valve open, slowly depress the clutch pedal to the floor and hold.
5. Remove the screwdriver from the coupling, closing the valve.
6. Release the clutch pedal.
7. **NOTE: The reservoir must be kept full at all times to ensure there will be no additional introduction of air into the system.**

   Refill reservoir to level at step.
8. Repeat Steps 4 through 7.
9. Close reservoir. Reconnect the coupling to the clutch slave cylinder. Check that the connection is secure by applying a slight tug to the clutch tube.
10. Stroke the clutch pedal as rapidly as possible for five to ten strokes.
11. Wait one to three minutes.
12. Repeat Steps 10 and 11 three more times.
13. Loosen bleed screw (located in the slave cylinder body next to the inlet connection).
14. Depress and hold clutch pedal while tightening bleed screw 3-5 Nm (27-44 lb-in).
15. Refill the reservoir to level at step.
16. The hydraulic system should now be fully bled and should properly release the clutch.

Clutch System

The primary function of the clutch system is to couple and uncouple engine power to the transmission upon driver command. For additional information, refer to Section 08-02 .

- Engine output is coupled to the transmission input shaft (7017) by friction existing between the clutch disc facings and the flywheel (6375)/ clutch pressure plate (7563) assembly. The extent of this friction is directly related to the composition of the facing material and the magnitude of the clamping forces exerted by the clutch pressure plate and flywheel on the facings. These factors limit the amount of torque that can be transmitted without slippage.
- The clamping force is obtained from a diaphragm spring contained within the clutch pressure plate assembly. This force is developed during the attachment of the clutch pressure plate assembly to the flywheel.
- Disengagement of the clutch (clutch pedal pressed) is accomplished when the release fingers are fully displaced toward the flywheel. This displacement removes the Belleville spring load from the clutch pressure plate and eliminates the coupling friction between the engine and the transmission.
- The release fingers are moved by the clutch release hub and bearing (7548), which receive motion through a control system from the clutch pedal (7519). Partial finger displacement does not release the clutch but results in lower coupling friction which can cause slippage under load.

The secondary function of the clutch pressure plate and clutch disc (7550) assemblies is to aid in isolating engine power pulses from the rest of the powertrain.

- The weight of the clutch pressure plate assembly adds to that of the flywheel and improves its function as a vibration damper.
- Contained within the clutch disc assembly are several coil springs. These springs, along with a controlled amount of friction between the hub and the drive plates, also absorb engine pulsations.
- The spring and friction characteristics are tailored to each engine/powertrain/vehicle application. Therefore, only specified clutch discs should be used for replacement.

NOTE: The clutch release hub and bearing is a constant-run, full-angular contact, self-aligning design that will not necessarily require replacement every time the clutch is serviced. The clutch release hub and bearing can be reused and should not be replaced unless roughness, binding or any other service condition is noted.

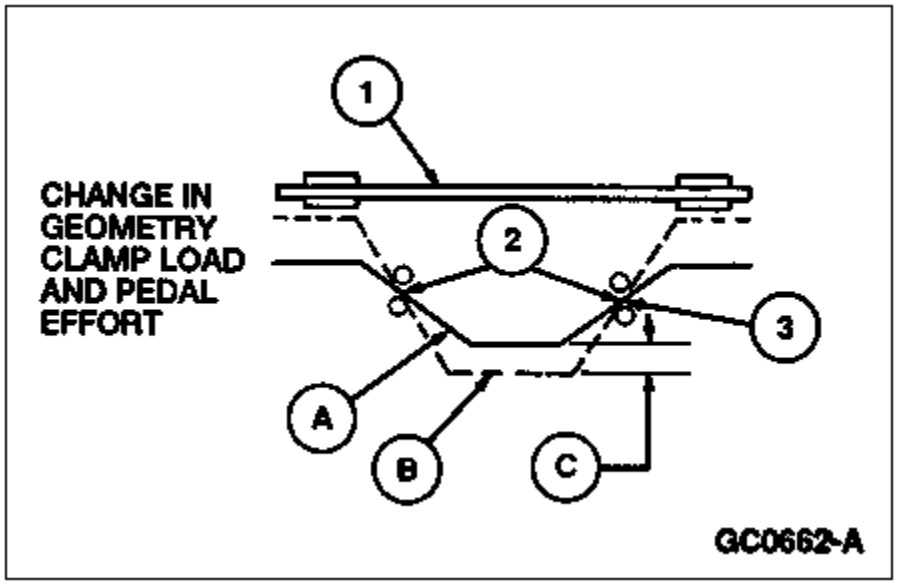
This system uses a self-adjusting clutch system operated by hydraulic pressure. The clutch release fingers are actuated by a constantly running, self-centering clutch release hub and bearing.

Clutch pressure plate assemblies will incorporate a self-adjusting mechanism which extends the normal wear life of these clutch systems. The mechanism consists of plastic ring, located directly under a series of ramps stamped into the top of the pressure plate cover and three small equally spaced coil springs loaded between the ring and the cover through three guide tabs.

The 2.3L/3.0L pressure plate utilizes a moving fulcrum point. The fulcrum point moves corresponding to disc wear in order to keep consistent finger geometry to maintain constant pedal effort over the life of the clutch disc.

Pedal efforts of conventional clutches increase because of geometry changes in the pressure plate diaphragm spring.

CONVENTIONAL CLUTCH PRESSURE PLATE (4.0L)



Item	Part Number	Description
1	7550	Clutch Disc
2	—	Fix Fulcrum (Part of 7563)
3	7563	Clutch Pressure Plate

Disc and Pressure Plate

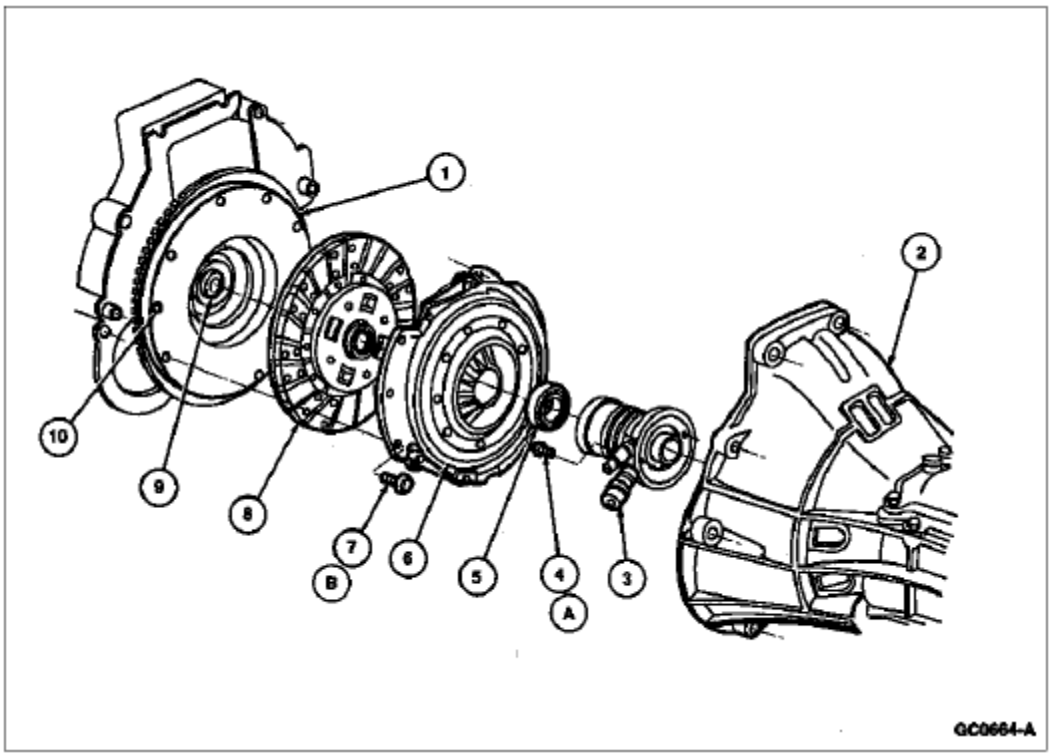
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Coupling Tool	T88T-70522-A
Clutch Aligner	T74P-7137-K

Removal

1. Disconnect the battery negative cable.
2. Disconnect clutch hydraulic system master cylinder push rod from clutch pedal (7519).
3. Raise the vehicle on a hoist and position suitable safety stands under vehicle.
4. Remove starter motor (11001).
5. Disconnect the hydraulic coupling at transmission with Clutch Coupling Tool T88T-70522-A. Slide the white plastic sleeve toward clutch slave cylinder, and apply a slight tug on tube.
6. Remove transmission (7003). Refer to Section 07-03 .
7. Check pressure plate finger height variations before removing.

Clutch Disc and Clutch Pressure Plate, Ranger 2.3L, 3.0L, 4.0L



Item	Part Number	Description
1	6375	Flywheel
2	7003	Transmission
3	7A508	Clutch Slave Cylinder
4	N605905-S	Bolt
5	7548	Clutch Release Hub and Bearing
6	7563	Clutch Pressure Plate
7	N802096	Box 7
8	7550	Clutch Disc
9	7120	Transmission Input Shaft Pilot Bearing
10	7K578	Flywheel Dowel Pin
A	—	Tighten to 19-26 Nm (14-19 Lb-Ft)
B	—	Tighten to 23-32 Nm (17-24 Lb-Ft)

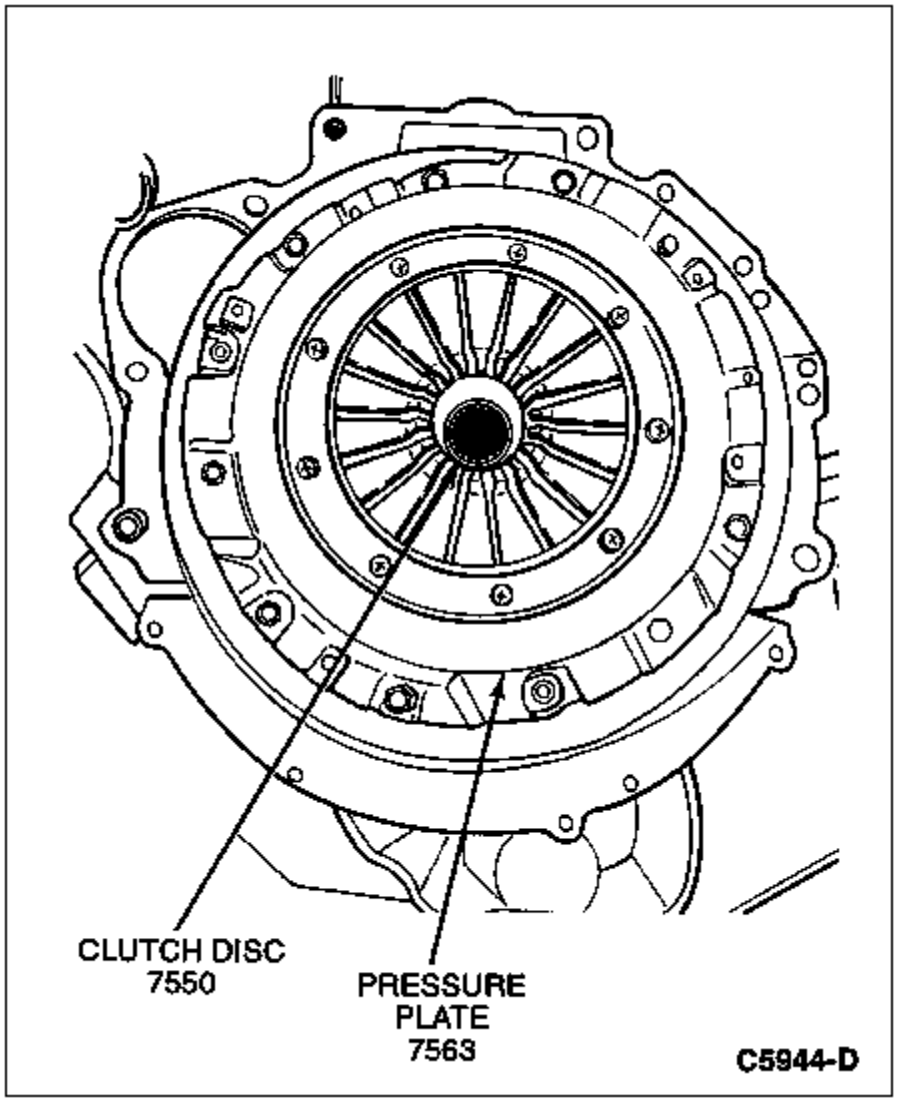
8. Mark assembly position of clutch pressure plate (7563) and cover to flywheel (6375) if installing original components.

9. **CAUTION: If cover and plate are to be reinstalled, bolts must be removed evenly or permanent damage to diaphragm spring will occur causing clutch to not release fully.**

   Loosen clutch pressure plate and cover attaching bolts evenly in a star pattern until clutch pressure plate diaphragm spring is expanded. Remove bolts.

10. Remove clutch pressure plate and clutch disc (7550) from flywheel.

2.3L, 3.0L and 4.0L



Installation

1. **CAUTION: Do not force the adjusting ring. Additional pressure may be required on the diaphragm fingers if the adjusting ring does not turn readily.**

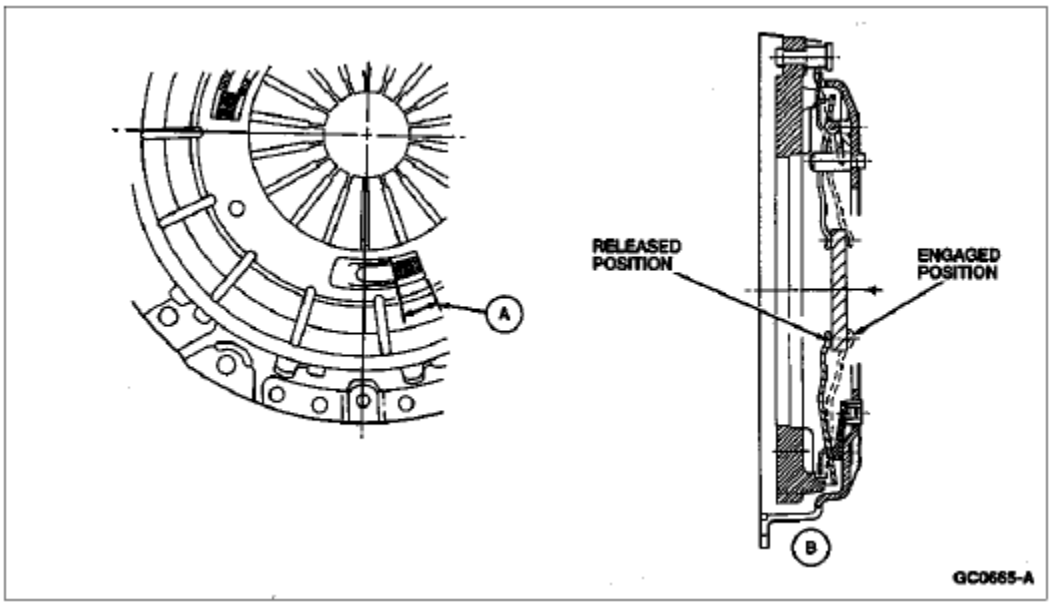
   NOTE: Clean clutch pressure plate and flywheel with a suitable commercial alcohol base solvent so surfaces are free from any oil film.

   NOTE: Do not use cleaners with a petroleum base. Do not immerse the clutch pressure plate in the solvent.

NOTE: It is not necessary to service as a set if procedure below is followed.

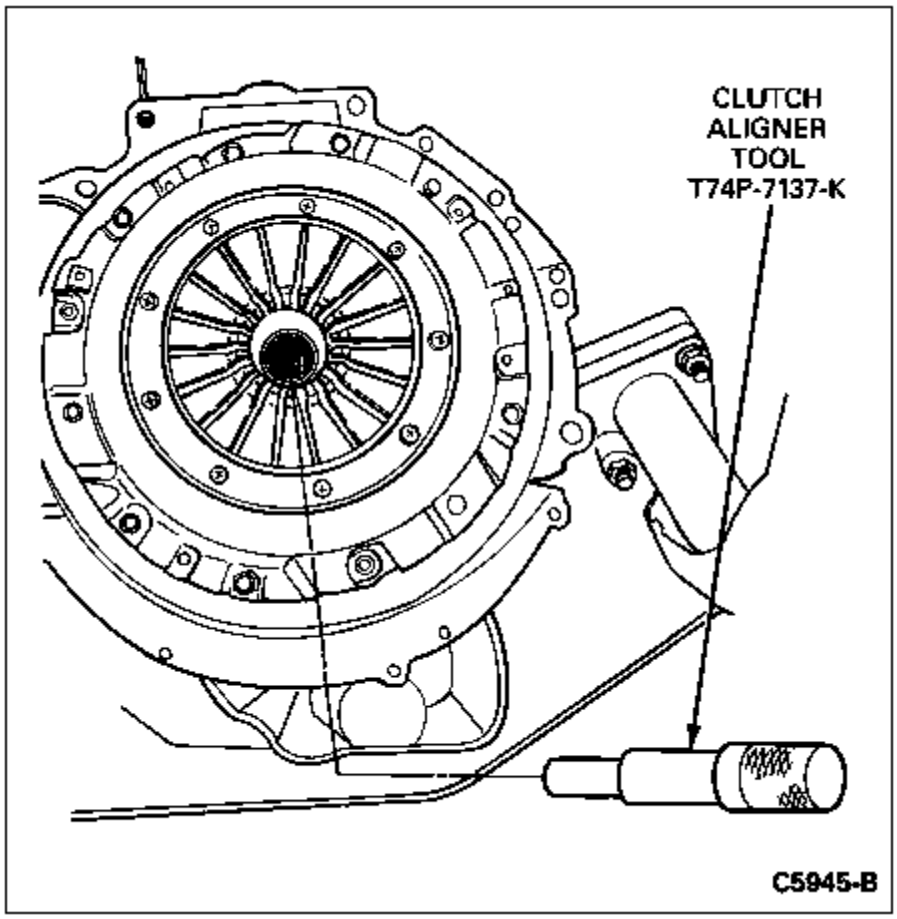
Both new and used clutch cover assemblies should always be adjusted to their new installation position before vehicle installation to ensure that the compressed adjusting ring actuation spring is approximately 14 mm as in A. If not, the cover assembly should be placed on a drill press table and the diaphragm fingers depressed to their released position using a simulated release bearing as shown in B. Minimal pressure in a counter clockwise direction should then be exerted on the adjusting ring in one or more locations to compress the adjusting ring springs to the desired 14 mm of compressed thickness.

Adjustment Indicator



2. Position clutch disc on flywheel so Clutch Aligner T74P-7137-K can enter clutch transmission input shaft pilot bearing (7118) and align clutch disc.

2.3L, 3.0L and 4.0L



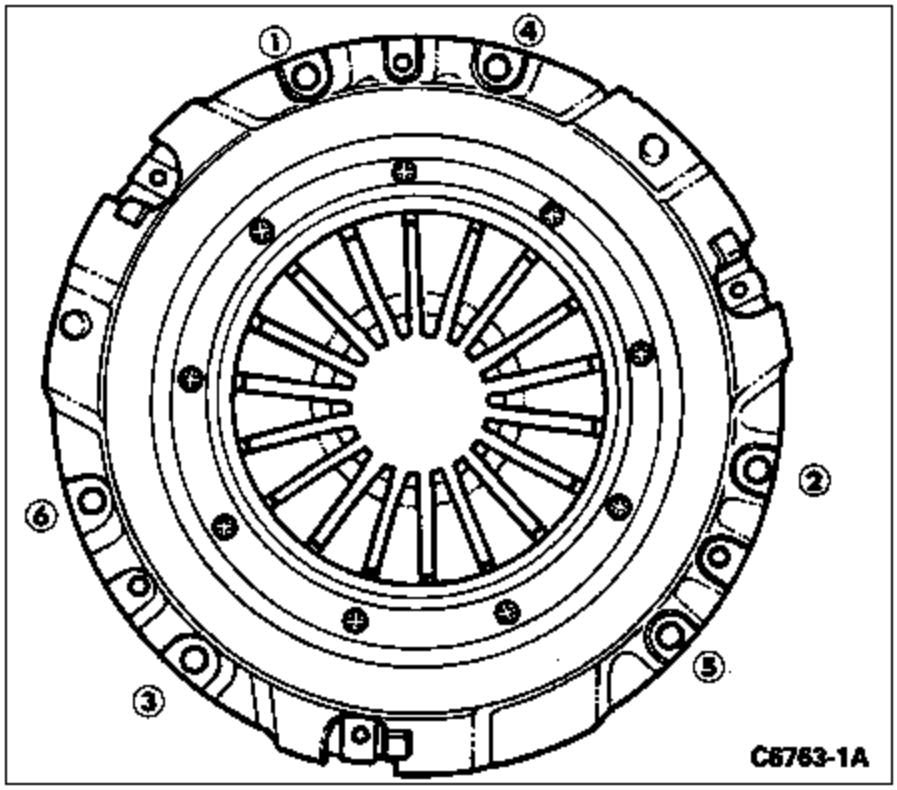
3. When installing original clutch pressure plate and cover, align assembly and flywheel with marks made during removal and with dowels on flywheel.

4. Position clutch pressure plate and cover on flywheel and dowels. Align the clutch pressure plate and clutch disc.

5. Install assembly bolts to flywheel. Tighten bolts to 23-32 Nm (17-24 lb-ft) uniformly in sequence shown.

6. Remove Clutch Aligner T74P-7137K.

2.3L, 3.0L and 4.0L



7. Install transmission. Refer to Section 07-03 .

8. Connect coupling by pushing the male coupling into female coupling of clutch slave cylinder.

9. Connect hydraulic clutch master cylinder push rod to clutch pedal.

10. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn the strategy.**

    Connect battery negative cable.

11. Bleed clutch system if required. Refer to Section 08-02 .

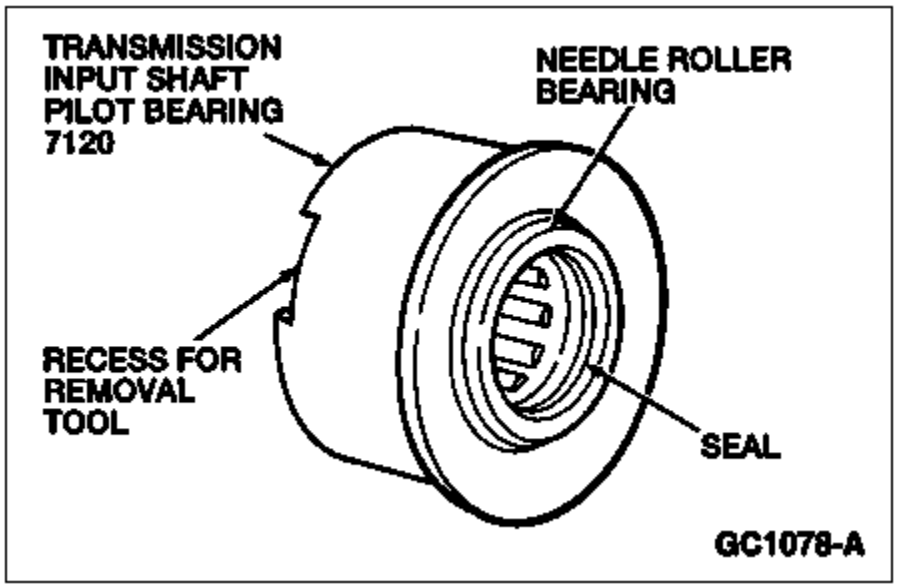
Pilot Bearing

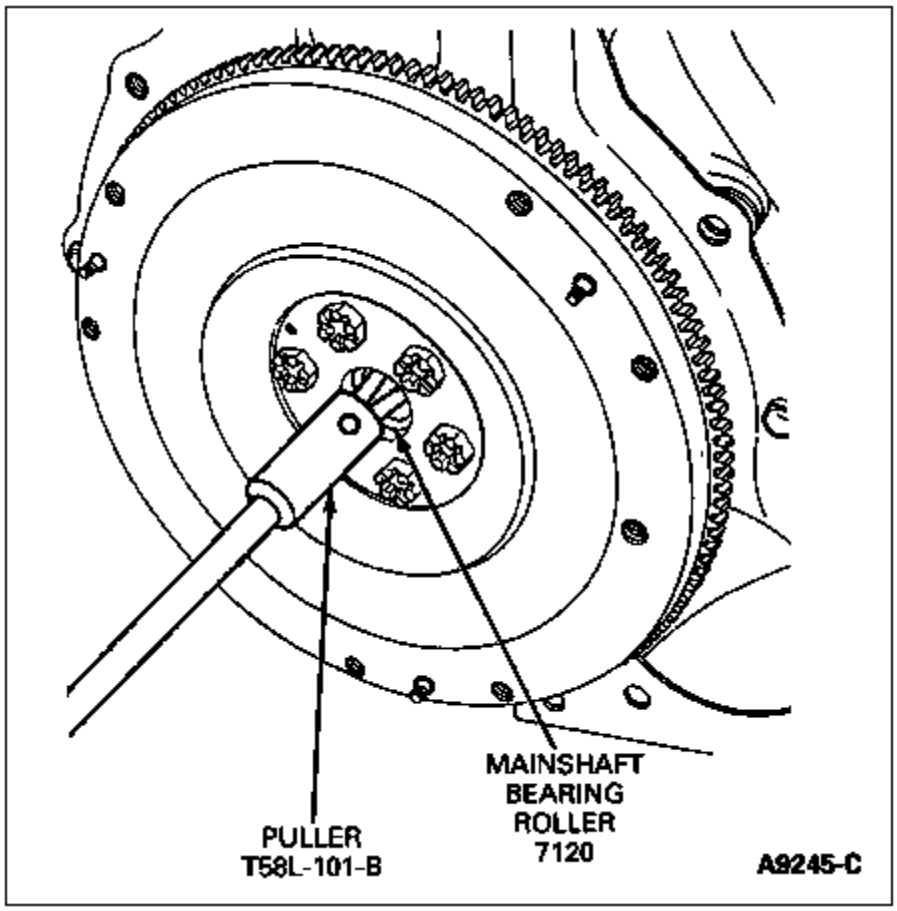
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Puller	T58L-101-B
Clutch Aligner	T71P-7137-H
Pilot Bearing Replacer	T71P-7137-C

Removal

1. Remove transmission (7003). Refer to Section 07-03 .
2. Remove the clutch pressure plate (7563) and clutch disc (7550) according to the procedures in this section.
3. Using Puller T58L-101-B, remove transmission input shaft pilot bearing (7118).





Installation

WARNING: AVOID USING TOO MUCH LUBRICANT AS IT MAY BE THROWN ON THE CLUTCH DISC WHEN THE CLUTCH REVOLVES.

NOTE: The transmission input shaft pilot bearing and seal are pregreased and do not require additional lubrication. A new transmission input shaft pilot bearing must be installed whenever a transmission input shaft pilot bearing is removed.

1. Coat crankshaft pilot bore with a small quantity of Premium Long-Life Grease XG-1-C or -K or equivalent grease meeting Ford specification ESA-M1C75-B.

2. Using Clutch Aligner T71P-7137-H and Pilot Bearing Replacer T71P-7137-C, install transmission input shaft pilot bearing with the seal facing the transmission.

3. **NOTE: Do not damage transmission input shaft pilot bearing during installation of transmission while transmission input shaft (7017) is being inserted into transmission input shaft pilot bearing.**

   Install clutch disc, clutch pressure plate and transmission following the procedures in this section and Section 07-03 .

Clutch Pedal

Removal

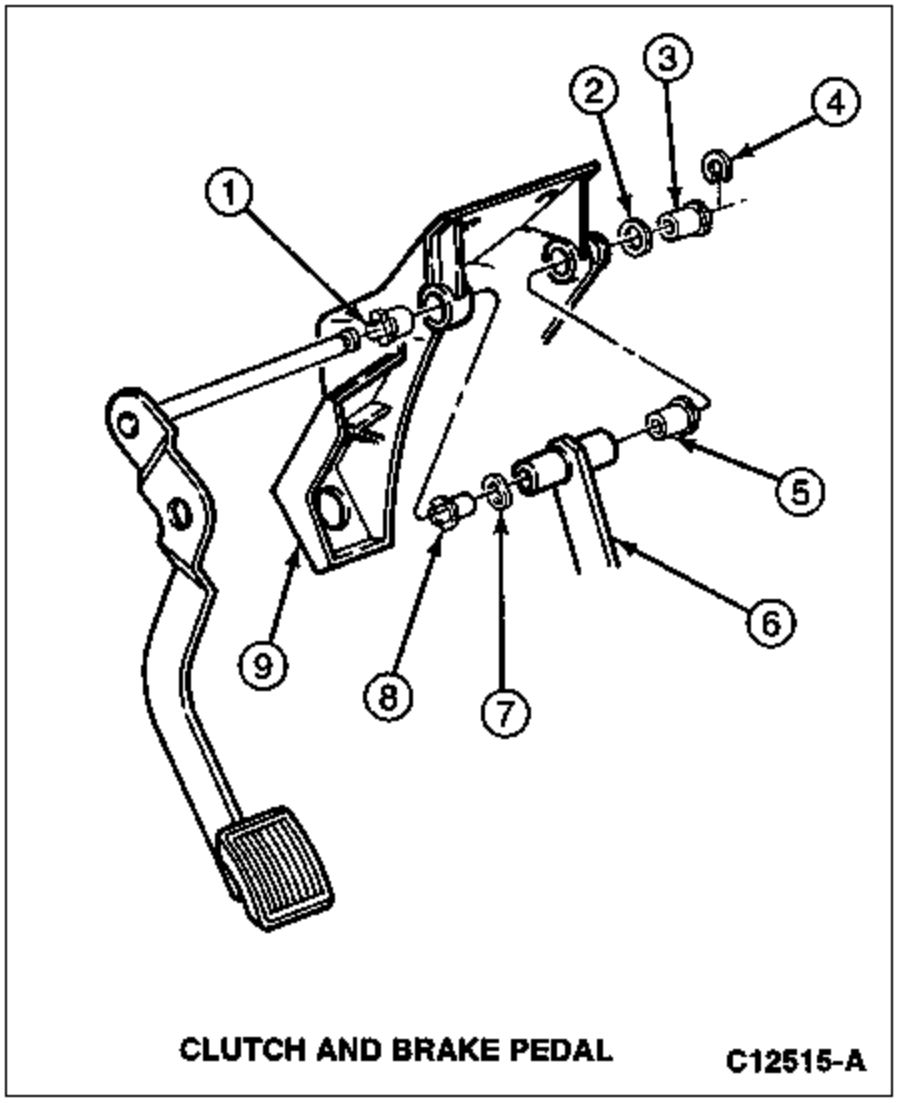
1. Disconnect the clutch master cylinder push rod by prying the retainer bushing and push rod off pedal pin.
2. Remove left side plastic cowl side panel. Refer to Section 01-05A .
3. Remove bolts securing parking brake mechanism. Swing mechanism out of the way.
4. Remove the retainer ring.
5. **NOTE: When the clutch pedal shaft is removed from the bracket, the brake pedal (2455), brake and clutch pedal bushings (2471) and spring washer become accessible.**

   Remove the clutch pedal (7519) from pedal support bracket.

Installation

1. **NOTE: Before installation of the clutch pedal shaft or clutch pedal, remove and inspect the brake and clutch pedal bushings, clean and lubricate with a light film of SAE 30 engine oil or equivalent and replace the brake and clutch pedal bushings if excessive wear is evident.**

   Install clutch pedal shaft through clutch and brake pedal support, brake and clutch pedal bushings, brake pedal and washers (as shown).
2. Install retainer ring.
3. Install clutch master cylinder push rod to pedal pin.
4. Secure parking brake mechanism. Refer to Section 06-05 .
5. Attach left side plastic kick panel.



CLUTCH AND BRAKE PEDAL C12515-A

Item	Part Number	Description
1	7508	Bushing
2	353574	Washer
3	7508	Bushing

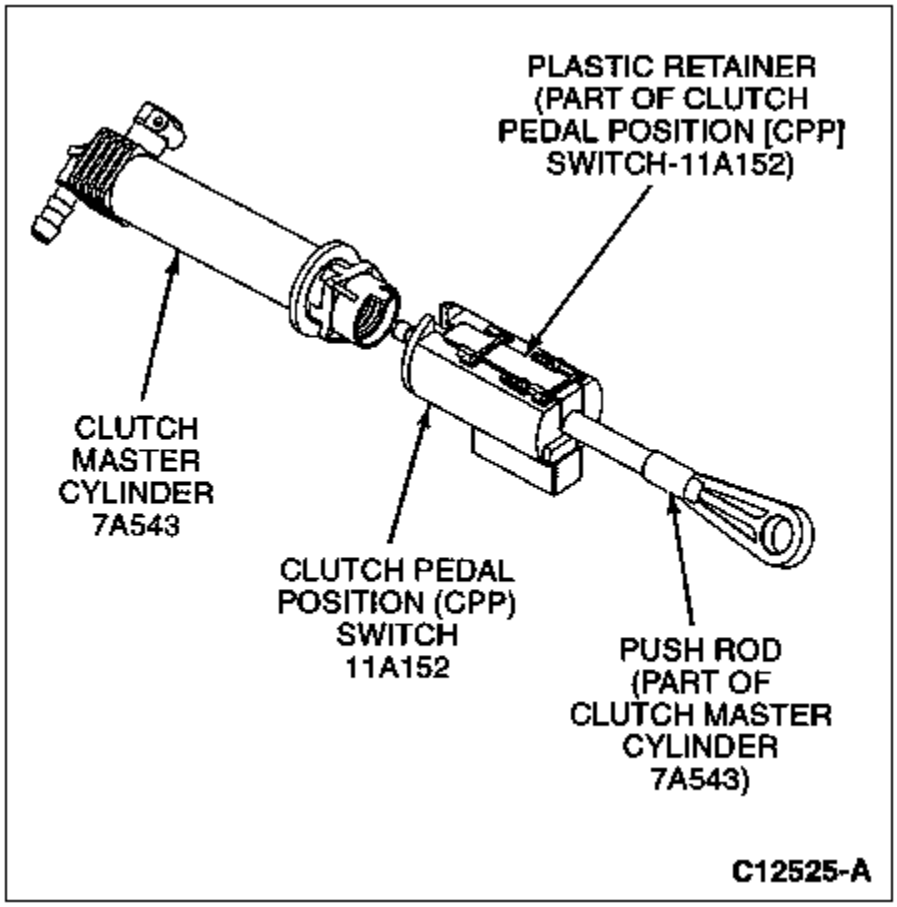
Clutch Pedal Position (CPP) Switch

Removal and Installation

1. Disconnect the wiring harness fromclutch pedal position switch (CPP) (11A152).
2. Pull down on orientation clip to separate from switch tab.
3. Rotate clutch pedal position switch one-half turn to expose plastic retainer.
4. Push tabs together and slide retainer rearward and separate fromclutch pedal position switch.
5. Remove clutch pedal position switch from clutch master cylinder (7A543) push rod.

For installation, follow removal procedures in reverse order.



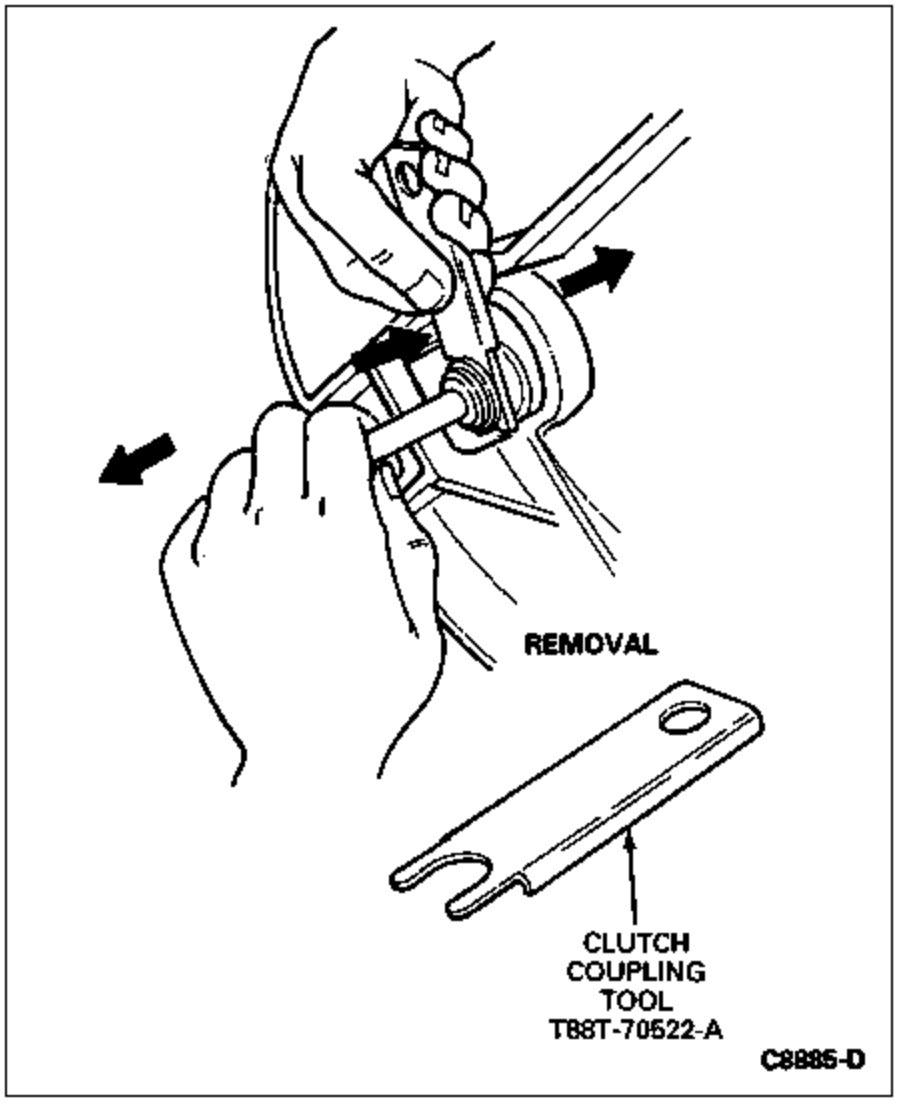
Clutch Slave Cylinder to Clutch Master Cylinder Tube

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Coupling Tool	T88T-70552-A

Removal and Installation

1. Raise vehicle on a hoist and position suitable safety stands under vehicle.
2. Disconnect the line from the plastic clip at the floor flange.
3. Uncouple the lower end of the line from the clutch slave cylinder using Clutch Coupling Tool T88T-70552-A by sliding the white plastic sleeve toward the clutch slave cylinder while pulling the line away from the clutch slave cylinder.



4. Remove the safety stands and lower the vehicle.
5. Remove clutch master cylinder (7A543) and line assembly.
6. Remove and discard the roll pin holding the line to the clutch master cylinder.
7. Disconnect the line from the clutch master cylinder by applying a slight tug on the line pulling away from the clutch master cylinder.
8. Check to be sure the O-ring is still in the outlet port of the clutch master cylinder. If not, replace.
9. Insert the new line into the clutch master cylinder outlet port.
10. Install a new roll pin to secure the line in place at the clutch master cylinder. Check installation by pulling the line away from the clutch master cylinder outlet port.
11. Bench bleed the system as described in Section 08-00 .
12. If a new line is installed, remove the yellow rubber protective cap and check that the O-ring is in

place. Check the master cylinder port to be sure there is no O-ring in the master cylinder before installing the new line. Insert the male coupling end into the female coupling of the clutch slave cylinder (7A508).

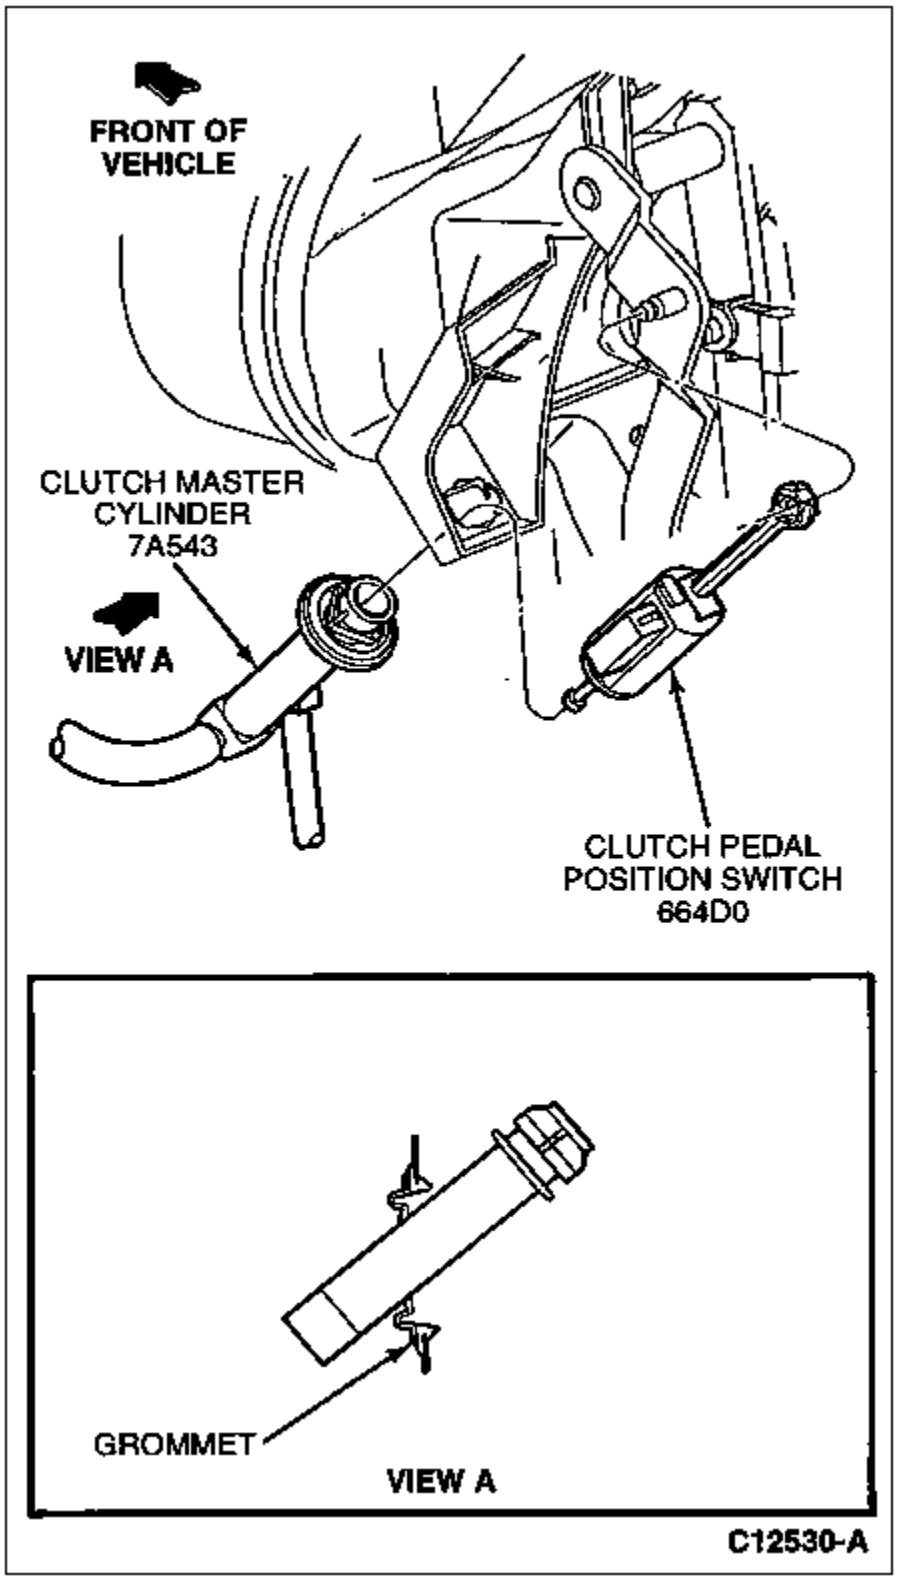
- Once the line is attached to the clutch slave cylinder, check that the connection is secure by applying a slight tug to the clutch tube.

13. Connect the line to the plastic clip at the floor flange.

Clutch Master Cylinder and Reservoir

Removal

1. Disconnect the clutch master cylinder push rod from the clutch pedal (7519) by prying the retainer bushing and push rod off the clutch pedal pin.
2. Remove the clutch pedal position switch (CPP) (11A152) from the clutch master cylinder (7A543). Refer to the procedure in this section.
3. Remove clutch master cylinder reservoir screw from the inner fender panel.
4. Uncouple the line from the clutch slave cylinder. Refer to Removal and Installation, Clutch Slave Cylinder to Clutch Master Cylinder Tube in this section.
5. Disconnect line from the mounting clips.
6. Twist the clutch master cylinder 1/8 turn counterclockwise as viewed from the driver's position, while pushing inward toward the driver's position. The rubber dash boot is removed with the master cylinder.



Installation

1. Bench bleed the clutch master cylinder. Refer to Section 08-00 .
2. Install the push rod through the hole in the engine compartment. Be sure it is located on the correct

side of the clutch pedal.

3. Place the clutch master cylinder in position and rotate the body 1/8 turn clockwise as viewed from the driver's position while pushing inward. Install the dash seal into the dash hole and check that it is completely inserted into the hole.

4. Position the clutch master cylinder reservoir on the cowl access cover and install the retaining screws.

5. Replace clutch master cylinder push rod retainer bushing if worn or damaged.

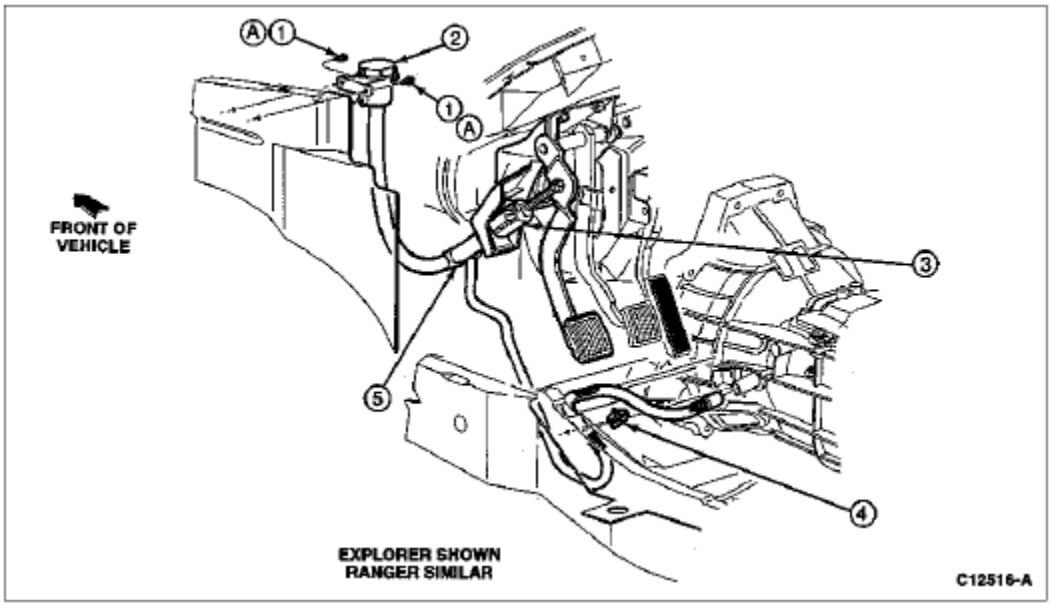
6. Install the clutch pedal position switch. Refer to the procedure in this section.

7. Install the retainer and push rod on the clutch pedal pin with the flange portion of the bushing facing away from the pedal blade of the clutch pedal.

8. Bleed the system. Refer to Section 08-00 .

9. Insert the coupling end into the clutch slave cylinder, and install line into clip(s).

Hydraulic Clutch Controls



Item	Part Number	Description
1	N610959-S301	Screw
2	7K500	Reservoir Assembly
3	7C534	Switch
4	N806750-S	Clip
5	7A543	Clutch Master Cylinder

		(18-27 Lb-In)

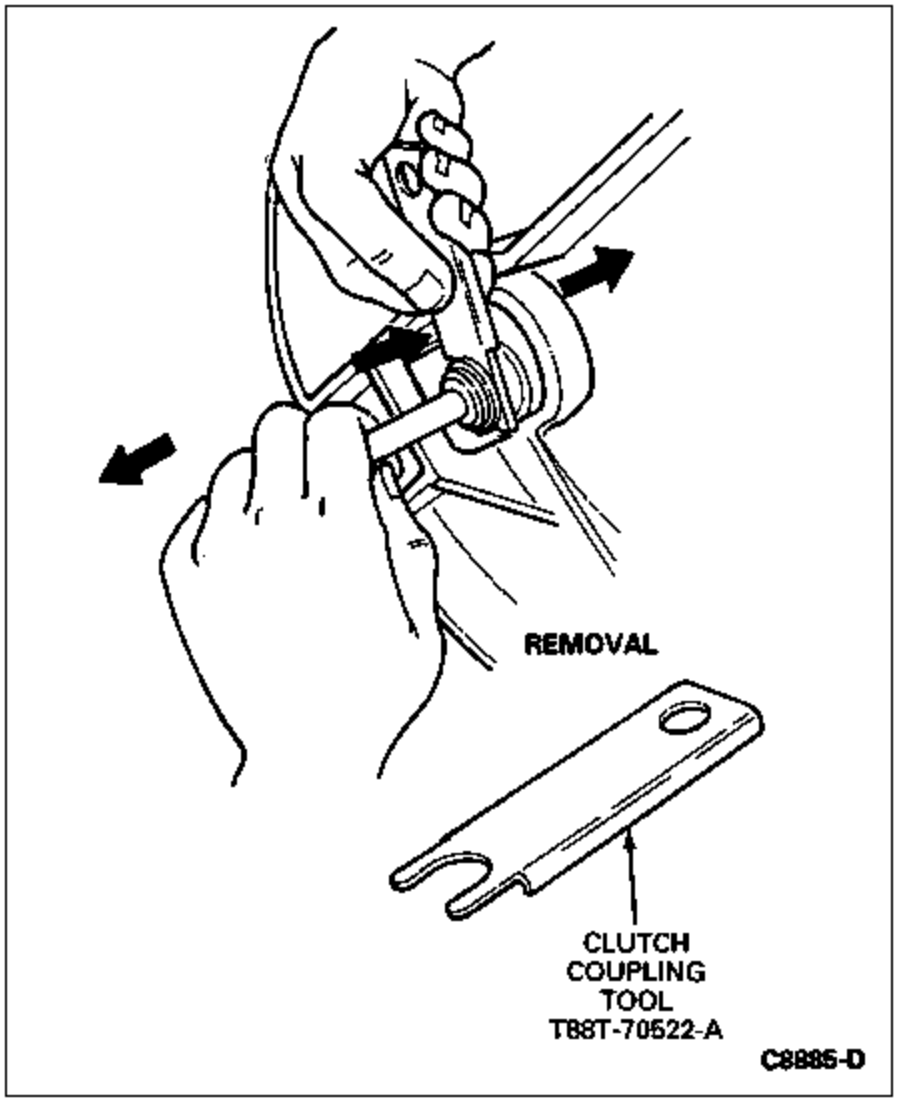
Clutch Slave Cylinder

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Clutch Coupling Tool	T88T-70522-A

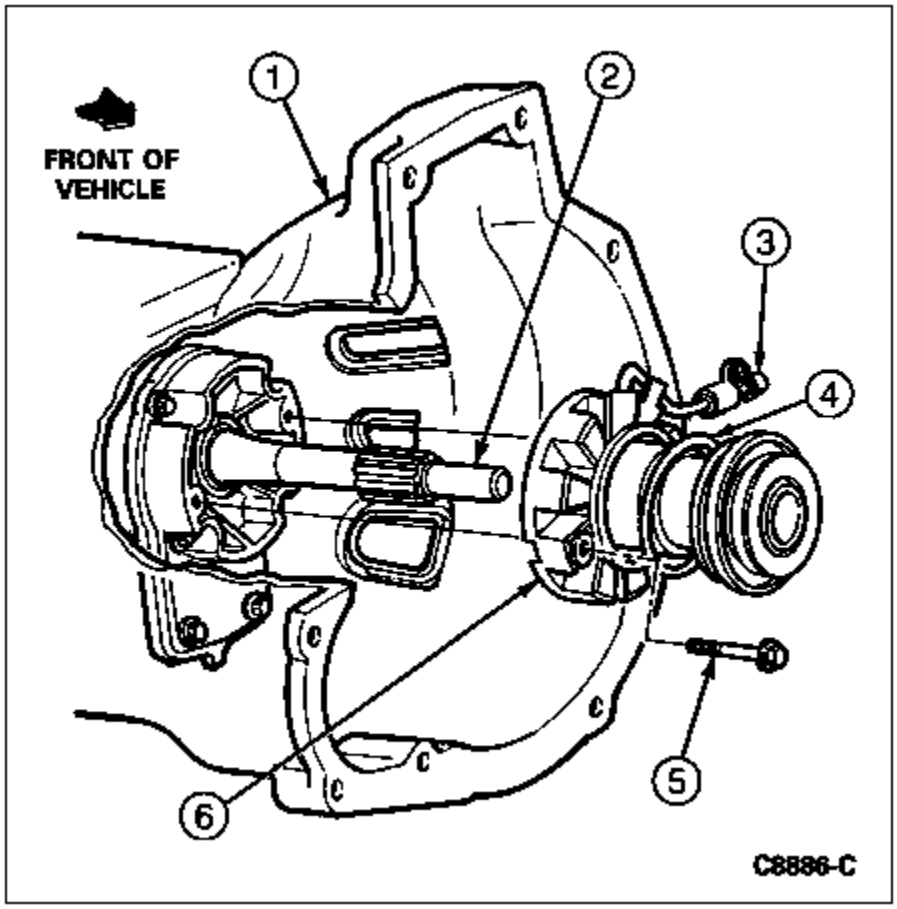
Removal and Installation

1. Disconnect the coupling at the transmission (7003) with Clutch Coupling Tool T88T-70522-A.
2. Slide white plastic sleeve toward the clutch slave cylinder while applying a slight tug on the tube.



3. Remove the transmission. Refer to Section 07-03 .
4. Remove clutch slave cylinder-to-transmission bolts.
5. Remove the clutch slave cylinder from the transmission input shaft (7017).

Refer to Section 08-00 for Hydraulic Clutch Bleed procedures. For installation, follow removal procedures in reverse order. Install the cylinder clutch slave attaching bolts and tighten to 19-26 Nm (14-19 lb-ft).



Item	Part Number	Description
1	7003	Transmission Housing
2	7017	Input Shaft
3	—	Hydraulic Bleed Screw (Part of 7A508)
4	—	Hydraulic Clutch Line Coupling (Part of 7A508)
5	N605907-S101	Bolt (2 Req'd)
6	7A508	Clutch Slave Cylinder

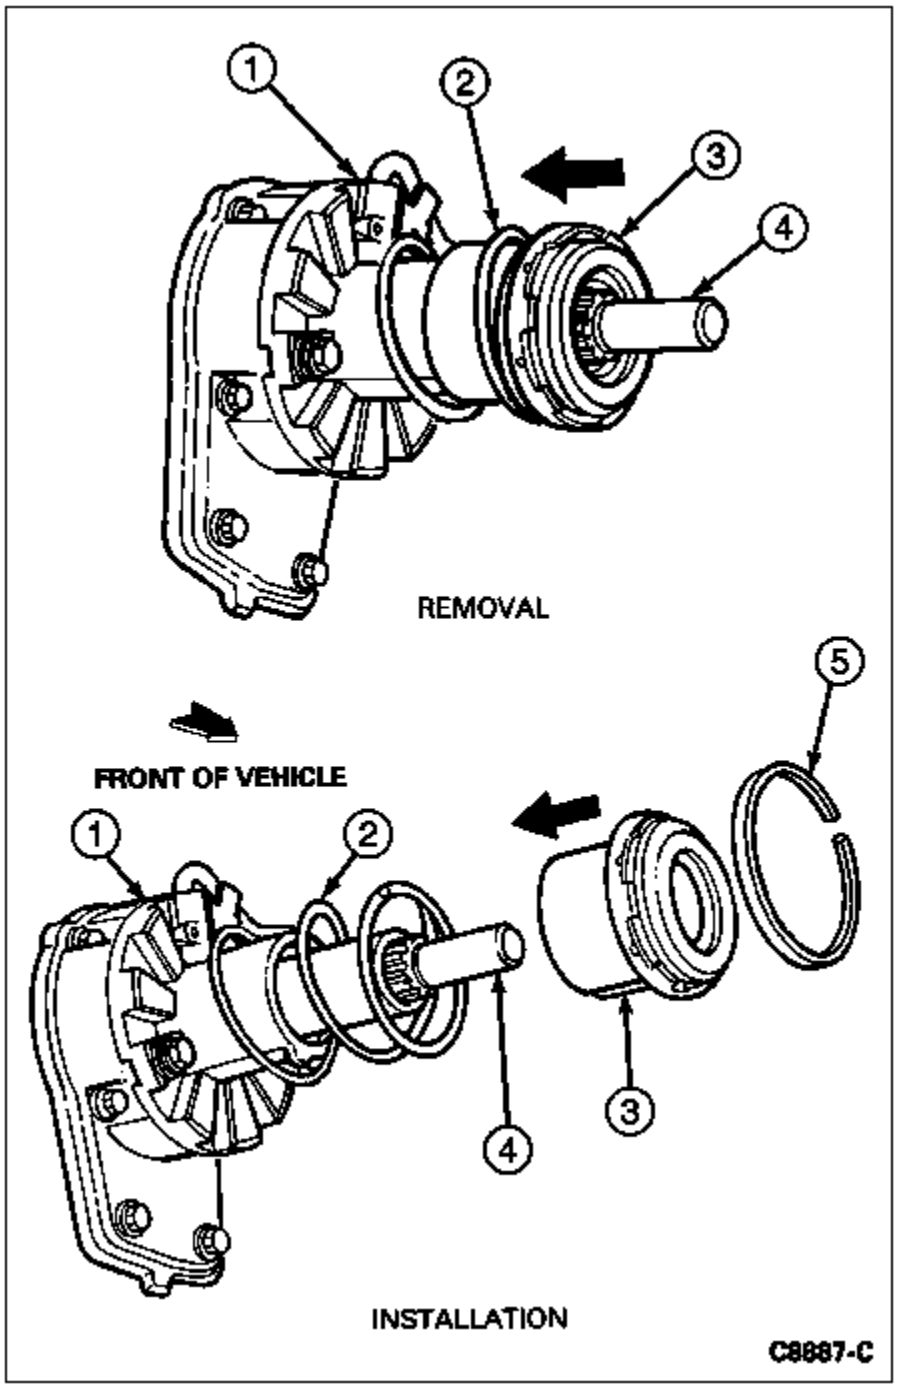
Clutch Release Hub and Bearing

Removal

1. Remove transmission (7003). Refer to Section 07-03 .
2. Push the clutch release hub and bearing (7548) toward transmission exposing retaining ring.
3. Remove retaining ring, pull clutch release hub and bearing off the clutch slave cylinder.

Installation

1. Install the clutch release hub and bearing to the clutch slave cylinder (7A508) by pushing into place.
2. Replace retaining ring.
3. Install transmission. Refer to Section 07-03 .



Item	Part Number	Description
1	7A508	Clutch Slave Cylinder
2	—	Preload Spring (Part of 7A508)
3	7548	Clutch Release Hub and Bearing
4	7017	Input Shaft
5	—	Retaining Ring (Part of 7A508)

Clutch Pedal, Clutch Linkage

The hydraulic clutch system provides automatic clutch adjustment for disc wear. The clutch actuation system does not have free play; it is automatically self-adjusting and will not require any routine service throughout the life of the clutch. No adjustment of clutch linkage or clutch pedal position is required.

Clutch Pedal Position (CPP) Switch

The clutch pedal position switch (CPP) (11A152) is not adjustable. If the CPP switch does not function properly, replace the CPP. Refer to the procedure in this section.

Clutch Master Cylinder Bolts	2-3	—	18-27

Exhaust System

This section covers general exhaust system alignment procedures and specifications.

Three-Way Catalytic Converter (TWC)

The exhaust systems vary between engines (6007). Three way catalytic converters (TWC) (5E212) in single-catalyst systems use a catalyst of monolithic construction in a clamshell container.

All Ford gasoline-powered compact trucks employ a three way catalytic converter in their emissions control systems and require the use of unleaded fuel.

The catalytic agent used in the TWC is an alloy of platinum and rhodium and/or palladium and rhodium, or palladium only.

The location and type of exhaust system gaskets, retaining clamps, and support brackets are shown in the illustrations.

tomsn048@gmail.com

Inspection and Verification

Exhaust system performance complaints such as excessive back pressure are usually noticeable by their effect on the performance of the engine (6007).

However, other malfunctioning components may have similar effects on the performance of the engine and be characterized by the same symptoms or complaints. It is, therefore, necessary to refer to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the engine.

For general exhaust system complaints, refer to the symptom chart and pinpoint tests before removing and replacing any parts.

1. Visually inspect exhaust manifold, exhaust inlet pipe, three way catalytic converter (TWC) (5E212), and muffler for cracks, leaks, punctures, improper welds or split seams with the exception of drain holes. Replace components as necessary.

2. Visually inspect the components of the TWC and exhaust system and related controls that may affect exhaust gas quality or cause backfire or loss of power.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Leaking fuel injectors	• Misrouted, damaged wiring
• Damaged air inlet passages	• Damaged ignition coil, spark plugs
• Inoperative Exhaust Gas Recirculation (EGR) valve	• Corroded, loose connectors
• Exhaust pipe pinched, crushed	
• Damaged, loose vacuum hoses	
• Incorrect idle speed	
• Dirty engine air filter • Damaged three way catalytic converter	

3. Check for broken or loose clamps, brackets or fasteners. Check all flanges between exhaust system components for loose fasteners and damaged gaskets. Tighten or replace as necessary.

4. Inspect wiring, connectors, and other components for obvious concerns due to looseness, corrosion, or other damage. This must be done when the engine is fully warmed so as to activate the system controls.

5. Check the vacuum lines and connections for looseness, pinching, leakage, splitting, blockage, or other damage that may cause malfunction.

6. If a vacuum line or orifice (restrictor) blockage is suspected as the obvious cause of a concern, correct the cause before proceeding to the next step.

tomsn048@gmail.com

7. Check engine oil for fuel dilution.

8. If all checks are OK, proceed to the symptom chart.

Exhaust Leakage or Noise

NOTE: In the event of a three way catalytic converter (TWC) failure, always check the muffler (5230) to be sure converter debris has not entered the muffler.

NOTE: Do not confuse drain holes with muffler body leaks.

External leaks in the exhaust system are often accompanied by noises and exhaust fumes. A visual inspection of the exhaust system will usually determine the location of a leak. When checking for exhaust leakage or noise, inspect the entire system for burnout holes and loose or corroded exhaust pipe flanges. Examine the underbody for greyish-white or black exhaust soot which indicates exhaust leakage at that point. For small leaks, have an assistant hold rags over the muffler outlet pipe (5255) while listening for the leak. This helps magnify the leak.

When testing for a rattle or vibration condition, it is helpful to use a rubber mallet. Tap on the exhaust components to simulate the bouncing action of the exhaust, while watching for exhaust-to-body/chassis contact. Also look for loose or damaged heat shields or exhaust pipe flanges.

Lightly tapping on the muffler and TWC can determine if there are loose or broken baffles in the muffler or a loose or broken element in the TWC.

tomsn048@gmail.com

Symptom Chart — Exhaust System

EXHAUST SYSTEM

Condition	Possible Source	Action
• Noisy or Leaking Exhaust	• Broken or loose clamps or brackets. • Punctures in muffler. • Exhaust manifold fasteners or gaskets.	• GO to Pinpoint Test A.
• Restricted Exhaust System	• Vacuum above 53.8 kPa (16 in-Hg). • Restricted exhaust manifold.	• GO to Pinpoint Test B.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: NOISY OR LEAKING EXHAUST

A1 CLAMPS AND BRACKETS

- Check for broken or loose clamps and/or brackets.

Are clamps and brackets OK?

Yes	No
GO to **A2**.	REPAIR or REPLACE as necessary. RESTART engine. If noise still exists, GO to **A2**.

A2 SYSTEM COMPONENTS

- Check muffler inlet pipe and muffler for punctures, split seams or improper welds.

Are system components OK?

Yes	No
GO to **A3**.	REPLACE muffler inlet pipe and/or muffler as necessary. If noise still exists, GO to **A3**.

A3 EXHAUST MANIFOLD

- Inspect exhaust manifold for loose fasteners or cracks.
- Inspect exhaust manifold gasket.

Are exhaust manifold and gasket OK?

Yes	No
GO to **B1**.	TIGHTEN fasteners to specification or REPLACE exhaust manifold. REFER to specific engine section in this manual. REPLACE exhaust manifold gasket.

PINPOINT TEST B: RESTRICTED EXHAUST SYSTEM TEST

tomsn048@gmail.com

B1 CHECK EXHAUST SYSTEM

Is the exhaust system visually OK?

Yes	No
GO to **B2** .	REPLACE any collapsed exhaust components. GO to **B2** .

B2 VACUUM TEST

- Attach a Rotunda Vacuum Pressure Tester 164-R0253 or equivalent to the intake manifold vacuum source.
- Hook up a tachometer.
- Start engine and gradually increase speed to 2000 rpm with transmission in NEUTRAL.

Is neutral vacuum above 53.8 kPa (16 in-Hg)?

Yes	No
REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the driveability concerns.	GO to **B3** .

B3 VACUUM TEST — EXHAUST DISCONNECTED

- Turn engine off.
- Disconnect exhaust system at manifold(s).
- Repeat vacuum test.

Is the manifold vacuum above 53.8 kPa (16 in-Hg)?

Yes	No
GO to **B4** .	GO to **B5** .

B4 VACUUM TEST — THREE WAY CATALYTIC CONVERTER ON, MUFFLER(S) OFF

- Turn engine off.
- Reconnect exhaust system at exhaust manifold.
- Disconnect muffler.
- Repeat vacuum test.

Is the manifold vacuum above 53.8 kPa (16 in-Hg)?

tomsn048@gmail.com

Yes	No
REPLACE muffler and RETEST.	REPLACE three way catalytic converter and INSPECT muffler to be sure three way catalytic converter debris has not entered muffler.

B5 EXHAUST MANIFOLD RESTRICTED

- Remove the exhaust manifold(s). Inspect the ports for casting flash by dropping a length of chain into each port. Do not use a wire or light to check ports. The restriction may be large enough for them to pass through but small enough to cause excessive back pressure at high engine rpm.

Is restriction OK?

Yes	No
REFER to Powertrain Control/Emissions Diagnosis Manual — lack of power.	REMOVE casting flash. If flash cannot be removed, REPLACE exhaust manifold(s) and RETEST.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Oxygen Sensor Wrench	T94P-9472-A

Removal

1. Disconnect battery ground cable (14301).
2. Raise and support vehicle.
3. Disconnect rear Heated Oxygen Sensor (HO2S) electrical connector.
4. Use Oxygen Sensor Wrench T94P-9472-A to remove rear HO2S.
5. Remove the two nuts and two bolts from exhaust pipe flange hold down spring (5F264) attaching three way catalytic converter (TWC) (5E212) tomuffler (5230) .
6. Remove the three exhaust inlet pipe-to-converter nuts that connect the three way catalytic converter to exhaust inlet pipe (5246). Swing the muffler and muffler outlet pipe (5255) to the rear, and then remove the three way catalytic converter and exhaust converter outlet gaskets (5E241), disengaging rod from insulator.

Installation

1. Position three way catalytic converter in place, engaging rod into insulator.
2. Install a new exhaust converter outlet gasket between the three way catalytic converter and muffler. Secure the flange gasket and flanges with two muffler-to-converter bolts, exhaust pipe flange hold

tomsn048@gmail.com

down springs and two nuts. Tighten muffler-to-converter bolts and nuts to 34-46 Nm (25-34 lb-ft).

3. Install an exhaust converter inlet pipe gasket (5B266) between the three way catalytic converter and exhaust inlet pipe. Install three exhaust inlet pipe-to-converter nuts and tighten to 34-46 Nm (25-34 lb-ft).

4. Tighten exhaust manifold connections by alternately tightening the manifold nuts to 34-46 Nm (25-34 lb-ft).

5. Use Oxygen Sensor Wrench T94P-9472-A to install rear HO2S. Tighten the rear HO2S to 34-46 Nm (25-34 lb-ft).

6. Connect rear HO2S electrical connector.

7. Connect battery ground cable.

---

tomsn048@gmail.com

Dual Three Way Catalytic Converter (TWC) and Pipe — Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Oxygen Sensor Wrench	T94P-9472-A

Removal

1. Disconnect battery ground cable (14301).
2. Raise and support vehicle.
3. Disconnect rear Heated Oxygen Sensor (HO2S) electrical connector.
4. Use Oxygen Sensor Wrench T94P-9472-A to remove rear HO2S.
5. Remove the two muffler-to-converter bolts.
6. Loosen and remove the exhaust manifold-to-Y pipe nuts. Slide flexible link, muffler (5230) and muffler outlet pipe rearward. Remove the gasket. Move the dual converter Y pipe (5F250) rearward. Rotate to clear studs and remove.

Installation

1. Install dual converter Y pipe onto exhaust manifold studs and loosely secure in place with exhaust manifold-to-Y pipe nuts.
2. Install a new non-asbestos gasket between three way catalytic converter and muffler. Secure flange gasket with two nuts. Tighten to 34-46 Nm (25-34 lb-ft).
3. Secure muffler to exhaust converter frame bracket (5E269). Tighten nuts to 25-35 Nm (18-26 lb-ft).
4. Tighten exhaust manifold connections by alternating the tightening of the manifold bolts or nuts to 34-46 Nm (25-34 lb-ft).
5. Use Oxygen Sensor Wrench T94P-9472-A to install rear HO2S.
6. Connect rear HO2S electrical connector.
7. Connect battery ground cable.

Three-Way Catalytic Converter, Ranger 2.3L Engine

Removal

1. Remove the two nuts and two bolts attaching three way catalytic converter (TWC) (5E212) to muffler (5230) and muffler outlet pipe (5255).
2. Remove two bolts attaching three way catalytic converter to the exhaust manifold.
3. Remove the three way catalytic converter from vehicle.

Installation

1. Install three way catalytic converter onto exhaust manifold studs and loosely secure in place.
2. Install a new exhaust converter outlet gasket (5E241) between three way catalytic converter and muffler and muffler outlet pipe.
3. Tighten the converter-to-muffler flange exhaust pipe flange hold down spring (5F264) to 37-50 Nm (27-37 lb-ft).
4. Position the exhaust outlet pipe frame bracket (5260) so the rod is aligned throughout the entire length of the exhaust outlet pipe frame bracket. Tighten nuts to 20-27 Nm (15-20 lb-ft) while maintaining alignment.
5. Tighten the exhaust manifold connection by alternately tightening the manifold bolts to 34-46 Nm (25-34 lb-ft).

Exhaust System Installation, Ranger Regular Cab and SuperCab, 2.3L Engine, 4x2 and 4x4

tomsn048@gmail.com

Three-Way Catalytic Converter, Ranger 3.0L MFI and 4.0L MFI

Removal

1. Remove the two nuts and two bolts from exhaust pipe flange hold down spring attaching three way catalytic converter to muffler and muffler outlet pipe.

2. Loosen and remove the three nuts that connect the three way catalytic converter to dual converter Y pipe (5F250). Swing the muffler and muffler outlet pipe to the rear, and then remove the three way catalytic converter and exhaust converter outlet gaskets, disengaging rod from insulator.

3. Loosen and remove the exhaust manifold-to-inlet pipe bolts. Move the inlet pipe rearward, rotate to clear studs and remove.

Installation

1. Install exhaust inlet pipe (5246) onto exhaust manifold and loosely secure in place with retaining bolts.

2. Position three way catalytic converter in place, engaging rod into insulator.

3. Install a new exhaust converter outlet gasket between the three way catalytic converter and muffler. Secure the flange gasket and flanges with two bolts exhaust pipe flange hold down spring and two nuts. Tighten to 34-46 Nm (25-34 lb-ft).

4. Install an exhaust converter inlet pipe gasket (5B266) between the three way catalytic converter and dual converter Y pipe. Secure with three nuts and tighten to 34-46 Nm (25-34 lb-ft).

5. Tighten exhaust manifold connections by alternately tightening the manifold nuts to 34-46 Nm (25-34 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Muffler Shield

The muffler shields are crimped onto the muffler and are serviced with the muffler.

tomsn048@gmail.com

Hanger Brackets

Removal

1. Remove muffler (5230) and muffler outlet pipe (5255) from exhaust outlet pipe frame brackets (5260) as previously described.

2. Remove rivets which hold brackets to frame.

Installation

1. Position exhaust outlet pipe frame brackets on frame and attach with 7/16-14 nut and bolt. Tighten to 20-25 Nm (15-19 lb-ft).

tomsn048@gmail.com

Exhaust System

Inspect exhaust inlet pipes (5246), muffler outlet pipes (5255) and mufflers (5230) for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system.

It is normal for a certain amount of moisture and staining to be present around the seams of the muffler. The presence of soot, light surface rust or moisture does not indicate a damaged exhaust system.

Inspect the muffler pipe brackets (5277), exhaust outlet pipe frame brackets (5260) for cracks and stripped or badly corroded bolt threads. When flat flange joints are loosened and/or disconnected to replace a shield pipe or muffler, always replace gasket and bolts and flange nuts if there is reasonable doubt that its service life is limited.

The exhaust system, including heat shields, must be free of leaks, binding, grounding and excessive vibrations.

These conditions are usually caused by loose or broken flange bolts, shields, brackets or pipes. If any of these conditions exist, check the exhaust system components and alignment. Align or replace as necessary.

tomsn048@gmail.com

Exhaust Shield Inspection

Raise the vehicle on a hoist. Shields are positioned on the topside and underside (if horizontal) or sides (if vertical) of the three way catalytic converter (TWC) (5E212). Shields should be free from bends which would bring any part of the shield in contact with the three way catalytic converter or muffler (5230). The shield should be clear of any combustible matter.

tomsn048@gmail.com

Exhaust System Alignment, Aerostar

NOTE: Aerostar exhaust systems contain a flexible coupling and should not require alignment.

If alignment is required, perform the following procedures to align the complete exhaust system:

1. Loosen pipe connections at exhaust manifold and all other flanges.

2. Align the flat flanges between the three way catalytic converter (TWC) (5E212) and muffler (5230).

3. Rotate the muffler to provide sufficient clearance to the frame, body and drivetrain to avoid ground-out conditions. Tighten flange nuts to 25-35 Nm (18-26 lb-ft).

4. **NOTE: Manifold nuts or bolt heads must bottom out on the fixed flange.**

   Tighten exhaust manifold connection by alternately tightening the right side and left side nuts to 34-46 Nm (25-34 lb-ft).

tomsn048@gmail.com

Exhaust System Alignment, Ranger

Perform the following procedures to align the complete exhaust system:

1. Loosen pipe connections at exhaust manifold, all flanges and the catalyst-to-rear engine mount U-bolt.

2. On six-cylinder engines (6007) (2.3L is a welded assembly), align the flat flanges between the exhaust damper (5F240) and three way catalytic converter (TWC) (5E212), and the three way catalytic converter and muffler (5230). Tighten nuts to 36-42 Nm (27-31 lb-ft).

3. On 2.3L engines, rotate the muffler to provide sufficient clearance to the frame, body and drivetrain to avoid ground-out conditions. Tighten flange nuts to 36-42 Nm (27-31 lb-ft).

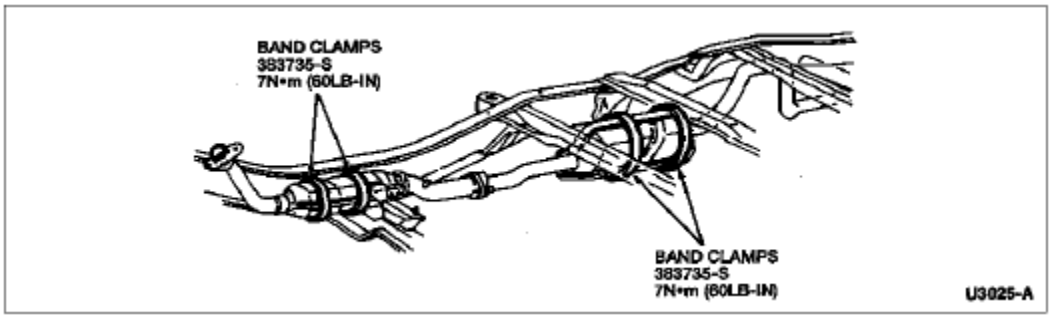
4. On 2.3L engines, position the U-bolt and bracket assembly so the rod is aligned throughout the entire length of the bracket and insulator assembly, and the U-bolt saddle notch is on the converter keyway. Tighten U-bolt nuts to 36-42 Nm (27-31 lb-ft) while maintaining alignment.

5. Tighten exhaust manifold connection by alternately tightening the right side and left side bolts or nuts to 34-46 Nm (25-34 lb-ft).

tomsn048@gmail.com

Muffler Shield and Three Way Catalytic Converter (TWC) Shields

Securing Heat Shields



NOTE: At idle or during normal driving conditions, a buzz or rattle may be detected, which can be traced to the exhaust system. The heat shield attachment to the muffler or three way catalytic converter (TWC) (5E212) may come free. The loose shield will vibrate off the muffler (5230) or three way catalytic converter and cause the buzz or rattle.

NOTE: The three way catalytic converter may have two cans. If shields on both cans are loose, four clamps (two for each) will be required.

1. Attach two band clamps to the three way catalytic converter or muffler as shown in the illustration.
2. Align the clamp to secure the heat shield to the muffler or three way catalytic converter. Tighten the clamp to 7 Nm (60 lb-in).
3. Trim excess "ear" to approximately 25mm (1 inch).

tomsn048@gmail.com

Fuel System, Service

The fuel charging assembly is the most important component in the fuel system. However, the fuel charging assembly cannot operate efficiently unless all other components in the system are performing correctly.

Section 10-01 of this group covers those test and adjustment procedures related directly to specific vehicle fuel supply problems. Other emission systems related to the fuel system are covered in the Powertrain Control/Emissions Diagnosis Manual.

Engine Air Cleaner

WARNING: DO NOT SMOKE OR CARRY LIGHTED TOBACCO OR OPEN FLAME OF ANY TYPE WHEN WORKING ON OR NEAR ANY FUEL RELATED COMPONENT. HIGHLY FLAMMABLE MIXTURES ARE ALWAYS PRESENT AND MAY BE IGNITED, RESULTING IN POSSIBLE PERSONAL INJURY.

- Refer to Section 03-12 .
- Refer to the Pre-Delivery manual or the Vehicle Owner Guide for the recommended air cleaner maintenance mileage interval.
- Cleaning the air cleaner filter element is not recommended. It should be replaced at the specified mileage intervals.
- Clean the air cleaner body and cover with solvent or compressed air. Wipe the air cleaner body and the cover dry if a solvent is used. Inspect the air cleaner body and cover for distortion or damage. Replace if required.
- Hold the filter element in front of a light and carefully inspect it for splits or cracks. Replace filter element if required.

Idle Air Control Valve

Refer to Section 03-04A or Section 03-04B .

Throttle Body

Refer to Section 03-04A or Section 03-04B .

Fuel Pump, Electric

Refer to Section 10-01 .

Fuel System

CAUTION: All adjustments affecting engine emissions should be performed by competent personnel using specified equipment. Refer to the Powertrain Control/Emissions Diagnosis Manual and to the specific fuel system section or specific engine section before performing critical fuel system adjustments.

SPECIFICATIONS

Refer to Section 10-01 for torque specifications.

Fuel Injected Engines

WARNING: DO NOT SMOKE, CARRY LIGHTED TOBACCO, OR OPEN FLAME OF ANY TYPE WHEN WORKING ON OR NEAR ANY FUEL-RELATED COMPONENT. HIGHLY FLAMMABLE MIXTURES ARE ALWAYS PRESENT AND MAY BE IGNITED, RESULTING IN POSSIBLE PERSONAL INJURY.

The multiport fuel injection system (MFI) is classified as a multi-point, pulse time, speed density control, fuel injection system. Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order in accordance with engine demand through fuel injectors mounted on a tuned lower intake manifold.

The powertrain control module (PCM) (12A650) accepts inputs from various engine sensors to compute the required fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range. The powertrain control module then outputs a command to the fuel injector nozzle tips (9E527) to meter the appropriate quantity of fuel.

The powertrain control module also determines and compensates for the age of the vehicle and its uniqueness. The powertrain control module will automatically sense and compensate for changes in altitude (i.e., from sea level to mountains) and will also permit push-starting the vehicle should it become necessary (manual transmission only).

tomsn048@gmail.com

Fuel Tank and Fuel Tank Filler Pipe

Fuel tanks (9002) are designed and fabricated of either non-corrosive metal or polyethylene molded plastic.

The fuel tank stores fuel for engine usage. Each fuel tank is of one-piece construction, either welded or molded design.

Fuel filling is accomplished through a fuel tank filler pipe (9034) attached to the fuel tank and/or external vent lines within the fuel tank filler pipe and fuel tank.

A venting system is used to provide an air space within the fuel tank when the fuel tank is filled to capacity. This air space provides for thermal expansion of the fuel as well as being an aid to the in-tank vapor vent system.

tomsn048@gmail.com

Fuel Tank Filler Cap

NOTE: Use of an aftermarket fuel tank filler cap (9030) other than an authorized Ford/Motorcraft service part could result in damage to the fuel system or improper system operation if not properly designed/manufactured for pressure vacuum relief. Customer warranty is void for fuel tank and/or fuel system damage resulting from the use of such fuel tank filler caps.

The fuel tank filler cap is designed to seal in fuel vapors, reducing unburned hydrocarbon emissions, while allowing air to enter as fuel is used. It is also designed to relieve high pressure inside the fuel tank (9002) due to fuel expansion and vaporizing because of high ambient temperature. The fuel tank filler cap has a built-in pressure/vacuum relief valve to achieve this. The valve opens to allow air to enter at -3.44 kPa (-0.50 psi, -1.0 in Hg). The valve opens to relieve pressure at 12.4 kPa (1.8 psi).

Fuel tank filler cap relief only operates when the fuel vapor canister cannot handle vapor adequately to preclude pressure buildup.

Air must enter the fuel tank as fuel is used because the fuel leaving the fuel tank would create a partial vacuum which could become strong enough that the fuel pump (9350) could not overcome it, causing fuel starvation. Also, air pressure on the outside of the fuel tank could collapse the fuel tank.

If pressure from fuel expansion and vaporization were to rise too high, the pressure could bulge the fuel tank, blow off hoses, and cause seals to leak. The risk would be greatest on a hot day when the fuel tank was filled with fuel from a cool underground storage tank. Normally, positive fuel tank pressures do not rise high enough to open the valve so fuel vapor can only escape via the vapor valve and tube to the charcoal evaporative emissions canister (EVAP canister) (9D653) and, ultimately, the engine (6007). Refer to Section 03-13.

The fuel tank filler cap is secured to the vehicle by a nylon tether to prevent loss during refueling.

tomsn048@gmail.com

Fuel Filter

Fuel is filtered at two locations on Aerostar and Ranger vehicles.

In-Line

The fuel filter (9155) on MFI applications provides extremely fine filtration to protect the small metering orifices of the fuel injector (9F593). The fuel filter cannot be cleaned. If the fuel filter becomes clogged or restricted, it should be replaced.

In-Tank

A nylon filter element (inlet filter sock) is mounted on the in-tank electric fuel pump inlet inside the fuel tank (9002) and is used to protect the fuel pump (9350) from fuel tank contaminants.

The in-tank filter is not serviced separately. To service the in-tank filter, replace the fuel pump and sender assembly.

tomsn048@gmail.com

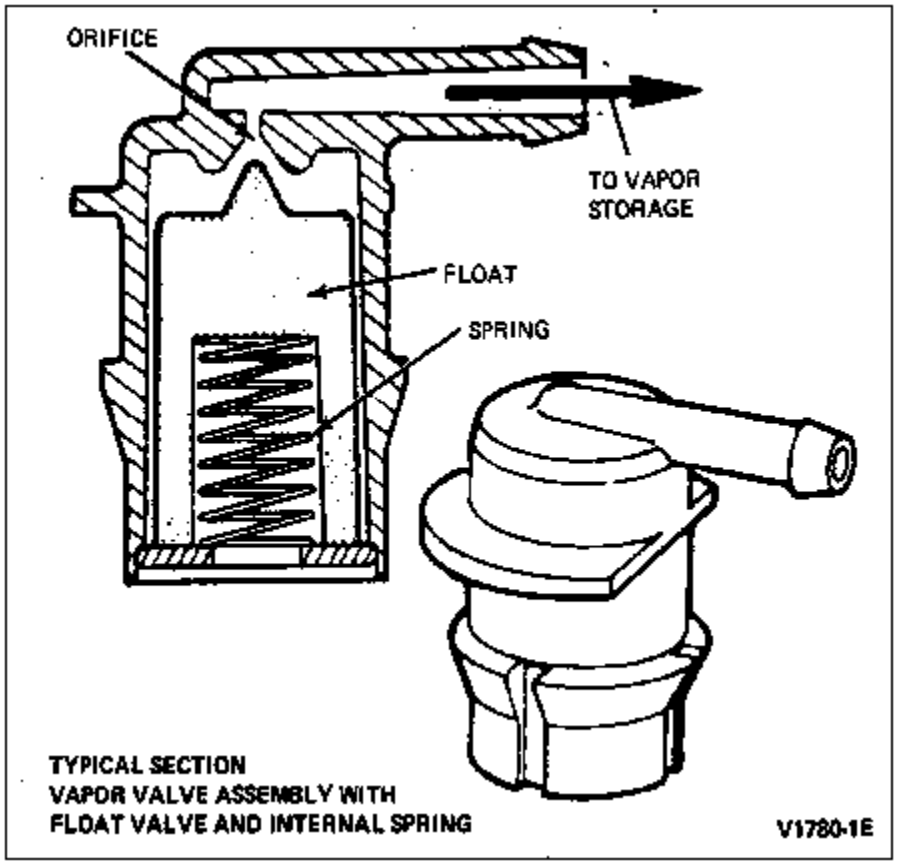
Fuel Vapor Valve, Aerostar

All fuel tank evaporative emission valves (9B593) make use of a small orifice that tends to allow only vapor and not liquid fuel to pass into the line running forward to the evaporative emissions canister (EVAP canister) (9D653). This evaporative emission valve mounts directly into the fuel tank (9002) using a rubber grommet. This evaporative emission valve is used for Aerostar 3.0L engines. For 4.0L engines, a differential evaporative emission valve is used.

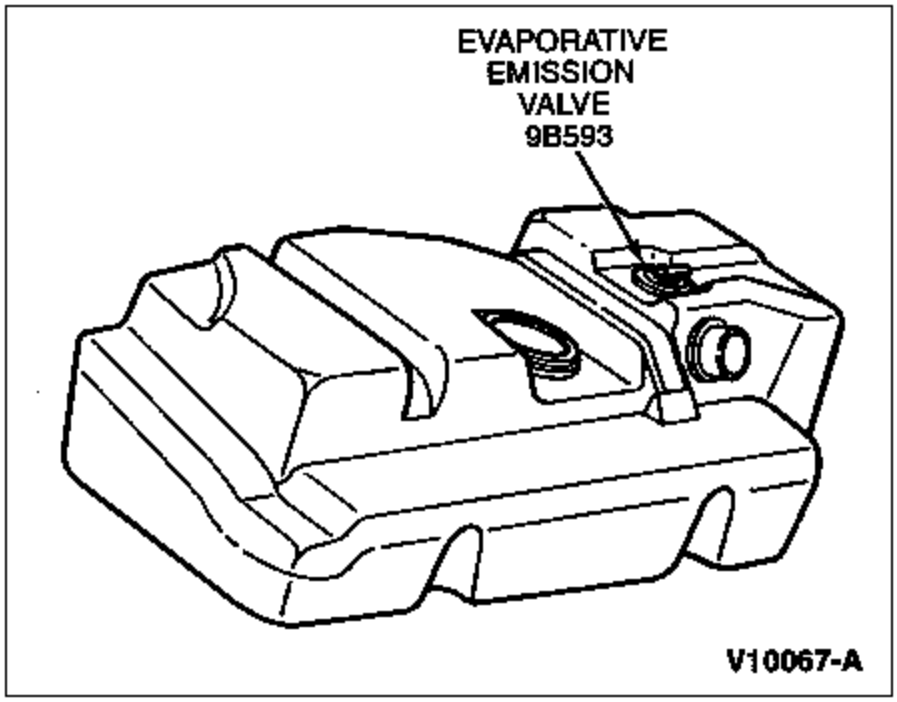
Fuel vapors contained in the sealed fuel tank are vented through the orificed fuel tank evaporative emission valve in the top of the fuel tank. The vapors leave the evaporative emission valve through a single vapor line and continue to the evaporative emissions canister in the engine compartment for storage, until such time as they are purged to the engine (6007).

In the event of extreme conditions (excessive fuel tank pressure) the purge port of the evaporative emission valve opens up, allowing fuel vapor to vent the atmosphere. This purging action stabilizes pressure in the fuel tank.

Fuel Vapor Valve, Aerostar



tomsn048@gmail.com



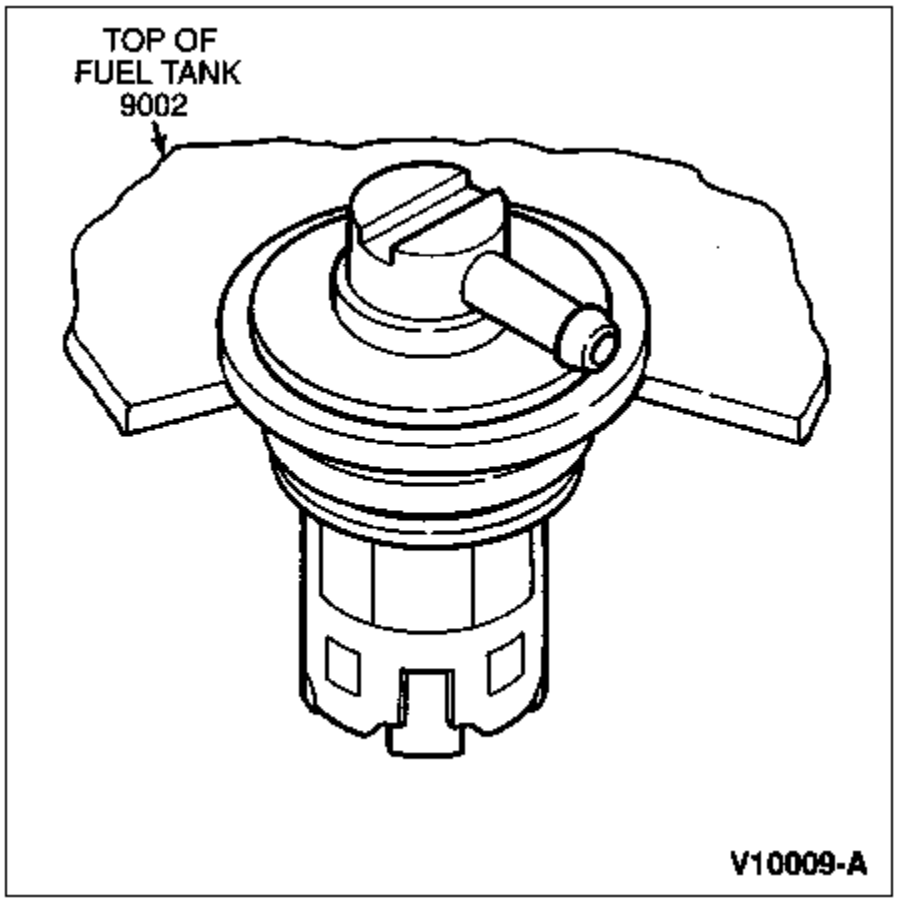
tomsn048@gmail.com

Fuel Vapor Valve, Ranger

The evaporative emission valve (9B593) makes use of a small orifice that tends to allow only vapor and not liquid fuel to pass into the line running forward to the fuel vapor canister. The evaporative emission valve mounts directly into the fuel tank (9002) using a rubber grommet.

Fuel vapors contained in the sealed fuel tank are vented through the orificed fuel tank evaporative emission valve in the top of the fuel tank. The vapors leave the evaporative emission valve through a single vapor line and continue to the fuel vapor canister in the engine compartment for storage, until such time as they are purged to the engine (6007).

Fuel Vapor Valve, Ranger



tomsn048@gmail.com

tomsn048@gmail.com

Fuel Tank Pressure Transducer

The fuel tank pressure (FTP) transducer is used to monitor the fuel tank pressure or vacuum during the OBD II purge monitor test of the Evaporative Emission System. It also performs a fuel system integrity check to determine if there is an evaporative leak. Variations in pressure will be converted into an analog voltage input signal to the powertrain control module (PCM) (12A650).

tomsn048@gmail.com

Fuel Lines

MFI engines use Teflon® stainless steel for fuel supply and return lines and carbon steel for vapor line in the engine compartment. Outside the engine compartment the materials are nylon (Aerostar and Ranger).

On Aerostar, the plastic fuel tube assemblies are secured to the body rails with nylon wraparound clips and push-in pins. The clips are located along the tube assembly by upsets on the fuel tube. On Ranger vehicles, the plastic fuel and vapor tube assemblies are secured to the frame rails with integral clips.

Spring Lock Coupling

Fuel tubes which connect to MFI engines utilize spring lock couplings in the engine compartment instead of the plastic or stainless steel push connect fittings. The spring lock couplings work by insertion of the fitting's male end, which is surrounded by two O-rings, into a female flared end engine fitting. The coupling engagement is secured by a garter spring which prevents the female flared end from becoming disengaged from the male end.

Spring Lock Coupling Disconnect Tool D87L-9280-B or equivalent is used to disconnect the 12.7mm (1/2-inch) spring lock coupling supply fitting. Tool D87L-9280-A or equivalent is used to disconnect the 9.52mm (3/8-inch) spring lock coupling return fitting.

tomsn048@gmail.com

Fuel Pump, Electric — Ranger

The multiport fuel injection (MFI) system uses a fuel tank (9002) and a fuel pump and sender assembly. The fuel tank has an internal pump cavity where the fuel pump and sender assembly rest. This design provides satisfactory operation during extreme vehicle maneuvers and steep vehicle climbing with low tank fill levels.

The fuel pump (9350) is mounted on the fuel pump and sender assembly inside the fuel tank. This assembly includes a check valve which is in the outlet of the fuel pump. The function of this valve is to maintain pressure in the system after the vehicle is shut down. The pressure retention helps prevent long cranks and hot starting problems. This fuel pump is capable of supplying 60 liters (15.9 gallons) of fuel per hour at 310 kPa (45 psi). The fuel pump has an internal pressure relief valve which limits the maximum fuel pump pressure to 850 kPa (125 psi). This only takes effect if there is a system blockage, causing system pressure to rise too high. The system pressure is controlled by a pressure regulator on the engine (6007).

The fuel pump is protected at its inlet by a nylon pickup element. This nylon element filters dirt and contaminants which could plug or damage the internal pump components while at the same time allowing passage of small quantities of water which may accumulate within the fuel tank sump.

The electrical system has a fuel pump control relay controlled by the powertrain control module (PCM) (12A650), which provides power to the fuel pump under various operating conditions. When the ignition switch (11572) is in the OFF position, the contacts of the PCM power and fuel pump relays are open.

tomsn048@gmail.com

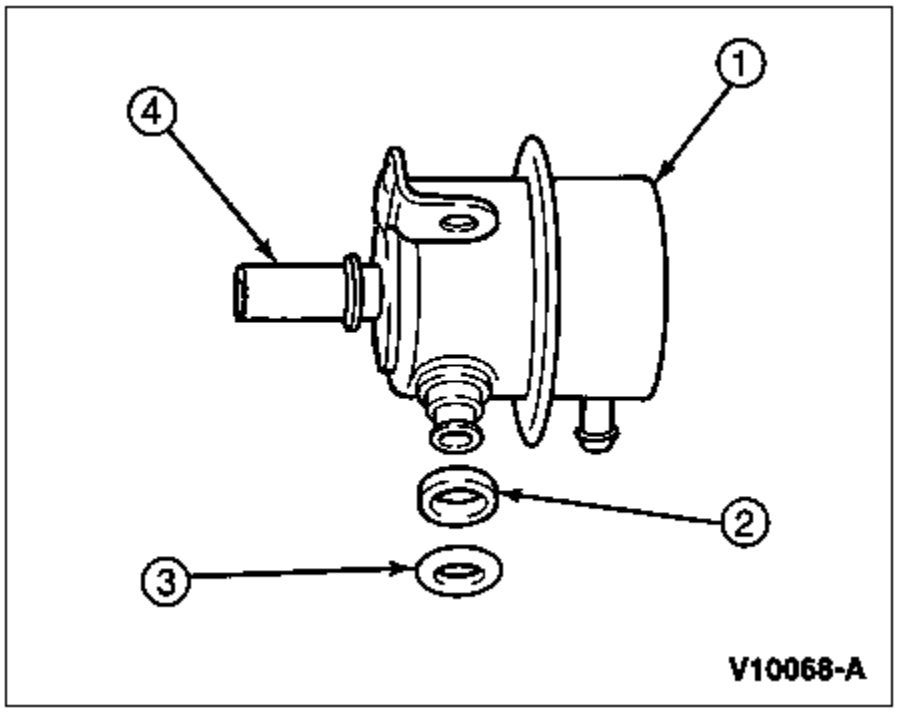
Fuel Pressure Regulator

The fuel pressure regulator (9C968) is attached to the fuel supply manifold assembly downstream of the fuel injectors. It regulates the fuel pressure supplied to the injectors. The regulator is a diaphragm-operated relief valve in which one side of the diaphragm senses fuel pressure and the other side is subjected to intake manifold vacuum. The nominal fuel pressure is established by a spring preload applied to the diaphragm. Balancing one side of the diaphragm with manifold pressure maintains a constant fuel pressure drop across the injectors. Fuel, in excess of that used by the engine, is bypassed through the regulator and returns to the fuel tank (9002).



Item	Part Number	Description

Inertia Fuel Shutoff Switch

WARNING: IF YOU SEE OR SMELL GASOLINE AT ANY TIME OTHER THAN DURING FUELING, DO NOT RESET THE INERTIA FUEL SHUTOFF SWITCH (IFS SWITCH) (9341).

The inertia fuel shutoff switch shuts off fuel to the engine (6007) in event of collision. Once the inertia fuel shutoff switch has shut off the fuel pump (9350) it must be manually reset to start engine.

On Ranger vehicles, the inertia fuel shutoff switch is located on the toe-board to the right of the transmission hump.

On Aerostar vehicles, it is located on the kick panel to the right of the front passenger seat.

5	01610	Dash Panel RH Side

tomsn048@gmail.com

Fuel Draining

Use appropriate adapter to connect Rotunda Fuel Storage Tanker 034-00002 or equivalent suction pump to the fuel hose (at the fuel pump-to-fuel tube connection) and drain the fuel tank (9002).

tomsn048@gmail.com

Fuel Filling

The fuel filler nozzle openings for the fuel tanks (9002) on vehicles with gasoline engines (6007) have been made smaller to prevent accidental filling with other than unleaded fuel. Gasoline pumps in the United States dispensing unleaded fuel are equipped with dispensing nozzles to accommodate the smaller filler opening in the fuel tank filler pipe (9034).

Expansion of fuel due to temperature increases or overfilling (topping off) can cause fuel overflow at the fuel tank filler cap (9030) when the vehicle is standing or the fuel tank filler cap is removed. To minimize this condition, it is recommended that the amount of fuel put in the fuel tank be limited to the third automatic pump shutoff.

tomsn048@gmail.com

Fuel Tanks

Steel Midship, Aerostar

Removal and Installation

1. **NOTE: Make sure fuel tank (9002) is properly supported during removal and installation procedures.**

   Drain fuel from fuel tank.

2. Loosen fuel tank filler pipe clamp.

3. Remove fuel tank heat shield (9A032) from vehicle.

4. Support fuel tank.

5. Remove bolt from rear fuel tank support strap (9092) and remove rear fuel tank support strap.

6. Remove bolt from front fuel tank support strap and remove front fuel tank support strap.

7. Partially lower fuel tank to gain access and remove feed and return lines from sender ports. To disconnect push connect fittings, refer to Push Connect Fittings in this section.

8. Remove electrical connector from sender unit.

9. Remove fuel vapor hose from evaporative emission valve (9B593).

10. Lower fuel tank from vehicle.

11. For installation, follow removal procedures in reverse order. The fittings used on 7.9mm (5/16-inch) nominal diameter nylon tubing use a hairpin clip. Clips should be replaced whenever a connector is removed. Refer to Push Connect Fittings in this section. Tighten bolts securing fuel tank support straps to 47-61 Nm (35-45 lb-ft). Tighten screws securing fuel tank heat shield to 3-6 Nm (27-53 lb-in). Tighten clamp securing fuel tank filler pipe (9034) to 3-4 Nm (27-35 lb-in).

Fuel Tank Filler Pipe, Aerostar

Lower Fill Hose

Removal and Installation

1. **NOTE: Fuel tank (9002) must be removed before lower fuel tank filler pipe (9034) can be removed from the fuel tank.**

   Remove fuel tank as described in this section.

2. Remove clamp which secures lower fuel tank to filler pipe hose (9047) to the fuel tank spud.

3. Pull lower fuel tank filler pipe from fuel tank.

4. For installation, follow removal procedures in reverse order. Tighten fill pipe hose clamp to 3-4 Nm (27-35 lb-in).

Upper Fill Pipe

Removal and Installation

1. **NOTE: Fuel tank must be less than half full before removing upper fuel tank filler pipe.**

   Drain fuel tank to less than half-full level.

2. Remove three bolts which secure the fuel tank filler pipe to the body side.

3. Loosen clamp that secures the outer fuel tank filler pipe to the lower fuel tank to filler pipe hose.

4. Disconnect the fuel tank filler pipe from the lower fuel tank to filler pipe hose.

5. Remove the upper fuel tank filler pipe by pulling the assembly up through the body side.

6. If required, the fuel tank filler cap (9030) may be slipped off the fuel tank filler pipe by pulling on the tether.

7. For installation, follow removal procedures in reverse order. Tighten clamp securing fuel tank filler pipe to 3.5-4.5 Nm (31-39 lb-in).

tomsn048@gmail.com

tomsn048@gmail.com

Fuel Tank Filler Pipe, Ranger

Removal

1. Loosen screw clamp attaching fuel tank to filler pipe hose (9047) to fuel tank (9002).
2. Remove three screws attaching fuel tank filler pipe (9034).

Installation

1. Replace three screws attaching the fuel tank filler pipe to body housing. Tighten screws to 3.5 Nm (30 lb-in).
2. Tighten screw clamps attaching fuel tank to filler pipe hose to 3-4 Nm (27-35 lb-in).

tomsn048@gmail.com

Fuel Filters

NOTE: Ignition switch (11572) must be in OFF position before removing the filter.

Fuel is filtered at two locations on Aerostar and Ranger vehicles.

In-Tank

A nylon filter element (inlet filter sock) is mounted on the in-tank electric fuel pump inlet inside the fuel tank and is used to protect the fuel pump from fuel tank contaminants.

The in-tank filter is not serviced separately. To service the in-tank filter, replace the fuel pump and sender assembly.

In-Line

The fuel filter on MFI applications provides extremely fine filtration to protect the small metering orifices of the fuel injector nozzle tips (9E527). The filter is a one-piece construction which cannot be cleaned. If the filter becomes clogged or restricted, it should be replaced.

MFI engines with electric fuel pumps (9350) have an in-line fuel filter, located on the left frame (5005) or body side rail downstream from the fuel pump.

The in-line fuel filter should last the life of the vehicle under normal driving conditions. If the filter does need to be replaced, proceed as follows.

Removal

CAUTION: If the fuel filter is being serviced with the rear of the vehicle higher than the front, or if the fuel tank (9002) is pressurized, fuel leakage (or siphoning from the tank fuel) from the lines could occur. To prevent this condition, maintain the vehicle front end at or above the level of the rear of vehicle. Also, relieve tank pressure by loosening the fuel tank filler cap (9030). Fuel tank filler cap should be retightened after pressure is relieved. If vehicle is warm, change the fuel filter before the pressure rebuilds.

1. **NOTE: Refer to installation figures under Removal and Installation, Fuel and Vapor Return Lines in this section.**

   Shut engine (6007) off. Depressurize fuel system. Refer to Service Procedures, Fuel System Pressure Relief in this section. Use caution to prevent combustion from fuel spillage.

2. Raise vehicle on hoist.

3. Remove push connect fittings at both ends of fuel filter as described in Removal and Installation, Push Connect Fittings in this section. Install new retainer clips in each plastic push connect fitting.

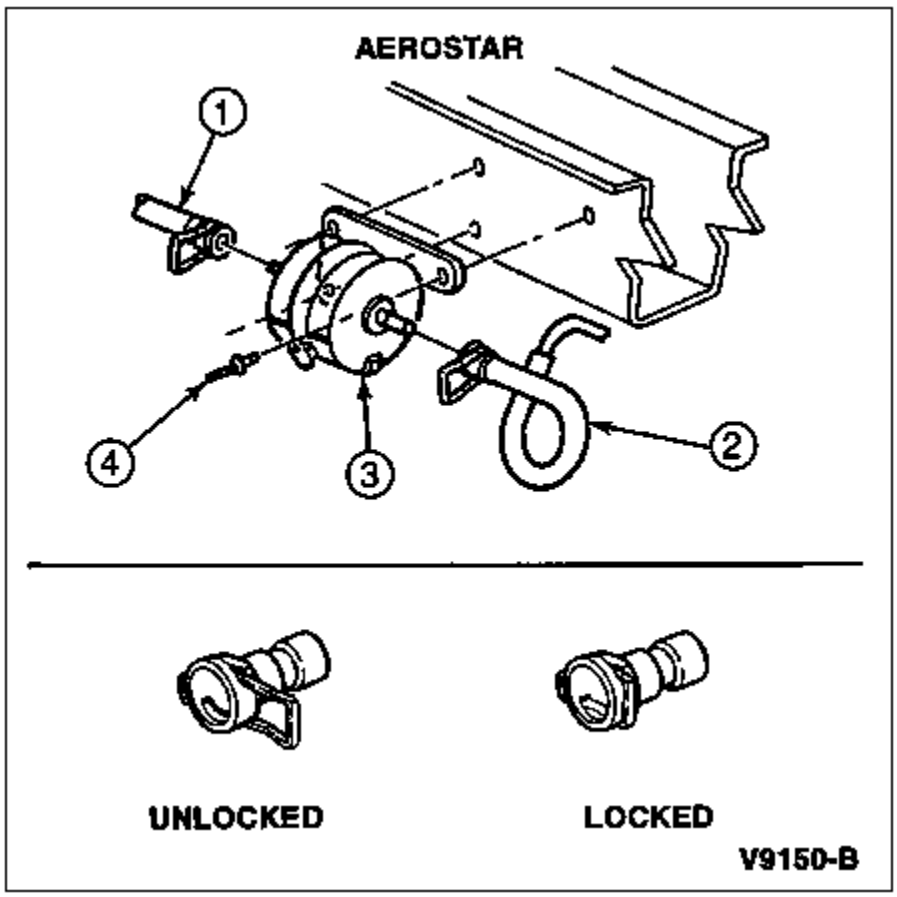
4. **NOTE: The "flow" arrow direction should be positioned as installed in bracket to make sure of proper flow of fuel through the replacement filter.**

tomsn048@gmail.com

Remove filter from bracket by loosening filter retaining clamp enough to allow filter to pass through.

Installation

1. Install filter in bracket, ensuring proper direction of flow as noted by arrow. Tighten clamp to 1.7-2.8 Nm (15-25 lb-in).
2. Install push connect fittings at both ends of filter as described in Removal and Installation, Push Connect Fittings in this section.
3. Lower vehicle.
4. Start engine and check for leaks.



Item	Part Number	Description

tomsn048@gmail.com

Fuel Tank Sending Unit and Pump — Aerostar, Ranger

CAUTION: Fuel supply lines remain pressurized for long periods of time after the engine (6007) is shut down. This pressure must be relieved before the fuel system is serviced. The fuel system on these vehicles is depressurized by disconnecting the inertia fuel shutoff switch (IFS switch) (9341) and cranking the engine for a minimum of 15 seconds.

NOTE: On some vehicles, fuel tank sending unit is not available separately. On those vehicles, to replace sending unit, replace entire fuel pump and sender assembly.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Tank Lockring Wrench	T90T-9275-A
Fuel Tank Sender Wrench	T86T-9275-A

Removal

1. Remove fuel tank (9002) as described in this section.
2. Remove fuel tank to bench. Remove any dirt that has accumulated around the fuel pump attaching flange so that it will not enter the fuel tank during fuel pump removal.
3. Turn the fuel tank sending unit locking retainer ring (9A307) counterclockwise with the Fuel Tank Lockring Wrench T90T-9275-A or Fuel Tank Sender Wrench T86T-9275-A and remove fuel tank sending unit locking retainer ring.
4. Remove the fuel pump and sender assembly.
5. Remove fuel pump mounting gasket (9417) and discard.

Installation

1. Clean the fuel pump mounting flange and the fuel tank mounting surface and groove in fuel tank sending unit locking retainer ring.
2. Put a light coating of Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B on a new fuel pump mounting gasket to hold it in place during assembly and install it in the fuel ring groove.
3. Install fuel pump and sending unit assembly carefully to make sure that the filter is not damaged. Be sure that the locating keys are in keyways and the fuel pump mounting gasket remains in place.
4. Hold the fuel sending unit and fuel pump mounting gasket in place. Install and rotate the fuel tank sending unit locking retainer ring clockwise using Fuel Tank Lockring Wrench T90T-9275-A.

tomsn048@gmail.com

a. For Ranger and Aerostar, tighten the fuel tank sending unit locking retainer ring to 55-74 Nm (40-55 lb-ft).
b. For Ranger SuperCab, tighten fuel tank sending unit locking retainer ring clockwise until stop.

5. Install fuel tank as described in Removal and Installation, Fuel Tanks in this section.

Inertia Fuel Shutoff Switch

WARNING: IF YOU SEE OR SMELL GASOLINE AT ANY TIME OTHER THAN DURING FUELING, DO NOT RESET THE INERTIA FUEL SHUTOFF SWITCH.

To Reset Switch

1. Turn ignition switch (11572) to OFF.
2. Check for leaking fuel in the engine compartment, fuel lines and fuel tanks.
3. If no fuel leak is apparent, reset the inertia fuel shutoff switch by pushing the reset button on the top of the inertia fuel shutoff switch.
4. Turn ignition switch to START for a few seconds, then to OFF.
5. Again, check for leaking fuel.

tomsn048@gmail.com

Fuel Vapor Valve

The evaporative emission valve (9B593) is not repairable. It must be replaced as a complete assembly. To replace the evaporative emission valve refer to Removal and Installation, Fuel Tanks in this section.

tomsn048@gmail.com

Fuel and Vapor Return Tubes

Plastic

CAUTION: Ford-approved nylon fuel tubing is made from material which has been tested and proven to be acceptable for use with commercially available fuels. It is also resistant to most environmental conditions. Avoid using alternate tubing materials. Use of non-approved tubing could pose a hazard in service.

CAUTION: Plastic fuel tube must not be repaired using hose and hose clamps. Push connect fittings cannot be repaired except to replace the retaining clips.

CAUTION: The plastic fuel lines can be damaged by torches, welding sparks, grinding and other operations which involve heat and high temperatures. If any repair or service operation will be used which involves heat and high temperatures, locate all fuel system components, especially the plastic fuel lines to be certain they will not be damaged. It is recommended that the plastic fuel tubes be removed from the vehicle if a torch or high heat producing equipment is to be used for service in the following areas:

1. Exhaust or suspension components in proximity to fuel tubes.
2. Underbody, rails and crossmembers (left side).
3. Dash panel; under vehicle or inside the passenger compartment (lower right side).
4. Front or rear wheel house/fender apron (right side).

PTFE (Teflon®) and Stainless Steel

In a high heat environment, Teflon® hose and stainless steel tubes with crimped joints are used. These tubes have been tested, and proven to be acceptable for use with commercial fuels. Avoid using alternate tubing materials. Use of non-approved tubing could pose a hazard in service.

CAUTION: Teflon® hose and stainless steel fuel tube assemblies must not be repaired using hose and hose clamps. If damaged, they must be replaced.

Vapor Hoses

Removal

To disconnect a hose from any component, refer to the following:

tomsn048@gmail.com

1. Securely grip component with one hand, and hose with the other hand as close as possible to connection.

2. Sharply twist hose along its axis to "break" the temporary bond between hose and component. (No adhesive is used to make hose connections during vehicle assembly, but natural aging of the connections causes a temporary bond to exist.)

3. It is important to "break free" the hose at its connection point as indicated in Step 2. If the joint is stubborn and the above method does not work, grip the hose with a pair of pliers directly over the joint and twist again.

4. **WARNING: MOST CONNECTIONS IN THE EVAPORATIVE EMISSION SYSTEM ARE VERY SECURE. A STRONG PULLING AND SIMULTANEOUS TWISTING ACTION IS REQUIRED TO DISCONNECT. WHEN DISCONNECTION OCCURS, BOTH HANDS COULD SHARPLY AND UNCONTROLLABLY MOVE IN THE DIRECTION OF EACH HAND'S PULLING. BE CAREFUL THAT NO SHARP OR POSSIBLE DAMAGING OBJECTS ARE IN LINE WITH THE DIRECTION OF PULL TO PREVENT PHYSICAL INJURY AND/OR DAMAGE TO THE OBJECTS THAT WILL BE IMPACTED BY THE HANDS WHEN DISCONNECTION OCCURS.**

   Once the hose/component joint has been broken, disconnect by securely gripping the component with one hand and hose with the other. Twist hose and at the same time pull apart.

Installation

1. To reconnect a hose to a component, wet the hose with water and push onto component.

2. Vapor hoses should be assembled with the minimum engagement shown in the following illustration.

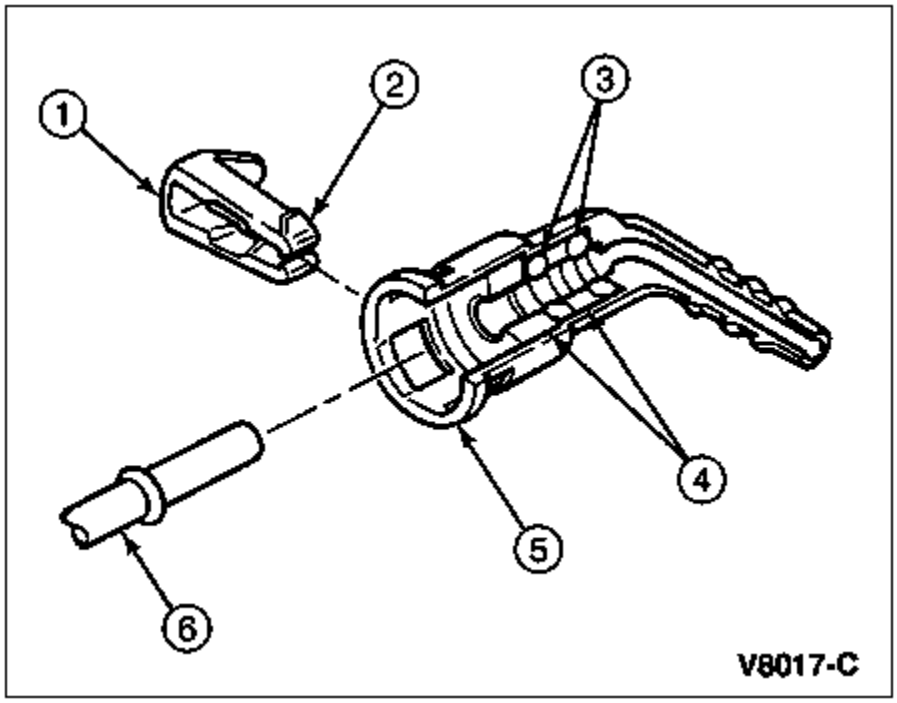
Push Connect Fittings

The fittings used on 7.9mm (5/16-inch) nominal diameter nylon tubing use a hairpin clip. Clips should be replaced whenever a connector is removed.

Disconnect all push connect fittings from components (filter, engine) prior to component removal. The push connect fittings that connect flexible fuel lines to the fuel tank sender cannot be disconnected until the fuel tank heat shield is removed and the tank is partially lowered just before removing the fuel tank (9002) completely.



Item	Part Number	Description
1	N802239-S	Hairpin Clip
2	—	Shipping Tab (Part of N802239-S)
3	—	O-Rings (Part of 3H307)
4	—	Spacers (Part of 3H307)
5	3H307	Sender
6	9J276	Steel or Nylon Tube

Plastic (Hairpin Clip)

tomsn048@gmail.com

Removal

1. Inspect visible internal portion of fitting for dirt accumulation. If more than a light coating of dust is present, clean the fitting before disassembly.

2. **CAUTION: Do not use any tools.**

   Some adhesion between the seals in the fitting and the tubing will occur with time. To separate, twist the fitting on the tube, then push and pull the fitting until it moves freely on the tube.

3. Remove hairpin type clip from fitting by first bending the shipping tab downward so that it will clear the body. Next (using hands only), spread the two clip legs approximately 3.0mm (1/8 inch) each to disengage the body and push the legs into the fitting. To remove completely, lightly pull the triangular end of the clip and work it clear of the tube and fitting. Discard clip. It must be replaced with a new one during installation.

4. Grasp the fitting and hose assembly and pull in an axial direction to remove the fitting from the steel or nylon tube.

5. When fitting is removed from the tube end, inspect the fitting and tube for any internal parts that may have been dislodged from the fitting. Any loose internal parts should be immediately installed, using the mating tube to insert the parts.

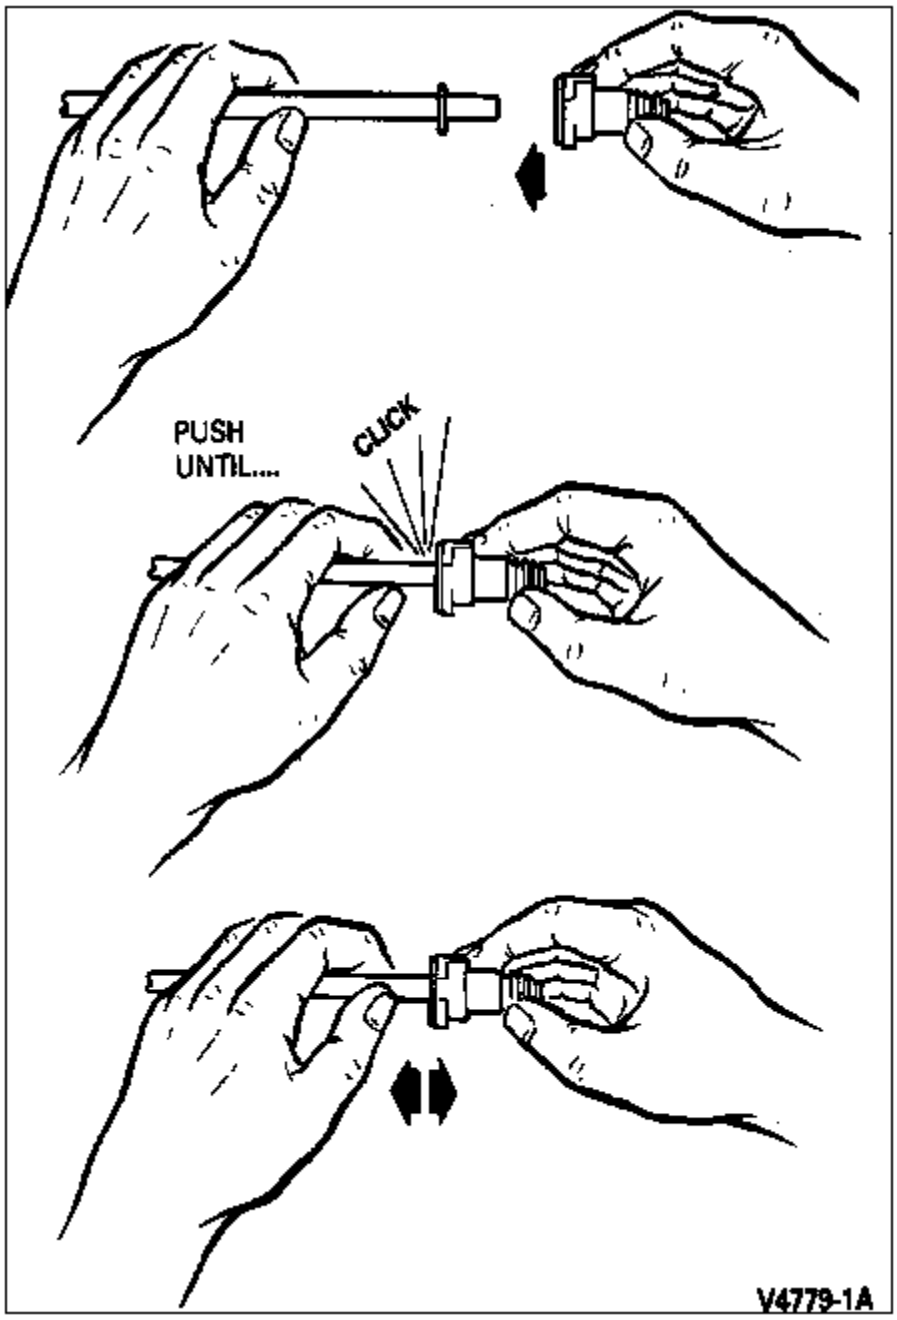
Installation

1. Install the new clip by inserting clip into any two adjacent openings with the triangular portion pointing away from the fitting opening. Install clip to fully engage the body (legs of hairpin clip locked on outside of body). Piloting with an index finger is necessary.

2. Before installing fitting on the tube, wipe tube end with a clean cloth. Inspect the inside and outside of the fitting to make sure it is free of dirt and/or obstructions.

3. To install the fitting onto the tube, align the fitting and tube axially and push the fitting onto the tube end. When the fitting is engaged, a definite click will be heard. Pull on fitting to make sure it is fully engaged.

tomsn048@gmail.com



Steel

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Quick Disconnect Tool (5/16-Inch) (Part of T90T-9550-S)	T90T-9550-B
Quick Disconnect Tool (3/8-Inch) (Part of T90T-9550-S)	T90T-9550-C

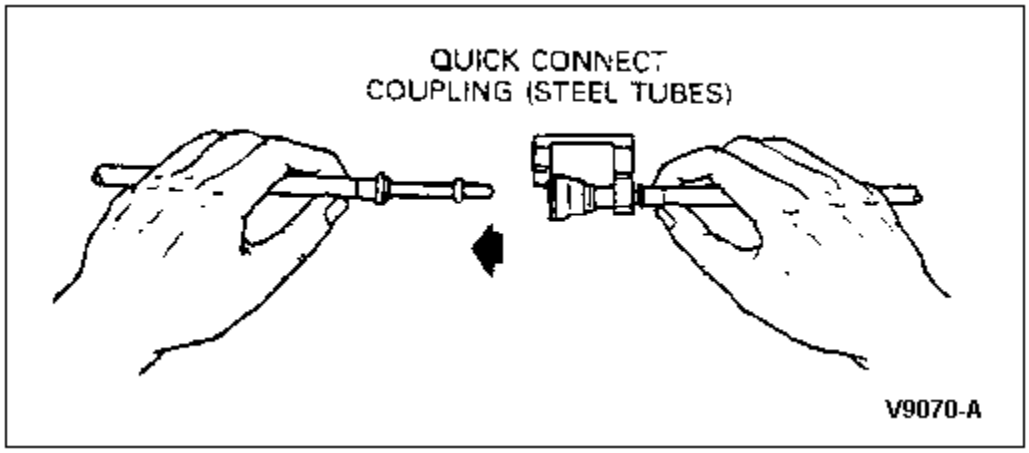
tomsn048@gmail.com

Removal

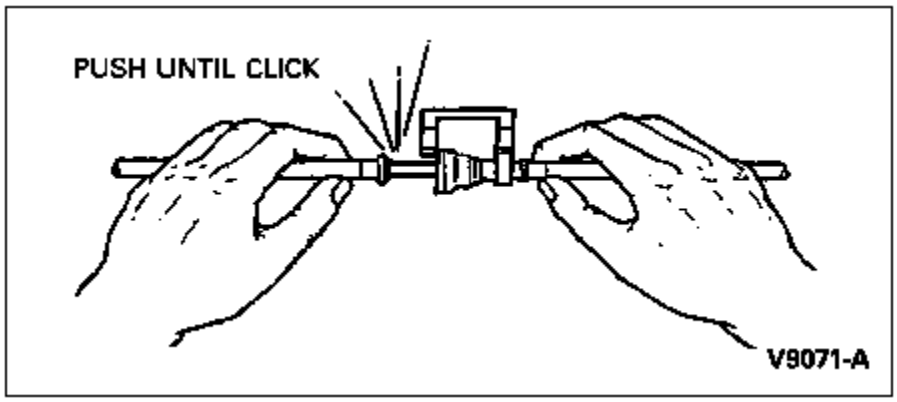
1. Release safety clip from fitting.
2. Fit Quick Disconnect Tool T90T-9550-B (5/16-inch) or T90T-9550-C (3/8-inch) to fitting body so the tool can enter the body and release the retaining fingers.
3. Push the tool into the fitting body to release the retaining fingers from the formed male tube end.
4. Pull the female fitting and the male tube end apart.
5. Remove the tool from the disconnected fitting.
6. Inspect the fitting for any internal parts that may have been damaged. Fuel tube should be replaced if internal parts are damaged.

Installation

1. Align the fitting and tube axially.

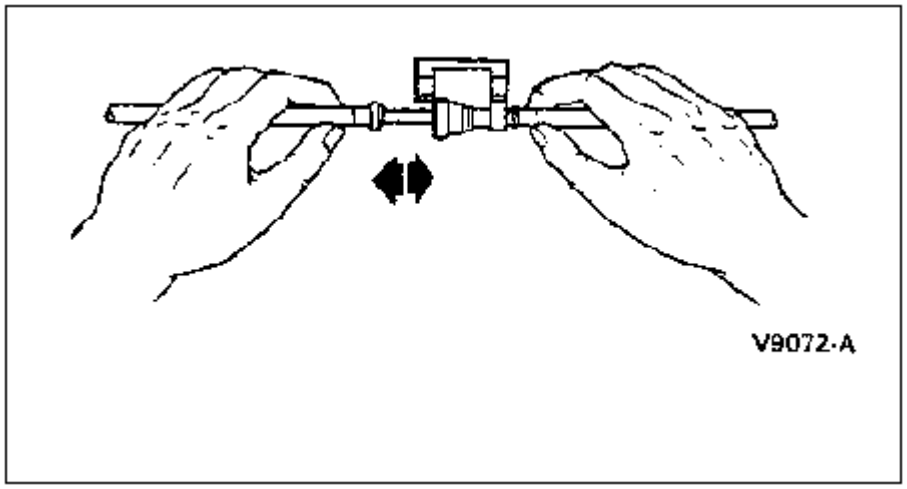


2. Push the tube into the fitting. When properly engaged, a click will be heard.

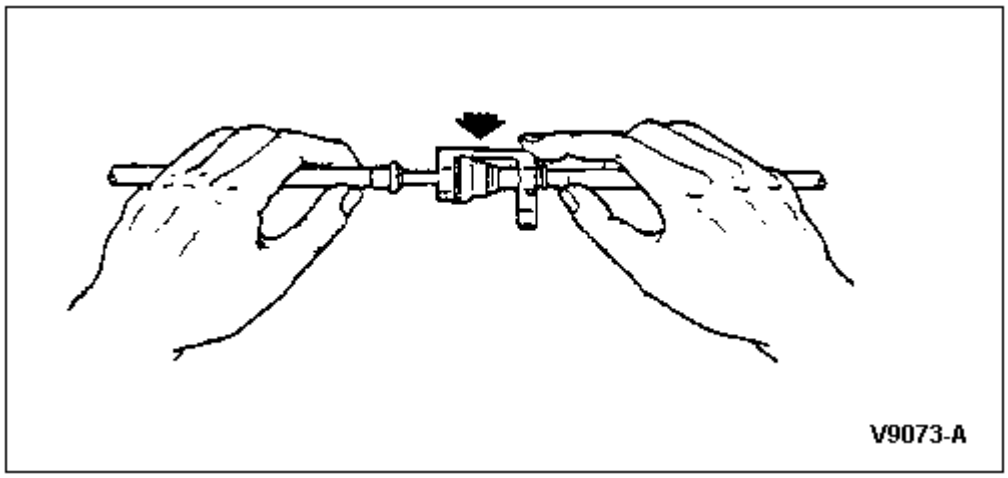


tomsn048@gmail.com

3. Pull on the fitting to make sure it is fully engaged.



4. Lock assembly with safety clip.



tomsn048@gmail.com

tomsn048@gmail.com

Spring Lock Connectors

Fuel tubes which connect to MFI engines utilize spring lock push connect fittings in the engine compartment instead of the plastic or stainless steel push connect fittings. The spring lock push connect fittings work by insertion of the fitting's male end, which is surrounded by two O-rings, into a female flared end engine fitting. The coupling engagement is secured by a garter spring which prevents the female flared end from becoming disengaged from the male end.

Spring Lock Coupling Disconnect Tool D87L-9280-B or equivalent is used to disconnect the 12.7mm (1/2-inch) spring lock coupling supply fitting. Tool D87L-9280-A or equivalent is used to disconnect the 9.52mm (3/8-inch) spring lock coupling return fitting.

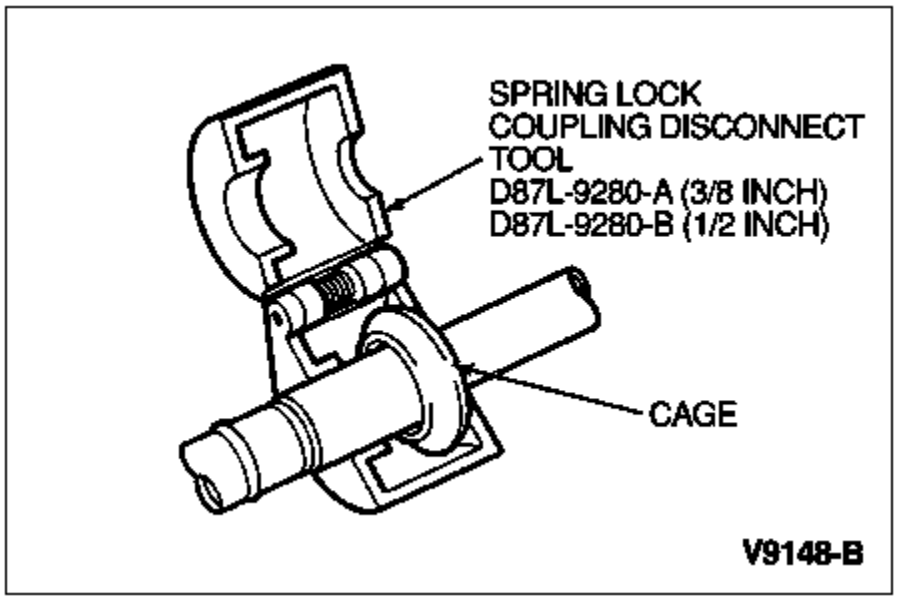
tomsn048@gmail.com

Spring Lock Couplings

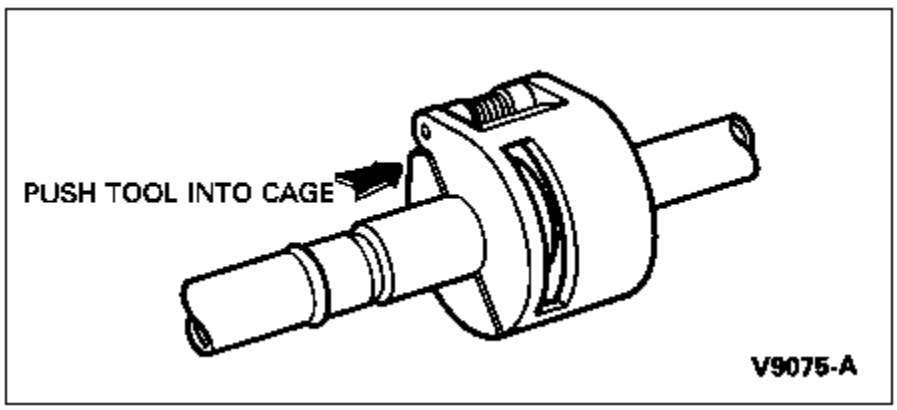
CAUTION: Discharge fuel system before disconnecting coupling.

Disconnecting

1. Remove safety strap. Fit tool to coupling so that tool can enter cage to release the garter spring.

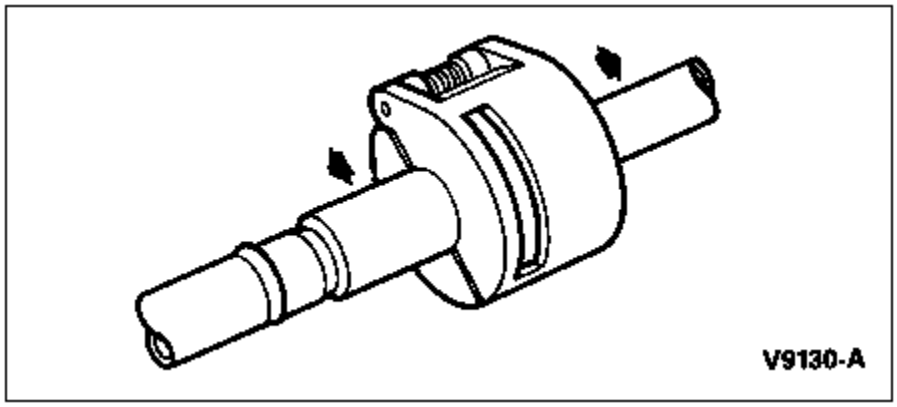


2. Push the tool into the cage opening to release the female fitting from the garter spring.

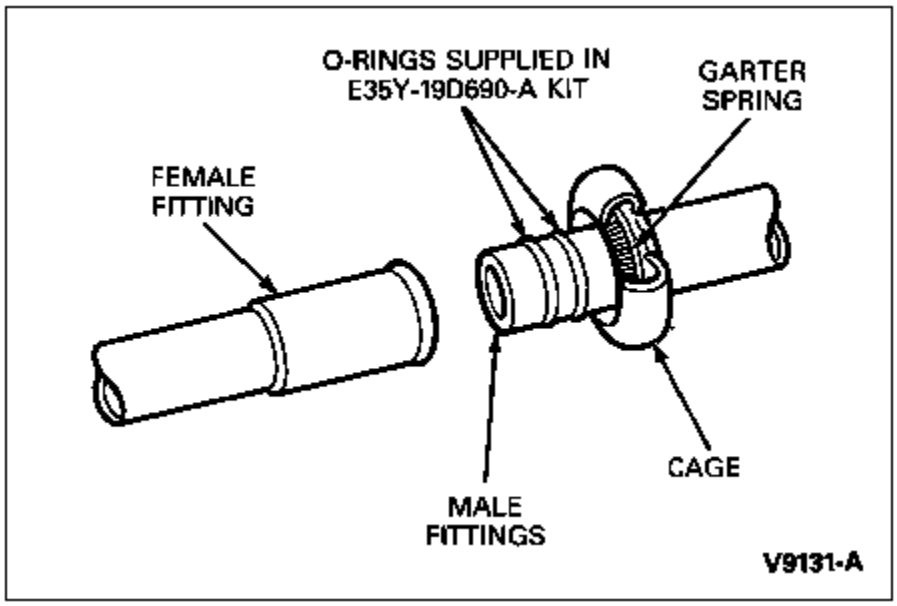


tomsn048@gmail.com

3. Pull the coupling male and female fittings apart.



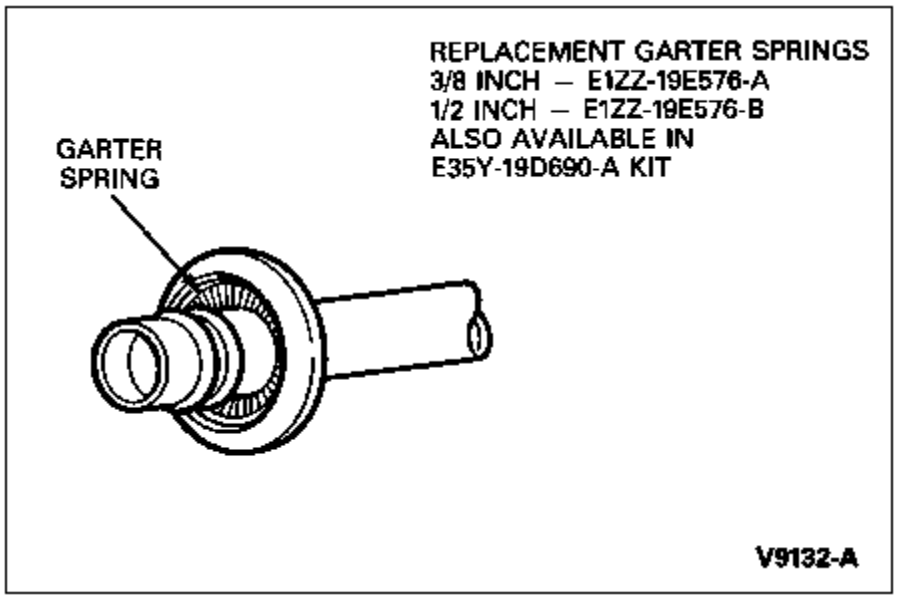
4. Remove the tool from the disconnected spring lock coupling.



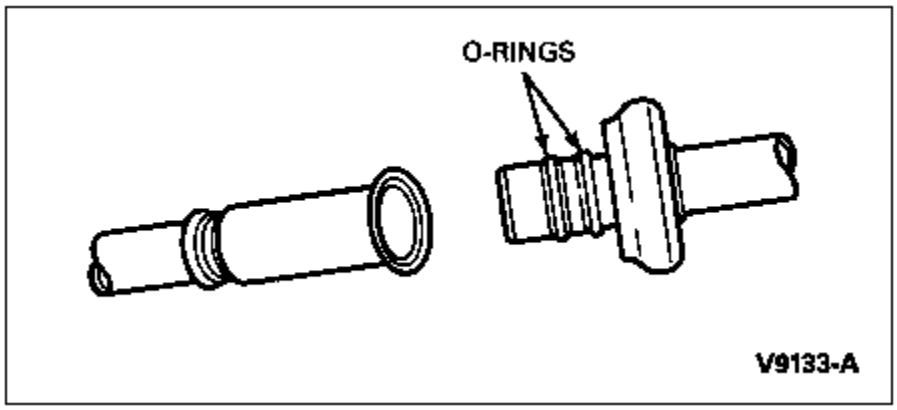
Connecting

1. Check for missing or damaged garter spring. If spring is damaged or missing: remove damaged spring with small hooked wire and install a new spring.

tomsn048@gmail.com

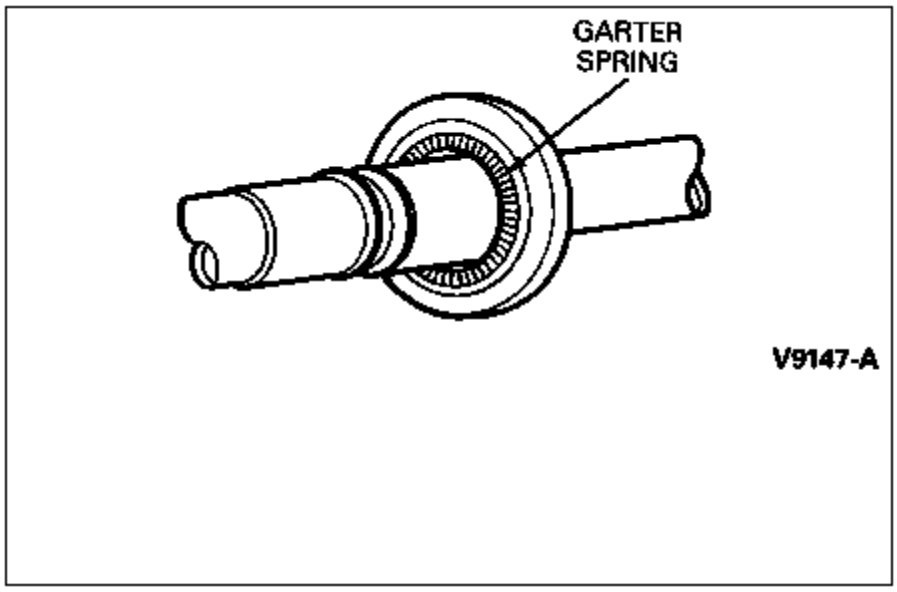


2. Clean fittings and install new O-rings. Use only specified O-rings supplied in Kit E35Y-19D690-A. Lubricate with clean refrigerant oil and assemble fitting by pushing with a slight twisting motion.



3. Visually check to be sure garter spring is over flared end of female fitting and pull on fitting to ensure full engagement.

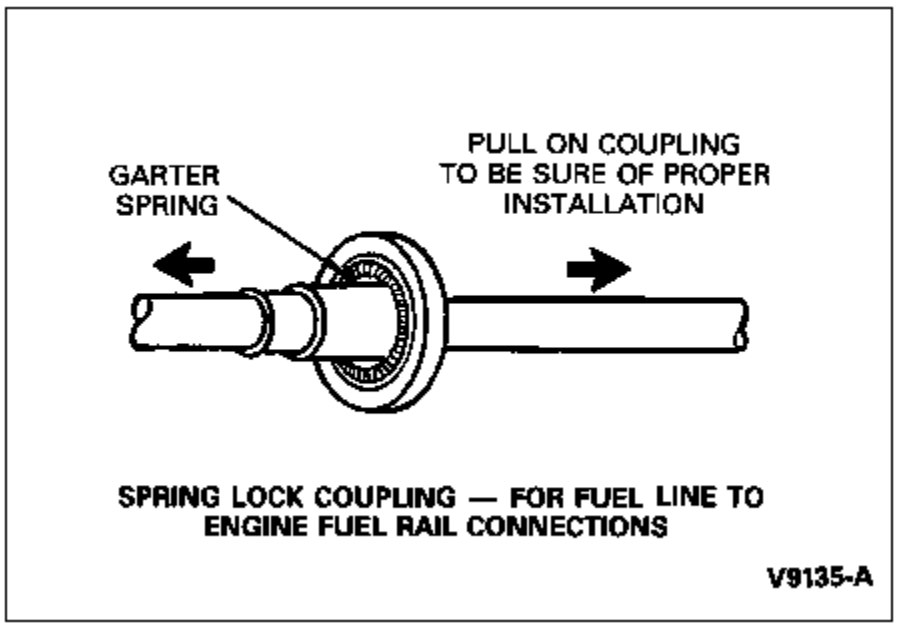
tomsn048@gmail.com



Spring Lock Coupling Safety Clip Installation

1. Visually check to be sure garter spring is over flared end of female fitting.

2. Pull on connector opposite the direction of installation to verify that the connector is locked in place. If connector is not locked in place, refer to Connecting Spring Lock Connector procedure in this section.

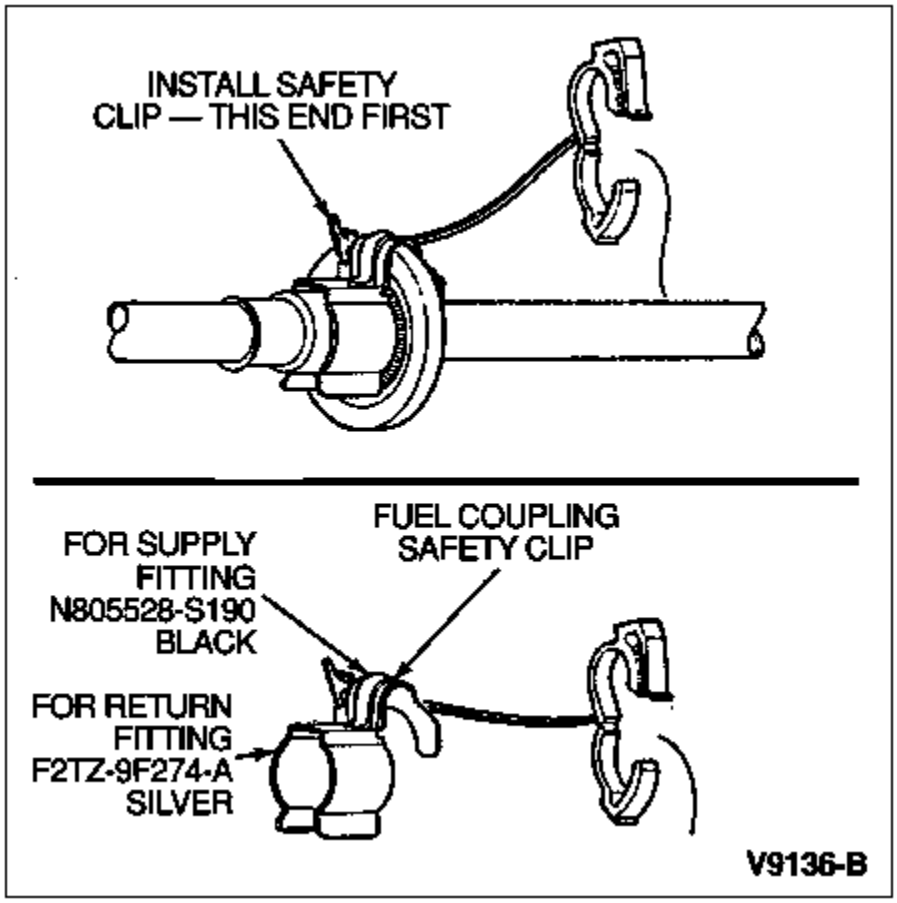


3. **NOTE: The black 12.7mm (1/2-inch) clip fits the fuel supply line. The silver 9.5mm (3/8-inch) clip fits fuel return line.**

   Install large end of clip to garter spring side of fuel line making sure that clip is properly positioned.

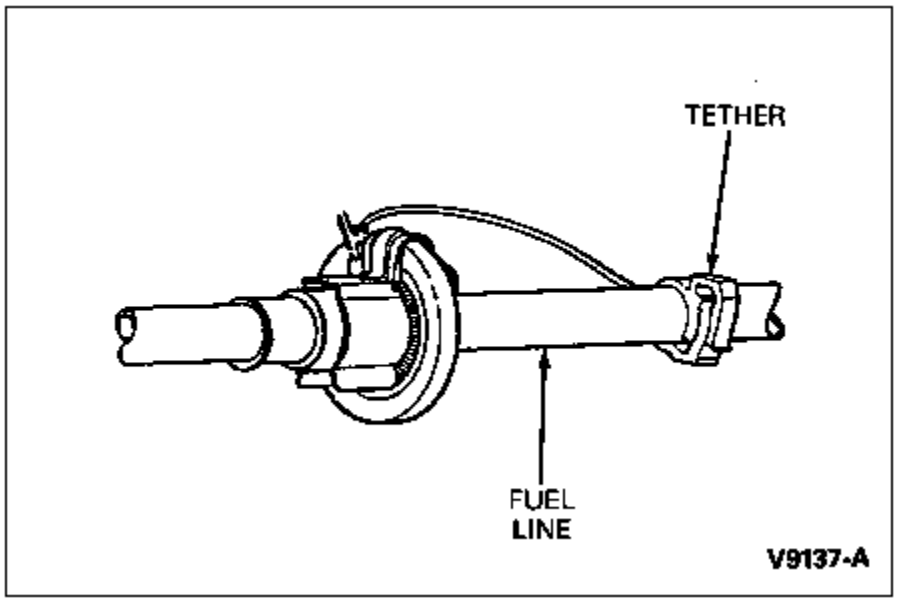
tomsn048@gmail.com

Refer to the following illustration.



4. Attach the tether to the fuel line and snap shut.

tomsn048@gmail.com



tomsn048@gmail.com

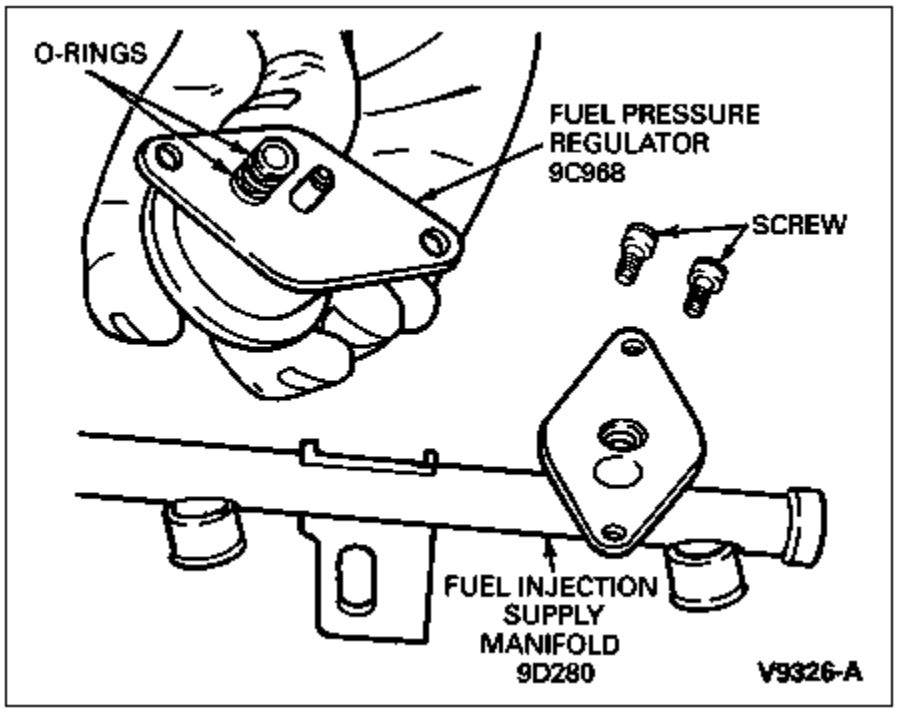
Fuel Pressure Regulator

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI Fuel Pressure Gauge)	T80L-9974-B

Removal

1. Make sure assembly is depressurized by removing fuel tank filler cap (9030) and releasing pressure from fuel system by opening the pressure relief valve on the fuel injection supply manifold assembly in the upper right corner of the engine compartment. Use Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI Fuel Pressure Gauge) T80L-9974-B.
2. Remove vacuum line at fuel pressure regulator (9C968).
3. Remove two Allen retaining screws from regulator housing and discard.
4. Remove fuel pressure regulator O-rings. Discard O-rings.
5. If scraping is necessary, be careful not to damage fuel pressure regulator or fuel supply line O-ring surfaces.



Installation

tomsn048@gmail.com

1. Lubricate new fuel pressure regulator O-rings with light oil meeting Ford Specification ESE-M2C39-F or equivalent. Never use silicone grease. It will clog the injectors.

2. Make sure O-ring surfaces of fuel pressure regulator and fuel injection manifold are clean.

3. Install new O-rings on fuel pressure regulator.

4. Using new Allen head retaining screws, install fuel pressure regulator on injector manifold. Tighten two retaining screws to 3-5 Nm (27-44 lb-ft).

5. Install vacuum line at fuel pressure regulator.

---

tomsn048@gmail.com

Fuel Tanks

Fuel tanks (9002) do not require special service procedures and may be steam-cleaned and/or serviced using standard procedures. After cleaning, allow to thoroughly air dry. The evaporative emission valve (9B593) should be replaced. Replace fuel tank strap bolts. The tank vapor valve assembly grommet (Ranger only), and fuel gauge sender and fuel pump assembly seal must be replaced. Failure to do so may result in tank leak.

Take care not to let steam cleaning tubing touch plastic as it will damage/distort fuel tank. Do not direct steam jet at one spot on plastic fuel tank for a prolonged period as it may damage/distort fuel tank.

Plastic Fuel Tank Repair

CAUTION: Leaks or damage to the polyethylene fuel tanks are not repairable. This applies to Aerostar and Ranger fuel tanks including all polyethylene portions of the fuel tank body and fittings. Fuel tank replacement is the only acceptable service. There are no reliable repair procedures that meet the same standards as a new fuel tank. Methods which appear to work may not function for the long term or after being subjected to normal use or abuse.

tomsn048@gmail.com

Fuel System Pressure Relief

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI Fuel Pressure Gauge)	T80L-9974-B

CAUTION: Fuel supply lines on MFI engines (6007) will remain pressurized for some period of time after the engine is shut off. This residual pressure must be relieved before servicing of the fuel system is begun.

On all MFI engines, the residual pressure in the fuel system can be relieved as follows:

- Use Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI Fuel Pressure Gauge) T80L-9974-B attached to the pressure measuring port on the engine fuel rail.
- Direct drain hose to a suitable container and depress the pressure relief button.

Alternate Method

- Disconnect the inertia switch.
- Crank the engine for 15 to 20 seconds to relieve pressure.

tomsn048@gmail.com

Accelerator Pedal and Linkage, Aerostar

The accelerator cable (9A758) is routed from the accelerator pedal assembly to the throttle lever.

Accelerator Pedal and Linkage, Ranger

The Ranger has been given new electronic transmissions (4R44E and 4R55E) which eliminates the kickdown control shaft rod previously used with the accelerator pedal and linkage system.

The accelerator cable (9A758) is controlled by an accelerator pedal and shaft (9725). The accelerator pedal and shaft should travel smoothly from the idle to wide-open throttle positions. Failure to return or hesitation on return to the idle position must not occur.

Surrounding components such as wiring, hoses, sound insulator, and floor covering must not contact the sliding inner member of the accelerator cable or the accelerator pedal and shaft.

On vehicles equipped with speed control, the speed control actuator and the accelerator cable are attached at the throttle lever on the throttle body (9E926). For further information on the speed control system, refer to the speed control under Description and Operation in Section 10-03.

Inspection and Verification

Exercise care when performing service on or around accelerator pedal linkage and controls. Inspect the accelerator pedal rod and attaching linkage for damage or distortion which would bind or limit accelerator pedal travel. Inspect the accelerator cable (9A758) for kinks or fraying which may cause binding. Also, inspect the engine idle speed adjustment to ensure correct idle speed specification after any accelerator linkage adjustment or repair.

Symptom Chart — Accelerator Pedal And Throttle Body Diagnosis

ACCELERATOR PEDAL AND THROTTLE BODY DIAGNOSIS

Condition	Possible Source	Action
• Accelerator Pedal Is Hard to Push Down or It Has a Rough, Raspy or Sticky Feel	• Full accelerator pedal travel is restricted. • Worn or damaged accelerator cable. • Restricted accelerator pedal operation.	• GO to Pinpoint Test A .
• High Engine Idle Speed	• Accelerator cable ball socket extends beyond the throttle lever ball stud.	• REFER to the throttle body diagnosis procedure in the appropriate section of the Powertrain Control/Emissions Diagnosis Manual.
	• Restricted accelerator pedal operation.	• ADJUST carpet, mat or wiring as required.
	• Worn or damaged accelerator cable.	• REPLACE as required.

PINPOINT TEST A: ACCELERATOR PEDAL AND CABLE CHECK

A1 WIDE-OPEN THROTTLE (WOT) ACCELERATOR CABLE ADJUSTMENT CHECK

- Disconnect the accelerator cable end from ball stud at throttle body.
- Make sure the disconnected end of the accelerator cable does not come in contact with any of the surrounding parts.
- Operate the accelerator pedal assembly by hand.

Is the full accelerator pedal travel to WOT restricted?

Yes	No
ADJUST insulator or trim items as required.	GO to **A2** .

A2 CHECK FOR SMOOTH ACCELERATOR PEDAL OPERATION

- Operate the accelerator pedal by foot.

NOTE: Accelerator cable should not be lubricated and it is not serviceable.

Is the accelerator pedal operation smooth?

Yes	No
REFER to the throttle body diagnosis procedures in the appropriate section in the Powertrain Control/Emissions Diagnosis Manual.	CHECK the accelerator pedal assembly for free operation or CHECK for worn or damaged cable. REPAIR or REPLACE as required.

Accelerator Cable

Removal

WARNING: NO SURROUNDING ENGINE COMPARTMENT COMPONENTS SUCH AS WIRING OR HOSES MAY CONTACT ANY MOVING MEMBER OF THE ACCELERATOR CONTROLS. ALL VEHICLES ARE TO BE CHECKED FOR RETURN TO IDLE AS FOLLOWS: NO PERCEPTIBLE HESITATION OR PREVENTION OF RETURN TO IDLE MAY OCCUR DURING SLOW REMOVAL OF THE FOOT FROM THE ACCELERATOR PEDAL AND SHAFT STARTING AT THE FULLY DEPRESSED WIDE-OPEN THROTTLE POSITION.

1. Remove the accelerator control splash shield screws/push pins, then remove accelerator control splash shield (9E766).

2. **CAUTION: Take special care when removing the accelerator cable so that the cable end tube and guide tube are not damaged.**

   Disconnect accelerator cable (9A758) from throttle lever ball stud at throttle body (9E926). Grasp cable at ball stud end and carefully remove accelerator cable from the ball stud.

3. Separate accelerator cable from speed control actuator cable (9A825) at the throttle lever.

4. Remove accelerator cable from accelerator cable bracket (9723) on intake manifold (9424).

5. From inside vehicle, remove accelerator cable end from top of accelerator pedal and shaft (9725).

6. Collapse clips at dash panel and push accelerator cable through dash panel into engine compartment to remove accelerator cable.

Installation

1. **CAUTION: Make sure accelerator cable is routed as shown in appropriate illustration.**

   Install accelerator cable through dash panel into passenger compartment, making sure clips are fully seated.

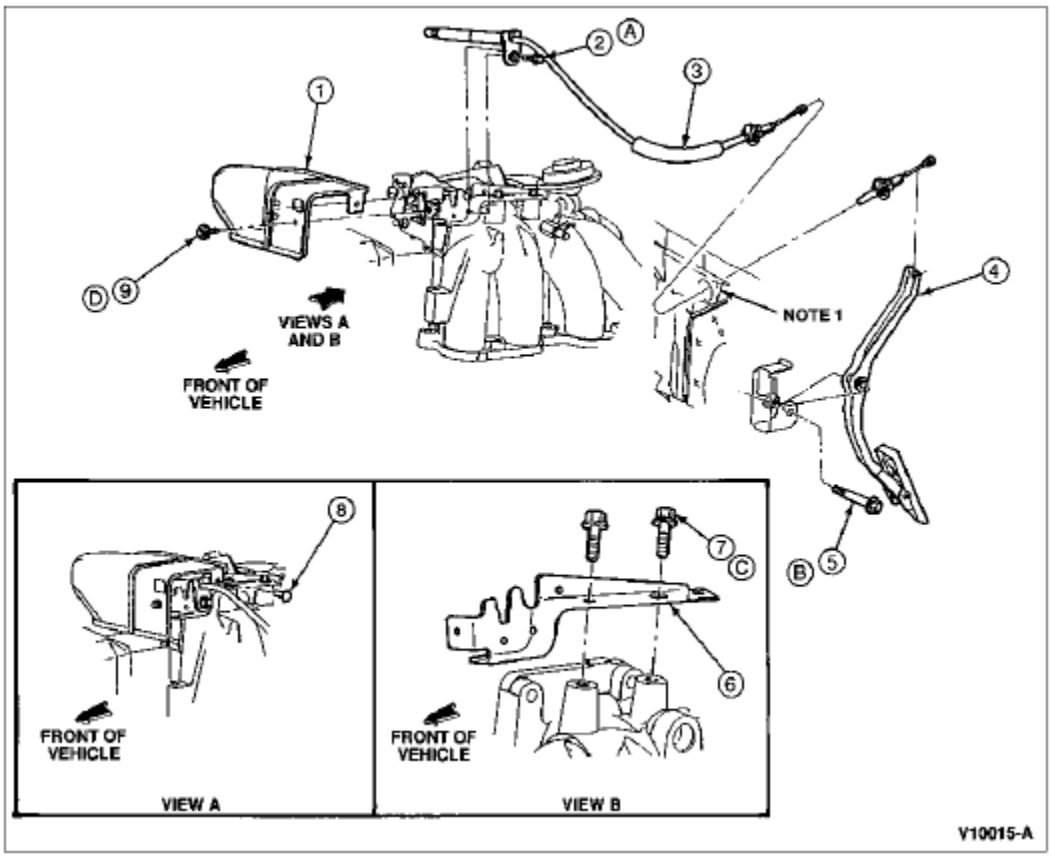
2. From inside vehicle, attach accelerator cable end to accelerator pedal and shaft, seating returner on accelerator cable end onto accelerator pedal and shaft.

3. Install accelerator cable into accelerator cable bracket on intake manifold, making sure that tab or pin on accelerator cable aligns with hole in accelerator cable bracket.

4. Attach accelerator cable end to throttle lever ball stud at throttle body. Carefully push only on the end of accelerator cable when snapping accelerator cable end over ball stud.

5. Position the accelerator control splash shield and install the accelerator control splash shield screws. Tighten the accelerator control splash shield screws to 7-9 Nm (62-79 lb-in).

Accelerator Cable, Ranger, 2.3L Engine



Item	Part Number	Description

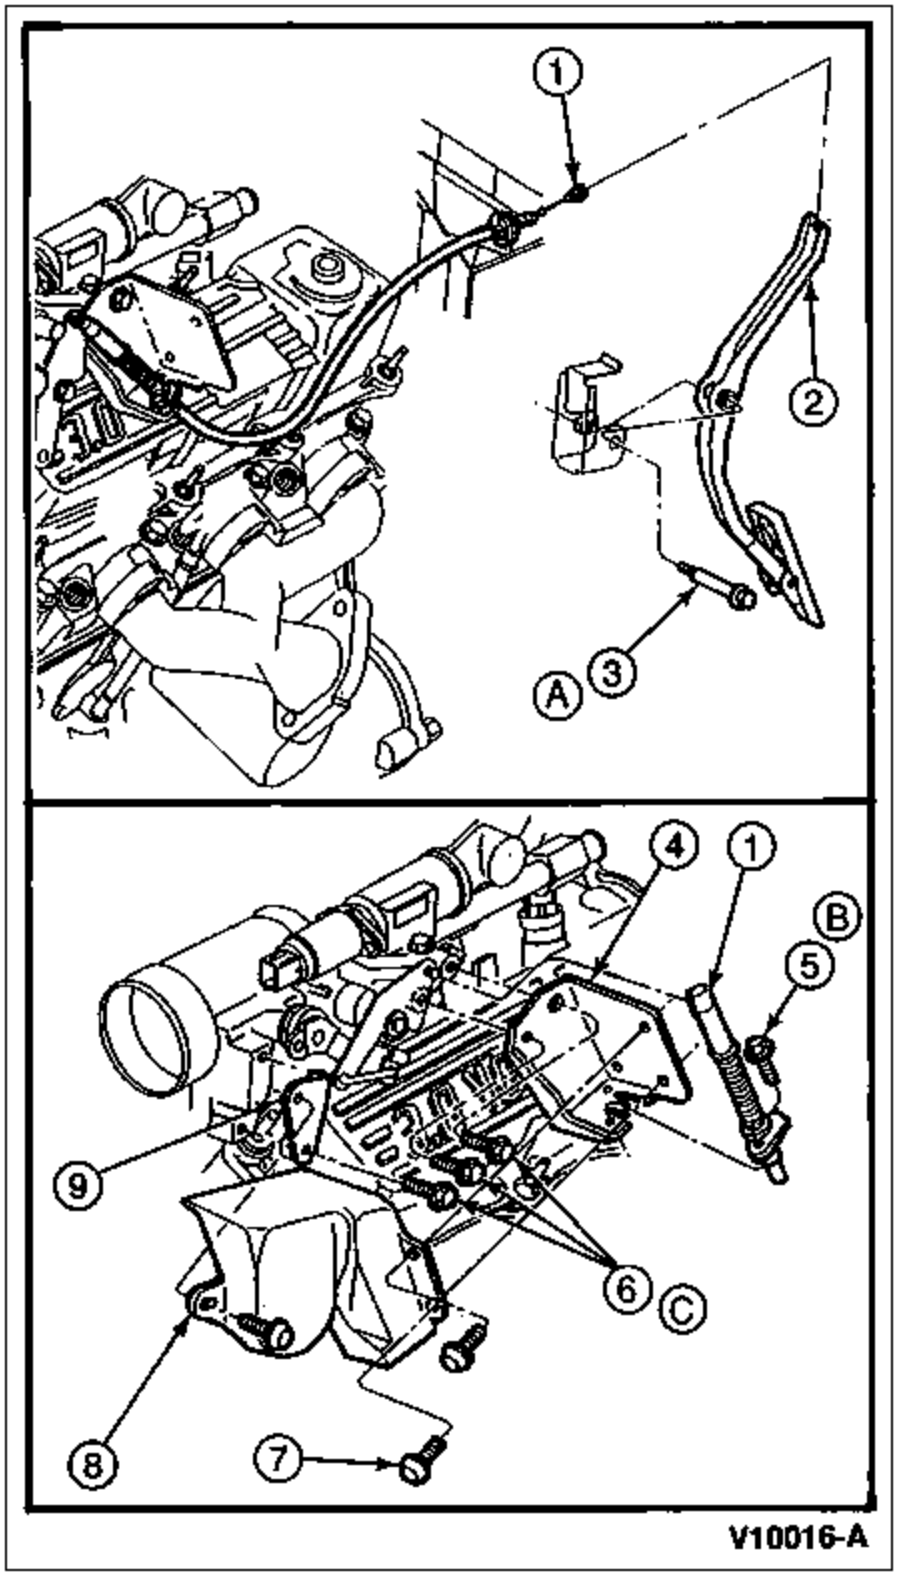
D	—	Tighten to 6-8 Nm (53-71 Lb-Ft)

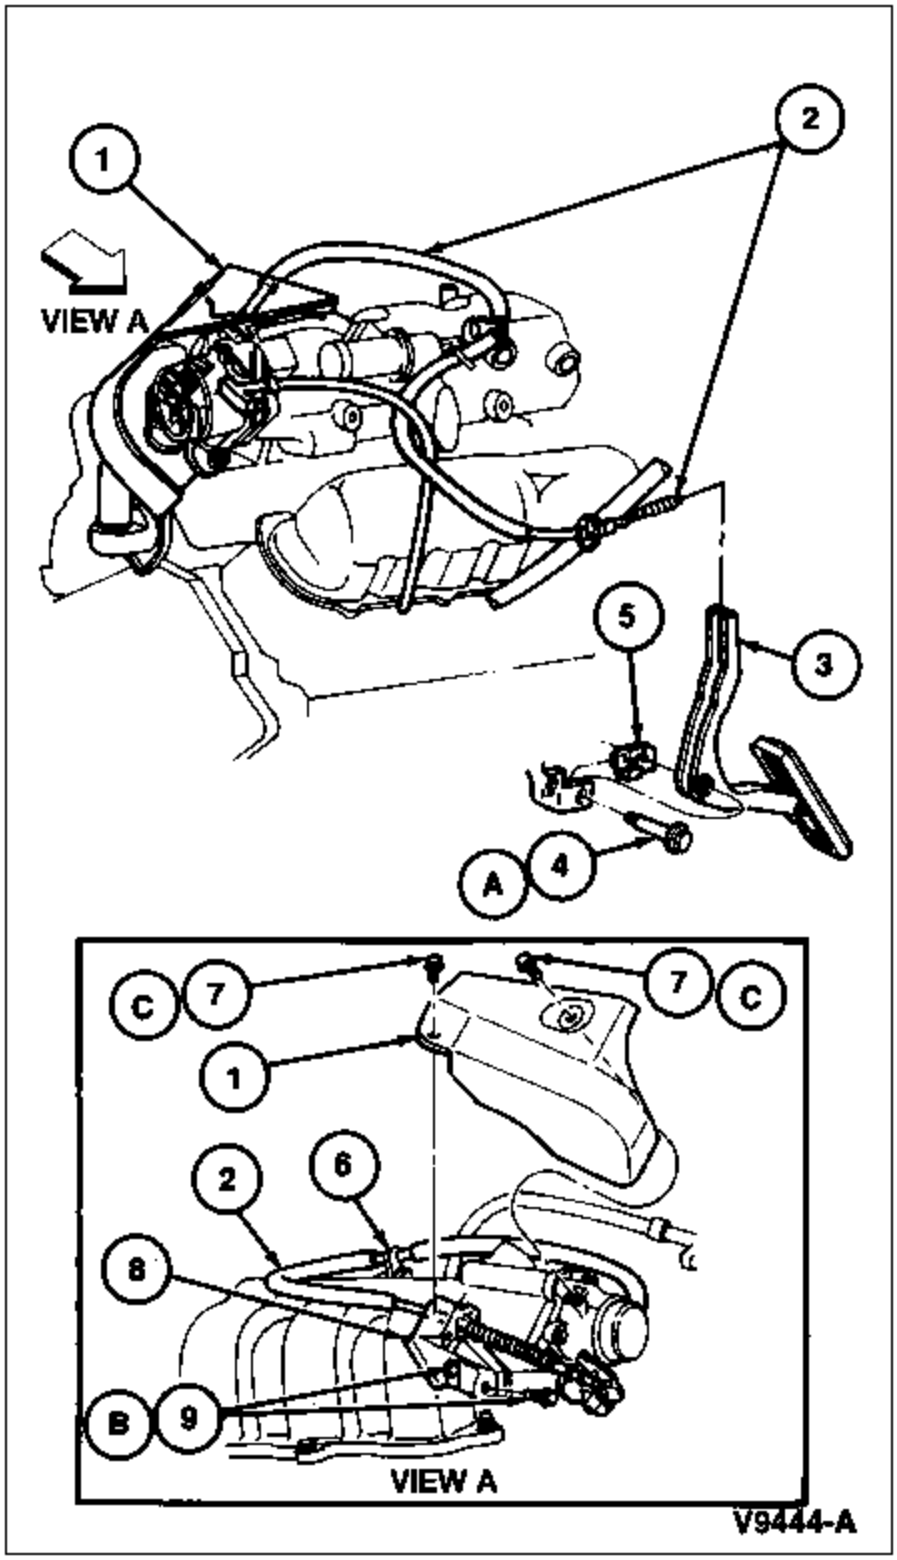
Accelerator Cable, Ranger, 3.0L Engine



Item	Part Number	Description
1	9A758	Accelerator Cable
2	9725	Accelerator Pedal and Shaft

3	N804397-S190	Bolt, M6
4	9723	Accelerator Cable Bracket
5	N610959-S2	Screw
6	N605786-S2	Bolt, M8
7	N804527-S100	Pushpin
8	9E766	Accelerator Control Splash Shield
9	9N818	Bracket, Accelerator Shield
A	—	Tighten to 9-12 Nm (80-106 Lb-In)
B	—	Tighten to 7-9 Nm (62-79 Lb-In)
C	—	Tighten to 8-10 Nm (71-89 Lb-In)

Accelerator Pedal and Shaft



Item	Part Number	Description
1	9E766	Accelerator Control Splash Shield
2	9A758	Accelerator Cable

3	9725	Accelerator Pedal and Shaft
4	N804397-S190	Accelerator Pedal Pivot Screw
5	N802172-S2	J-Nut
6	N802769-S	Clip
7	N610959-S2 (2 Req'd)	Accelerator Control Splash Shield Screw
8	9723	Accelerator Cable Bracket
9	N605786-S2 (2 Req'd)	Accelerator Cable Bracket Bolt
A	—	Tighten to 9-12 Nm (80-106 Lb-In)
B	—	Tighten to 21-29 Nm (15-21 Lb-Ft)
C	—	Tighten to 7-9 Nm (62-79 Lb-In)

Removal

1. Disconnect accelerator cable (9A758) from accelerator pedal and shaft (9725).

2. Remove accelerator pedal pivot screw attaching accelerator pedal and shaft to dash panel and remove accelerator pedal and shaft.

Installation

1. Position accelerator pedal and shaft to dash panel and install accelerator pedal pivot screw (and J-nut on Aerostar only). Tighten accelerator pedal pivot screw to 9-12 Nm (80-106 lb-in).

2. Connect accelerator cable to accelerator pedal and shaft.

Accelerator Pedal, Ranger

ACCELERATOR CABLE 9A758
ACCELERATOR PEDAL AND SHAFT 9725
ACCELERATOR PEDAL PIVOT SCREW N804397-5190
V10018-C

Accelerator Cable Bracket

Removal

1. Remove the accelerator control splash shield (9E766), if equipped.
2. Remove the accelerator cable (9A758) from the accelerator cable bracket (9723).
3. Remove the accelerator cable bracket bolts and remove the accelerator cable bracket from the upper intake manifold (9424).

Installation

To install, reverse the removal procedure.

Tighten the accelerator cable bracket bolts to 21-29 Nm (15-21 lb-ft).

Kickdown Control Shaft Rod, Aerostar

If transmission kickdown at wide-open throttle is difficult to achieve, requiring excessive effort or kickdown is not attained, check to make sure that aftermarket floormats have not been installed or mispositioned behind or under the accelerator pedal pad or shaft, which could result in the above listed symptoms by restricting full pedal movement.

Speed Control System

The speed control system consists of:

- Speed control servo (9C735).
- Speed control actuator cable (9A825).
- Vehicle speed sensor (VSS) (9E731) (Ranger only).
- Operator controls, located on the steering wheel (3600).
- Speed control actuator switch (9D743).
- Stoplight switch.
- Deactivator switch.
- Deactivator switch located on the brake master cylinder (2140) (Ranger only).
- Deactivator switch located on the brake pedal (2455) (Aerostar only).
- Instrument cluster indicator light (Ranger only).

The system operates independently of engine vacuum, therefore no vacuum lines are required.

Speed Control Actuator Switch Assembly

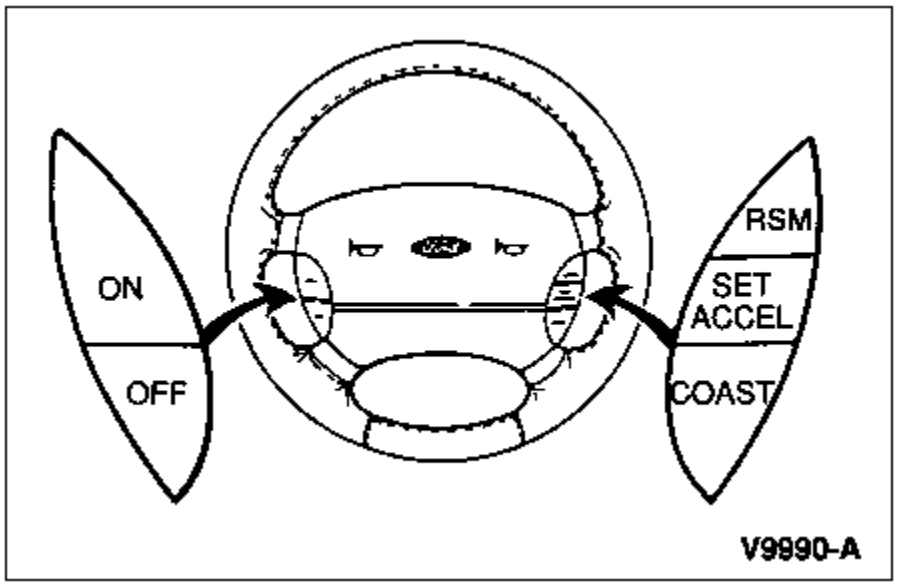
- Is mounted in the steering wheel.

It consists of:

- LH buttons (ON, OFF)
- RH buttons (RSM, SET/ACCEL, COAST)
- Necessary wiring

Ranger Shown, Aerostar Similar

tomsn048@gmail.com



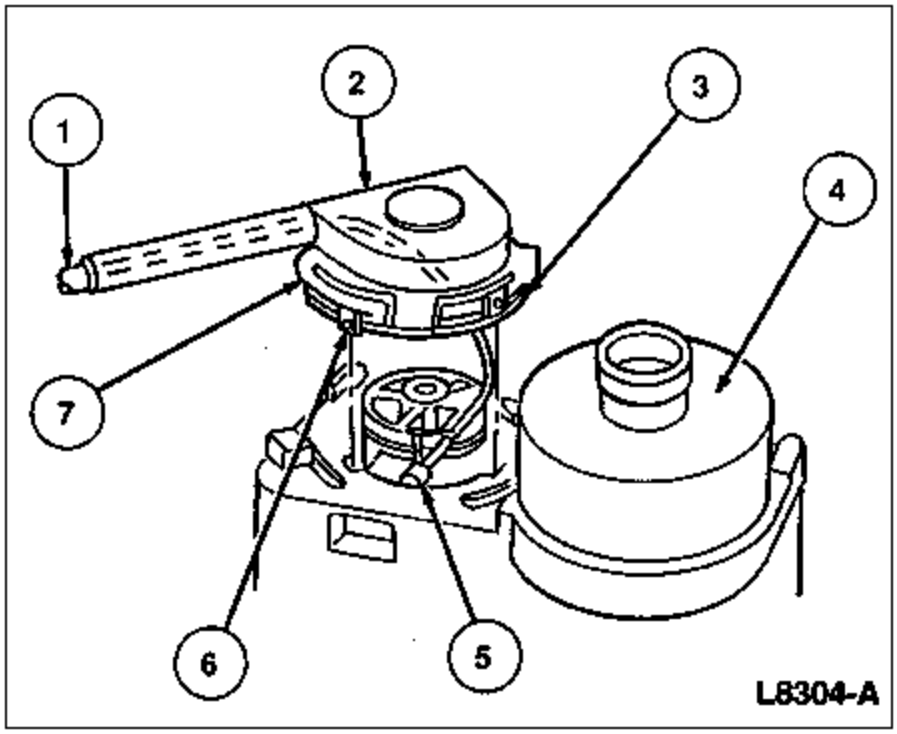
Speed Control Indicator Light (Ranger Only)

- Is located in the instrument cluster (10849) above the speedometer.
- Comes on when speed control is ON and speed is set.
- Light goes out when brakes are applied or system is turned OFF.
- When ignition key is turned to ON position, light comes on briefly as part of cluster display self test.
- Light does not indicate problem with speed control system.

Speed Control Servo

- Is mounted on the right front fender on Ranger, and is located on the left side of the engine compartment on Aerostar.
- Is connected to the throttle linkage with a speed control actuator cable.
- Electronics are integrated into the speed control servo, eliminating the need for any other speed control electronic modules in the vehicle.

tomsn048@gmail.com



Item	Part Number	Description
1	9A825	Speed Control Actuator Cable
2	—	Actuator Cable Cap (Part of 9A825)
3	—	Seal (Part of 9A825)
4	9C735	Speed Control Servo
5	—	Cable Ball Slug (Part of 9A825)
6	—	Cap Locking Tabs (Part of 9A825)
7	—	Locking Arm (Part of 9A825)

Stoplight Switch

- Is a normally open switch that closes when the brake pedal is applied.
- Sends an electrical signal to the speed control servo when closed and disengages speed control system.
- Returns to its open position when the brake pedal is released.

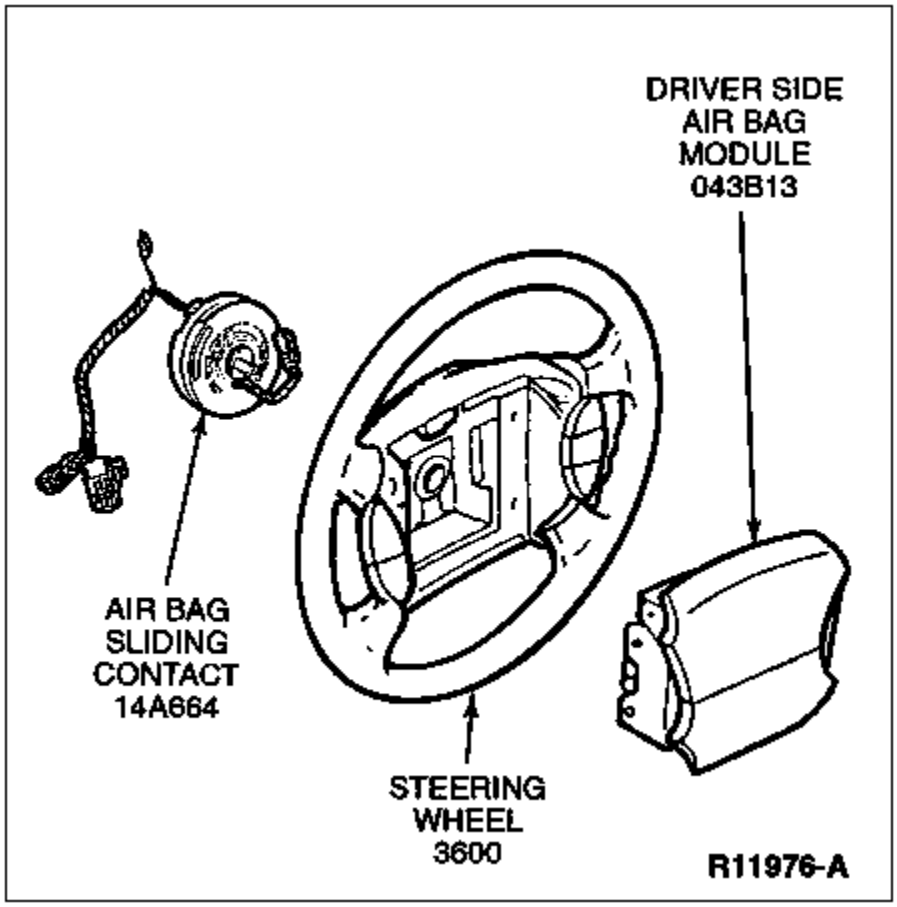
Air Bag Sliding Contact

- Is located behind the center of steering wheel.
- Transfers electrical signals from the steering column wiring to the following components.

tomsn048@gmail.com

- Driver side air bag module (043B13)
- Steering wheel horn switch
- Speed control actuator switch assembly

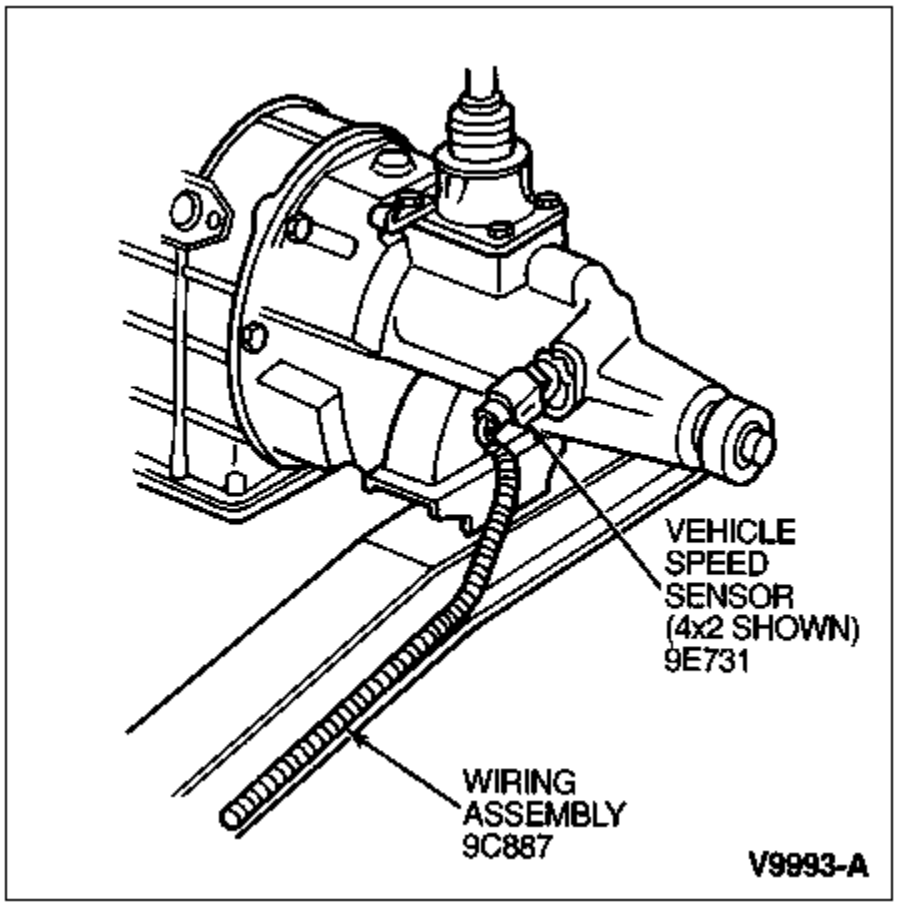
Air Bag Sliding Contact, Ranger



Vehicle Speed Sensor (VSS), (Ranger Only)

- Is mounted to the transmission on Ranger, and mounted on the rear axle assembly on Aerostar vehicles.
- On Ranger it is a magnetic pickup driven by a gear which is driven by the transmission.
- On Aerostar, the signal is routed directly to the anti-lock brake control module (2B373) and the programmable electronic speedometer/odometer module (PSOM).
- Sends a signal to the speed control servo proportional to vehicle speed.

tomsn048@gmail.com



Deactivator Switch

- Under increased brake pedal motion, the deactivator switch will open and remove power from the speed control servo, releasing the throttle from servo control.
- On Aerostar, the switch is located on the brake pedal. On Ranger, it is located on the brake master cylinder.

Deactivator Switch, Ranger

tomsn048@gmail.com

2	N606689-S106	Bolt
3	9A825	Speed Control Actuator Cable
4	N802768-SB	Clip
5	9D726	Clip
6	9F924	Deactivator Switch

System Activation

To operate the speed control system, the engine (6007) must be running and the vehicle speed must be greater than 48 km/h (30 mph). Under these conditions, the system is activated by pressing the ON switch in the steering wheel. Then, the operator must depress and release the SET/ACCEL switch. This will result in the current speed being maintained until a new speed is set, the brake pedal is depressed, or the OFF switch is depressed. Only one switch button should be depressed at a time because the speed control system will accept only one command at a time.

Increasing Set Speed

tomsn048@gmail.com

Accel

A continuous depression of the SET/ACCEL switch will cause a smooth increase in vehicle speed. Upon release of the SET/ACCEL switch the new vehicle speed will be maintained.

The vehicle speed can be manually increased at any time by depressing the accelerator pedal and shaft (9725) until the higher speed is reached and stabilized, then depressing and releasing the SET/ACCEL switch.

Tap-Up

Current vehicle set speed may be increased 1.6 km/h (1 mph) by a momentary tap of the SET/ACCEL switch. Multiple taps of the SET/ACCEL switch will cause vehicle speed to increase in increments of 1.6 km/h (1 mph). For example, if currently set at 80 km/h (50 mph) then five taps will increase vehicle speed and set it at 89 km/h (55 mph).

Decreasing Set Speed

Coast

A continuous depression of the COAST switch will cause a smooth decrease in vehicle speed. Upon release of the COAST switch the new vehicle speed will be maintained.

The vehicle speed can be manually decreased at any time by momentarily depressing the brake pedal until the lower speed is reached and stabilized, then depressing and releasing the SET/ACCEL switch.

If vehicle speed is reduced below 48 km/h (30 mph) then the driver must manually increase the speed to over 48 km/h (30 mph) and reset the system.

Tap-Down

Current vehicle set speed may be decreased 1.6 km/h (1 mph) by a momentary tap of the COAST switch. Multiple taps of the COAST switch will cause vehicle speed to decrease in increments of 1.6 km/h (1 mph). For example, if currently set at 89 km/h (55 mph) then five taps will decrease vehicle speed and set it at 80 km/h (50 mph).

Resume

When the speed control system is disabled by pressing the brake pedal, the previous set speed may be re-established by momentarily depressing the RSM switch. The resume feature will not function if the system has been turned off with the OFF switch or if the ignition switch (11572) is turned off. If the vehicle speed has dropped below 48 km/h (30 mph) then RESUME will not function until the vehicle speed becomes greater than 48 km/h (30 mph).

Contact Assembly (Clockspring)

The contact assembly provides electrical interface between the steering column tube (3514) and the control switches in the steering wheel.

Inspection and Verification

Visual inspection is an important part of diagnosis. The inspection should be done to locate obvious reasons for customer concern.

When performing visual inspection, check all items for abnormal conditions. Look for such items as bare, broken or disconnected wires. For the speed control to function properly, speed control servo (9C735) (throttle actuator) and throttle linkage should operate freely and smoothly.

Any concerns found by the visual inspection should be corrected before further tests of the speed control system are made. The following items should be inspected.

- If the amber RABS, ABS or 4WABS indicator in the instrument cluster stays lit when the ignition switch (11572) is in the RUN position, then refer to Section 06-09A or Section 06-09B before continuing with the speed control diagnostics.
- Does the horn (13832) work? If not, check the horn circuit fuse, horn relay and horn circuit wiring. Refer to Section 13-06 .
- Do the stoplamps light when the brake pedal (2455) is depressed? If not, check the stoplamp circuit fuse, rear lamps (13404), wiring and stoplamp switch. Refer to Section 17-01 .

Electronic Servo Assembly

Check for unseated connectors at the speed control servo.

- Look for loose or unseated connector pins.
- Check for broken wires at the connectors.

Actuator Cable

- Misadjusted speed control actuator cable (9A825). If misadjustment is suspected, refer to Adjustments, Actuator Cable , in this section.
- Broken speed control actuator cable.

tomsn048@gmail.com

tomsn048@gmail.com

Self-Test Diagnostics — (Ranger Only)

WARNING: THIS IS A KEY ON ENGINE OFF (KOEO) TEST ONLY THAT'S CONDUCTED IN PARK ONLY WITH EMERGENCY BRAKE FULLY ENGAGED.

1. Enter Self-Test Diagnostics by depressing the speed control OFF switch while turning the ignition key to ON, ensuring engine DOES NOT start and is not running. The speed control indicator lamp on the instrument panel will flash ONCE to indicate that speed control module entered the diagnostic mode. Release the OFF switch.

2. **NOTE: If the ON switch is not pressed within 5 seconds after entering diagnostics mode, the module times out and the procedure must be started over.**

   Press the remaining switches in this sequence: ON, RESUME (RSM), COAST (CST), and SET/ACCEL.

3. The speed control indicator lamp will flash as each switch is pressed. Press each switch in the sequence immediately after the light goes out for the previous switch.

4. After all five speed control switches complete the sequence, the indicator lamp will flash to indicate a Pass or Fail:

   a. 1 Flash — Test passed.
   b. 2 Flashes — BOO SWITCH defective, circuit defective, or Brake Pedal applied.
   c. 3 Flashes — BRAKE DEACTIVATION SWITCH is open or circuit defective.
   d. 4 Flashes — SPEED SENSOR is out of range or not connected.
   e. 5 Flashes — SPEED CONTROL SERVO is defective.

5. Immediately after a passed STATIC test, the speed control module then performs a DYNAMIC test automatically by actuating the throttle lever from 1 mm to 10 mm of travel from the idle position. During this DYNAMIC throttle pull, observe throttle movement to witness any binding or sticking of actuator cable, proper connection of actuator cable to throttle lever, and ensure THROTTLE RETURNS BACK TO IDLE POSITION. If improper connection and/or binding or sticking of actuator is observed, go to the Pinpoint Test Section.

6. Return Ignition Switch to OFF position and go to the Pinpoint Test section, if necessary.

tomsn048@gmail.com

tomsn048@gmail.com

Symptom Chart — Electronic Speed Control System

NOTE: Self-Test diagnostics must be performed before Pinpoint Test (Ranger Only).

ELECTRONIC SPEED CONTROL SYSTEM

Condition	Possible Source	Action
• Speed Control Inoperative	• Blown fuse. • Circuitry. • Stoplight switch. • Burnt stoplamp bulb. • Speed control actuator switch. • Vehicle speed sensor. (Ranger only). • Speed control servo. • Programmable electronic speedometer/odometer module (PSOM). (Aerostar only).	• GO to Pinpoint Test A .
• SET/ACCEL Switch Inoperative	• Speed control actuator switches. • Speed control servo. • Circuitry.	• GO to Component Test .
• COAST Switch Inoperative	• Speed control actuator switch. • Speed control servo. • Circuitry.	• GO to Component Test .
• RSM Switch Inoperative	• Speed control actuator switch. • Speed control servo. • Circuitry.	• GO to Component Test .
• OFF Switch Inoperative	• Speed control actuator switch. • Speed control servo. • Circuitry.	• GO to Component Test .
• Set Speed Fluctuates	• Vehicle speed sensor (Ranger only). • Speed control servo. • Speed control actuator switch. • Circuitry. • Loose fit or binding between	• GO to Pinpoint Test B .

tomsn048@gmail.com

	speed control actuator cable and throttle body. • Programmable electronic speedometer/odometer module (PSOM) (Aerostar only). • Engine.	• REFER to Powertrain Control/Emissions Diagnosis Manual. SERVICE engine as required.
• Speed Control Does Not Disengage When Brakes Are Applied	• Stoplight switch. • Speed control servo. • Blown fuse. • Circuitry. • Deactivator switch. • Binding actuator cable.	• GO to Pinpoint Test C .

tomsn048@gmail.com

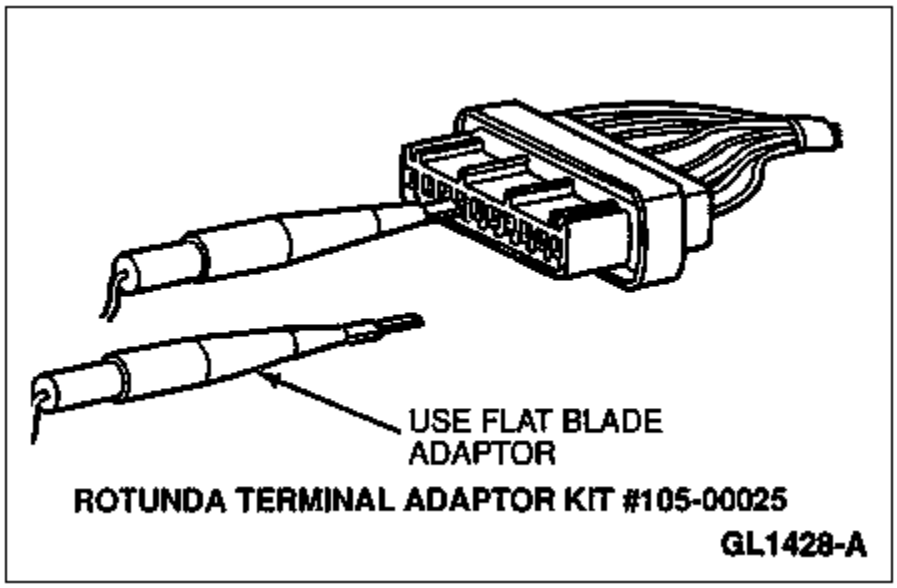
Pinpoint Tests

PINPOINT TEST A: SPEED CONTROL INOPERATIVE

A1 VERIFY THERE IS POWER TO SPEED CONTROL SERVO

- Disconnect harness connector from the speed control servo.
- Use Rotunda 73 Digital Multimeter 105-R00051 or equivalent to make the specified measurements at the harness connector. To avoid terminal damage, use Rotunda Terminal Adapter Kit 105-00025 or equivalent.
- With the ignition switch in RUN, measure voltage between Pin 7 (Circuit 1003 [GY/Y], Ranger, Circuit 296 [W/P], Aerostar) ground.

Is battery voltage measured (12v nom.)?



Yes	No
GO to **A2** .	SERVICE Circuit 1003 (GY/Y) (Ranger) or Circuit 296 (W/P) (Aerostar) as necessary. REPLACE fuse if necessary.

A2 CHECK FOR STUCK STOPLIGHT SWITCH

tomsn048@gmail.com

- With no brakes applied, measure the voltage between Pin 4 (Circuit 306 [T/LB], Ranger, Circuit 810 [R/LG], Aerostar) and Pin 10 (Circuit 676 [PK/O]).

Is battery voltage measured (12v nom.)?

Yes	No
Stoplight switch is stuck on. REPLACE stoplight switch.	Stoplight switch is OK. GO to **A3** .

A3 CHECK BRAKE/CLUTCH CIRCUIT

- With the ignition switch in OFF position, measure the resistance between Pin 4 (Circuit 306 [T/LB], Ranger, Circuit 810 [R/LG], Aerostar) and Pin 10 (Circuit 676 [PK/O]).

Is resistance less than 20 ohms?

Yes	No
Brake input Circuit OK. GO to **A4** .	Brake light bulbs blown or brake circuit open. SERVICE circuit.

A4 CHECK DEACTIVATOR SWITCH CIRCUIT

- Turn the ignition switch to RUN position.
- With no brakes applied, place a 12-volt circuit test light between Pin 9 (Circuit 307 [BK/Y], Ranger, Circuit 636 [O], Aerostar) and Pin 10, (GND, Circuit 676 PK/O).

Is the light illuminated?

Yes	No
GO to **A7** .	GO to **A5** .

A5 VERIFY POWER AT DEACTIVATOR SWITCH HARNESS CONNECTOR

- Remove wiring harness connector from deactivator switch.
- Place 12-volt circuit test light between Circuit 1003 ([GY/Y], Ranger, Circuit 10 [LG/R], Aerostar) of deactivator switch connector and chassis ground.

Is the light illuminated?

Yes	No
GO to **A6** .	SERVICE blown fuse 11 or open Circuit 1003 (GY/Y) for Ranger or Circuit 10 (LG/R) for Aerostar.

A6 CHECK FOR OPEN CIRCUIT BETWEEN DEACTIVATOR SWITCH AND SPEED

tomsn048@gmail.com

CONTROL SERVO

- Measure resistance of Circuit 307 (BK/Y), Ranger, circuit 636 (O), Aerostar from deactivator switch connector to Pin 9 of speed control servo connector.

Is resistance less than 1 ohm?

Yes	No
REPLACE deactivator switch.	SERVICE open Circuit 307 (BK/Y), Ranger or Circuit 636 (O), Aerostar in harness.

A7 CHECK FOR STUCK "ON" SPEED CONTROL ACTUATOR SWITCH ASSEMBLY

- With no steering wheel switches pressed, measure voltage between Pin 5 (Circuit 151 [LB/BK]) and Pin 10 (GND, Circuit 676 [PK/O]).

Is there battery voltage?

Yes	No
REPLACE left (ON/OFF) speed control actuator switch.	GO to **A8** .

A8 CHECK "ON" SWITCH OPERATION

- With steering wheel ON switch pressed, measure voltage between Pin 5 (COMMAND, Circuit 151 [LB/BK]) and Pin 10 (GND, Circuit 676 [PK/O]).

Is there battery voltage (12v nom.)?

Yes	No
GO to **A12** .	GO to **A9** .

A9 VERIFY POWER AT AIR BAG SLIDING CONTACT CONNECTOR AT BASE OF STEERING COLUMN

- Disconnect air bag sliding contact at 6-pin connector at the base of steering column.
- Measure voltage between Circuit 6 (Y/LG) at air bag sliding contact connector on instrument panel harness and Pin 10 (Circuit 676 [PK/O]) of speed control servo connector.

Is there battery voltage?

Yes	No
GO to **A10** .	CHECK fuse 12 (Aerostar) or fuse D (Ranger), Circuit 460 (Y/LB), horn relay, and Circuit 6 (Y/LG). SERVICE as necessary.

tomsn048@gmail.com

A10 CHECK AIR BAG SLIDING CONTACT FOR HIGH RESISTANCE

- Disconnect speed control actuator switch connector from air bag sliding contact.
- Measure resistance across each of the air bag sliding contact windings between the air bag sliding contact connector at the base of steering column and speed control switches connector in steering wheel.

Is each resistance reading less than 1.0 ohm?

Yes	No
GO to **A11** .	REPLACE air bag sliding contact.

A11 CHECK FOR OPEN CIRCUIT IN STEERING WHEEL WIRING HARNESS

- Reconnect air bag sliding contact assembly at base of steering column.
- Disconnect connector at ON/OFF switch.
- Measure voltage between Pin 5 (Circuit 151 [LB/BK]) and chassis ground (steering wheel).

Is there battery voltage?

Yes	No
REPLACE left (ON/OFF) speed control actuator switch.	REPLACE steering wheel wiring harness.

A12 CHECK FOR STUCK COMMAND SWITCHES

- With no steering wheel switches pressed, measure resistance between Pin 5 (Circuit 151 [LB/BK]) and Pin 6 (COMMAND RTN, Circuit 848 [DG/O], Ranger, Circuit 248 [T/O], Aerostar).

Is resistance greater than 3k Ohms?

Yes	No
GO to **A13** .	If resistance is less than 100 ohms, REPLACE left (ON/OFF) switch. If greater than 100 ohms, REPLACE right (RSM/SET/COAST) switch.

A13 CHECK SET/ACCEL SWITCH OPERATION

- With the SET/ACCEL switch pressed, measure the resistance between Pin 5 (COMMAND, Circuit 151 [LB/PK]) and Pin 6 (COMMAND RTN, Circuit 848 [DG/O], Ranger, Circuit 248 [T/O], Aerostar).

Is resistance between 646 and 714 ohms?

Yes	No
GO to **A14** .	REPLACE right (RSM/SET/COAST) speed

tomsn048@gmail.com

	control actuator switch.

A14 CHECK COAST SWITCH OPERATION

- With COAST switch pressed, measure resistance between Pin 5 (Circuit 151 [LB/BK]) and Pin 6 (Circuit 848 [DG/O], Ranger, Circuit 248, [T/O] Aerostar).

Is resistance between 114 and 126 ohms?

Yes	No
GO to **A15** .	REPLACE right (RSM/SET/COAST) speed control actuator switch.

A15 CHECK RESUME SWITCH OPERATION

- Disconnect harness connector from speed control servo assembly.
- With RSM switch pressed, measure resistance between Pin 5 (Circuit 151) and Pin 6 (Circuit 848 [DG/O], Ranger, Circuit 248, [T/O] Aerostar).

Is resistance between 2090 and 2310 ohms?

Yes	No
GO to **A16** .	REPLACE right (RSM/SET/COAST) speed control actuator switch.

A16 CHECK OFF SWITCH OPERATION

- Disconnect harness connector from speed control servo. With OFF switch pressed, measure resistance between Pin 5 (Circuit 151) and Pin 6 (Circuit 848 [DG/O], Ranger, Circuit 248, [T/O] Aerostar).

Is resistance less than 4 ohms?

Yes	No
GO to **A17** .	REPLACE left (ON/OFF) speed control actuator switch.

A17 CHECK COMMAND SWITCH RETURN CIRCUIT

- Measure resistance between Pin 6 (Circuit 848 [DG/O], Ranger, Circuit 248 [T/O], Aerostar) and Pin 10 (GND, Circuit 676 [PK/O]).

Is resistance greater than 1 ohm?

Yes	No

tomsn048@gmail.com

If Ranger, GO to **A18**. If Aerostar, GO to **A22**.	SERVICE short in Circuit 848 or Circuit 248. RECONNECT speed control servo.

A18 CHECK VSS CIRCUIT (RANGER)

- Measure resistance between Pin 3 (Circuit 679 [GY/BK]) and Pin 10 (Circuit 676 [PK/O]).

Is resistance between 200 and 300 ohms?

Yes	No
GO to **A20**.	GO to **A19**.

A19 CHECK VSS (RANGER)

- Remove VSS connector.
- Measure resistance across VSS terminals.

Is resistance between 200 and 300 ohms?

Yes	No
CHECK for opens or shorts in Circuit 679 (GY/BK) and 676 (PK/O).	REPLACE vehicle speed sensor.

A20 ROAD TEST VEHICLE

- Road test vehicle and observe speedometer needle.

Does the needle waver?

Yes	No
REPLACE vehicle speed sensor.	Vehicle speed sensor checks OK. GO to **A21**.

A21 CHECK FOR BROKEN OR BINDING CABLE

- Remove speed control actuator cable from speed control servo assembly.
- Check for broken or binding cable by pulling on cable ball slug to ensure throttle moves freely.

Is cable OK?

Yes	No
REPLACE speed control servo assembly.	REPLACE speed control actuator cable.

tomsn048@gmail.com

A22 CHECK PSOM CIRCUIT (AEROSTAR)

- Disconnect the harness connector from PSOM.
- Measure resistance between speed control servo connector Pin 3 (Circuit 679 [GY/BK]) and PSOM connector Pin 7 (Circuit 679 [GY/BK]).

Is resistance less than 5 ohms?

Yes	No
GO to **A23** .	SERVICE open in Circuit 679 (GY/BK).

A23 CHECK PSOM CIRCUIT FOR SHORT (AEROSTAR)

- Measure resistance between PSOM connector Pin 7 (Circuit 679 [GY/BK]) and ground.

Is resistance greater than 10,000 ohms?

Yes	No
REFER to Section 13-01 for diagnosis of PSOM. If PSOM is OK, GO to **A24** .	SERVICE short to ground in Circuit 679 (GY/BK).

A24 CHECK FOR BROKEN OR BINDING CABLE

- Remove speed control actuator cable from speed control servo assembly.
- Check for broken or binding cable by pulling on cable ball slug to ensure throttle moves freely.

Is cable OK?

Yes	No
REPLACE speed control servo assembly.	REPLACE speed control actuator cable.

PINPOINT TEST B: SET SPEED FLUCTUATES

B1 CHECK THE CONDITION WITHOUT SPEED CONTROL

- Verify that engine is properly tuned.
- Verify that condition does not occur when driving without speed control.

Does condition occur without speed control?

Yes	No
SERVICE engine as required.	GO to **B2** .

tomsn048@gmail.com

B2 CHECK FOR BINDING IN SPEED CONTROL ACTUATOR CABLE AND THROTTLE BODY LINKAGE

- Check for binding or sticking of speed control cable or throttle linkage and throttle plate.
- Make sure throttle cable bracket and speed control servo bracket are not loose.

Are components OK?

Yes	No
If Ranger, GO to **B3** . If Aerostar, GO to **B7** .	SERVICE as required.

B3 CHECK VSS CIRCUIT (RANGER)

- Measure resistance between Pin 3 (Circuit 679 [GY/BK]) and Pin 10 (Circuit 676 [PK/O]).

Is resistance between 200 and 300 ohms?

Yes	No
GO to **B5** .	GO to **B4** .

B4 CHECK VSS (RANGER)

- Remove VSS connector.
- Measure resistance across VSS terminals.

Is resistance between 200 and 300 ohms?

Yes	No
CHECK for opens or shorts in circuit 679 (GY/BK) and 676 (PK/O).	REPLACE vehicle speed sensor.

B5 ROAD TEST VEHICLE

- Road test vehicle and observe speedometer needle.

Does the needle waver?

Yes	No
REPLACE vehicle speed sensor.	Vehicle speed sensor checks OK. GO to **B6** .

B6 CHECK SPEED CONTROL SERVO ASSEMBLY

- Substitute known good speed control servo.

tomsn048@gmail.com

- Test vehicle for proper operation.

Does system operate properly?

Yes	No
REPLACE speed control servo assembly.	CHECK MAP sensor and EGR valve position (EVP) sensor and speed control cable adjustment. SERVICE as necessary.

B7 CHECK PSOM CIRCUIT (AEROSTAR)

- Disconnect the harness connector from PSOM.
- Measure resistance between speed control servo connector Pin 3 (Circuit 679 [GY/BK] and PSOM connector Pin 7 (Circuit 679 [GY/BK]).

Is resistance less than 5 ohms?

Yes	No
GO to **B8** .	SERVICE open in Circuit 679 (GY/BK).

B8 CHECK PSOM CIRCUIT FOR SHORT (AEROSTAR)

- Measure resistance between PSOM connector Pin 7 (Circuit 679 [GY/BK] and ground.

Is resistance greater than 10,000 ohms?

Yes	No
REFER to Section 13-01 for diagnosis of PSOM. If PSOM is OK, GO to **B9** .	SERVICE short to ground in Circuit 679 (GY/BK).

B9 CHECK FOR BROKEN OR BINDING CABLE

- Remove speed control actuator cable from speed control servo assembly.
- Check for broken or binding cable by pulling on cable ball slug to ensure throttle moves freely.

Is cable OK?

Yes	No
REPLACE speed control servo assembly.	REPLACE speed control actuator cable.

PINPOINT TEST C: SPEED CONTROL DOES NOT DISENGAGE WHEN BRAKES ARE APPLIED

tomsn048@gmail.com

C1 CHECK DEACTIVATOR SWITCH CIRCUIT

- Turn ignition switch to RUN.
- Disconnect harness connector from the speed control servo.
- With no brakes applied, place a 12 Volt Circuit Test Light between Pin 9 (Circuit 307, Ranger [BK/Y], Circuit 636 [O], Aerostar) and Pin 10 (GND, Circuit 676 [PK/O]).

Is the light illuminated?

Yes	No
GO to **C2** .	REFER to Pinpoint Test A — Speed Control Inoperative.

C2 CHECK DEACTIVATOR SWITCH OPERATION

- Leave ignition switch in RUN.
- Fully apply brakes with the 12-Volt Circuit Test Light still between Pin 9 (Circuit 307, Ranger [BK/Y], Circuit 636 [O], Aerostar) and Pin 10 (GND, Circuit 676 [PK/O]).

Does the light turn off?

Yes	No
GO to **C3** .	REPLACE deactivator switch.

C3 CHECK STOPLIGHT SWITCH CIRCUIT

- With brakes applied, measure voltage between Pin 4 (Circuit 306 [T/LB], Ranger, Circuit 801 [R/LG], Aerostar) and Pin 10 (GND Circuit 676 [PK/O]).

Is there battery voltage?

Yes	No
GO to **C4** .	SERVICE stoplight switch, Fuse 11, or open in Circuit 306 (T/LB), Ranger or Circuit 810 (R/LG), Aerostar. RECONNECT speed control servo.

C4 CHECK FOR BINDS IN SPEED CONTROL ACTUATOR CABLE AND THROTTLE BODY ATTACHMENT

- Remove speed control actuator cable from speed control servo.
- Check for broken or binding cable by pulling on cable ball slug to ensure throttle moves freely.

Is cable OK?

tomsn048@gmail.com

Yes	No
REPLACE speed control servo.	REPLACE speed control actuator cable.

tomsn048@gmail.com

Component Test

Speed Control Actuator Switch Assembly

To test speed control actuator switch (9D743), perform the following voltage and resistance measurements.

Voltage Measurements: remove connector from speed control servo (9C735). Connect the negative lead of voltmeter to Pin 10 (Circuit 676 [PK/O]) of connector. Measure the DC or AC voltage of the following circuits with positive lead of meter.

VOLTAGE MEASUREMENT — DC

Circuit Name	Pin	Circuit	Wire Color	Test Condition	Approximate Voltage
Ignition Feed	7	1003 (Ranger) 296 (Aerostar)	GY/Y (Ranger) W/P (Aerostar)	Ignition switch in RUN	Battery voltage (12 volts)
Deactivator Switch Feed	9	307 (Ranger)	BK/Y (Ranger)	No brakes applied	Battery Voltage (12 volts)
		636 (Aerostar)	O (Aerostar)	Brake pedal applied	Less than 0.5 volt
Stoplight Switch Feed	4	306 (Ranger)	T/LB (Ranger)	No brakes applied	Less than 0.5 volt
		810 (Aerostar)	R/LG (Aerostar)	Brake pedal applied	Battery voltage (12 volts)
Command Signal (Control Line)	5	151	LB/BK	No switches pressed	Less than 0.5 volt
				Press and hold ON switch	Battery voltage (12 volts)
Indicator Lamp (Ranger)	1	203	O/LB	Ignition Switch in RUN	Battery Voltage (12 volts)

VOLTAGE MEASUREMENT — AC

Circuit Name	Pin	Circuit	Wire Color	Test Condition	Approximate Voltage
VSS Output Signal (Ranger)	3	679	GY/BK	Vehicle on road about 30 mph	1.4 volts AC minimum
				Vehicle on road about 45 mph	1.6 volts AC minimum

Resistance Measurements: remove connector at speed control servo. Connect an ohmmeter between the designated circuits with ignition switch (11572) off.

tomsn048@gmail.com

RESISTANCE MEASUREMENTS

Circuit Name	Pin	Circuit	Wire Color	Test Condition	Approximate Resistance
Stoplight Switch to Ground	4 to 10	306 to 676 (Ranger) 810 to 676 (Aerostar)	T/LB to PK/O (Ranger) R/LG to PK/O (Aerostar)	Brakes not applied	Less than 10 ohms
VSS Signal to Ground (Ranger)	3 to 10	679 to 676	GY/BK to PK/O	Harness disconnected from servo	200-300 ohms
Command Signal to Command Return	5 to 6	151 to 848 (Ranger) 151 to 248 (Aerostar)	LB/BK to DG/O (Ranger) LB/BK to T/O (Aerostar)	No switches pressed Press OFF switch Press COAST switch Press ACCEL switch Press RSM switch	Greater than 3000 ohms Less than 4 ohms 114-126 ohms 646-714 ohms 2090-2310 ohms
Command Return to Ground	6 to 10	848 to 676 (Ranger) 248 to 676 (Aerostar)	DG/O to PK/O (Ranger) T/O to PK/O (Aerostar)	No switches pressed	Open circuit

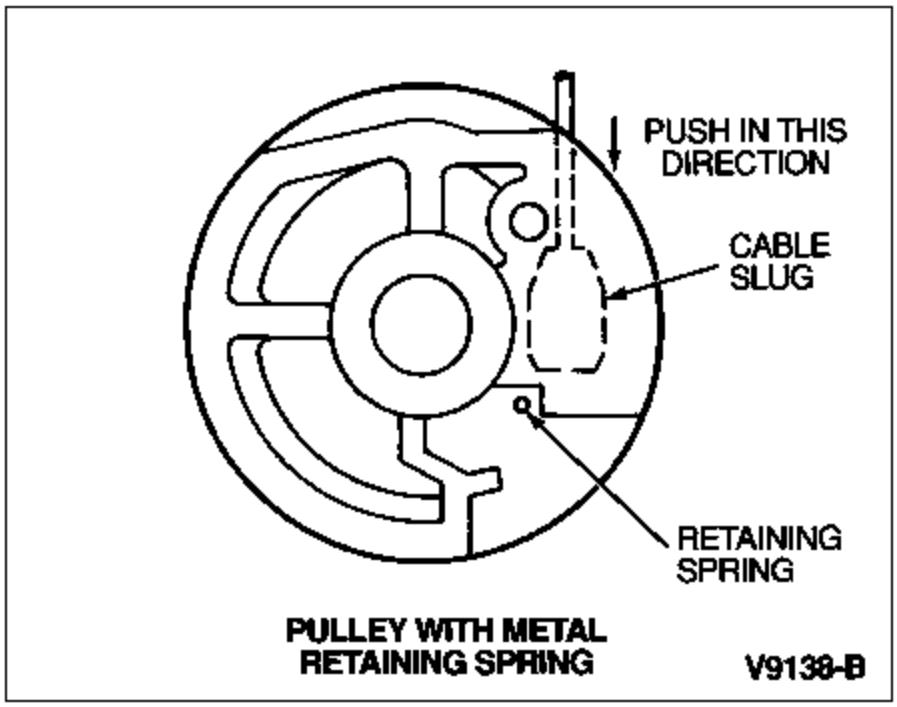
tomsn048@gmail.com

Speed Control Servo

Removal

1. Remove the screw(s) that mount speed control bracket to vehicle.
2. Disconnect speed control 10-way connector.
3. Depress accelerator pedal and shaft (9725), then push locking arm on speed control actuator cap and rotate cap counterclockwise.
4. Remove cable ball slug from servo rotor.
5. Remove speed control actuator cable slug from speed control servo pulley. Gently push actuator cable slug past retaining spring using a small screwdriver.
6. Remove bracket from the speed control servo (9C735); keep bracket, screw(s), eyelets and insulators for reuse.

Speed Control Servo Rotor



Installation

tomsn048@gmail.com

1. Attach bracket to speed control servo with three screws, eyelets and insulators. Tighten to 6-7 Nm (53-62 lb-in).
2. Attach speed control 10-way connector to speed control servo.
3. Make sure the rubber seal is fully seated on actuator cable cap.
4. Depress accelerator pedal and shaft if accelerator cable (9A758) is attached to throttle and lock cable ball in slot located in servo pulley.
5. Release accelerator cable or pull accelerator cable at throttle end.
6. Insert cap locking tabs into speed control servo slots as shown.
7. Rotate cap clockwise until locking arm engages locking tab on servo.
8. Position speed control actuator cable (9A825) and mount with screws.
9. Adjust speed control actuator cable as described in Adjustments, Actuator Cable in this section.

tomsn048@gmail.com

Speed Control Actuator

Removal

1. Remove speed control actuator cable (9A825) from speed control servo (9C735) as described in Removal and Installation, Speed Control Servo in this section.
2. Remove speed control actuator cable from throttle bracket.
3. Remove speed control actuator cable from accelerator cable (9A758).

Installation

1. Snap speed control actuator cable onto accelerator cable.
2. Snap speed control actuator cable to throttle cable bracket.
3. Attach speed control actuator cable to speed control servo as described in Removal and Installation, Speed Control Servo in this section.
4. Adjust speed control actuator cable as described in Adjustments, Actuator Cable in this section.

tomsn048@gmail.com

tomsn048@gmail.com

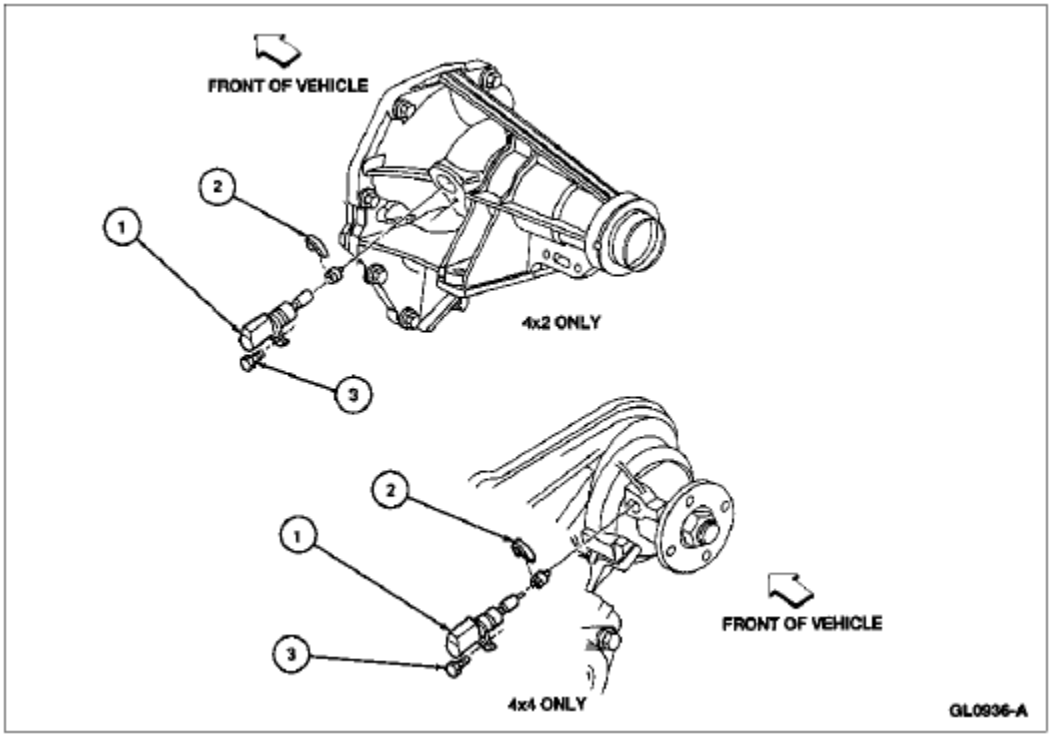
Vehicle Speed Sensor, Ranger

Removal and Installation

1. Separate the electrical connector to speed sensor on the automatic transmission/transaxle.
2. Remove retaining bolt or nut.
3. Remove vehicle speed sensor (VSS) (9E731).
4. Remove drive gear.

For installation, follow removal procedures in reverse order. Make sure to install drive gear on vehicle speed sensor before installing vehicle speed sensor into transmission.

Vehicle Speed Sensor, Ranger Shown



Item	Part Number	Description
1	9E731	Vehicle Speed Sensor
2	57622-S2	Bolt
3	W620397-S36	Nut and Washer Assembly

tomsn048@gmail.com

tomsn048@gmail.com

Deactivator Switch, Ranger

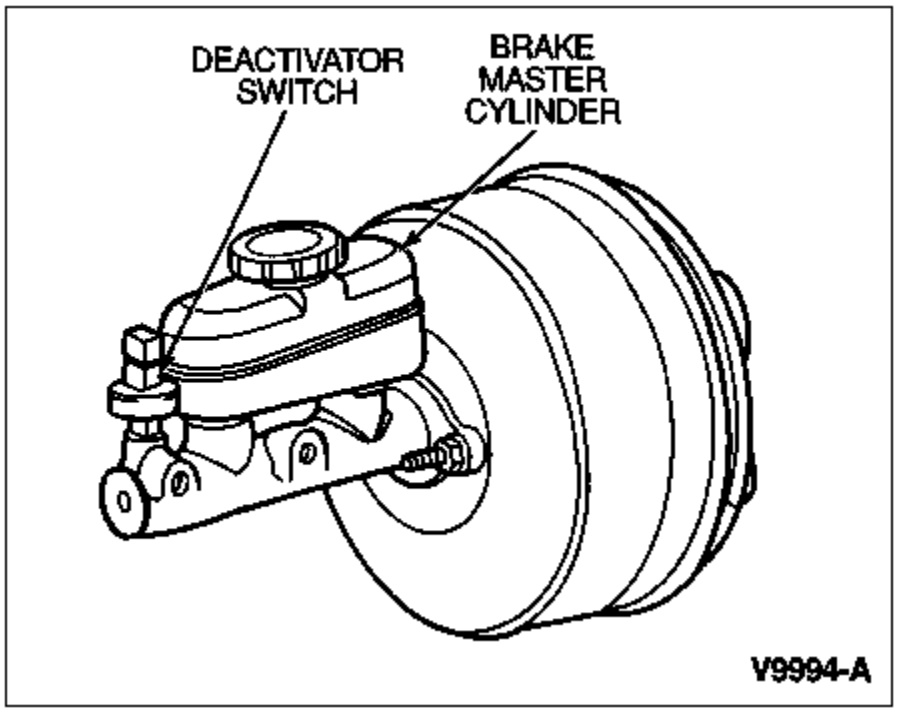
Removal

1. Disconnect deactivator switch connector. Deactivator switch is located on brake master cylinder (2140).

2. Unscrew switch and remove.

Installation

For installation, follow removal procedures in reverse order. Tighten switch to 15-20 Nm (12-14 lb-ft) and bleed brake lines as described in Section 06-06 .



tomsn048@gmail.com

tomsn048@gmail.com

Deactivator Switch, Aerostar

Removal

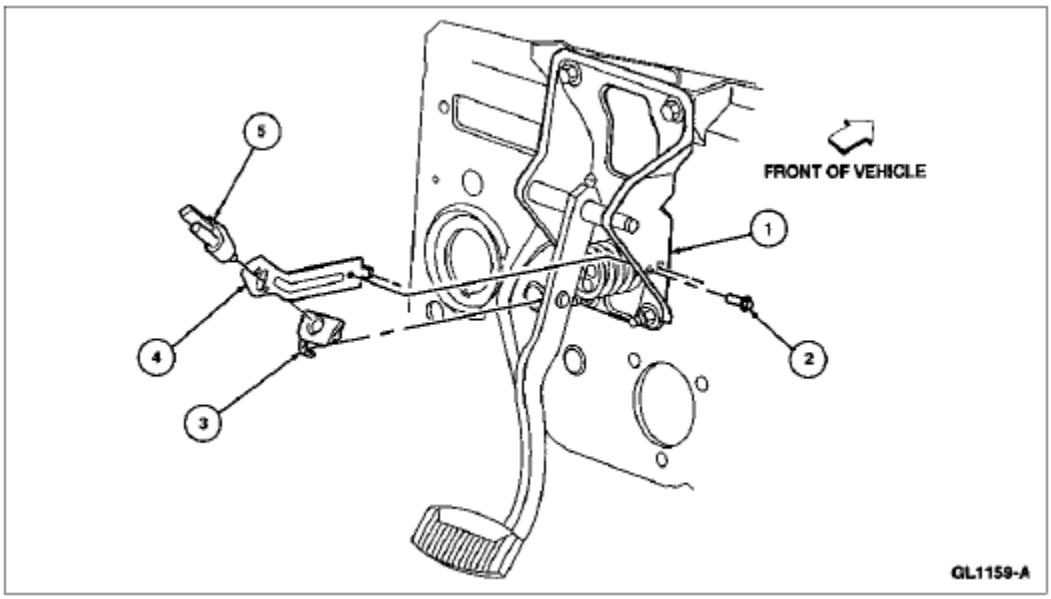
1. Disconnect the deactivator switch electrical connector.
2. Twist the deactivator switch counterclockwise slightly and remove.

Installation

1. **NOTE: Inspect the deactivator switch bracket for damage. If necessary, remove the screw and replace with a new bracket. Be sure the guide tab is aligned in the slot on the brake pedal (2455).**

   Install the bracket. Tighten the screw to 7.6-10.4 Nm (67-92 Lb-In).
2. While slightly depressing the brake pedal, insert a new deactivator switch and turn counterclockwise until it locks in place.
3. **NOTE: In the installed position, with the brake pedal applied, the deactivator switch is closed. Be sure the two pins of the switch are aligned alike before releasing the brake pedal.**

   Release the brake pedal.
4. Connect the electrical connector.



tomsn048@gmail.com

tomsn048@gmail.com

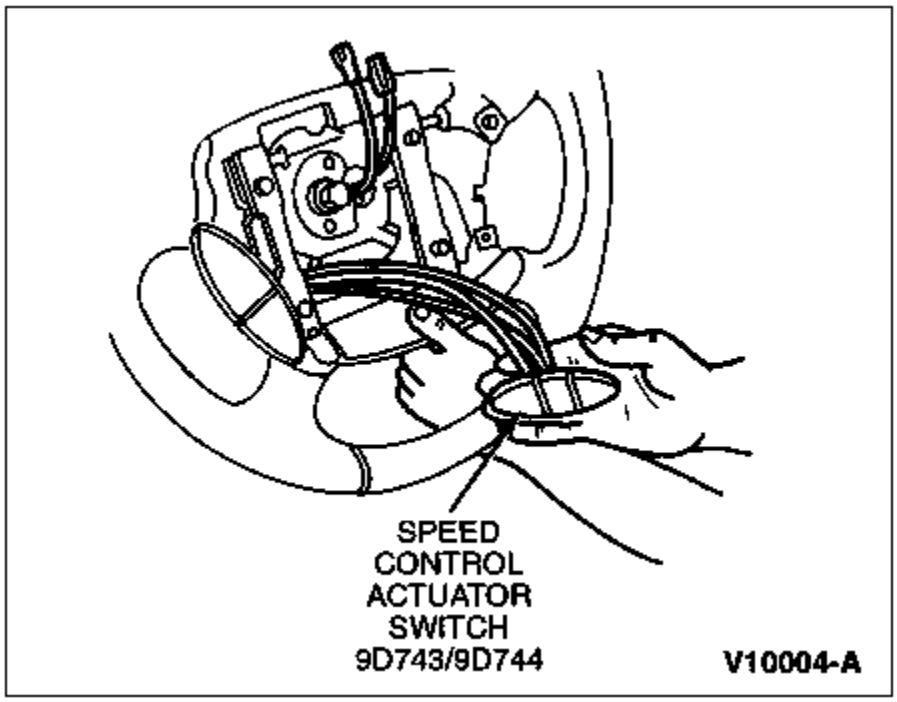
Switch, Speed Control (Ranger Only)

Removal

NOTE: The left actuator switch, right actuator switch, and wiring assembly can be serviced independently. The bulb for switch graphics backlighting is not serviceable as a separate item. To service a bulb, replace the left or right actuator switch.

1. Make sure the vehicle's front wheels are facing straight ahead, and the steering wheel (3600) is oriented in the straight-ahead position.
2. Disconnect the battery to starter relay cable. Wait at least one minute before proceeding to allow the air bag backup power supply to discharge.
3. Remove driver side air bag module (043B13). Refer to Section 01-20B .
4. Disconnect the wiring connector(s) at the sides of the switch(es) to be serviced.
5. Remove the (2) retaining screws per actuator switch, and remove switch from steering wheel.

Ranger Shown, Aerostar Similar



tomsn048@gmail.com

Installation

1. **NOTE: Install ground eyelet under the upper screw on the right switch.**

   Position the left and right speed control actuator switches on the steering wheel and install four Phillips head attaching screws.

2. Connect the wiring harness connectors to each switch by pushing onto the switch pins until the connector snaps in place.

3. Install the driver side air bag module. Refer to Section 01-20B .

---

tomsn048@gmail.com

Switch, Speed Control (Aerostar Only)

Removal and Installation

WARNING: ON AEROSTAR VEHICLES EQUIPPED WITH A SUPPLEMENTAL AIR BAG SYSTEM, REFER TO THE BODY, CHASSIS MANUAL, SECTION 01-20C FOR INFORMATION RELATED TO AIR BAG SYSTEM OPERATION AND SPECIAL HANDLING PROCEDURES. FAILURE TO ADHERE TO THESE PROCEDURES MAY RESULT IN AIR BAG DEPLOYMENT WHICH COULD RESULT IN PERSONAL INJURY.

WARNING: THE ELECTRICAL CIRCUIT NECESSARY FOR SYSTEM DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, BOTH BATTERY CABLES MUST BE DISCONNECTED PRIOR TO SERVICING OR REPLACING ANY SYSTEM COMPONENT.

WARNING: PLACE DRIVER SIDE AIR BAG MODULE (043B13) IN BENCH WITH TRIM COVER FACING UP.

WARNING: THE BACKUP POWER SUPPLY MUST BE DISCONNECTED BEFORE ANY AIR BAG COMPONENT IS SERVICED.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

1. Remove driver side air bag module from steering wheel (3600). Refer to Section 01-20C for removal and installation procedures.
2. Disconnect horn/speed control black wire harness connection from clockspring contact connector located in upper center of steering wheel.
3. Remove two retaining screws from base of each speed control actuator switch (9D743).
4. Remove electrical tape from wire connectors located at each upper clip in steering wheel.
5. Disconnect speed control switch wires at untaped wire connectors and remove switches.

   For installation, follow removal steps in reverse order.

tomsn048@gmail.com

tomsn048@gmail.com

Harness, Speed Control Switch Wiring

Removal

1. Remove speed control switch. If necessary, refer to the procedure in this section.
2. Disconnect the steering wheel wiring harness connector at the air bag sliding contact (14A664). Connector is located at the right side of the steering wheel attaching bolt.
3. Remove steering wheel. Refer to Section 11-04A for Ranger and Section 11-04B for Aerostar.
4. Disconnect wiring harness flag terminals from the (2) horn switches.
5. Remove right horn switch. Refer to Section 13-06 .
6. On back side of steering wheel, remove (2) screws attaching back cover.
7. Carefully remove back cover from steering wheel.
8. Disconnect wiring harness from retaining clips near right horn switch, and remove wiring harness from steering wheel (3600).

Installation

1. With the steering wheel rim facing down on a bench, route the wiring harness around the steering wheel upper spokes to the switch locations. Route the wiring with the black 5-pin air bag sliding contact connector from the right speed control switch through the 2 retaining clips and through the 2 wire locating ribs beneath the right horn switch.
2. Route the horn switch wires as follows:
   - wire from the right speed control switch to the left horn switch
   - wire from the left speed control switch to the right horn switch
3. Carefully install steering wheel back cover, and install back cover attaching screws.
4. Carefully route the wiring between the locator posts and the top inside of the back cover.
5. Reinstall the right horn switch, being careful to not pinch the wiring. Tighten horn switch attaching bolts to 6.5-7.5 Nm (4.8-5.5 lb-ft).
6. Connect the wiring harness terminals to each horn switch.
7. Install the steering wheel. Refer to Section 11-04A .

tomsn048@gmail.com

8. Install the steering wheel wiring harness 5-pin connector into the air bag sliding contact at the right side of the steering wheel bolt.

---

tomsn048@gmail.com

Actuator Cable

1. Remove cable retaining clip from actuator cable at accelerator cable bracket (9723).
2. Set throttle plate to closed position.
3. Pull on the actuator cable to take up any slack. Back off at least one notch so that there is 1mm (.040 inch) of slack in the cable. The cable must not be pulled tight for proper operation.
4. While holding the cable, insert the retaining clip and snap securely.

tomsn048@gmail.com

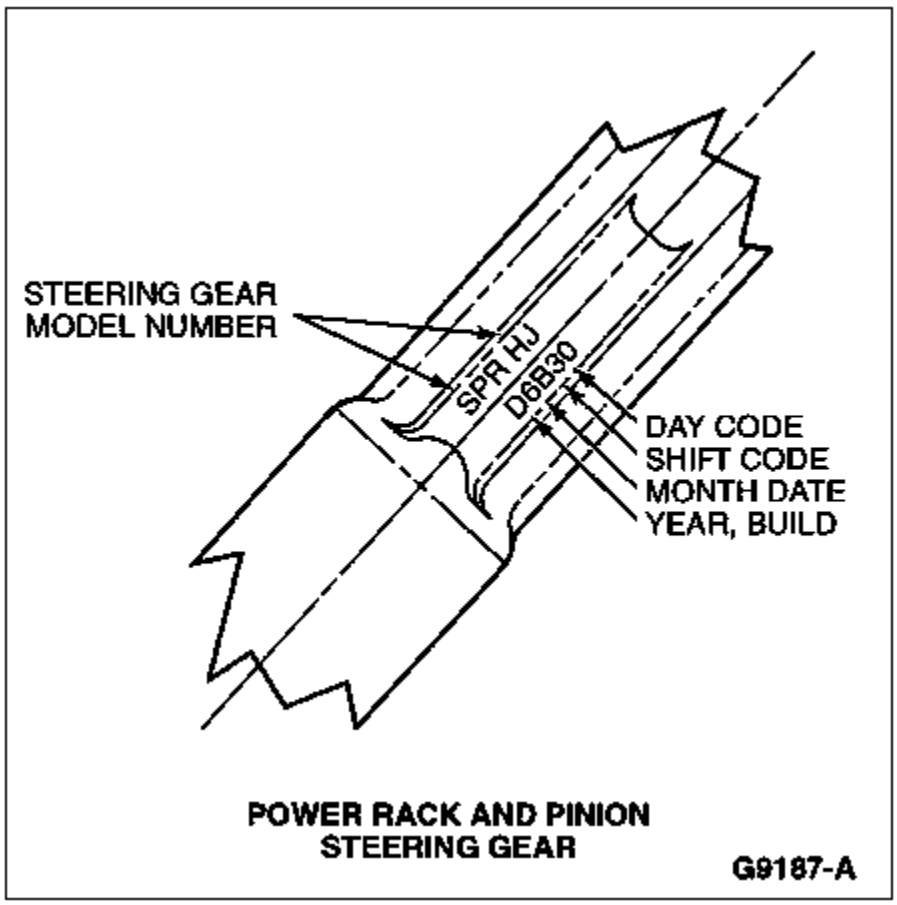
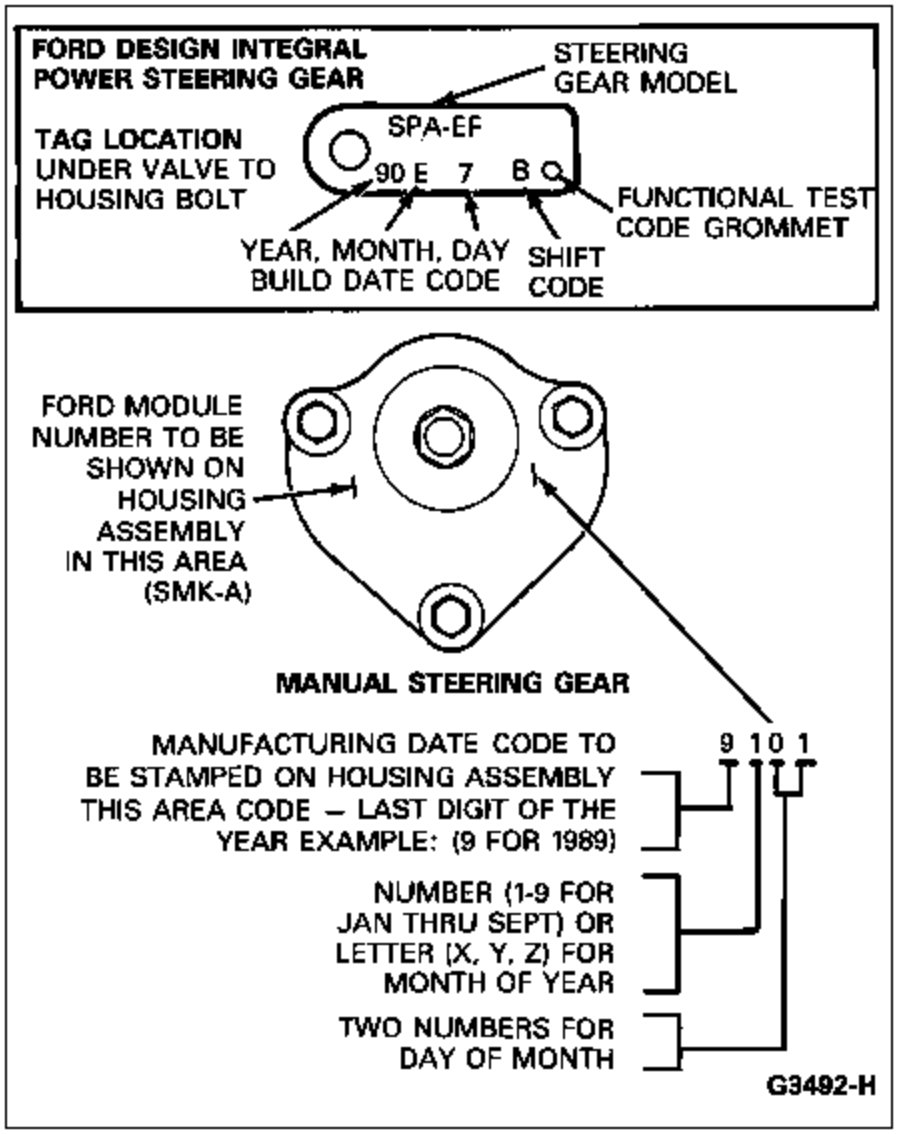
Identification

Steering Gear Model

Steering gears (3504) are identified by a service identification tag fastened to the assembly, or by the steering gear model number stamped on the housing. Tags and stamped model numbers contain coded information. The power rack and pinion Aerostar has a date stamp on the steering gear housing (3548) steering gear housing (3548). The Ranger has an identification tag attached to the piston cylinder of the steering gear. The date stamp is on the housing assembly. An optional dot matrix ID may be substituted on Ranger only and is located on the sector cover.



tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Pump, Power Steering

NOTE: Always use these tags when requesting service parts as there may be slight differences in internal components.

A pressure-sensitive identification tag is attached to the power steering fluid reservoir. The top line of this tag indicates the basic model number (HBC) and the suffix.

The C-II power steering pump (3A674) is a drive belt, slipper-type pump with a fiberglass-reinforced nylon power steering fluid reservoir . The power steering fluid reservoir is attached to the rear side of the pump housing front plate and the power steering pump housing (3A643) is encased within the housing and reservoir. The power steering pressure hose (3A719) is attached with a quick connect fitting, located below the filler neck at the outboard side of the power steering fluid reservoir. The fitting allows the line to swivel. This is normal and does not indicate an untorqued fitting.

tomsn048@gmail.com

Inspection and Verification

Inspect steering system for worn or damaged components. Inspect hoses and connections for leaks. Refer to appropriate Group 11 section.

tomsn048@gmail.com

Symptom Charts

The charts in this section can be used as an aid in diagnosing steering system conditions. For suspension system diagnosis guides, refer to Section 04-00 and for normal steering gear diagnosis refer to Diagnosis and Testing in this section. Additional diagnosis procedures can be found in Section 05-00.

STEERING SYSTEM DIAGNOSIS

Condition	Possible Source	Action
• Feedback — (Rattle, Chuckle, Knocking Noises in the Steering Gear or Inside the Vehicle) Roughness Is Felt in the Steering Wheel by the Driver When the Vehicle Is Driven Over Rough Pavement	• Steering column gear input shaft couplings loose.	• CHECK steering column gear input shaft couplings for damage and REPLACE if required. If not damaged, TIGHTEN retaining bolts to 41-57 Nm (31-42 lb-ft).
	• Loose steering gear locknut (Ranger).	• CHECK steering gear locknut for damage and REPLACE if required. If no damage is found, TIGHTEN locknut to 40-55 Nm (30-40 lb-ft).
	• Connecting bolts on steering column shaft intermediate loose (Aerostar).	• CHECK bolts for damage and REPLACE if required. If not damaged, TIGHTEN to 41-57 Nm (31-42 lb-ft).
	• Gear loose on frame (Ranger).	• CHECK bolts for damage and REPLACE as required. If bolts are not damaged, TIGHTEN mounting bolts to 68-84 Nm (50-62 lb-ft).
	• Insufficient meshload (Ranger).	• SET meshload to specification. REFER to Meshload in the Adjustments portion of Section 11-02B .
	• Loose worm race locknut (Ranger).	• CHECK nut for damage and REPLACE as required. If nut is not damaged, TIGHTEN nut to 75-122 Nm (55-90 lb-ft).
	• Insufficient worm thrust bearing preload (Ranger).	• REPLACE valve assembly. REFER to Disassembly and Assembly procedures in Section 11-02B .
	• Damaged/omitted sector shaft bearing (gear might also exhibit external leakage from sector seals) (Ranger).	• REPLACE steering gear housing. REFER to Disassembly and Assembly procedures in Section 11-02B .

tomsn048@gmail.com

• Noise in Steering — Squeak, Creak or Rattle	• Steering column shroud interference with steering wheel.	• REPLACE steering column shrouds or steering wheel or REPOSITION steering column shroud as required. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for repair procedures.
	• Air bag sliding contact.	• REFER to Section 01-20B .
	• Loose steering column mounting bolts or screws.	• CHECK bolts for damage and REPLACE if required. If bolts are not damaged, TIGHTEN to specification. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for individual bolt or screw torque specifications.
	• Looseness of ball bearings or insufficient lube.	• CHECK bearings for damage or excessive wear and REPLACE if required. If no damage is found, LUBE bearings and TIGHTEN to specification. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger.
	• Steering shaft insulators cracked or dry (Aerostar).	• CHECK insulators for cracks and REPLACE if required. If no cracks are found, LUBE insulators.
	• Steering column shaft bearing sleeve out of position.	• CHECK steering column bearing sleeves for damage and REPLACE if required. If no damage is found, REPOSITION steering column bearing sleeve. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger.
	• Bearing retainer out of position.	• CHECK bearing retainers for damage and REPLACE if required. If no damage is found, RESEAT bearing retainers. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger.
• Noise in Steering Column — Clunk	• Loose steering column intermediate shaft coupling to steering column bolt.	• CHECK steering column gear input shaft coupling bolt for damage and REPLACE if required. If no damage is found, TIGHTEN bolt to 41-57 Nm (31-42 lb-ft).
	• Improper steering gear meshload (Ranger).	• READJUST to specification. REFER to Section 11-02B , Ranger for adjustment procedures.
	• Defective steering column intermediate shaft coupling.	• REMOVE steering column intermediate shaft coupling from lower steering column shaft. Manually INSPECT steering

tomsn048@gmail.com

		column intermediate shaft coupling and lower steering column shaft for metallic lash. INSPECT steering column intermediate shaft coupling for loose plug. REPLACE assembly as required. REFER to Section 11-04A , Ranger for repair procedures.
	• Looseness of bearings or insufficient bearing lube at the interface of balls to inner and outer face.	• CHECK ball bearings for damage. If damage is found REPLACE as required. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for bearing replacement procedures.
• Noise, Knock, Clunk, Rapping, Squeaking Noise When Turning	**Power Steering Only**	
	• Steering wheel-to-steering column shroud interference.	• ADJUST or REPLACE as required. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger.
	• Air bag sliding contact.	• Refer to Section 01-20B .
	• Steering column mounting nuts loose.	• CHECK nuts for damage and REPLACE if required. If nuts are not damaged, TIGHTEN nuts to 26-36 Nm (19-27 lb-ft) for Ranger and 13-17 Nm (10-13 lb-ft) for Aerostar.
	• Intermediate shaft connecting bolts loose.	• CHECK bolts for damage and REPLACE if required. If bolts are not damaged, TIGHTEN bolts to 41-57 Nm (31-42 lb-ft).
	• Steering gear mounting bolts loose (Ranger).	• CHECK bolts for damage and REPLACE if required. If bolts are not damaged, TIGHTEN bolts to 68-84 Nm (50-62 lb-ft).
	• Intermediate shaft rubbing against steering column (Ranger).	• REMOVE intermediate shaft from steering column. PULL steering shaft out from column 6mm (1/4 inch). REATTACH lower steering column shaft.

FORD INTEGRAL AND POWER RACK AND PINION STEERING GEAR

Condition	Possible Source	Action
• Hissing Sound	• Hiss may be expected when the steering wheel is at the end of travel or when turning at standstill.	• Hiss is a normal characteristic of rotary steering gears and in no way affects steering. DO NOT REPLACE the power steering gear input shaft and control valve assembly unless the hiss is extremely objectionable. A replacement valve will also exhibit a slight noise and will not always correct the condition. INVESTIGATE for a grounded steering column tube or a loose steering column opening weather seal at the dash panel. Any metal to metal contact will transmit valve hiss into the

tomsn048@gmail.com

		passenger compartment through the steering column. VERIFY clearance between steering column intermediate shaft coupling components. Be sure steering column intermediate shaft coupling and steering gear are aligned so steering column intermediate shaft coupling rotates in a flat plane and is not distorted as lower steering column shaft rotates.
• Grunt in 4WD only.	• Grunt expected when the steering wheel is turning during parking maneuvers.	• Grunt in 4WD is a characteristic of the routing of the hoses. DO NOT REPLACE the steering gear as it will not eliminate the grunt.

POWER STEERING PUMP AND DRIVE BELT NOISE

Condition	Possible Source	Action
• Power Steering Drive Belt Squealing	• Check drive belt for proper tension or glazing.	• TIGHTEN or REPLACE drive belt as required.
• Power Steering Pump Noisy	• Low fluid level and possible leakage.	• REFILL to specified level. PURGE air from system. CHECK for leaks. SERVICE as required.
• Swish-Type Noise	• Fluid flow into the power steering pump valve of the pump valve housing with fluid temperature below 54℃ (130° F).	• Normal noise.
• Whine-Type Noise	• Aerated fluid, or power steering pump rotor cam contour damaged.	• PURGE system of air. If condition not resolved, REPLACE pump assembly.
• Clicking Mechanical-Type Noise	• Pump slippers too long, excessive wear of pumping elements. Excessive slipper to slot clearance, or out of square slipper springs.	• REPLACE power steering pump.
• Chatter-Type Noise	• Chipped corners on rotor outside diameter or distorted slipper spring.	• REPLACE power steering pump.
• Other Cause of Noise	• Improper assembly of components such as slippers.	• REPLACE power steering pump.
	• Imperfections on power steering pump rotor outside diameter or power steering pump rotor end surface.	• REPLACE power steering pump.
	• Damaged power steering pump rotor splines.	• REPLACE power steering pump.
	• Hairline crack on cam inner surface.	• REPLACE power steering pump.
	• Interference between power steering pump rotor and cam.	• REPLACE power steering pump.

tomsn048@gmail.com

	• Excessively worn or scored pumping elements and power steering pump pressure plates.	• REPLACE power steering pump.
• Power Steering Pump Leaks	• Fluid, power steering pump fluid reservoir filler cap.	• CHECK for indications of false leakage — overfilled power steering fluid reservoir, improperly installed, damaged or lost power steering pump fluid reservoir filler cap.
	• Loose or damaged hose connections.	• REPAIR or REPLACE as required.
	• Leakage between power steering fluid reservoir and power steering pump housing.	• REPAIR or REPLACE as required. REFER to Section 11-02A for power steering pump repair.
	• Leakage at power steering pump rotor shaft oil seal.	• REPLACE power steering pump. REFER to Section 11-02A for power steering pump repair.

STEERING SYSTEM PROBLEMS

Condition	Possible Source	Action
• Steering Very Difficult/Very Easy.	• Restricted hoses. • Power steering pump. • Steering gear. • Ball joints.	• Go to Pinpoint Test A .
• Steering Wheel Off-Center (Clear Vision)	• Incorrect toe setting. (Steering wheel is positively aligned to steering shaft. Position is not adjustable.)	• REFER to Section 04-00 for adjustment procedure.
• Pulls or Drifts to One Side	• Insufficient tire pressure.	• ADJUST tire pressure.
	• Improperly adjusted wheel alignment.	• ADJUST wheel alignment.
	• Tire conicity.	• ROTATE tires. If wander or pull moves with worn tires, REPLACE tires.
	Power Steering Only • Steering gear valve binding or out of balance.	• REPLACE steering gear.
• Wanders Side to Side — Loose Steering	• Insufficient tire pressure.	• ADJUST tire pressure.
	• Improperly adjusted wheel alignment.	• ADJUST wheel alignment.
	• Flexible coupling damaged or worn	• REPLACE as required. REFER to Section 11-04A for steering

tomsn048@gmail.com

	(Ranger).	column repair.
	• Steering column intermediate shaft bolts.	• CHECK bolts for damage and REPLACE if required. If not damaged, TIGHTEN to 41-57 Nm (30-42 lb-ft).
	• Column intermediate shaft joints loose or worn.	• REPLACE lower steering column shaft. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for steering column repair.
	• Steering gear meshload adjustments (Ranger).	• ADJUST to specification. REFER to Section 11-02B for adjustments.
	• Steering gear loose on frame.	• CHECK mounting bolts for damage and REPLACE if required. If no damage is found, TIGHTEN bolts to 108-142 Nm (80-105 lb-ft) for Aerostar 4x2, 83-111 Nm (61-82 lb-ft) for Aerostar E4WD, 68-84 Nm (50-62 lb-ft) for Ranger.
	• Incorrect meshload (Ranger).	• SET meshload to specification. REFER to Meshload in the Adjustments portion of Section 11-02B .
	• Loose race locknut (Ranger).	• CHECK race locknut for damage and REPLACE as required. If no damage is found, TIGHTEN nut to 75-122 Nm (55-90 lb-ft).
	• Insufficient worm thrust bearing preload (Ranger).	• REPLACE valve assembly. REFER to Steering Gear in the Disassembly and Assembly portion of Section 11-02B .
	• Damaged sector shaft bearing (gear might also exhibit external leakage from sector seal) (Ranger).	• REPLACE gear housing assembly. REFER to Steering Gear Housing in the Disassembly and Assembly portion of Section 11-02B .
	• Center lash (Ranger).	• Improper fit or worm to piston. REPLACE valve assembly (be certain to CHECK meshload prior to replacing valve for center lash).
• Heavy Steering Effort — Poor or Loss of Assist During Turns and Parking	• Steering wheel-to-column shroud interference.	• REMOVE interference.
	• Misaligned lower steering column shaft (if so equipped) to steering gear interference.	• ALIGN or ADJUST as required. REFER to Section 11-04A for Ranger flex coupling alignment procedures.

tomsn048@gmail.com

		• Steering column alignment.	• ALIGN or ADJUST as required. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for column alignment procedures.
		• Bent or damaged rack (Aerostar).	• REPLACE steering gear. REFER to Section 11-02C .
		• Leakage or loss of fluid.	• REFER to External Leak Diagnosis in this section for repair.
		• Low power steering pump fluid.	• FILL as necessary.
		• Contaminated fluid, incorrect fluid.	• REPLACE with correctly specified fluid.
		• Air in power steering system.	• ADD fluid, TIGHTEN connections and BLEED system. REFER to Air Bleeding in this section for repair.
		• Glazing or improper drive belt tension.	• TIGHTEN or REPLACE drive belt as required. REFER to Section 03-05 in the Powertrain, Drivetrain Manual for belt service.
		• Hose or cooler line restrictions.	• CLEAR or REPLACE as required.
		• Improper engine idle speed.	• READJUST idle speed.
		• Power steering pump pulley loose or warped.	• REPLACE power steering pump pulley. REFER to Section 11-02A for replacement procedures.
		• Loose rack piston (Aerostar).	• REPLACE steering gear. REFER to Section 11-02C for Aerostar steering gear repair.
		• Low steering system fluid fill.	• ADD steering fluid to proper level.
		• Engine idle too low.	• SET engine idle to specification. REFER to the Powertrain Control/Emissions Diagnosis Manual.
		• Loose drive belt tension.	• CHECK drive belt tension and SET to specification. REFER to Section 03-05 for tightening procedure.
		• Power steering pump flow/relief pressure not to specification.	• TEST power steering pump and SERVICE as necessary. REFER to Pump Flow and Pressure Tests in this section for power steering pump testing procedures.
		• External leakage	• REFER to Pump Flow and

tomsn048@gmail.com

	giving low fluid level.	Pressure Tests in this section.
	• Piston Teflon® seal cut or twisted (Ranger).	• REPLACE piston Teflon® seal. REFER to Piston in the Disassembly and Assembly portion of Section 11-02B.
	• Loose/missing rubber backup piston rack seal (Ranger).	• REPLACE/INSTALL rubber backup rack seal. REFER to Piston in the Disassembly and Assembly portion of Section 11-02B.
	• Valve/steering gear housing oil passages blocked (Ranger).	• REPLACE steering gear input worm gear and rack as required. REFER to Disassembly and Assembly procedures in Section 11-02B.
• Heavy Steering Effort — Poor or Loss of Assist During Turns and Parking (Continued)	• Leakage past piston end cap (Ranger).	• CHECK piston end cap for damage. If no damage is found, TIGHTEN piston end cap to 95-149 Nm (70-110 lb-ft). If damage is found, REPLACE valve assembly. REFER to the Disassembly and Assembly portion of Section 11-02B.
	• Porosity in the piston bore (housing casting).	• REPLACE steering gear housing. REFER to Section 11-02B, Ranger or Section 11-02C, Aerostar.
	• Porosity in piston (Ranger).	• REPLACE valve assembly. REFER to Valve Housing in the Disassembly and Assembly portion of Section 11-02B.
	• Valve sleeve Teflon® seal(s) damaged (Ranger).	• REPLACE valve sleeve Teflon® seal(s). REFER to Worm and Valve Sleeve in the Disassembly and Assembly portion of Section 11-02B.
	• Bent or damaged rack assembly (Aerostar).	• REPLACE steering gear. REFER to Section 11-02C.
• Returnability Poor	• Column bearing damaged.	• REPLACE bearing. REFER to Section 11-04B, Aerostar or Section 11-04A, Ranger for service procedures.
	• Binding steering linkage.	• REFER to Section 11-03 for Ranger.
	• Steering gear adjustment (Ranger).	• ADJUST to specification. REFER to Section 11-02B for power steering gear adjustments.
	• Kinked power steering pressure hose or tube.	• INSPECT and REPAIR or REPLACE as required.
	• Obstruction within steering gear or lines	• INSPECT, REMOVE obstructions and REPAIR or

tomsn048@gmail.com

	(Ranger). • Bent or damaged rack (Aerostar). • Binding in the valve assembly (Ranger). • Steering gear meshload too high (Ranger). • Contamination in system. • Wheel alignment.	REPLACE as required. • REPLACE steering gear. REFER to Section 11-02C . • REPLACE power steering gear input shaft and control of valve assembly. REFER to Section 11-02B for steering gear repair procedures. • REPAIR gear assembly as required. REFER to Section 11-02B for steering gear repair procedures. • FLUSH power steering system. • Refer to Section 04-00 .
• Rough, Lumpy or Binding Steering — Sticky or Catchy Feel While Turning	• Steering gear adjustments set too high. • Rack and pinion teeth or bearings damaged due to high impact loads (Aerostar).	• ADJUST as required. REFER to Section 11-02B , Ranger for adjustment procedures. • REPLACE complete gear assembly. REFER to Section 11-02C , Aerostar for replacement procedures.
• Pointing, Darting, Sticky Steering — Road Feel Is Not Smooth, Cannot Make Minor Corrections with Ease	• Steering gear adjustment set too high (Ranger). • Steering column shaft sticky. • Binding steering linkage, tie rods and ends. • Lower steering column shaft binding because of worn out steering column intermediate shaft coupling.	• ADJUST as required. REFER to Section 11-02B , Ranger for adjustment procedures. • DISCONNECT lower steering column shaft and VERIFY free rotation of the steering column. REPAIR as required. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for repair procedures. • REPLACE as required. REFER to Section 11-02B , Ranger or Section 11-02C for Aerostar. • REPLACE lower steering column shaft steering column intermediate shaft coupling. REFER to Section 11-04B , Aerostar or Section 11-04A , Ranger for repair procedures.
• Shimmy — A Consistent Side-to-Side Wobble in the Steering Wheel and Road Wheels. Usually Felt at Speeds over 64 km/h (40 mph) and	**Power Steering Only**	

tomsn048@gmail.com

Amplified When Driven over Pot Holes or Bumps		
	• Rack and pinion insulators worn.	• REPLACE as required. REFER to Section 11-02C for gear insulator replacement procedures.
	• Steering gear mounting bolts loose.	• CHECK bolts for damage and REPLACE as required. If not damaged, TIGHTEN to the following specifications: 108-142 Nm (80-105 lb-ft) Aerostar 4x2 models; 83-111 Nm (61-82 lb-ft) Aerostar E4WD models; 68-84 Nm (50-62 lb-ft) Ranger.
	• Improperly adjusted wheel alignment.	• ADJUST wheel alignment.
• External Leakage	• Loose hose fittings.	• CHECK hose fittings for damage and REPLACE as required. If no damage is found, TIGHTEN fittings to specification. REFER to Specifications portion of Section 11-02B, Ranger and Section 11-02C, Aerostar for torque specification.
	• Missing/damaged hose fitting tube seats (Ranger).	• INSTALL/REPLACE tube seats. REFER to Valve Housing in the Disassembly and Assembly portion of Section 11-02B.
	• Seal leak from power steering gear input shaft and control.	• CHECK shaft for damage. CHECK housing bore for porosity or damage. REPLACE steering gear if necessary.
	• Leak at valve mounting face (Ranger).	• CHECK bolts for proper torque. REPLACE valve housing O-ring (s). REFER to Valve Housing in the Disassembly and Assembly portion of Section 11-02B.
	• Leak at sector shaft adjuster screw locknut (Ranger).	• CHECK locknut for damage and REPLACE as required. If no damage is found, TIGHTEN locknuts to 48-61 Nm (35-45 lb-ft).
	• Seal leak at steering gear sector shaft (Ranger).	• REPLACE seals of steering gear sector shaft and EXAMINE steering gear sector shaft for pitting or corrosion. REPLACE steering gear sector shaft if necessary. CHECK housing seal bore for porosity or damage. REPLACE housing if necessary.
	• Leak from steering gear.	• REPLACE steering gear. REFER to Steering Gear Housing in the

tomsn048@gmail.com

	• Leak at steering gear sector shaft housing cover, or cracked steering gear sector shaft housing cover (Ranger).	Disassembly and Assembly portion of Section 11-02B , Ranger and Section 11-02C , Aerostar. • CHECK bolt torques. CHECK O-ring seal and system relief pressure.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: STEERING VERY DIFFICULT/VERY EASY

A1 FLOW RATE AND PRESSURE CHECK

- Remove the pressure fitting from the power steering pump and connect it into the appropriate adapter of the analyzer.
- Thread the other adapter of the analyzer into the power steering pump.

  NOTE: The analyzer may be connected at any accessible point between the power steering pump and the steering gear on the pressure side.

- Connect the analyzer to the adapters and tighten both to 20 Nm (15 lb-ft).
- Add power steering fluid to the power steering pump as required.
- Start engine and run at idle for approximately 2 minutes.
- Record the flow and pressure at 74-79°C (165-175°F).

Is the pressure above 1034 kPa (150 psi)?

Yes	No
CHECK for restricted hoses or restricted gear passages. REPAIR or REPLACE as required.	GO to **A2** .

A2 FLOW RATE CHECK, POWER STEERING PUMP VALVE PARTIALLY CLOSED

- Partially close the power steering pump valve and allow the pressure to build to 5100 kPa (740 psi). Record the flow at 74-79°C (165-175°F).

Is the flow rate below specifications?

Yes	No
REPLACE power steering pump. REFER to Section 11-02A .	GO to **A3** .

A3 PRESSURE CHECK, POWER STEERING PUMP VALVE OPENED AND CLOSED

NOTE: Do not allow the power steering pump valve to remain closed for more than 5 seconds.

tomsn048@gmail.com

- Completely close and partially open the power steering pump valve three times.
- Record the pressure when the power steering pump valve is closed.

Is pressure within specifications?

Yes	No
GO to **A4** .	REPLACE power steering pump.

A4 FLOW RATE CHECK, ENGINE RUNNING AT 1500 RPM

- Increase engine speed to 1500 rpm.
- Record free flow rate.

Is the flow rate greater than the maximum free flow specified in the chart?

Yes	No
REPAIR or REPLACE the flow control power steering pump valve as required.	GO to **A5** .

A5 PRESSURE AND FLOW RATE CHECK, STEERING WHEEL TURNED FROM STOP TO STOP

- Turn the steering wheel from the left stop to the right stop.

  NOTE: Do not hold against stop for more than 5 seconds.

- Record the pressure and the flow rate while holding the steering wheel hard against the stops.

Is the recorded pressure at both stops approximately the same as the pressure recorded in Step A3 and does the flow rate drop below 0.5 gallons/min?

Yes	No
GO to **A6** .	Excessive internal leakage in steering gear. REPAIR or REPLACE steering gear.

A6 BACK PRESSURE CHECK

- Turn steering wheel slightly in both directions and release quickly while observing the pressure gauge.

Does the needle move from the normal back pressure reading and snap back as the steering wheel is released?

Yes	No
System is OK.	CHECK ball joints. CHECK the column for free rotation before disassembling the steering gear.

tomsn048@gmail.com

	REPLACE as required.

tomsn048@gmail.com

Preliminary Procedures

Make the following preliminary checks before servicing the steering system. If hoses are to be disconnected, label them prior to removal so they can be easily identified for reassembly.

Air Bleeding

Verify the power steering pump (3A674) has been filled as instructed above. Run the engine until it reaches normal operating temperature. Turn the steering wheel (3600) to the left and right several times without hitting the stops. Recheck the fluid level and if any air bubbles are present, refer to Service Procedures, Purging Power Steering System of Air in this section.

Fluid Level

The fluid level can be checked either hot or cold, but use the appropriate mark on the dipstick. Check for bubbles in the fluid when taking a fluid level reading. If bubbles are evident, refer to Service Procedures, Purging Power Steering System of Air in this section. If a low level is indicated on the dipstick, add MERCON® Power Steering Fluid.

Pump Belt

NOTE: Drive belt tension adjust is not required on vehicles with drive belt tensioner (6B209).

Check the tension of the belt. Refer to Section 03-05 for belt tension check and belt removal and installation, if necessary.

tomsn048@gmail.com

External Leakage

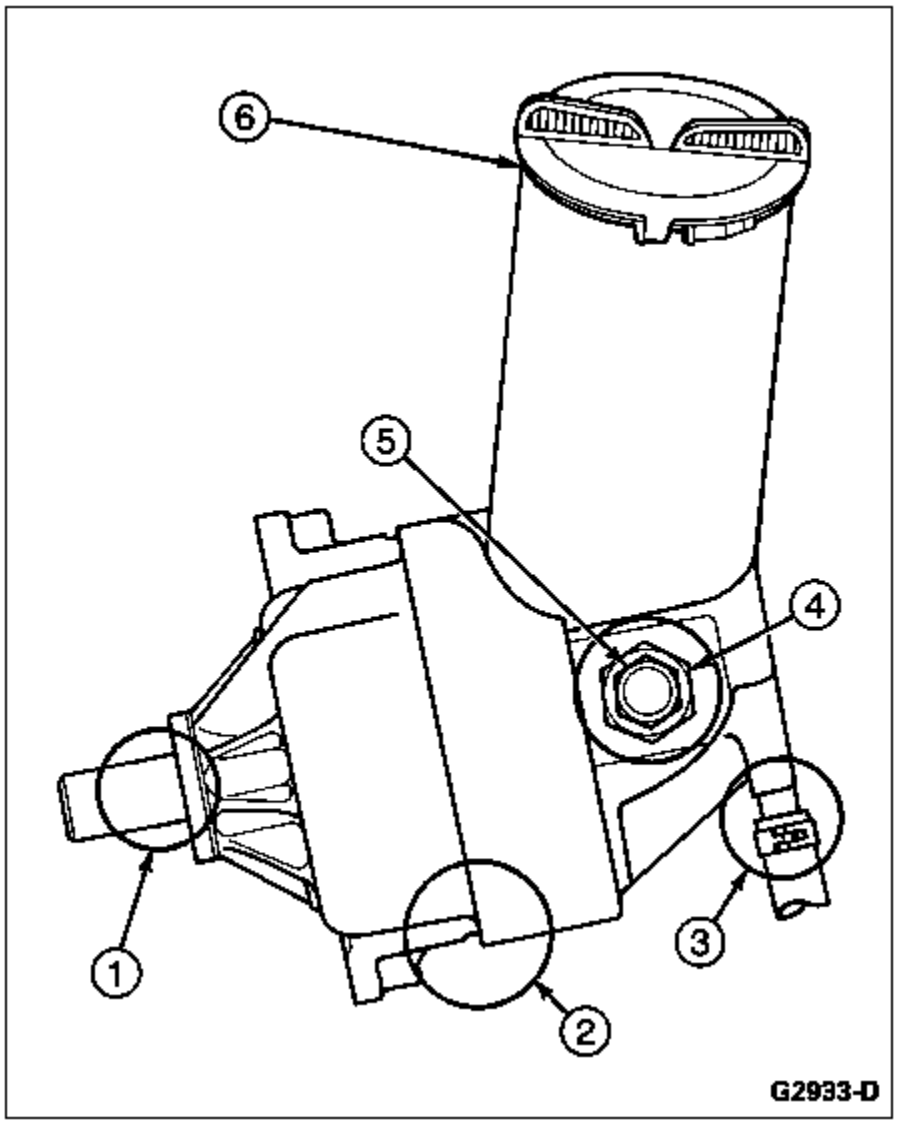
When looking for leaks, use the following procedure to pinpoint the exact cause and location to avoid misdiagnosis:

1. Check for overfill condition.
2. Wipe the suspected area dry.
3. Check for fluid overflow and aeration.
4. Check for exact source of leak. For example, oil may be running down from another area (engine (6007), etc.) and the drip may not be the leak point.
5. **CAUTION: Do not hold the steering wheel (3600) against a stop for more than three to five seconds at a time. Cycle the steering wheel from stop to stop ten times and check for leaks. The bellows may have to be moved back from the steering gear housing (3548) to observe the leak.**

   With the engine idling, turn the steering wheel from left to right several times. Check all possible leakage points. Some leaks are high pressure leaks and may require holding the steering wheel against the stops for fluid to seep out.
6. Tighten all loose fittings to specifications. Replace damaged lines and seals.
7. Check hoses for cut O-rings.
8. Refer to the following component areas for detailed leakage checks.

   The numbered parts in the following illustration correspond to the numbered categories in the External Leak Checks Chart.

tomsn048@gmail.com

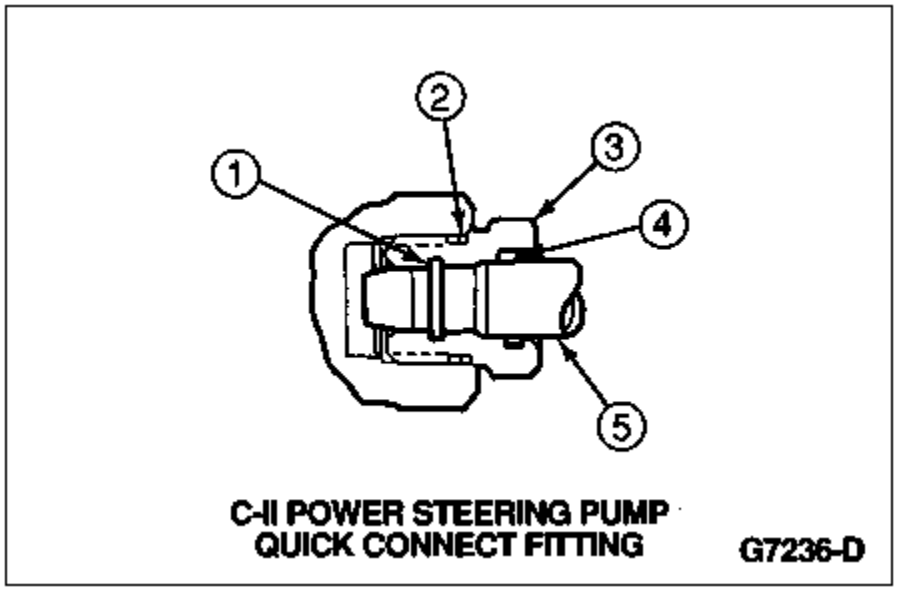


EXTERNAL LEAK CHECKS

Leak Category	Parts Required for Service
1. Power steering pump rotor shaft oil seal	• Replace power steering pump assembly.
2. Reservoir O-ring seal (Part of 3A674)	• Replace pump assembly.
3. Power steering return hose	• Reposition or replace return hose clamp.
4. Power steering fluid reservoir	• Tighten power steering pump assembly. ▪ replace O-ring seal ▪ check for damaged threads (cross-threaded) • Replace power steering pump assembly. ▪ housing cover threads are stripped; replace power steering pump housing
5. Power steering pressure, return and pump outlet line	• Tighten power steering pressure hose tube nut to 41-54 Nm (31-40 lb-ft).

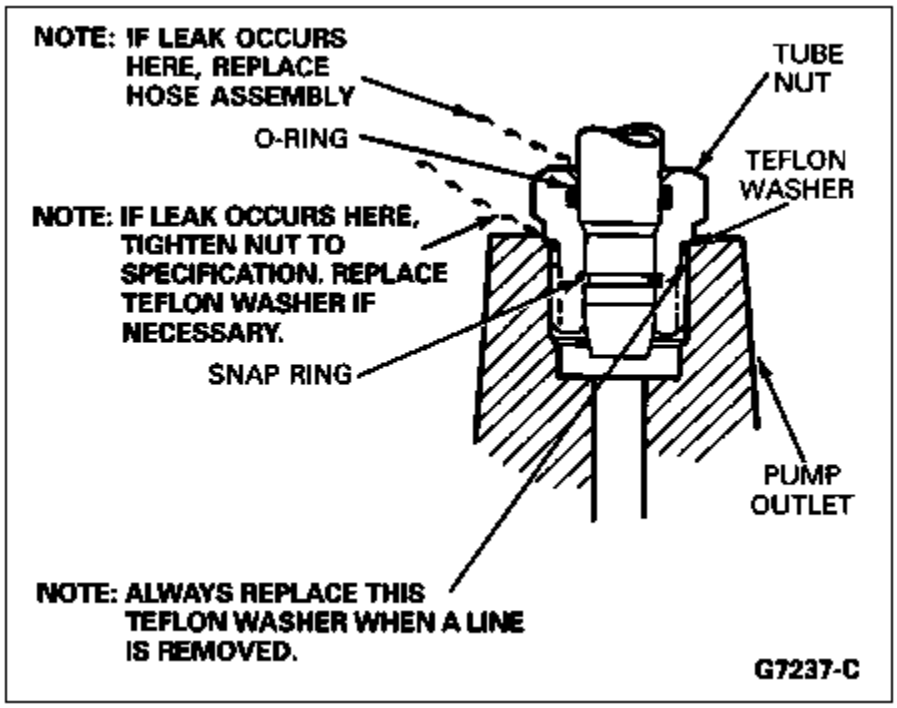
tomsn048@gmail.com

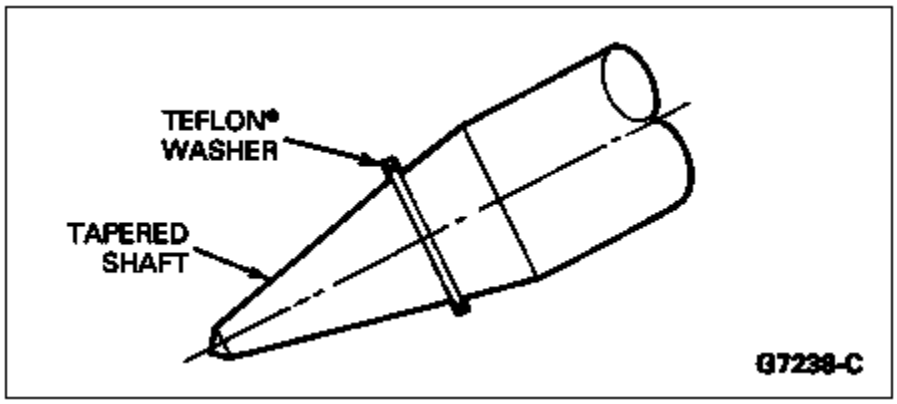
connector kit	• If leak continues, remove tube nut and: ▪ inspect Teflon® washer ▪ replace Teflon® washer **Note:** A tapered shaft may be required to stretch washer prior to installation on the tube nut, so it may be slipped over the nut threads. • Replace power steering pressure hose assembly if leak is caused by O-ring.
6. Power steering pump fluid reservoir filler cap	• Check for damaged or missing reservoir cap or power steering pump reservoir fluid level indicator. • Check fluid level; correct as required. • If leak continues, replace filler cap.



Item	Part Number	Description
1	—	Snap Ring (Part of 3A713)
2	—	Plastic Washer (Part of 3A713)
3	—	Tube Nut (Part of 3A713)
4	—	O-Ring (Part of 3A713)
5	3A713	Power Steering Return Hose

tomsn048@gmail.com





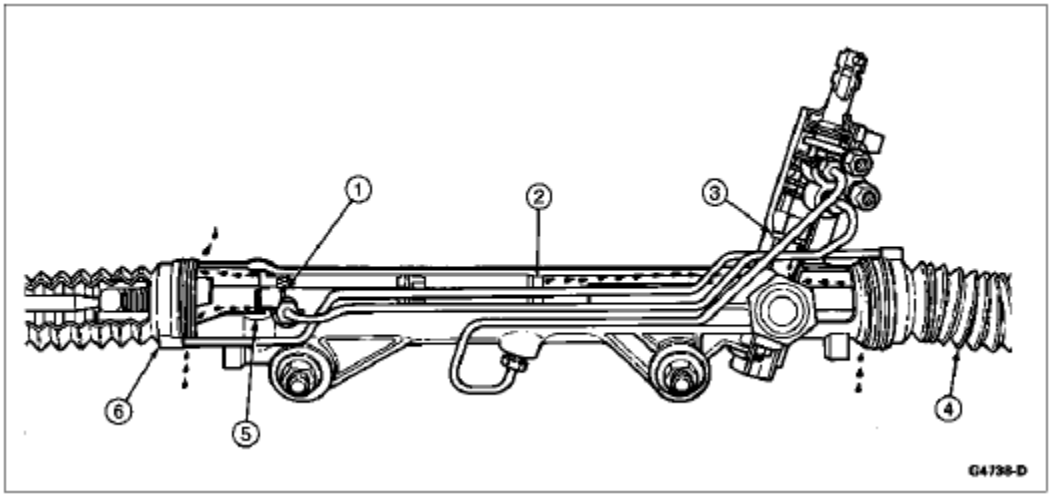
tomsn048@gmail.com

tomsn048@gmail.com

External Leakage — Leak Inspection, Ford Rack and Pinion Power Steering Gear, Aerostar

If the pinion seal leaks, it will show up as a bellows leak.

Steering Gear Bellows Leak Points, Aerostar



Item	Part Number	Description
1	—	Outer Rack Seal (Part of 3E501)
2	—	Inner Rack Seal (Part of 3E501)
3	—	Pinion Seal (Part of 3E501)
4	—	Left Bellows (Part of 3E501)
5	—	Leak Category 4
6	—	Right Bellows (Part of 3332)

LEAK INSPECTION

Leak Category	Part Required for Service
1. Line fittings	• Loose. Tighten to 27-34 Nm (20-25 lb-ft). Do not overtighten. • Plastic seals at tube nut. Plastic seals should be replaced each time hose is disconnected. • Replace power steering return hose or power steering pressure hose as required.
2. Leak at (right or left) transfer line	• Loose. Tighten to 20-34 Nm (15-25 lb-ft). Do not overtighten. • Replace O-ring seals.

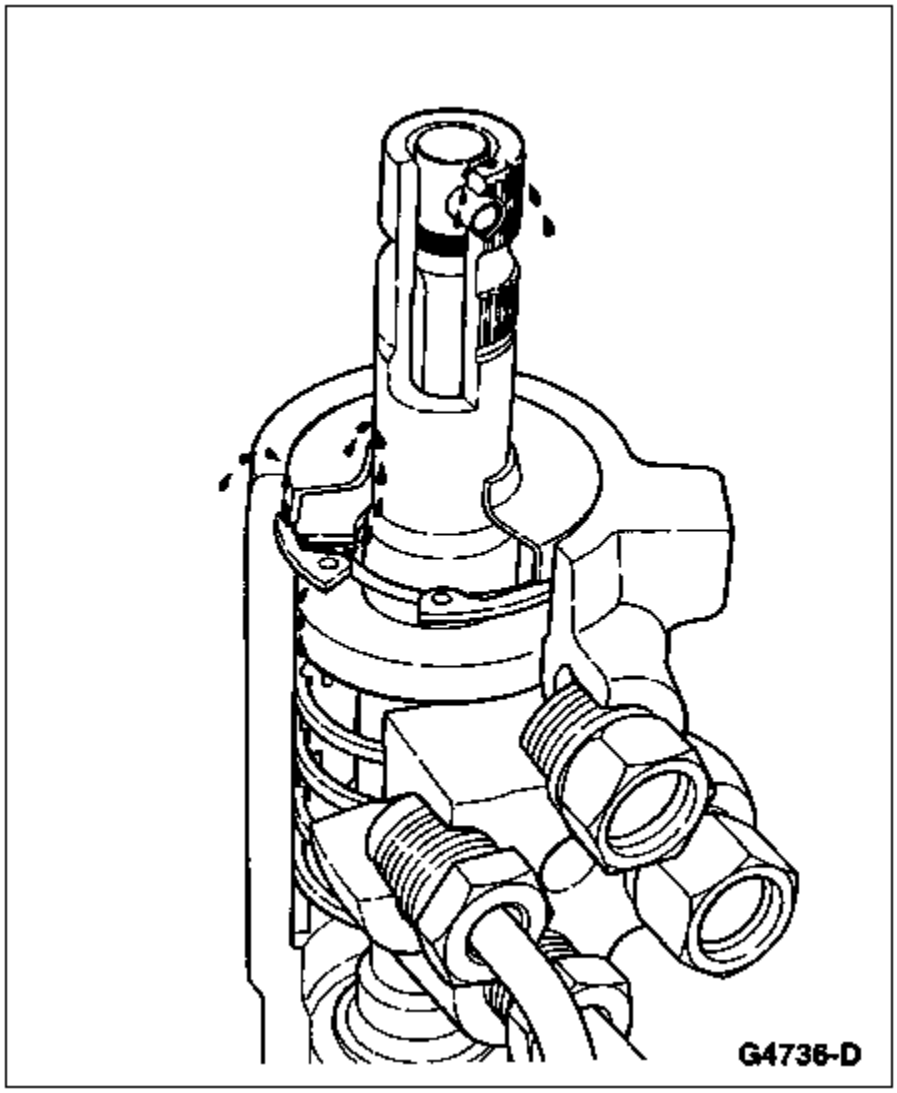
tomsn048@gmail.com

	• Replace line assembly as required.
3. Leak at power steering gear input shaft seal (Aerostar only)	• Replace power steering gear input shaft seal.
4. Leak at either or both bellows (Aerostar only)	• Replace steering gear.
5. Leak at end of power steering gear input shaft and control (Aerostar only)	• Replace steering gear.
6. Steering gear — porosity, cracked or stripped threads (Aerostar only)	• Replace the steering gear housing.

Note: Whenever a gear assembly is disassembled for seal replacement, the gear seal contact surfaces should be checked for roughness and cleaned. Replace components such as input shaft/valve assembly or rack assembly only if the sealing surfaces cannot be cleaned satisfactorily with crocus cloth.

tomsn048@gmail.com

External Leakage — Leak Points, Power Steering Input Shaft and Control Valve Assembly, Aerostar



Since most fluid leaks occur at the fittings and connections in a power steering hydraulic system, these parts should be checked before steering gear (3504) is replaced. Leakage at any of the areas shown in the illustration requires steering gear replacement.

1. Clean the outside of the steering gear, the bottom surfaces of the power steering pump (3A674), all lines and fittings. Be sure all dirt, oil, and grease is removed from areas where leaks may exist.

2. Tighten all fittings, using a flare-nut wrench. **Do not tighten the fittings with a standard open-end wrench.** If a properly tightened fitting leaks, replace the tube seat.

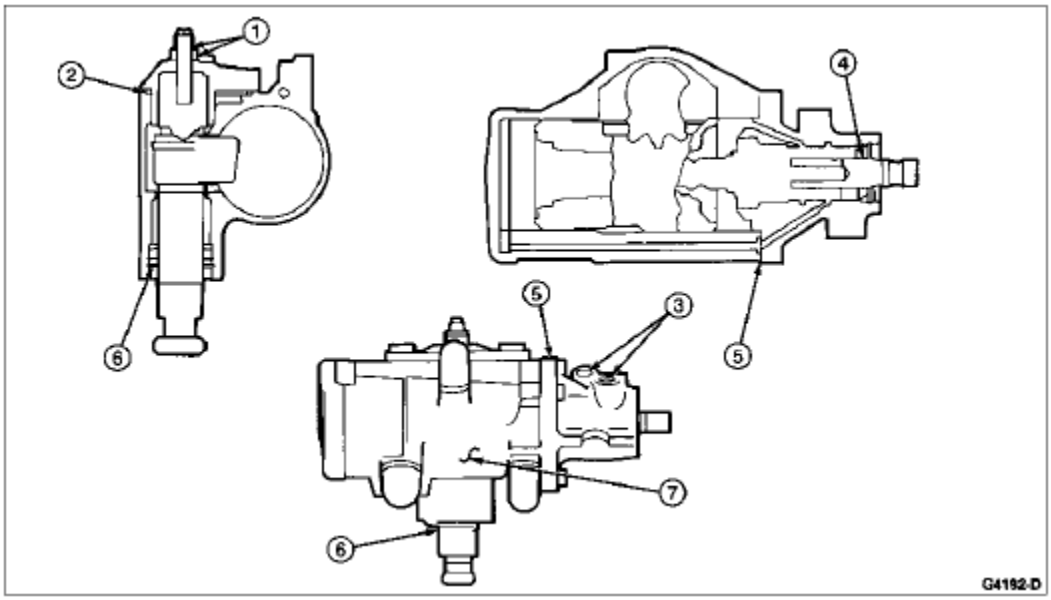
tomsn048@gmail.com

tomsn048@gmail.com

External Leakage — Leak Inspection, Power Steering Gear, Ranger

1. With the vehicle engine (6007) off, wipe the complete power system dry (steering gear (3504), power steering pump (3A674), hoses and connections).
2. Check oil level in pump power steering fluid reservoir and adjust as directed in this section.
3. Start the engine and turn the steering wheel (3600) from stop to stop several times. **Do not hold the steering wheel against the stops as damage to the power steering pump could result.**
4. Determine the exact source of leakage by carefully observing the leakage areas, as shown in the following illustration.

Power Steering Gear Leak Inspection, Ranger



POWER STEERING GEAR LEAK INSPECTION, RANGER

Leak Category	Part Required for Service
1. Sector shaft adjuster screw lock nut (Part of 3575)	• Tighten locknut to 48-61 Nm (35-45 lb-ft). Replace nut if leakage continues. Check the cover surface for damage.
2. Steering gear housing end cover	• Tighten bolts to 75-94 Nm (50-70 lb-ft). Replace steering gear sector shaft seal. Examine steering gear sector shaft seal for damage when replacing steering gear sector shaft seal.
3. Hose fittings (Part of 3548)	• Tighten fitting nuts to 30-40 Nm (22-30 lb-ft). If leakage continues, remove hose and clean interface area. If tube nut threads are

tomsn048@gmail.com

	damaged, replace hose. If tube seats are damaged, replace tube seat. If housing threads are badly stripped, replace the valve housing only.
4. Power steering gear input shaft seals	• Replace power steering gear input shaft seals and snap ring. Check power steering gear input shaft and control surface for damage. Check steering gear housing seal bore for damage.
5. Control valve housing mounting face (Part of 3548)	• Tighten control valve housing bolts to 42-62 Nm (30-45 lb-ft). If leak continues, replace O-ring. Examine sealing surface for damage.
6. Steering gear sector shaft seal and snap ring	• Replace steering gear sector shaft seal. Check seal bore, steering gear sector shaft, and snap ring groove for damage. Check sector housing roller bearing for damage.
7. Steering gear housing	• Replace steering gear housing.

tomsn048@gmail.com

External Leakage — Leak Check, Manual Steering Gear, Ranger

1. With the engine (6007) off, wipe the steering gear (3504) clean.

2. **WARNING: WHEN USING A JACK TO LIFT THE VEHICLE, ALWAYS SUPPORT THE VEHICLE PROPERLY USING JACKSTANDS.**

   NOTE: To ease the turning effort of the steering wheel (3600), lift the front of the vehicle just enough to raise the front tires off the ground.

   Turn the steering wheel from stop to stop several times.

3. Check the sector shaft seal and steering gear input shaft seal for leakage. Also check the sector cover area, the steering gear worm thrust bearing adjuster (3A670) and the steering gear housing (3548) of the steering gear for signs of steering gear grease leakage.

4. If leakage is observed, replace the seals.

5. If leakage is observed at the steering gear housing end cover (3568), tighten the bolts to specification. If leakage still occurs at the steering gear housing end cover, replace the steering gear housing end cover. Refer to Section 11-01 for replacement procedures.

6. If leakage occurs at the steering gear worm thrust bearing adjuster, check the plug for cracks. Refer to Section 11-01 for service.

7. If the steering gear housing leaks, it must be replaced. Refer to Section 11-01 for replacement procedures.

tomsn048@gmail.com

Pump Flow and Pressure Tests

The flow and pressure tests will measure system component performance. Follow the steps below.

Prior to performing the Pump Flow and Pressure Test, the following checks for conditions which could cause loss of power assist must be performed and corrective action taken if necessary.

1. Check power steering fluid reservoir for proper fluid level and contamination.
2. Check tires for correct air pressure.
3. Check drive belt (8620) for proper tension.
4. Check power steering pump (3A674) for correct model and vehicle application.
5. Check part number for correct power steering pump pulley (3A733) on power steering pump and steering gear (3504).
6. Visually check entire system for damage, replacing parts as necessary.

If the above items are to specifications, or have been corrected, and the loss of assist still exists, test the power steering pump flow and pressure to determine whether the trouble is in the power steering pump, steering gear, or control valve using the following test equipment.

Test Equipment

1. Engine tachometer.
2. Thermometer — 17° to 140° C (0° to 300° F).
3. **CAUTION: Possible contamination of the power steering system fluid may cause permanent damage to gauges and instruments incorporated in the analyzer.**

   Power Steering Analyzer D79L-33610-A or equivalent.
4. One set of adapter fittings.

Test Procedure

The following test procedure used in conjunction with the Power Steering Analyzer D79L-33610-A or Rotunda Power Steering Analyzer 014-00207 or equivalent provides a method for checking the complete power steering system. The Power Steering Analyzer can be used to determine the cause of hard steering and/or lack of assist problems. The analyzer provides readouts for the following:

1. System back pressure.

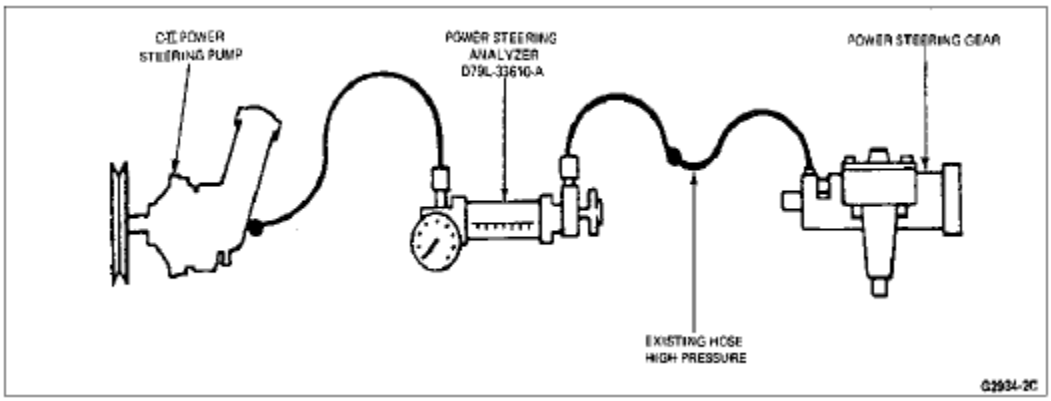
tomsn048@gmail.com

2. Pump flow.
3. Power steering control valve and cylinder internal leakage.

The interpretation of the above readouts will determine which of the following conditions or components are the cause of the problem:

4. Restriction in hoses or fittings.
5. Power steering gear input shaft and control valve and cylinder.
6. Sticking power steering gear input shaft and control valve.
7. Inefficient power steering pump rotor (3D607) and cam pack.
8. Sticking relief valve.
9. Binding in suspension.

Power Steering Analyzer Hookup, Typical Installation



tomsn048@gmail.com

tomsn048@gmail.com

Tie Rod Articulation Torque

1. **NOTE: The articulation effort may be checked with the steering gear (3504) removed or installed in the vehicle. Refer to the appropriate steps.**

   Disconnect the tie rod end (3A130) from the front wheel spindle (3105) as described under Steering Gear in the Removal and Installation portion of the appropriate Group 11 Section.

2. **CAUTION: When replacing tie rod ends, make sure the new tie rod end is adjusted to the same length as the original tie rod end.**

   Check tie rod ends for looseness and replace as necessary.

3. Connect the tie rod ends to the front wheel spindles as described under Steering Gear in the appropriate Group 11 Section. Check and adjust toe as described in Section 04-00 .

tomsn048@gmail.com

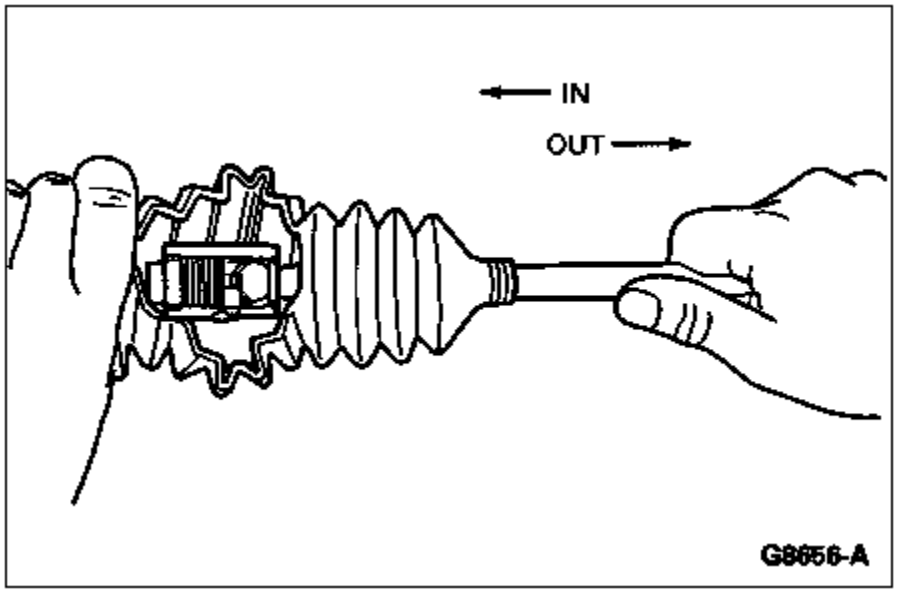
Front Wheel Spindle Connecting Rod or End

1. If tie rod end (3A130) is worn or exhibits excessive lash or axial free play, the following symptoms may occur:

    a. Clunk or rattle noise in front end during deceleration.
    b. Front tire wear.
    c. Inability of consistent alignment setting by service.
    d. Lack of center feel.
    e. Vehicle wander.

2. Replace both tie rod ends if one tie rod end is worn.

Inner Tie Rod Lash Check



tomsn048@gmail.com

tomsn048@gmail.com

Purging Power Steering System of Air

1. Tightly insert the rubber stopper of the air evacuator assembly into power steering fluid reservoir.
2. Start the engine.
3. Apply 68-85 kPa (20-25 in-Hg) maximum vacuum for minimum of three minutes at idle; maintain maximum vacuum with vacuum source. Refer to the illustration.
4. Release vacuum and remove vacuum source.
5. Turn the engine off.
6. Add fluid to FULL WARM or power steering oil reservoir (3A697) center mark.
7. Reinstall vacuum source and apply 68-85 kPa (20-25 in-Hg) vacuum.
8. Start the engine engine (6007)
9. **NOTE: Do not hold steering wheel on stops.**

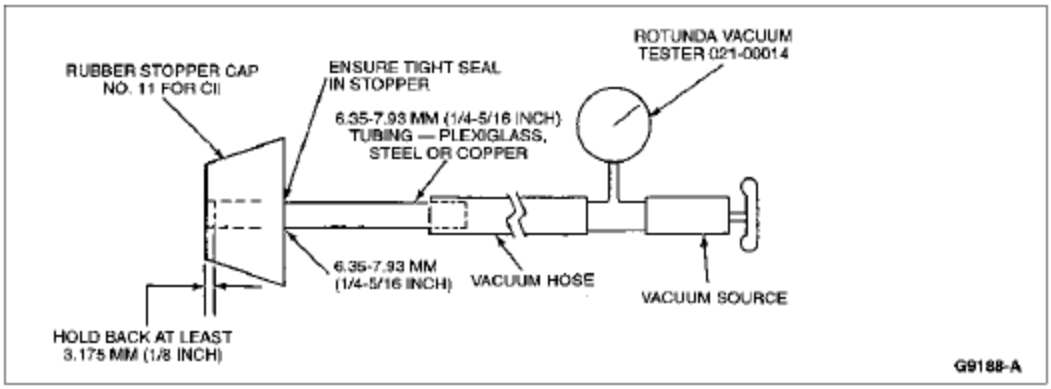
   Cycle steering wheel (3600) from lock to lock every 30 seconds for approximately 5 minutes.
10. Turn engine off, release vacuum and remove vacuum source.
11. Add fluid if necessary and install dipstick or reservoir cap.
12. **NOTE: Do not hold steering wheel on stops.**

    Start engine and cycle steering wheel from lock to lock every 30 seconds for approximately 5 minutes.
13. **NOTE: In severe cases, it may be necessary to repeat air purge with vacuum source procedure.**

    Check for oil leaks at all connections.

Purging Power Steering System of Air

tomsn048@gmail.com



tomsn048@gmail.com

Start-Up Procedure After Power Steering Pump or Gear Service

Upon initial engine start-up after a power steering pump or gear overhaul (particularly the pump), there is very frequently much noise and aeration. This is due to air trapped in the overhauled unit which mixes with the surging fluid and causes aeration. The problem can be minimized if the following procedure is used.

1. Disconnect ignition control module (ICM) (12A199) connector to prevent engine (6007) from starting.

2. Fill the power steering oil reservoir (3A697).

3. Crank the engine with the starter motor (11001) and continue adding fluid until the level remains constant. Be careful to avoid prolonged cranking as the battery (10653) may be drained and the starter motor damaged.

4. Rotate the steering wheel (3600) approximately 30 degrees each side of center while continuing to crank the engine.

5. Recheck the fluid level and fill as required.

6. Reconnect the ICM connector.

7. To clear diagnostic trouble codes, disconnect battery for one minute and then reconnect battery.

8. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.**

   Start the engine and allow it to run for several minutes. Rotate the steering wheel from stop to stop.

9. Shut off the engine and recheck the fluid level. Add as required.

tomsn048@gmail.com

tomsn048@gmail.com

Pump, Power Steering

Flushing

When contamination is noted while overhauling the steering gear (3504), it will be necessary to flush the power steering pump (3A674).

1. Leave all hoses connected, except the power steering pressure hose (3A719) at the steering gear.
2. Place the power steering pressure hose in a suitable container.
3. Fill the power steering oil reservoir (3A697) with MERCON® Power Steering Fluid.
4. Disconnect the ICM connector to prevent the engine from starting.
5. While approximately two quarts of the power steering gear fluid are being poured into the power steering fluid reservoir, engage the starter motor (11001).
6. As soon as all the fluid has been poured in, turn off the ignition switch (11572).
7. Attach the power steering pressure hose at the steering gear.
8. Check the fluid level.
9. Crank the engine (6007) with the starter motor and continue adding fluid until the level remains constant. Connect the ICM connector.
10. Start the engine and cycle the steering wheel (3600) from stop to stop to expel any air from the system.

tomsn048@gmail.com

tomsn048@gmail.com

Steering Gear

Flushing

Flushing the steering gear (3504) is required when installing a repaired power steering pump (3A674).

1. Remove the power steering pump and remove the power steering pump rotor (3D607) as outlined in Section 11-02A .

2. Install the power steering pump rotor on the repaired power steering pump. Install the power steering pump and connect only the power steering pressure hose (3A719) to the power steering pump.

3. Place the power steering return hose (3A713) from the steering gear in a suitable container and plug the power steering fluid reservoir return tube.

4. Fill the power steering fluid reservoir with MERCON® Power Steering Fluid.

5. Disconnect the ICM connector to prevent the engine (6007) from starting and raise the front wheels (1007) off the ground.

6. While approximately two quarts of steering gear fluid are being poured into the reservoir, crank the engine using the ignition switch (11572). At the same time, cycle the steering wheel (3600) from stop to stop. Do not hold the steering wheel against a stop for more than three to five seconds at a time.

7. **NOTE: Be careful to avoid excessive cranking as the battery (10655) will be drained and the starter motor (11001) damaged.**

   As soon as all of the fluid has been poured in, turn the ignition switch off and attach the ICM connector.

8. **NOTE: When the battery (10653) is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.**

   To clear fault codes, disconnect the battery for one minute, and then reconnect thebattery.

9. Remove the plug from the power steering oil reservoir return tube, and attach the power steering return hose to the power steering fluid reservoir.

10. Check the power steering fluid reservoir fluid level, add fluid to the proper level.

11. Start the engine and cycle the steering from stop to stop to expel any trapped air from the system.

tomsn048@gmail.com

tomsn048@gmail.com

Lubrication Schedule, Manual Steering Gear

The steering gear (3504) is factory-filled with steering gear lubricant. Seasonal change of this lubricant should not be performed and the steering gear housing (3548) should not be drained. No additional lubricant is required for the life of the steering gear unless leakage is noted or repairs performed.

Every 50,000 km (30,000 mi), the steering gear should be inspected for seal leakage (actual solid grease, not just oil film). If the seal is replaced or the steering gear is overhauled, the steering gear housing should be refilled. Refer to Section 11-01 for recommended lubricant and fill procedures.

tomsn048@gmail.com

SPECIFICATIONS

Belt Tension

Tension Codes	New [a] N (Lbs)	Used/Reset [b] N (Lbs)	Allowable Minimum [c] N (Lbs)
4.0L	480-586 (108-132)	480-586 (108-132)	480 (108)
3.0L	444-622 (100-140)	355-444 (80-100)	266 (60)

[a] New installation, no run time.
[b] Used belt, more than 5 minutes of operation.
[c] When checking belt tension or a used belt, the tension must be above the "allowable minimum." If below minimum, it must be reset (adjusted).

Note: The 2.3L and 3.0L engines are equipped with drive belt tensioners that indicate when the drive belt is worn (stretched). A pointer and gauge are built into the drive belt tensioner. When the pointer no longer registers within the range limits of the gauge, the drive belt must be replaced.

Power Steering Pump Specifications

Vehicle Model	Minimum Flow @ 5100 kPa (740 psi)		Minimum Relief Pressure		Maximum Relief Pressure		Maximum Free Flow @ 1500 RPM	
	Liters/ Minute 76℃ (170℉)	Gallons/Minute 76° C (170°F)	kPa	psi	kPa	psi	Liters/ Minute	Gallons/Minute

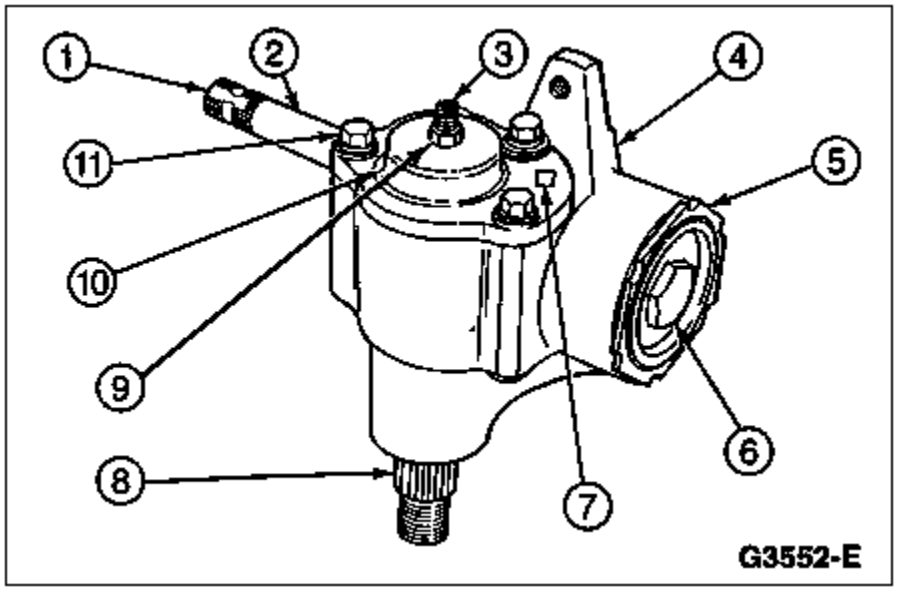
Steering Gear

The steering gear (3504) is of the worm and recirculating ball type. The steering gear sector shaft (3575) is supported by a needle bearing in the steering gear housing (3548) and a bushing in the steering gear housing end cover (3568). A steering gear input worm gear and rack (3524) is used which has threads that mate to the threads of the steering gear input worm gear and rack via continuous rows of steering gear worm balls (3647) between the two. Steering gear worm balls recirculate through two steering gear ball return guides (3523). The steering gear input worm gear and rack has gear teeth cut on one face which mesh with gear teeth on the steering gear sector shaft. As the steering wheel (3600) is rotated, the steering gear input worm gear and rack rotates, causing the steering gear input worm gear and rack to move up or down the steering gear input worm gear and rack. Since the gear teeth on the steering gear input worm gear and rack are meshed with the gear teeth on the steering gear sector shaft, the movement of the steering gear input worm gear and rack causes the steering gear sector shaft to rotate and swing the steering gear sector shaft arm (3590).

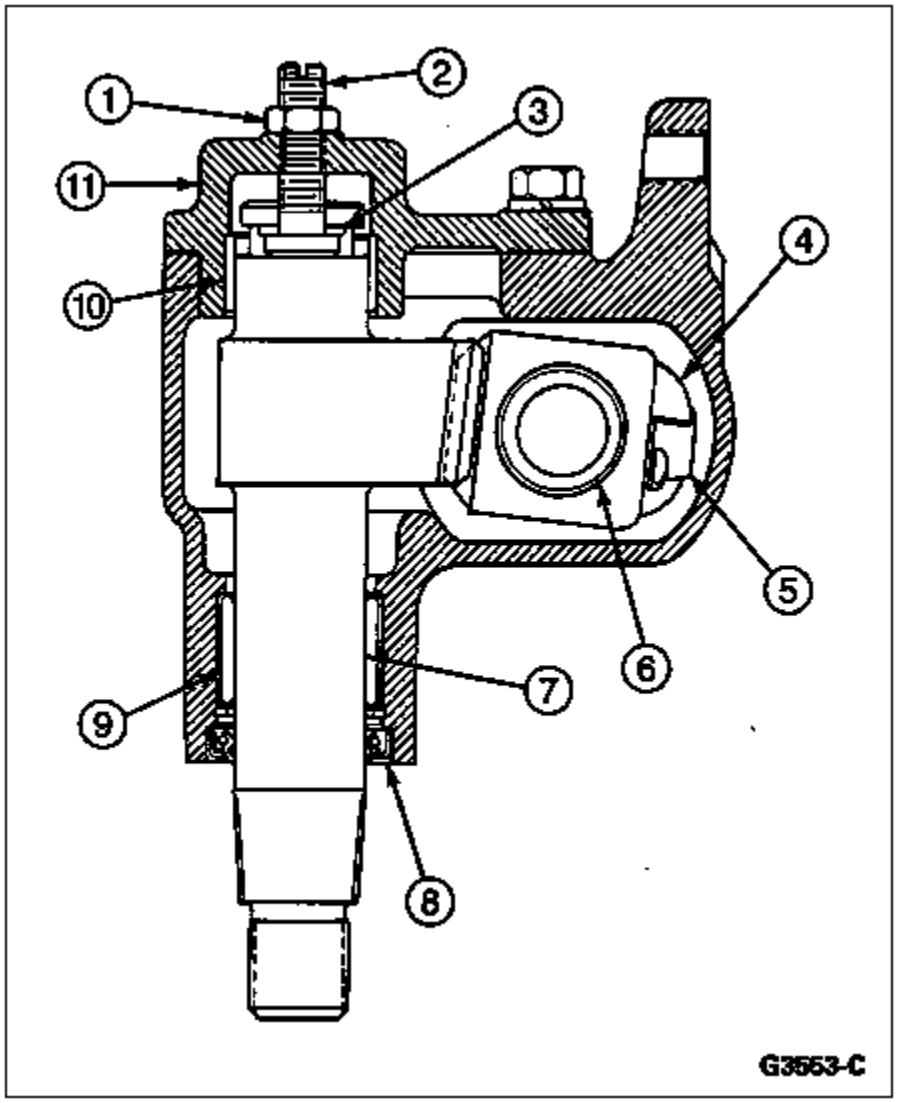


Item	Part Number	Description
1	3A525	Steering Column Intermediate Shaft Coupling
2	3524	Steering Gear Input Worm Gear and Rack
3	3577	Steering Gear Sector Shaft Adjusting Screw
4	3548	Steering Gear Housing
5	3707	Steering Gear Worm Thrust Bearing Locknut
6	3A670	Steering Gear Worm Thrust Bearing Adjuster
7	—	Location of Gear Model Number
8	3575	Steering Gear Sector Shaft
9	—	Steering Gear Sector Shaft Adjusting Screw Locknut

		(Part of 3577)
10	3568	Steering Gear Housing End Cover
11	—	Sector Cover Bolts (Part of 3548)

The design of two separate circuits of balls results in an almost friction-free operation of the steering gear input worm gear and rack and the steering gear input worm gear and rack. When the steering wheel is turned, the steering gear worm balls roll in the ball thread grooves of the steering gear input worm gear and rack and steering gear input worm gear and rack. When the steering gear worm balls reach the end of their respective circuit, they enter the steering gear ball return guides and are returned to the other end of the circuits.

The teeth on the steering gear sector shaft and the steering gear input worm gear and rack are designed so that an interference fit exists between the two when the front wheels are straight ahead. This interference fit eliminates gear tooth lash on center for a positive feel when driving straight ahead. Proper mesh engagement between the steering gear sector shaft and steering gear input worm gear and rack is obtained by an adjusting screw which moves the steering gear sector shaft axially.



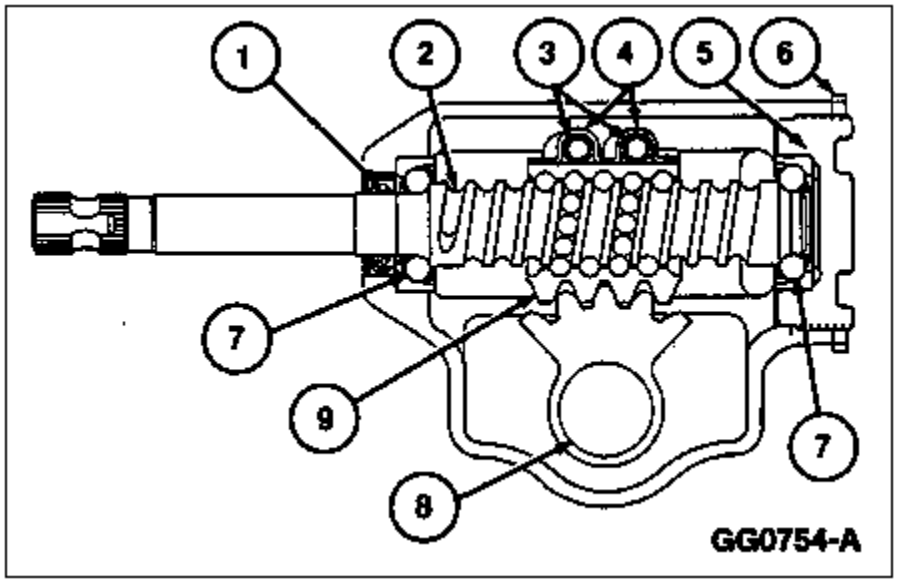
Item	Part Number	Description
1	—	Locknut (Part of 3577)
2	3577	Steering Gear Sector Shaft Adjusting Screw
3	—	Shim (Part of 3575)
4	3523	Steering Gear Ball Return Guide
5	3544	Steering Gear Ball Return Guide Clamp
6	3524	Steering Gear Input Worm Gear and Rack
7	3575	Steering Gear Sector Shaft
8	—	Seal (Part of 3575)
9	—	Needle Bearing (Part of 3575)
10	—	Bushing (Part of 3575)
11	3568	Steering Gear Housing End Cover

The steering gear worm thrust bearing adjuster (3A670) can be turned to provide proper preloading of the steering gear worm thrust bearings (3571). Worm bearing preload eliminates worm end play and is necessary to prevent steering free play and vehicle wander.

NOTE: The manual steering gear will not cause the vehicle to pull to one side. A minor pull condition caused by the tires or suspension misalignment can be masked (covered up) by setting preload and meshload to specifications. The steering gear will not cause road wheel shimmy, although if the steering gear meshload/preload is set too low, it may amplify an existing shimmy condition in the suspension.

The manual steering gear is a constant (23.75:1) ratio.

Manual Steering Gear



Item	Part Number	Description

Steering Gear

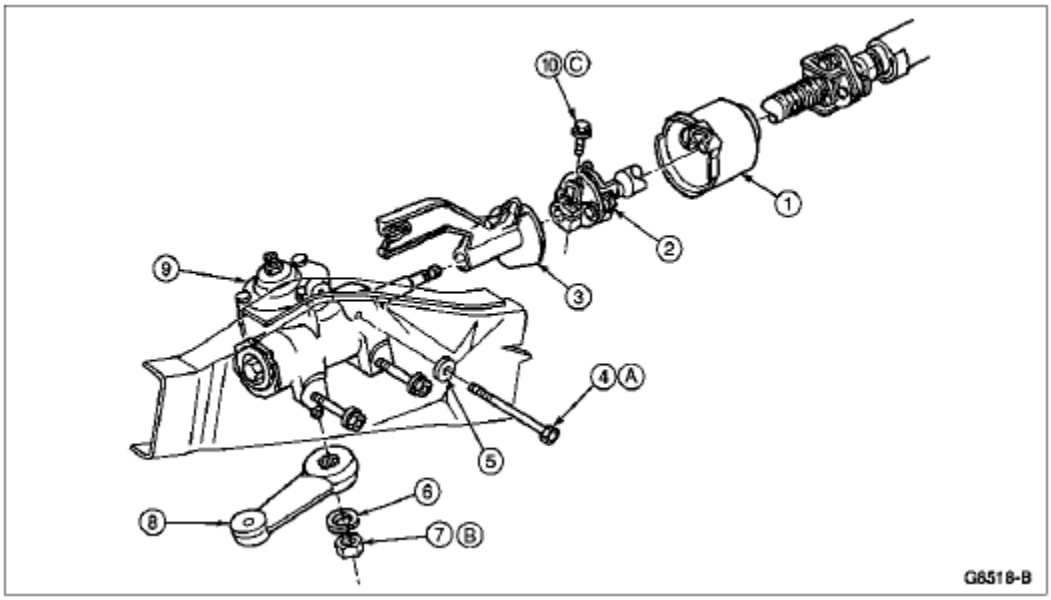
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F

Removal

1. Slide the upper steering shaft u-joint shield (3F540) from the lower steering column intermediate shaft coupling (3A525) to access the pinch bolt.
2. Disconnect the lower steering column shaft (3B676) at the steering gear (3504).
3. Remove the lower steering shaft u-joint shield.
4. Remove the nut and washer that secures the steering gear sector shaft arm (3590) to the steering gear sector shaft (3575).

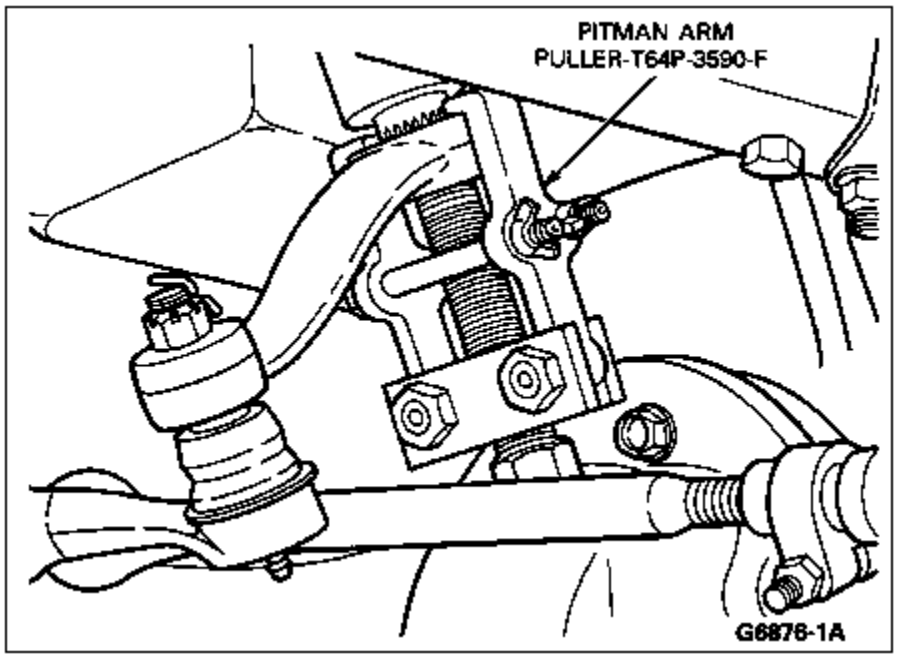
Steering Gear



Item	Part Number	Description

1	3F540	Steering Shaft U-Joint Shield (Upper)
2	—	Steering Column Intermediate Shaft
3	3C662	Steering Shaft U-Joint Shield (Lower)
4	389564-5190	Bolt
5	388273-S100	Washer
6	34798-S2	Washer
7	380771-S101	Nut
8	3590	Steering Gear Sector Shaft Arm
9	3504	Steering Gear
10	N803942-S100	Intermediate Shaft Pinch Bolt
A	—	Tighten to 68-84 Nm (50-62 Lb-Ft)
B	—	Tighten to 230-310 Nm (170-230 Lb-Ft)
C	—	Tighten to 40.3-54.7 Nm (29.4-39.9 Lb-Ft)

5. Remove the steering gear sector shaft arm using Pitman Arm Puller T64P-3590-F. Do not hammer on the end of the puller as this can damage the steering gear.



6. Remove the bolts and washers that attach the steering gear to the side rail. Remove the steering gear.

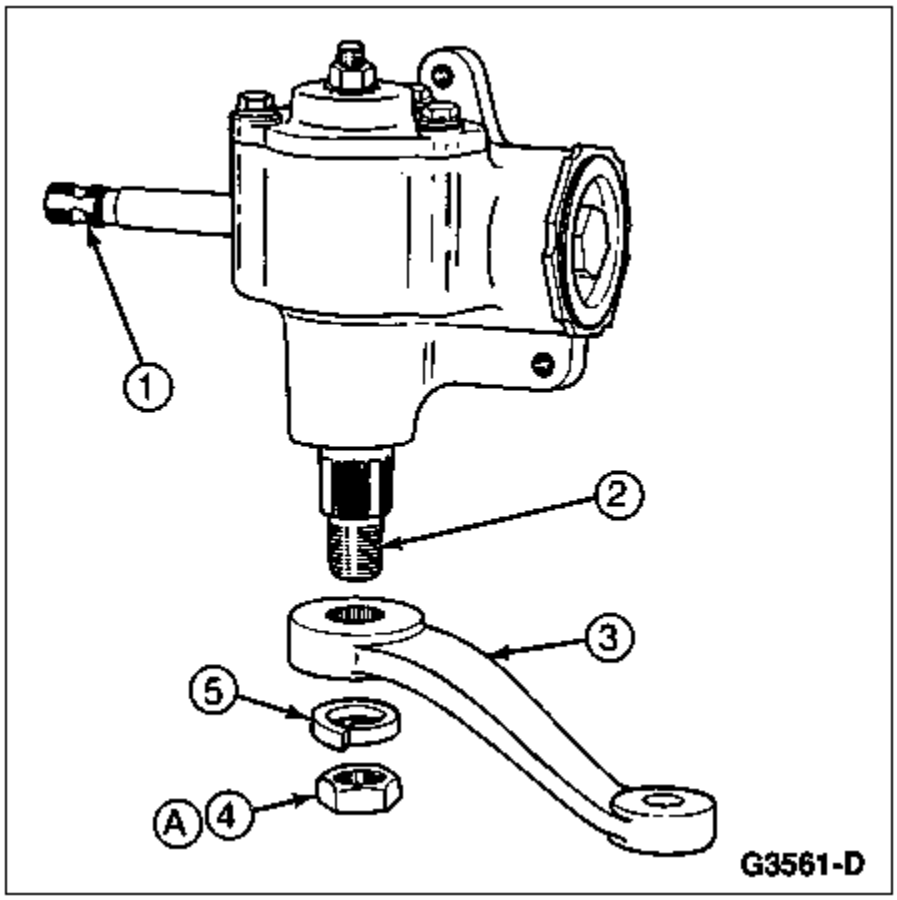
Installation

1. Rotate the steering gear input worm gear and rack (3524) from stop to stop, counting the total number of turns. Then turn back exactly half-way, placing the steering gear on center.

2. Slide the lower steering shaft u-joint shield on the steering gear input worm gear and rack.

3. Position the steering column intermediate shaft coupling on the steering gear input worm gear and rack. Make sure that the flat on the steering gear input worm gear and rack is facing straight up and aligns with the flat on the steering column intermediate shaft. Install the steering gear to side rail with bolts and washers. Tighten the bolts to 68-84 Nm (50-62 lb-ft).

4. Install the steering column intermediate shaft coupling to steering gear input worm gear and rack pinch bolt and tighten to 40.3-54.7 Nm (29.4-39.9 lb-ft).



Item	Part Number	Description
1	3524	Steering Gear Input Gear Worn and Rack
2	3575	Steering Gear Sector Shaft
3	3590	Steering Gear Sector Shaft Arm
4	380771	Nut
5	34814	Washer
A	—	Tighten to 230-310 Nm (170-230 Lb-Ft)

5. Align the two blocked teeth on the steering gear sector shaft arm with four missing teeth on the steering gear sector shaft. Place the steering gear sector shaft arm on the steering gear sector shaft and install the attaching washer and nut. Tighten the nut to 230-310 Nm (170-230 lb-ft).

6. Snap the upper steering shaft u-joint shield to the lower steering shaft u-joint shield.

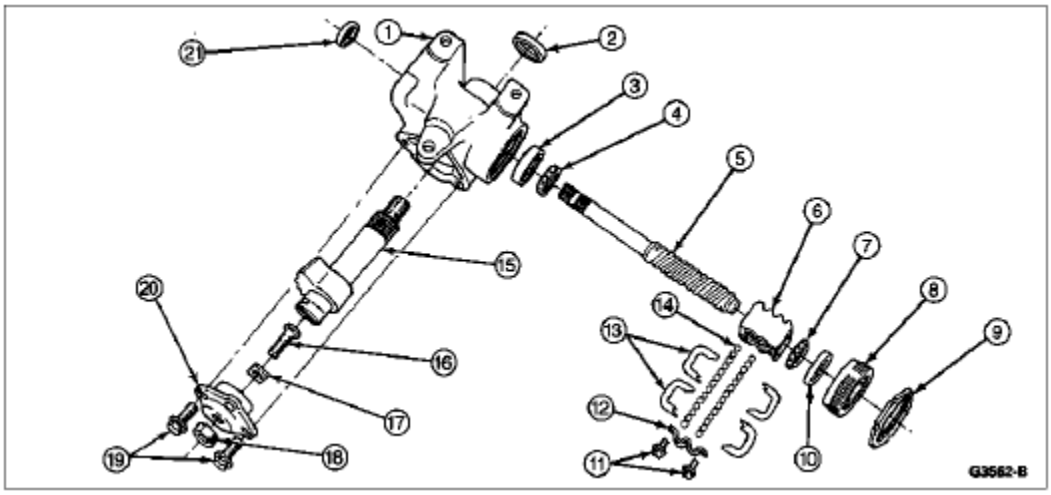
7. Count the steering wheel rotations for a full left-hand and full right-hand turn, making sure they are equal.

Steering Gear

CAUTION: The steering gear parts must be kept free of dirt. Clean paper or rags should be spread on the work bench before starting disassembly of the steering gear (3504).

Disassembly

Steering Gear, Exploded View



Item	Part Number	Description

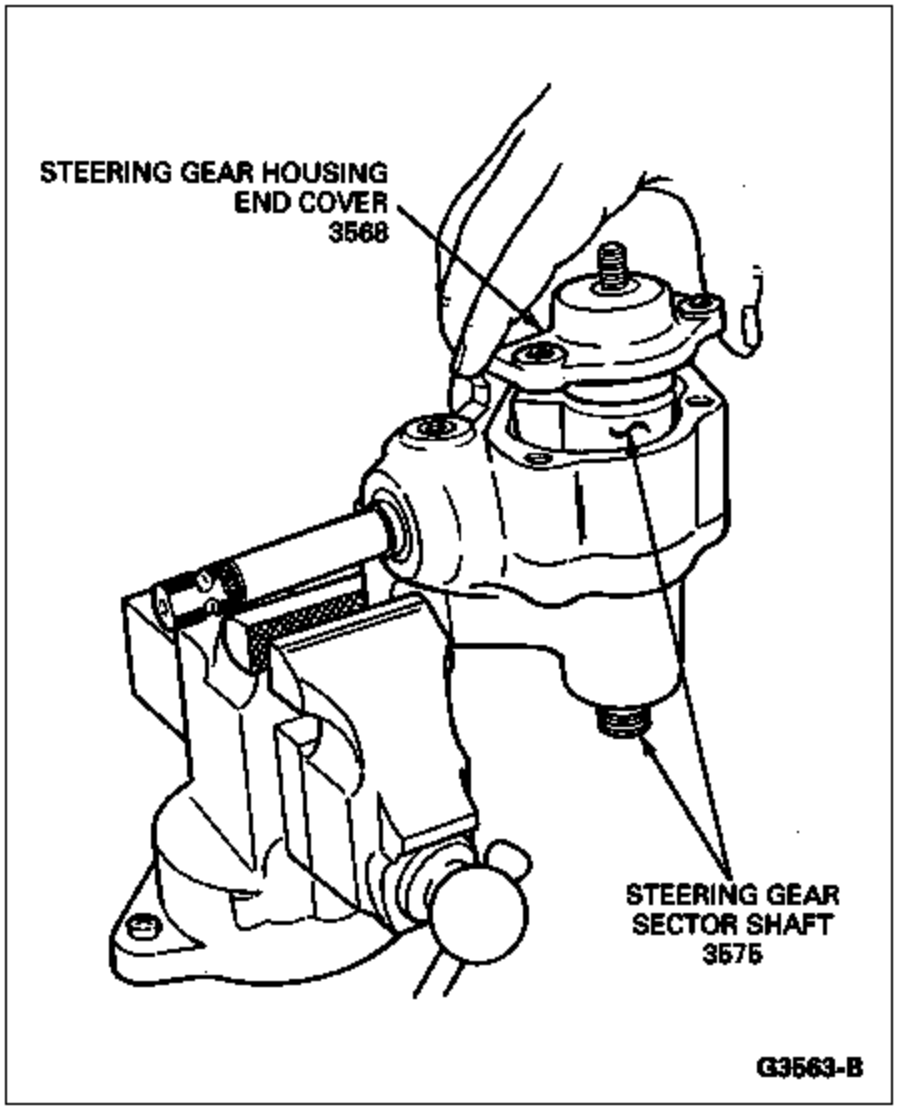
2	3591	Steering Gear Sector Shaft Housing Oil Seal
3	3552	Steering Gear Worm Bearing Cup
4	3571	Steering Gear Worm Thrust Bearing
5	3524	Steering Gear Input Worm Gear and Rack
6	3524	Steering Gear Input Worm Gear and Rack
7	3571	Steering Gear Worm Thrust Bearing
8	3A670	Steering Gear Worm Thrust Bearing Adjuster
9	3707	Steering Gear Worm Thrust Bearing Locknut
10	3552	Steering Gear Worm Bearing Cup
11	388889-S	Ball Guide Clamp Bolts
12	—	Ball Return Guide Clamps

13	3523	Steering Gear Ball Return Guide
14	3647	Steering Gear Worm Ball
15	3575	Steering Gear Sector Shaft
16	3577	Steering Gear Sector Shaft Adjusting Screw
17	3A657	Steering Gear Sector Shaft Adjusting Shim Kit
18	34690-S	Lash Adjuster Locknut
19	383685-S2	Sector Cover Bolts
20	3568	Steering Gear Housing End Cover
21	—	Input Shaft Oil Seal

1. Remove steering gear; refer to procedure in this section.

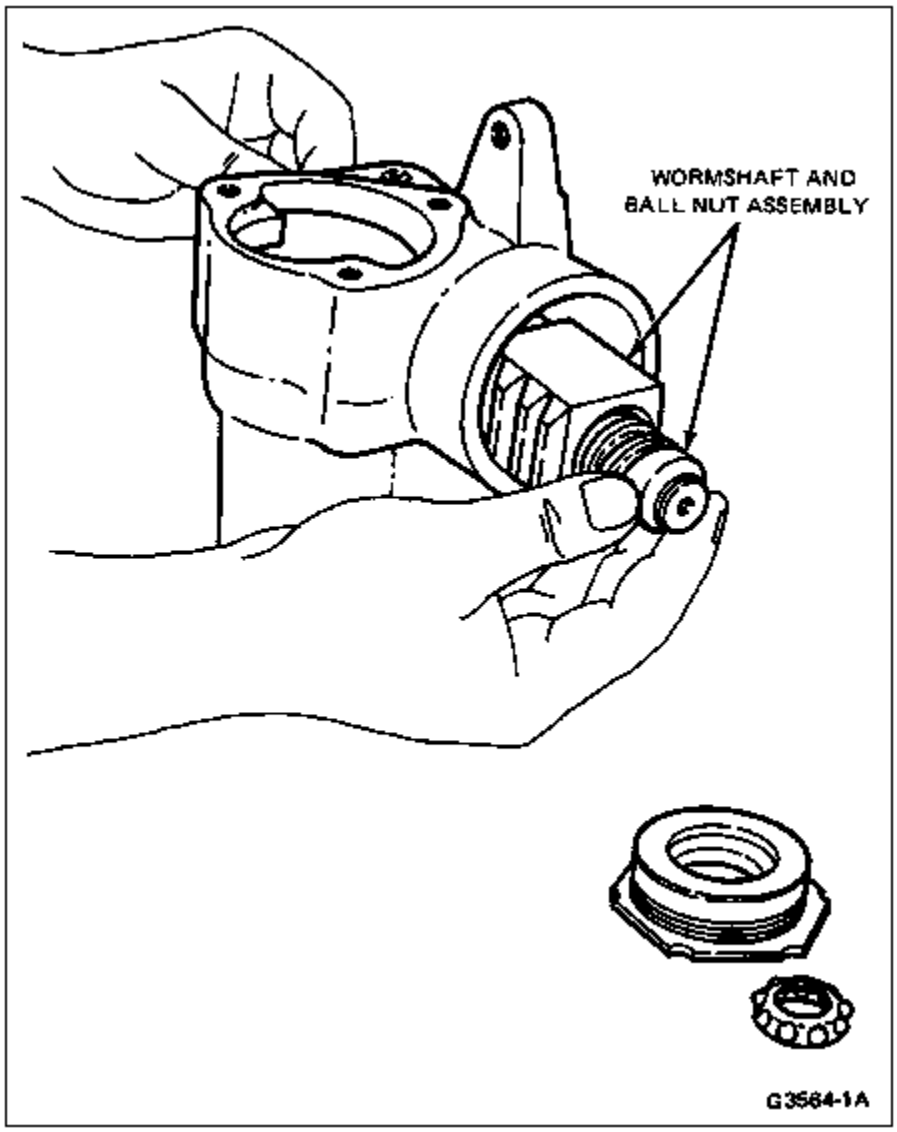
2. Rotate the steering gear input worm gear and rack (3524) from stop to stop, counting the total number of turns. Then turn back exactly half-way, placing the steering gear on center.

3. Remove the sector adjusting cover bolts. Remove the steering gear sector shaft (3575) with steering gear housing end cover (3568). Remove steering gear housing end cover from the steering gear sector shaft by turning the screw clockwise. KEEP THE SHIM WITH THE SCREW.



4. Loosen the steering gear worm thrust bearing locknut (3707) with Locknut Wrench T82T-3504-BH and remove the steering gear worm thrust bearing adjuster (3A670) and the steering gear worm thrust bearing (3571).

5. Carefully pull steering gear input worm gear and rack from steering gear housing (3548) and removesteering gear worm thrust bearing. To avoid damage to the steering gear ball return guide (3523), keep the ball nut from running down to either end of the worm.



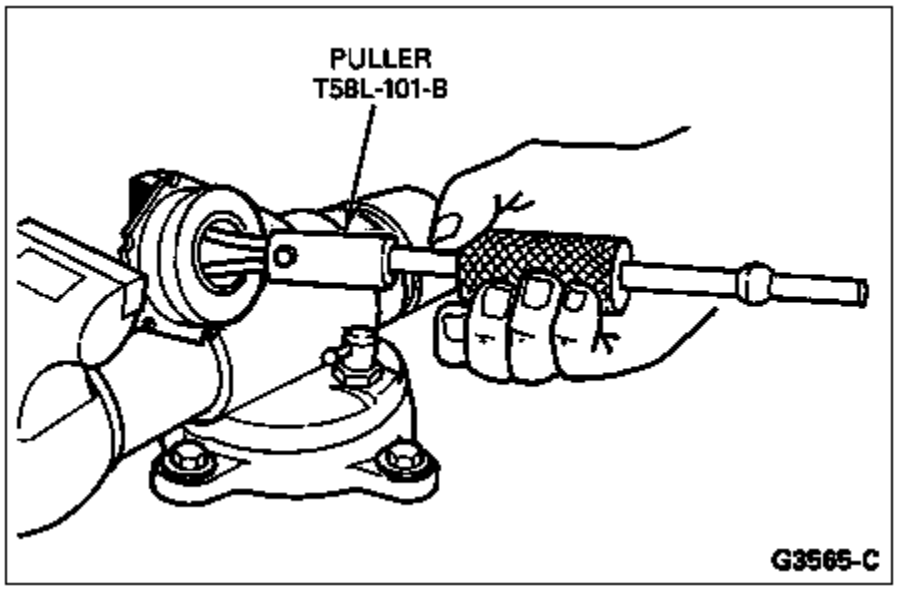
6. **NOTE: Because the individual parts of the worm and ball nut are not available for service, do not disassemble parts. If the steering gear sector shaft cannot rotate freely in the steering gear input worm gear and rack, replace the entiresteering gear.**

   NOTE: To avoid damage to the steering gear ball return guides, keep the steering gear input worm gear and rack from running down to either end of the steering gear input worm gear and rack.

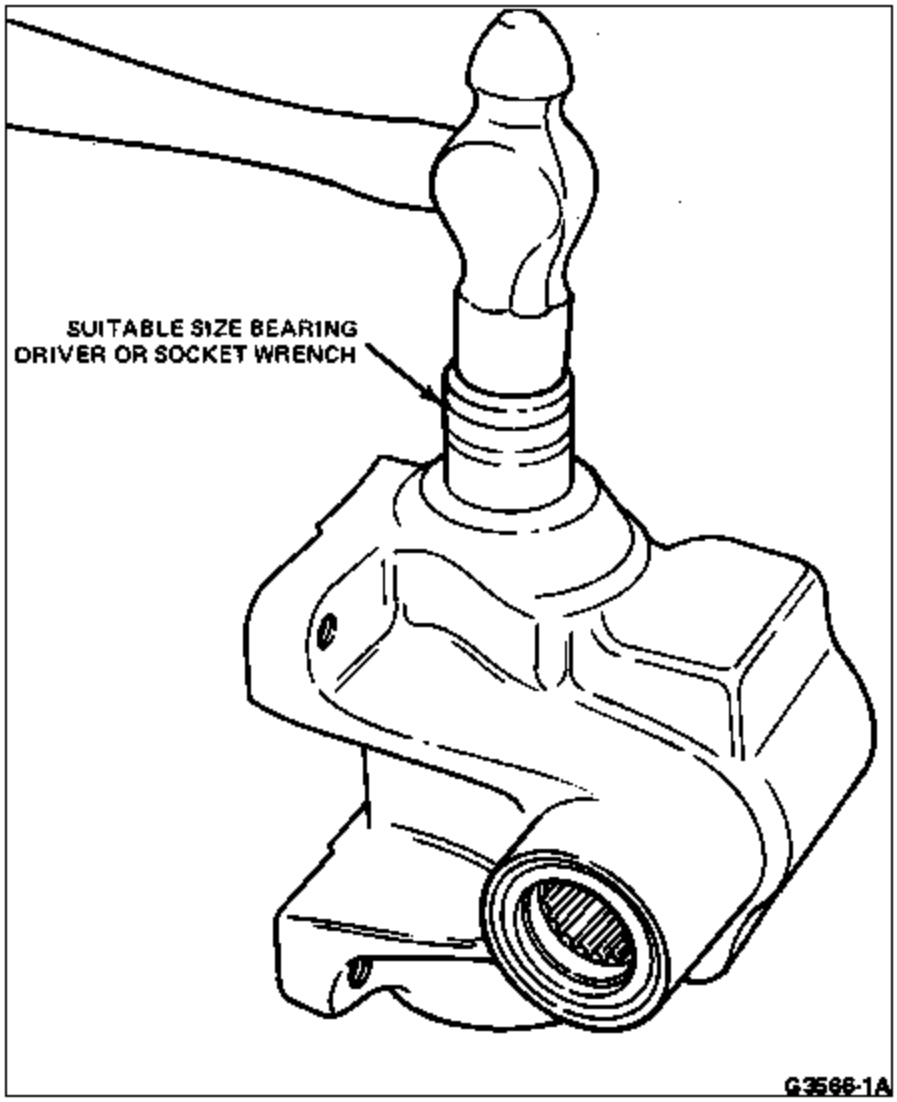
   Pry out the sector shaft and steering gear sector shaft oil seals (3738). Discard the seals.

Housing Bearing Cup Removal

Remove the steering gear worm bearing cup (3552) using Puller T58L-101-B.



Remove the steering gear worm bearing cup from the steering gear housing (3548) using a hammer and a suitable size bearing driver or socket.



SUITABLE SIZE BEARING
DRIVER OR SOCKET WRENCH
G3566-1A

Sector Shaft Needle Bearing

NOTE: The sector shaft needle bearing is serviced only as a unit with the housing. Do not attempt to remove the sector needle assembly.

NOTE: All the parts must be washed in cleaning solvent and dried thoroughly with air prior to inspection.

Inspection

1. Scrape off the gasket material from the mating surfaces of the steering gear housing end cover (3568) and steering gear housing (3548) and inspect surface.

2. Carefully inspect steering gear worm balls (3647) and steering gear worm bearing cups (3552) for signs of indentation. Also, check for any signs of chipping or breakdown of the surface. Any part that shows signs of damage must be replaced.

3. Inspect the fit of steering gear sector shaft (3575) in steering gear sector shaft housing cover (3580). If the bushing is worn, a new steering gear housing end cover and steering gear sector shaft housing cover must be installed.

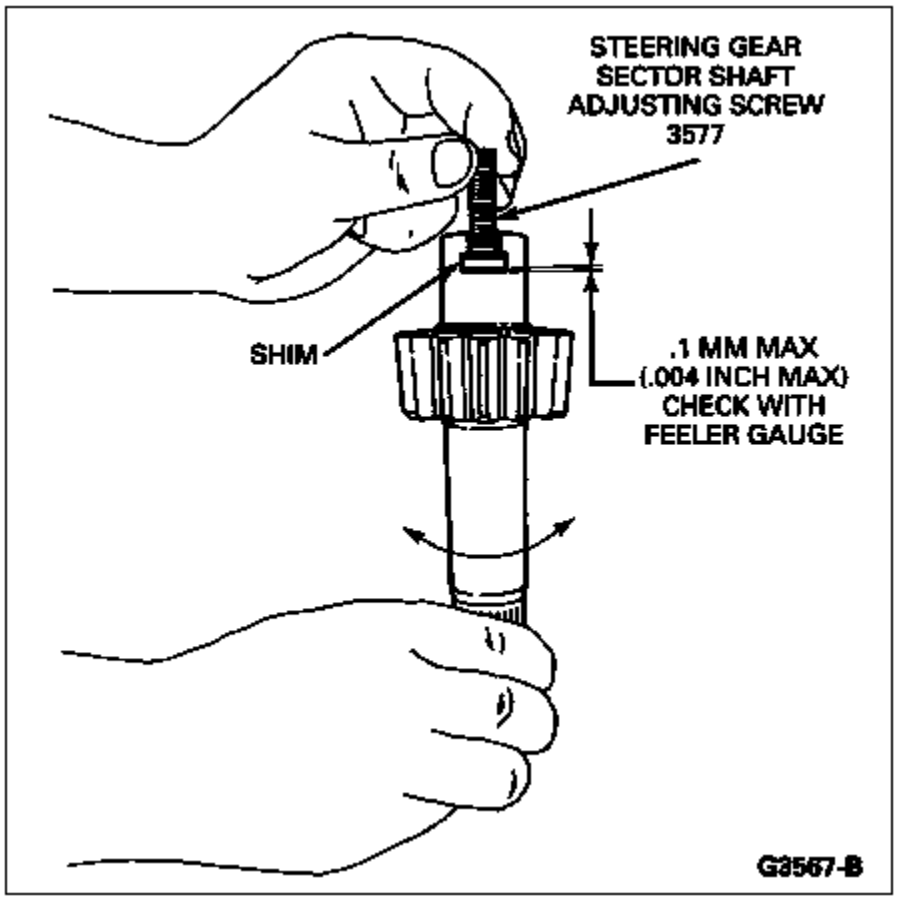
4. Inspect the steering gear input worm gear and rack (3524) for chipping, excessive wear or surface breakdown. If the steering gear input worm gear and rack is damaged, replace the steering gear input worm gear and rack as a unit.

5. Inspect the steering gear input worm gear and rack for tightness or binding by turning the steering gear input worm gear and rack. If binding or tightness are indicated, replace steering gear input worm gear and rack as a unit.

6. **NOTE: If one or more needles fall out, they may be cleaned and put back using steering gear lube to hold them in place.**

   Inspect the steering gear housing for cracks or damage. Inspect the needle bearing inside the steering gear housing for missing needles. Replace the steering gear housing which includes needle bearing if damage is found.

7. Inspect the sector gear teeth for chipping, excessive wear and surface breakdown. Replace the steering gear sector shaft if damage is found.



Assembly

SPECIAL SERVICE TOOL(S) REQUIRED

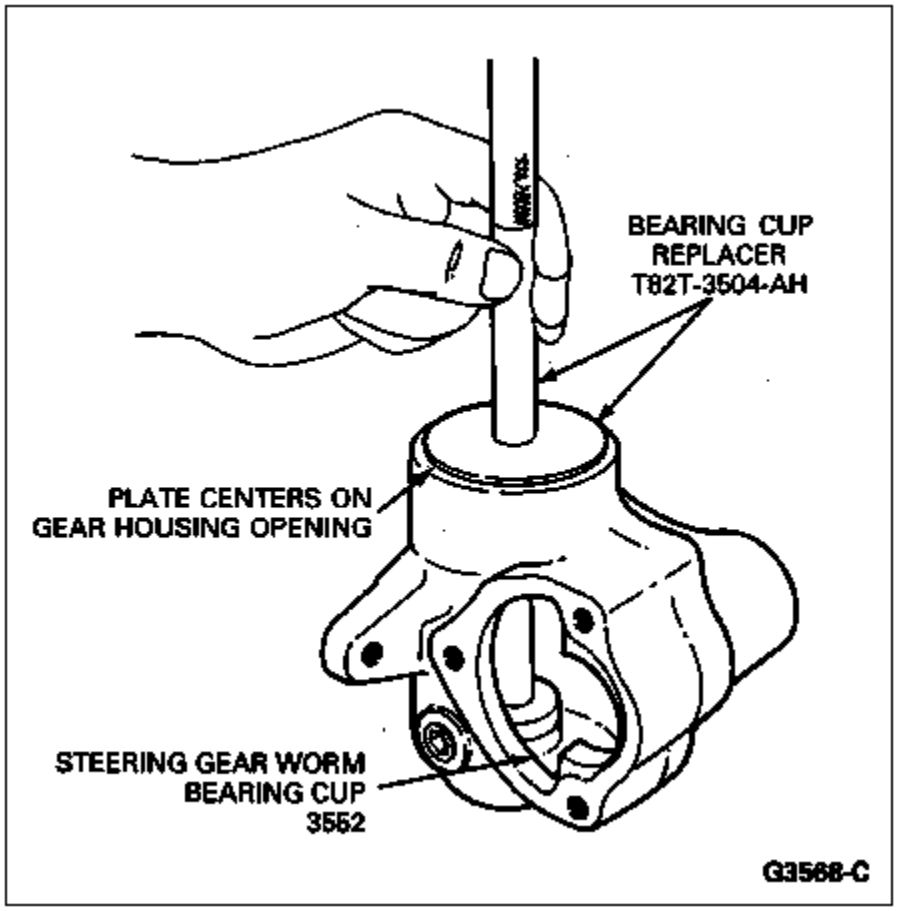
Description	Tool Number
Bearing Cup Replacer	T82T-3504-AH

Prior to assembling the steering gear (3504), make sure that all of the internal gear component parts removed from the steering gear housing have been cleaned and dried.

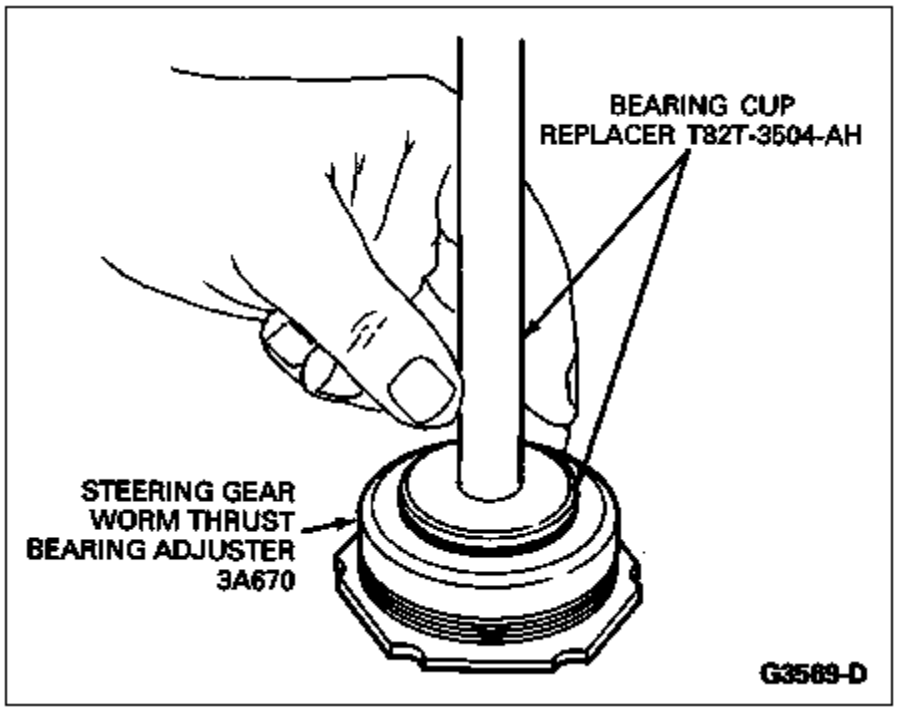
1. Check the clearance between the sector adjusting screw head and the bottom of the sector shaft T-slot. If the clearance is more than 0.1mm (0.004 inch), install a new shim as required to reduce the clearance to 0.10mm (0.004 inch) or less. Steering gear lash adjuster kit contains five shims: 1.95mm (0.078 inch), 2.00mm (0.080 inch), 2.05mm (0.082 inch), 2.10mm (0.084 inch) and 2.15mm (0.086 inch).

2. While holding the sector adjuster screw, turn the steering gear sector shaft back and forth. The steering gear sector shaft must turn freely. If the steering gear sector shaft does not turn freely, increase the T-slot clearance using an appropriate shim from the steering gear sector shaft adjusting shim kit (3A657). However, make sure that the resulting clearance is not more than 0.10mm (0.004 inch).

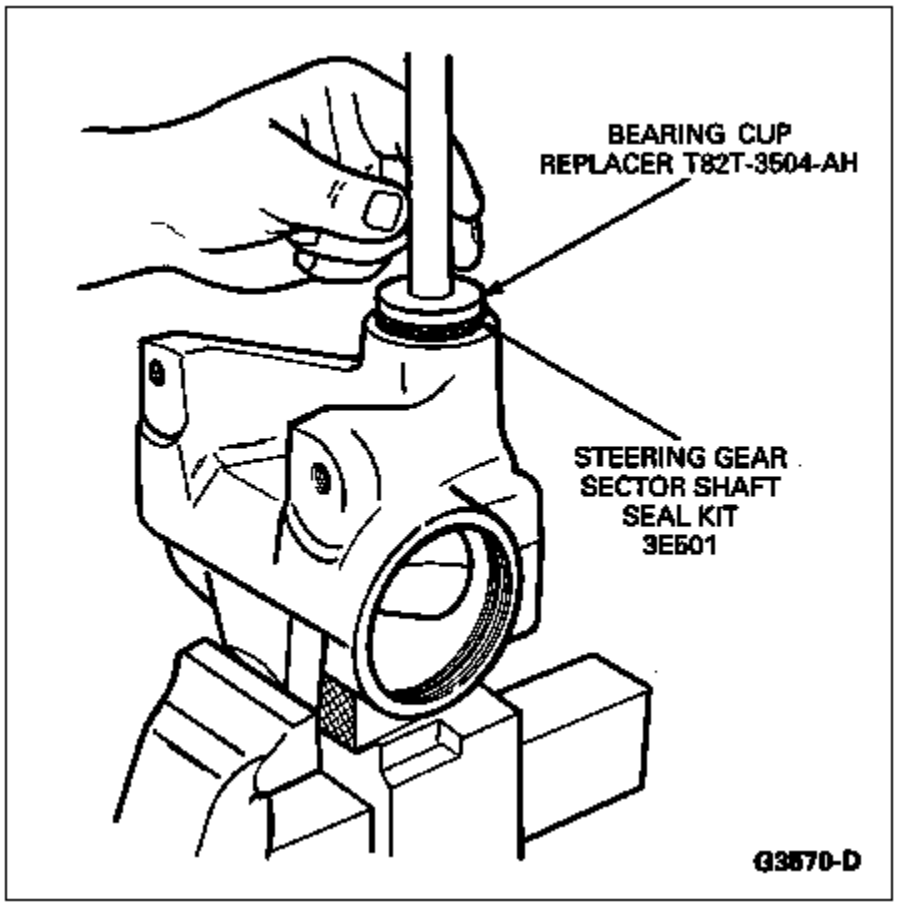
3. If the steering gear worm bearing cup was removed from the steering gear housing, install a new steering gear housing end cover using Bearing Cup Replacer T82T-3504-AH.



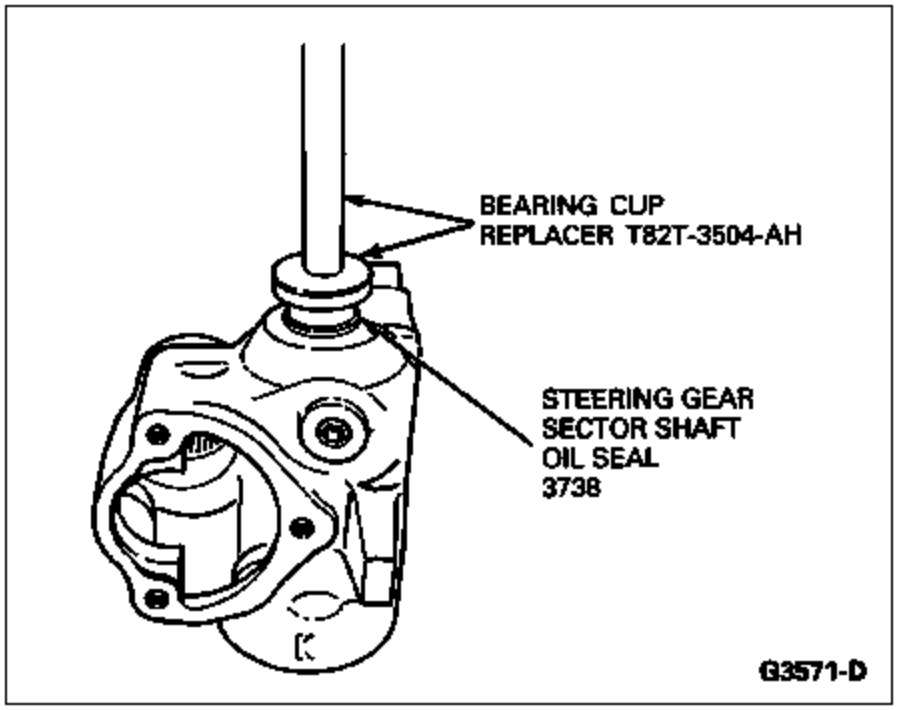
4. If the steering gear worm thrust bearing adjuster (3A670) was removed, install a steering gear housing end cover using Bearing Cup Replacer T82T-3504-AH.



5. Install the steering gear sector shaft seal (3E501) in thesteering gear housing using Bearing Cup Replacer T82T-3504-AH. Press the steering gear sector shaft seal until it bottoms out.



6. Tap thesteering gear sector shaft oil seal (3738) in the steering gear housing using Bearing Cup Replacer T82T-3504-AH. The steering gear sector shaft oil seal should be assembled flush with the housing surface.



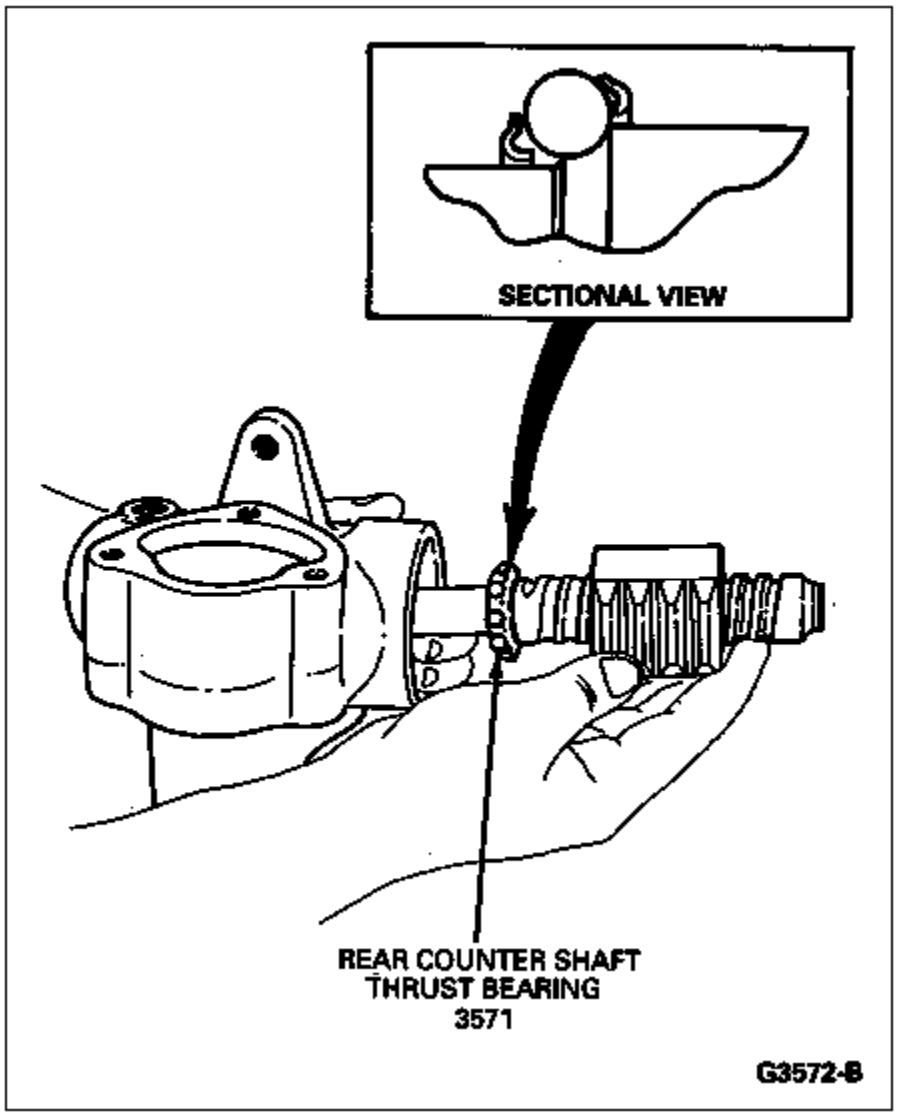
7. Clamp the steering gear housing in a vise with the wormshaft bore horizontal and the steering gear sector shaft facing up.

8. Apply Steering Gear Grease C3AZ-19578-A or equivalent meeting Ford specification ESW-M1C87-A to the steering gear worm thrust bearings (3571), sector shaft needle bearing in the steering gear housing and the sector cover bushing.

9. Slip one of the steering gear worm thrust bearings over the steering gear input worm gear and rack. Make sure that the bearing cage is positioned correctly as shown.

   Insert the steering gear input worm gear and rack into the steering gear housing. Feed the splined end of the wormshaft through the steering gear worm thrust bearing and steering gear sector shaft oil seal. Place the remaining steering gear worm thrust bearing in the steering gear worm thrust bearing adjuster.

Steering Gear Input Gear Worm and Rack



10. Install the steering gear worm thrust bearing adjuster and steering gear worm thrust bearing locknut (3707) into the housing opening, being careful to guide the wormshaft end into the steering gear worm thrust bearing until nearly all end play has been removed from the steering gear input worm gear and rack.

11. Position the steering gear sector shaft adjusting screw (3577) and shim into the sector shaft slot. Check the clearance between the screw head and the bottom of the sector shaft T-slot. The clearance must not be greater than 0.1mm (0.004 inch). If the clearance is greater than 0.1mm (0.004 inch), install a new shim as required to reduce the clearance to 0.1mm (0.004 inch) or less. Steering gear sector shaft adjusting shim kit contains five shims: 1.95mm (0.078 inch), 2.00mm (0.080 inch), 2.05mm (0.082 inch), 2.10mm (0.084 inch), and 2.15mm (0.086 inch).

12. Lubricate the steering gear with 290 grams (10.2 oz. by weight) of Steering Gear Grease C3AZ-19578-A or equivalent meeting Ford specification ESW-M1C87-A. Rotate the steering gear input worm gear and rack until the steering gear input worm gear and rack is near the end of its travel. Pack as much of the measured grease into the steering gear housing as possible through the sector shaft opening. Rotate the steering gear input worm gear and rack to move the steering gear input worm gear and rack near the other end of its travel and pack more grease through the steering gear housing.

13. Rotate the steering gear input worm gear and rack until the steering gear input worm gear and rack is in the center of travel.

14. Insert the steering gear sector shaft containing the steering gear sector shaft adjusting screw and shim into the steering gear housing so that the center tooth of the steering gear sector shaft enters the center rack tooth space in the steering gear input worm gear and rack. Rotating the ball nut teeth slightly up will aid in alignment of the gear teeth and installation of the steering gear sector shaft.

15. Pack the remaining grease into the steering gear housing.

16. Apply a 3.20mm (1/8-inch) wide x 3.20mm (1/8-inch) high bead of sealant, Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A, to the mating surfaces of the steering gear housing end cover and steering gear housing. The two mating surfaces must be dry and free of grease and all foreign materials prior to applying the sealant material and assembly of the steering gear housing end cover.

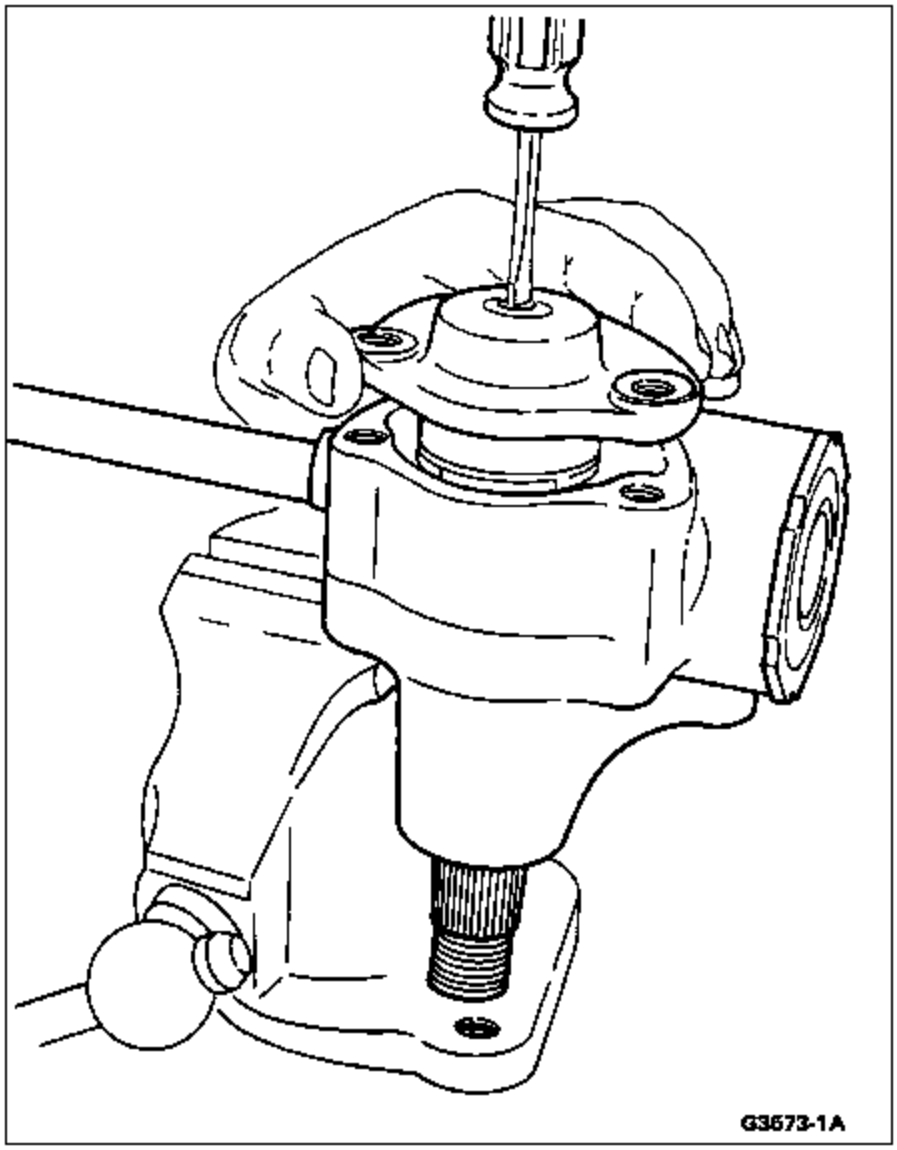
17. Approximately five minutes after applying the sealant, engage the steering gear sector shaft adjusting screw with the tapped hole in the center of the steering gear housing end cover. Turn the steering gear sector shaft adjusting screw counterclockwise as shown. Continue turning the steering gear sector shaft adjusting screw until the steering gear housing end cover is flush with the steering gear housing.

18. Install the steering gear housing end cover to steering gear housing by attaching washer and bolts. Do not torque the bolts unless there is a lash between the steering gear sector shaft and the steering gear input worm gear and rack. The lash can be obtained by turning the steering gear sector shaft adjusting screw counterclockwise.

19. Tighten the sector cover attaching bolts to 43-54 Nm (32-40 lb-ft).

20. Adjust the steering gear preload and meshload. Refer to the Adjustment portions of this section.

21. Install steering gear; refer to procedure in this section.



G3673-1A

Adjustment Procedure

Preload and Meshload Check, In Vehicle

1. **NOTE: Prior to checking preload and meshload in vehicle, make sure that the steering column is properly aligned and that the steering column intermediate shaft coupling (3A525) is not distorted.**

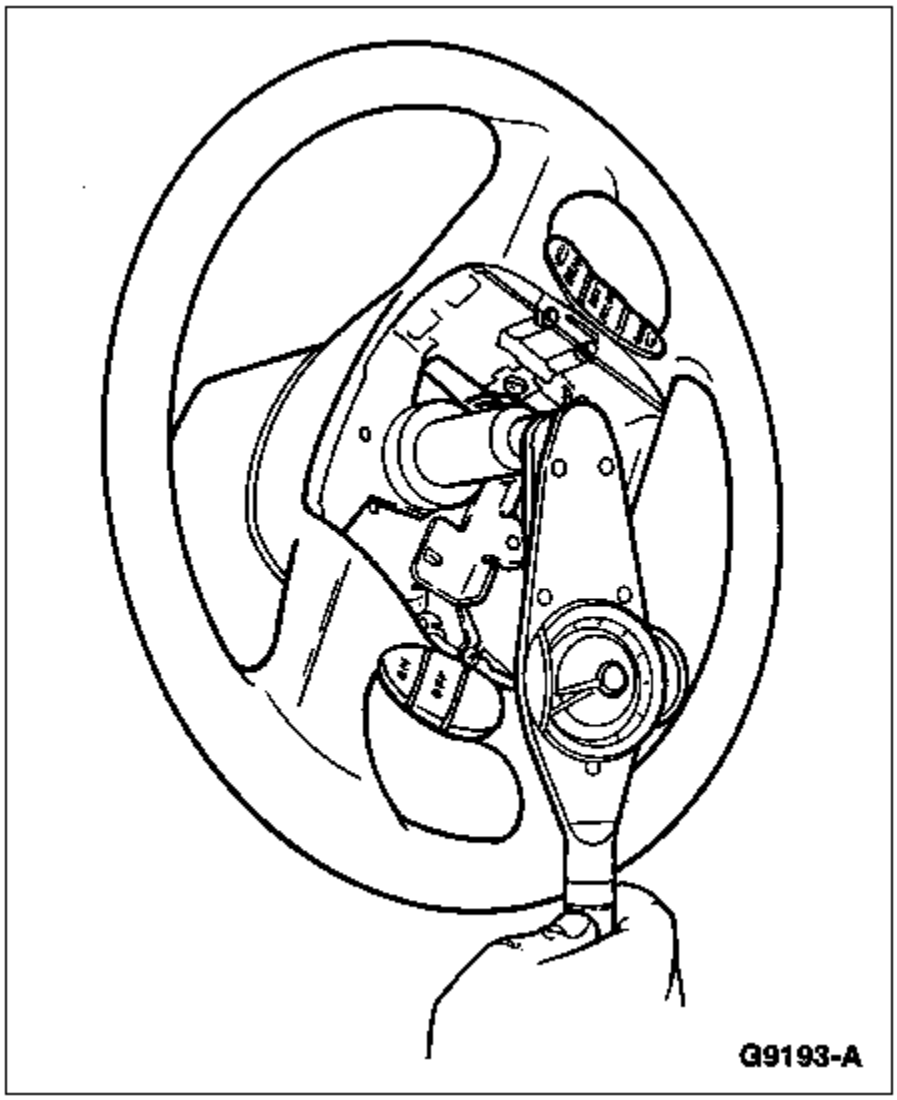
   Disconnect steering linkage at the steering gear sector shaft arm (3590) at the ball stud. Refer to Section 11-03 for procedure.

2. Lubricate steering gear sector shaft oil seal (3738) with a drop of Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F.

3. Remove the horn pad assembly from the steering wheel (3600).

4. Turn the steering wheel slowly to one stop.

5. Place a lb-in torque wrench on the steering wheel nut. Measure the torque (preload) required to rotate the steering wheel at a constant speed for approximately 1-1/2 turns. If the preload is not within .22-.68 Nm (2-6 lb-in), readjust preload (see following text Worm and Roller Mesh Preload, Out-of-Vehicle). Worm preload cannot be adjusted in the vehicle.



6. Rotate the steering wheel from stop to stop, counting the total number of turns then back half-way, placing the steering gear (3504) on center. (Approximately six turns, stop to stop.)

7. Place a lb-in torque wrench on the steering wheel nut. Observe the highest reading (meshload) by rotating the steering shaft back and forth approximately 90 degrees either way across center. The meshload must be within .68-1.24 Nm (6-11 lb-in) and at least .23 Nm (2 lb-in) over the preload. If the meshload is out of specifications, readjust it.

Worm and Roller Mesh Preload, Out-of-Vehicle

1. Tighten bolts of steering gear housing end cover (3568) to 43-54 Nm (32-40 lb-ft). This step will aid in meshload retention.

2. Loosen steering gear worm thrust bearing adjuster (3A670) and tighten the steering gear worm thrust bearing locknut (3707) until all end play has been removed. Lubricate steering gear sector shaft oil seal (3738) with a drop of Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F.

3. Using an 11/16-inch, 12-point socket and a lb-in torque wrench, carefully turn the steering gear input worm gear and rack (3524) all the way to the right. Measure the left turn torque required to rotate the steering gear input worm gear and rack at a constant speed for approximately 1-1/2 turns. This torque reading is "preload."

4. Tighten or loosen the steering gear worm thrust bearing locknut as required until the correct preload .56-.68 Nm (5-6 lb-in) is obtained. Tighten the steering gear worm thrust bearing locknut to 225-253 Nm (166-187 lb-ft).

5. Rotate the steering gear (3504) from stop to stop, counting the total number of turns, then turn back half-way, placing the steering gear on center. (Approximately six turns stop to stop.)

6. Again, using the 11/16-inch, 12-point socket and lb-in torque wrench, observe the highest reading while the steering gear is turned approximately 90 degrees either way across center. If the highest reading (meshload) is not within 102-124 Nm (9-11 lb-in) and at least .45 Nm (4 lb-in) over the preload, turn the steering gear sector shaft adjusting screw (3577) as required.

7. Hold the steering gear sector shaft adjusting screw and tighten the locknut to 19-34 Nm (14-25 lb-ft).

SPECIFICATIONS

MANUAL STEERING GEAR PRELOAD SPECIFICATIONS

Description	Specification
Gear Ratio	Model SMK-A — 23.75:1 (Constant)

Manual Steering Gear

Steering Pump

The C-II power steering pump (3A674) is a belt-driven slipper-type pump with a fiberglass-reinforced nylon power steering fluid reservoir, attached to the rear of power steering pump pressure plate (3D590). The power steering pump is encased within the power steering pump housing (3A643) and power steering fluid reservoir. The power steering pressure hose (3A719) is attached with a quick-connect fitting, located below the power steering fluid reservoir. The fitting allows the line to swivel. This is normal and does not indicate an untorqued fitting.

An identification tag is attached to the power steering fluid reservoir. The top line of this tag indicates the basic model number (HBC) and the suffix.

NOTE: Always use these tags when requesting service assemblies as there may be slight differences in internal components.

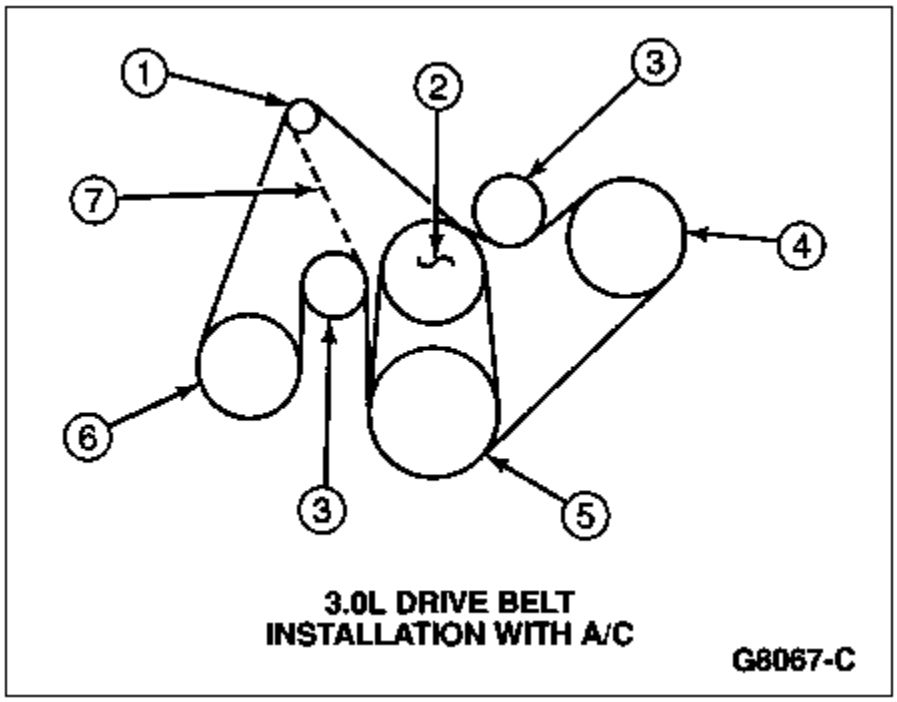
Pump and Pulley

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Steering Pump Pulley Remover	T69L-10300-B
Steering Pump Pulley Replacer	T65P-3A733-C

Removal

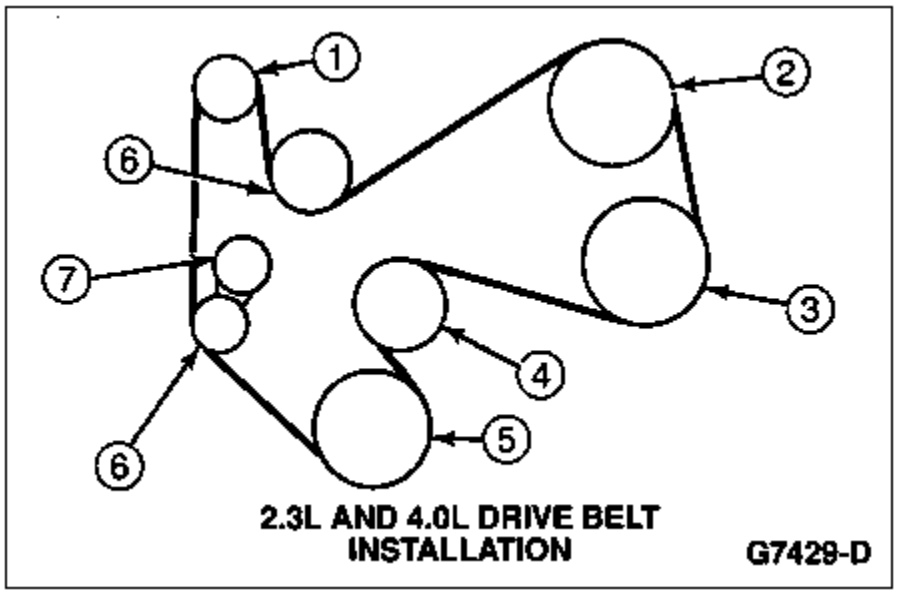
1. Disconnect the power steering return hose (3A713) at the pump and drain fluid.
2. Remove the power steering pressure hose (3A719) by unscrewing connector from the pump.
3. On the Aerostar 3.0L V-6 engine (6007), loosen the drive belt tensioner (6B209) and adjustment bolts.



Item	Part Number	Description
1	10346	Generator
2	8501	Water Pump
3	8678	Belt Idler Pulley
4	3A733	Power Steering Pump Pulley

5	6303	Crankshaft
6	2884	A/C Clutch
7	—	Without A/C

On the 2.3L I-4 and 4.0L V-6 engines, slacken belt tension by lifting drive belt tensioner in a counterclockwise direction. On Ranger 3.0L V-6 engines, slacken belt tension by lifting drive belt tensioner in a clockwise direction. Remove drive belt (8620) from under drive belt tensioner and slowly lower pulley to stop. Remove the drive belt from the power steering pump pulley (3A733).



Item	Part Number	Description
1	10346	Generator
2	2884	A/C Clutch
3	3A733	Power Steering Pump Pulley
4	8501	Water Pump
5	6303	Crankshaft
6	8678	Belt Idler Pulley
7	6B209	Drive Belt Tensioner

4. **NOTE: If the drive belt requires servicing, refer to Section 03-05 .**

   Remove the drive belt from the power steering pump pulley.

5. Remove the oil dipstick tube.

6. Remove the power steering pump support (3C511).

7. Install Steering Pump Pulley Remover T69L-10300-B on the pulley.

8. **NOTE: Do not apply pressure on the power steering pump rotor shaft (3B559). Pressure will damage internal thrust areas of the power steering pump (3A674).**

   While holding the remover tool nut stationary with a wrench, rotate the inner spindle of the remover tool clockwise until the pulley is pulled off the power steering pump rotor shaft.

9. Remove the bolts attaching the power steering pump to the A/C compressor mounting bracket (2882).

Installation

1. Install the power steering pump on the A/C compressor mounting bracket. Install and tighten attaching bolts to 41-61 Nm (30-44 lb-ft). On 4.0L engine, tighten to 47-64 Nm (35-47 lb-ft).

2. Position the support on the A/C compressor mounting bracket. Install mounting bolts and tighten to 47-64 Nm (35-47 lb-ft).

3. **NOTE: Fore/aft location of power steering pump pulley on power steering pump rotor shaft is critical. Incorrect belt alignment may cause drive belt squeal or chirp. Make sure pull-off groove on power steering pump pulley is facing front and flush with end of shaft ± 0.254mm (± 0.010 inch).**

   Install the Steering Pump Pulley Replacer T65P-3A733-C and install the power steering pump pulley.

4. Install the drive belt on the power steering pump pulley.

5. On the 2.3L I-4, Ranger 3.0L V-6, and 4.0L V-6 engines, position and rotate drive belt on engine. While lifting drive belt tensioner in a counterclockwise direction (clockwise on Ranger 3.0L V-6), slide drive belt under drive belt tensioner and lower drive belt tensioner to drive belt.

   On Aerostar 3.0L V-6 engine, position the belt idler pulley (8678) assembly to give the drive belt the tension specified. Refer to belt tension check in Section 03-05 . Tighten the drive belt tensioner and adjustment bolts to 47-64 Nm (35-47 lb-ft).

6. Install the power steering pump support, if removed.

7. Install the oil dipstick tube.

8. Install the pressure hose tube nut and new Teflon® wagner into power steering pump valve outlet fitting (3D654) and tighten to 30-40 Nm (22-30 lb-ft).

9. Connect the power steering return hose to the power steering pump, and reposition the clamp.

10. Fill the power steering fluid reservoir with Motorcraft MERCON® ATF Power Steering fluid meeting Ford specifications MERCON® . Start the engine and turn the steering wheel (3600) from left to right without hitting stops to remove air from the system.

11. Check for leaks and recheck the fluid level. Add fluid if necessary to proper level as specified in Section 11-00 .

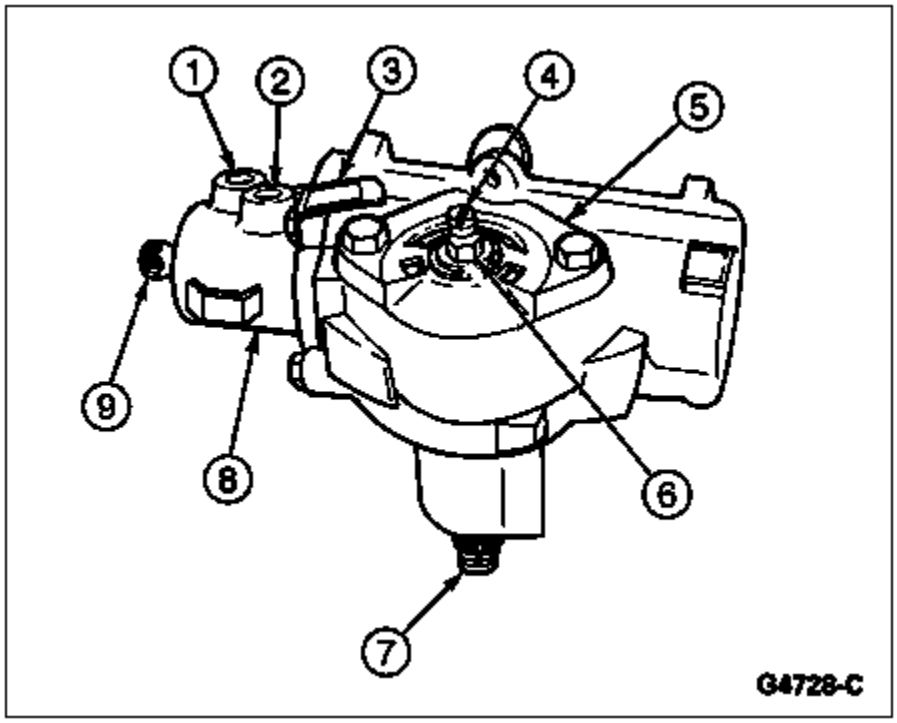
Steering Gear

The steering gear (3504) is a torsion-bar type of hydraulic assisted system. The system includes steering gear input worm gear and rack (3524) which is meshed to the gear teeth on the steering gear sector shaft (3575). The steering gear also includes a rotary-style hydraulic valve consisting of an input shaft, control valve sleeve and torsion bar. The valve sleeve is pinned to the worm. The input shaft is connected to the worm through the torsion bar. The other end of input shaft attaches to the steering column and steering wheel (3600).



Item	Part Number	Description

Steering Gear

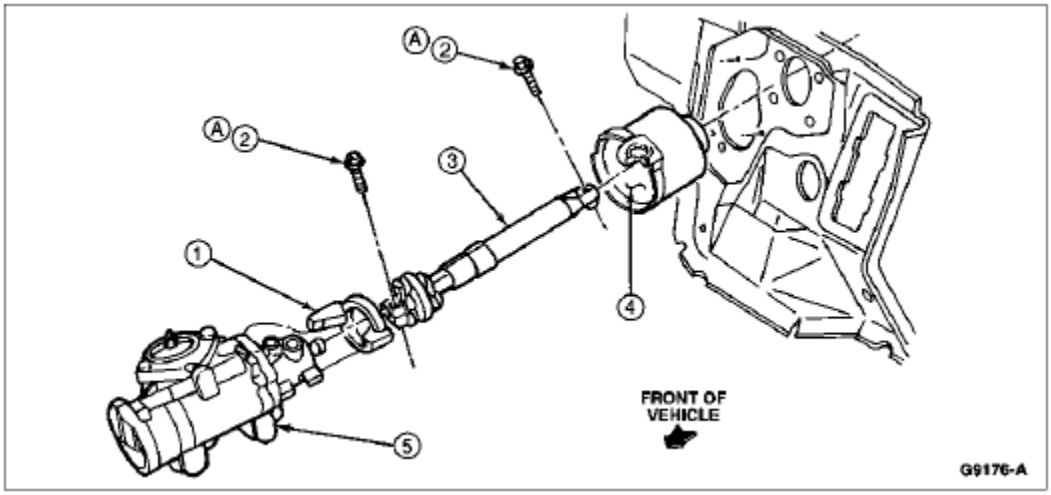
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F

Removal

1. Unscrew the nuts attaching the power steering pressure hose (3A719) and power steering return hose (3A713) to the steering gear (3504) using a flare nut wrench. Plug the lines and the ports in the steering gear.

Power Steering Installation



Item	Part Number	Description
1	3F540	Steering Shaft U-Joint Shield (Lower)
2	N803942-S100	Steering Column Intermediate Shaft Pinch Bolt
3	3A525	Steering Column Intermediate Shaft Coupling
4	3F540	Steering Shaft U-Joint Shield (Upper)
5	3504	Steering Gear
A	—	Tighten to 40.3-54.7 Nm (29.4-39.9 Lb-Ft)

2. Slide the upper steering shaft u-joint shield (3F540) from the lower steering column shaft (3B676) to access pinch bolt. Remove the bolt and disconnect the lower steering column shaft at the steering gear.

tomsn048@gmail.com

3. Raise the vehicle and remove the steering gear sector shaft arm (3590) from the steering gear sector shaft (3575) using Pitman Arm Puller T64P-3590-F. Remove the tool from the steering gear sector shaft arm.

4. Support the steering gear, and remove the bolts attaching the steering gear.

5. Work the steering gear free of the steering column intermediate shaft. Remove the steering gear from the vehicle, then remove the lower steering shaft u-joint shield.

Installation

1. Install the steering shaft u-joint shield onto the steering gear lugs.

2. Slide the steering shaft u-joint shield into place on the steering shaft assembly. Turn the steering wheel so the spokes are in the horizontal position.

3. Center the steering gear input shaft with the indexing flat facing down.

4. Slide the steering gear input shaft into the steering column intermediate shaft and into place on the frame side rail. Install the attaching bolts and tighten to 68-84 Nm (50-62 lb-ft). Tighten the steering column intermediate shaft pinch bolt to 40.3-54.7 Nm (29.4-39.9 lb-ft).

5. Be sure the wheels are in the straight ahead position, then install the steering gear sector shaft arm on the sector shaft. Install the steering gear sector shaft arm attaching washer and nut. Tighten nut to 230-310 Nm (170-228 lb-ft).

6. Connect and tighten the pressure and the return lines to the steering gear to 27-41 Nm (20-30 lb-ft).

7. Snap the upper and lower steering gear shaft U-joint shields together.

8. Disable ignition. Fill the reservoir to specifications listed in Section 11-00 . Crank the engine by operating the ignition switch in start mode while turning the steering wheel from left to right to distribute the fluid.

9. Recheck fluid level and add Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F if necessary. Restore ignition. Start the engine and turn the steering wheel from side to side. Inspect for fluid leaks. Recheck fluid level. Refer to Section 11-00 to purge the system of air if necessary.

Steering Gear Input Shaft Oil Seal Kit, XR50

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Adjuster and Locknut Wrench	T66P-3553-B
Bench Mounted Holding Fixture	T57L-500-B
Puller	T58L-101-B
Impact Slide Hammer	T59L-100-B
Input Shaft Bearing/Seal Tool Set	T65P-3524-A1, T65P-3524-A2 and T65P-3524-A3

Removal

Take precautions when removing the steering gear; use a clean workbench and tools; handle all parts carefully to avoid nicks, burrs, scratches and dirt.

1. Remove the steering gear (3504) from the vehicle. Refer to the procedure in this section.
2. Drain all the remaining fluid from the steering gear into a suitable container.
3. Mount the steering gear vertically in a soft-jawed vice with the power steering gear input shaft and control (3D517) pointing up.
4. Remove the four bolts retaining the valve housing to the steering gear.
5. Turn the loosened valve housing clockwise until there is approximately 34mm (1.5 inch) between the valve housing and the steering gear housing (3548).
6. Insert two bolts, approximately 62mm in length, through the valve housing to the steering gear keeping the 34mm clearance between the valve housing and the steering gear.
7. Remove the locknut retaining setscrew from the valve housing.
8. Using Adjuster and Locknut Wrench T66P-3553-B remove the steering gear worm thrust bearing locknut (3707).
9. Remove the previously installed 62mm bolts and then remove the valve housing.
10. Mount the valve housing into Bench Mounted Holding Fixture T57L-500-B.
11. Using Puller T58L-101-B and Impact Slide Hammer T59L-100-B, remove the dust seal from the valve housing.
12. Remove the snap ring from the valve housing.
13. Turn the bench mounted holding fixture to invert the valve housing.

tomsn048@gmail.com

14. Insert Input Shaft Bearing/Seal Tool Set T65P-3524-A2 and T65P-3524-A3 into the valve body assembly opposite the oil seal end, and gently tap the bearing and the pressure seal out of the housing.

Installation

1. Inspect steering gear worm ball (3647) and power steering gear input shaft and control for any damage. Replace components as required.

2. Coat the steering gear worm ball and seal surface of the housing with petroleum jelly or equivalent.

3. Install the steering gear worm ball with the metal side covering, facing the rollers outward. Seat the steering gear worm ball in the valve housing using Tool T65P-3524-A1. Be sure steering gear worm ball rotates freely.

4. Dip a new oil seal in Manual Transmission Fluid (SAE 80W) F2ZZ-19C547-A or equivalent lubricant meeting Ford specification ESP-M2C83-C and place it in the housing with the metal side facing outward. Drive the seal into the housing until the outer edge does not quite clear the snap ring groove.

5. Insert the snap ring in the housing until it is fully seated in the groove.

6. **NOTE: When the valve housing is reinstalled, the seal will be located just past the undercut in the power steering gear input shaft and control.**

   Place the new dust seal in the housing with the dished side facing out. Using Tool T65P-3524-A3 drive dust seal into place.

7. Pack the area between the two seals with Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-B and ESR-M159-A.

8. Inspect valve housing O-ring for damage. Replace if required.

9. Install the valve housing on the power steering gear input shaft and control. Install the two 62mm temporary bolts keeping 34mm between the valve housing and the steering gear housing as done during Step 6 of the removal process.

10. Install the steering gear worm thrust bearing locknut and tighten to 75-122 Nm (55-90 lb-ft). Install the locknut setscrew.

11. Remove the 62mm temporary bolts and position the valve housing onto the steering gear housing. Install the valve housing retaining bolts and tighten to 40-60 Nm (30-45 lb-ft).

12. Remove the steering gear from the soft-jawed vise and install it into the vehicle. Refer to the procedure in this section.

---

tomsn048@gmail.com

tomsn048@gmail.com

Steering Gear

Take the following precautions when servicing the steering gear (3504):

- Use a clean workbench and tools.
- Thoroughly clean the exterior of the steering gear with solvent and drain off excess hydraulic fluid, if necessary.
- Handle all parts carefully to avoid nicks, burrs, scratches and dirt.
- Do not use solvent on seals.

SPECIAL SERVICE TOOL(S) REQUIRED

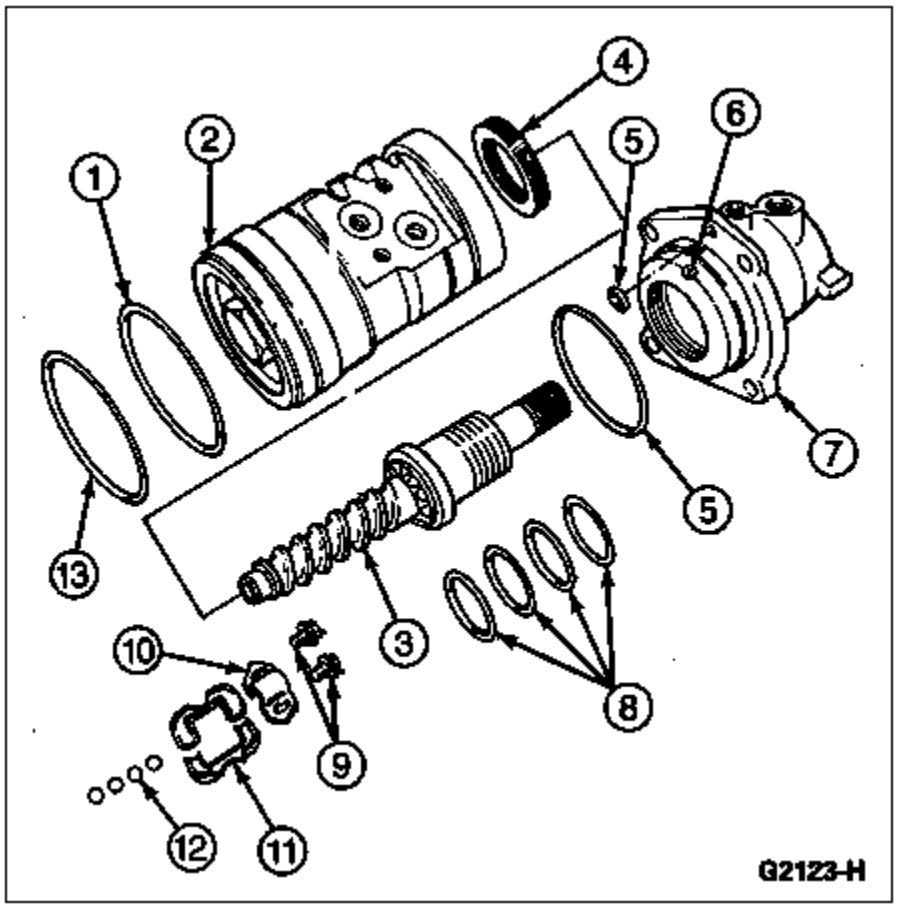
Description	Tool Number
Bench Mounted Holding Fixture	T57L-500-B
Adjuster and Locknut Wrench	T66P-3553-B
Spacer — Valve Housing to Piston	T66P-3553-C

Disassembly

1. Remove steering gear; refer to procedure in this section.

2. Hold the steering gear upside down over a drain pan and cycle the power steering gear input shaft and control (3D517) several times to drain the fluid from the steering gear.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Piston Ring (Part of 3E502)
2	—	Piston (Part of 3E502)
3	3524	Steering Gear Input Worm Gear and Rack
4	3707	Steering Gear Worm Thrust Bearing Locknut
5	—	O-Ring (Part of 3E502)
6	—	Race Locknut Setscrew (Part of 3C516)
7	3C516	Valve Housing
8	—	Valve Sleeve Seals (Part of 3E501)
9	—	Clamp Guide Bolts
10	3544	Steering Gear Ball Return Guide Clamp
11	3523	Steering Gear Ball Return Guide
12	3647	Steering Gear Worm Ball
13	3F520	Rack Seal

3. Secure the steering gear in a soft-jawed vise.

tomsn048@gmail.com

4. **NOTE: The indexing flat on the power steering gear input shaft and control should be facing downward.**

   Turn the power steering gear input shaft and control to either stop; then turn it back two turns to center the steering gear.

5. Remove the attaching bolts of the steering gear housing end cover (3568).

6. Tap the lower end of the steering gear sector shaft (3575) with soft hammer and lift the steering gear housing end cover and steering gear sector shaft from the steering gear **as an assembly.** Discard the O-ring.

7. **NOTE: The following step is required only when it is necessary to remove steering gear sector shaft from the steering gear.**

   Remove the nut from the sector shaft adjusting screw. Turn the steering gear housing end cover counterclockwise and remove it from the sector shaft adjuster screw. It may be necessary to hold the screw with a screwdriver.

8. **NOTE: If valve housing or the valve sleeve seals are to be replaced, proceed to Step 11. If steering gear sector shaft housing oil seals (3591) are to be replaced go to steering gear procedure. The steering gear worm ball (3647) needs to be removed if the valve sleeve rings are to be replaced.**

   Remove the valve housing attaching bolts and identification tag. Lift the valve housing off the steering gear. Remove the valve, piston assembly and control valve gasket. Discard the gasket.

9. With the piston held so the steering gear ball return guide (3523) faces up, remove the steering gear ball return guide clamp (3544).

10. With a finger over the opening in the steering gear ball return guide turn the piston so the steering gear ball return guide faces down over a clean container. Let the steering gear ball return guide drop into the container.

11. Rotate the power steering gear input shaft and control from stop to stop until all steering gear worm balls fall from the piston into the container. The valve assembly can then be removed from the piston. Inspect the piston bore to make sure all balls have been removed.

12. Install the valve body assembly in the Bench Mounted Holding Fixture T57L-500-B and loosen the steering gear worm thrust bearing locknut (3707) from the valve housing.

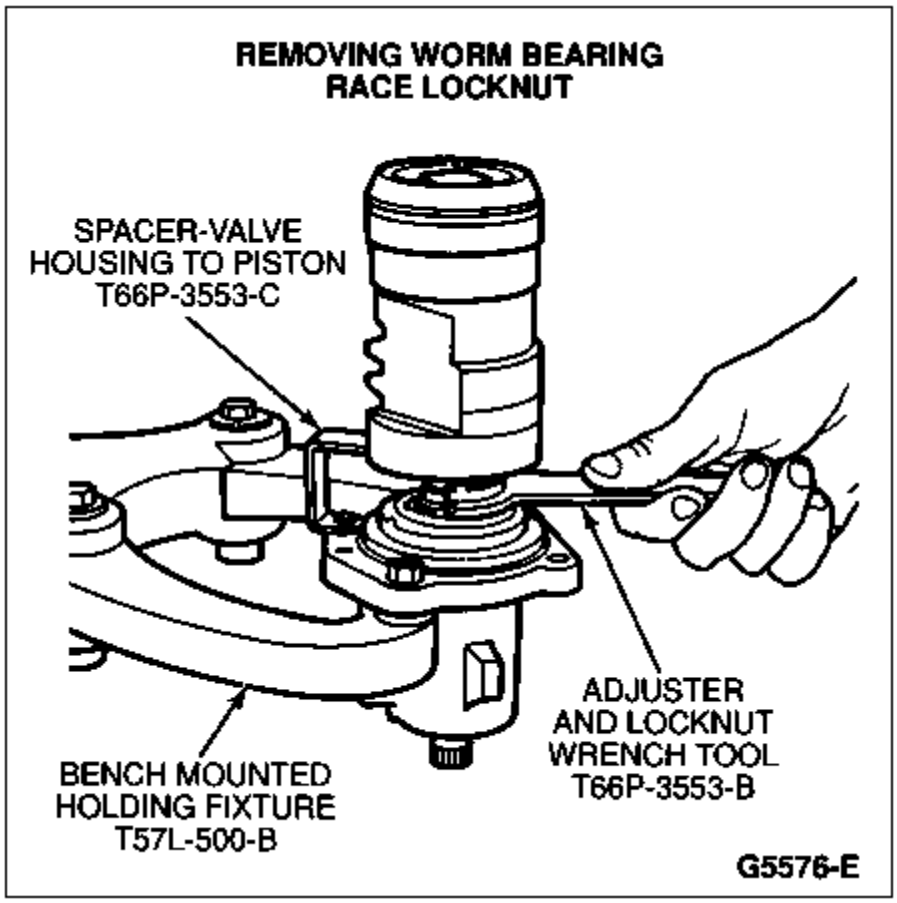
13. Remove the steering gear worm thrust bearing locknut using Adjuster and Locknut Wrench T66P-3553-B and Spacer — Valve Housing to Piston T66P-3553-C.

14. **NOTE: Piston need not be in place if removed to facilitate valve sleeve seal replacement.**

    Carefully slide the power steering gear input shaft and control, steering gear and valve assembly out of the valve housing.

15. Clean and inspect all components; refer to the procedure in this section.

tomsn048@gmail.com

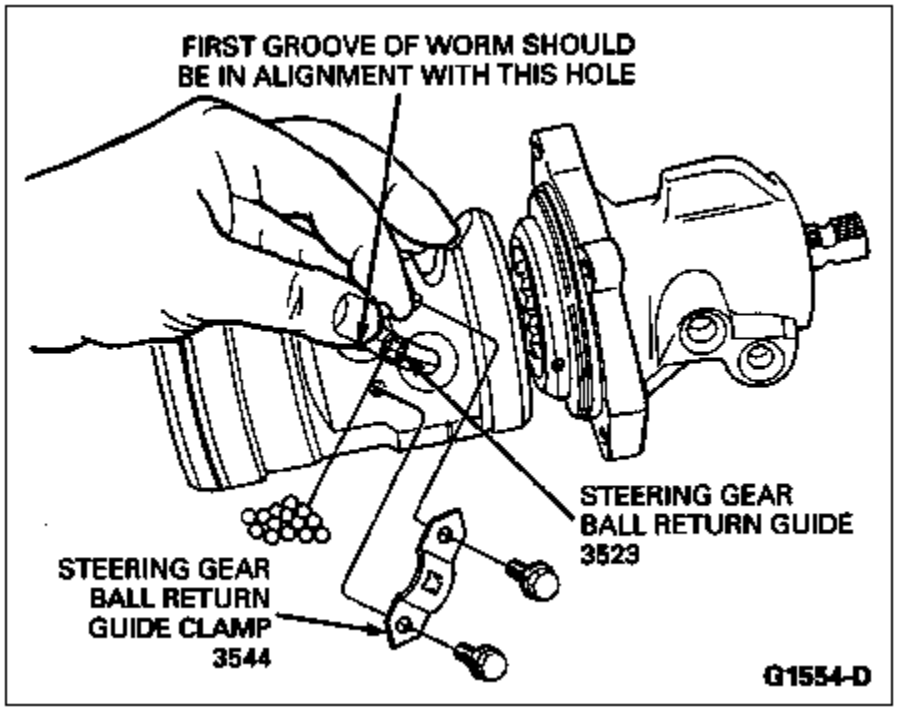


Assembly

1. Mount the valve housing in the bench mounted holding fixture with the flanged end up.
2. Apply a light coat of Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F to the Teflon® rings on the valve sleeve.
3. Carefully install the steering gear input worm gear and rack (3524) in the housing.
4. Install the steering gear worm thrust bearing locknut in the housing and tighten to 75-122 Nm (55-90 lb-ft).
5. Install the Allen head race locknut setscrew through the power steering gear control valve housing o-ring (3756) and tighten to 1.7-2.8 Nm (15-25 lb-in).
6. Place the piston on the bench with the steering gear ball return guide holes facing up. Insert the steering gear input worm gear and rack into the piston so the first groove is in line with the hole nearest the center of the piston.
7. Place the steering gear ball return guide in the piston. Turning the power steering gear input shaft and control counterclockwise, place the same steering gear worm ball as removed in Step 9 of Steering Gear Disassembly in the steering gear ball return guide. During assembly 27 to 29 balls are required. If all the balls have not been inserted upon reaching the left stop, rotate the power steering gear input shaft and control in one direction, then the other while inserting the remaining balls.

tomsn048@gmail.com

Steering Gear Assembly



8. Secure the steering gear ball return guide in the ball nut with the steering gear ball return guide clamp. Tighten bolts to 4.8-7.9 Nm (42-70 lb-in).

9. Apply petroleum jelly or equivalent to the Teflon® seal on the piston.

10. Place a new steering gear sector shaft housing cover gasket (3581) on the valve housing.

11. Slide the piston and valve into the steering gear housing (3548) being careful not to damage the front suspension steering ball stud dust seal (3332).

12. Align the oil passage in the power steering gear control valve housing o-ring with the passage in the steering gear housing. Place a new O-ring onto the oil passage hole of the steering gear housing. Install identification tag onto the steering gear housing. Install, **but do not tighten,** the attaching bolts. Identification tag is to be installed under upper right valve housing bolt.

13. Rotate the piston so the teeth are in the same plane as the steering gear sector shaft. Tighten the attaching bolts of power steering gear control valve housing o-ring to 41-62 Nm (30-45 lb-ft).

14. Position the steering gear sector shaft housing oil seal in the steering gear housing. Turn the power steering gear input shaft and control to center the piston.

15. Apply petroleum jelly or equivalent to the steering gear housing, and position the steering gear sector shaft and steering gear housing end cover assembly in the gear housing. Install the steering gear housing end cover. Tighten the bolts to 75-94 Nm (55-70 lb-ft).

16. Attach an inch-pound torque wrench to the power steering gear input shaft and control. Adjust meshload to specification. Refer to Specifications chart.

tomsn048@gmail.com

tomsn048@gmail.com

Piston

Disassembly

1. Disassemble steering gear; refer to procedure in this section.
2. Remove the Teflon® piston seal and O-ring from the piston and ball nut. Discard both seal and O-ring.

Assembly

1. Dip a **new** O-ring in Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33F and install it on the piston and ball nut.
2. Install a **new** Teflon® piston seal on the piston and ball nut being careful not to stretch it more than necessary.
3. Assemble the steering gear. Refer to the procedure in this section.

tomsn048@gmail.com

Steering Gear Housing

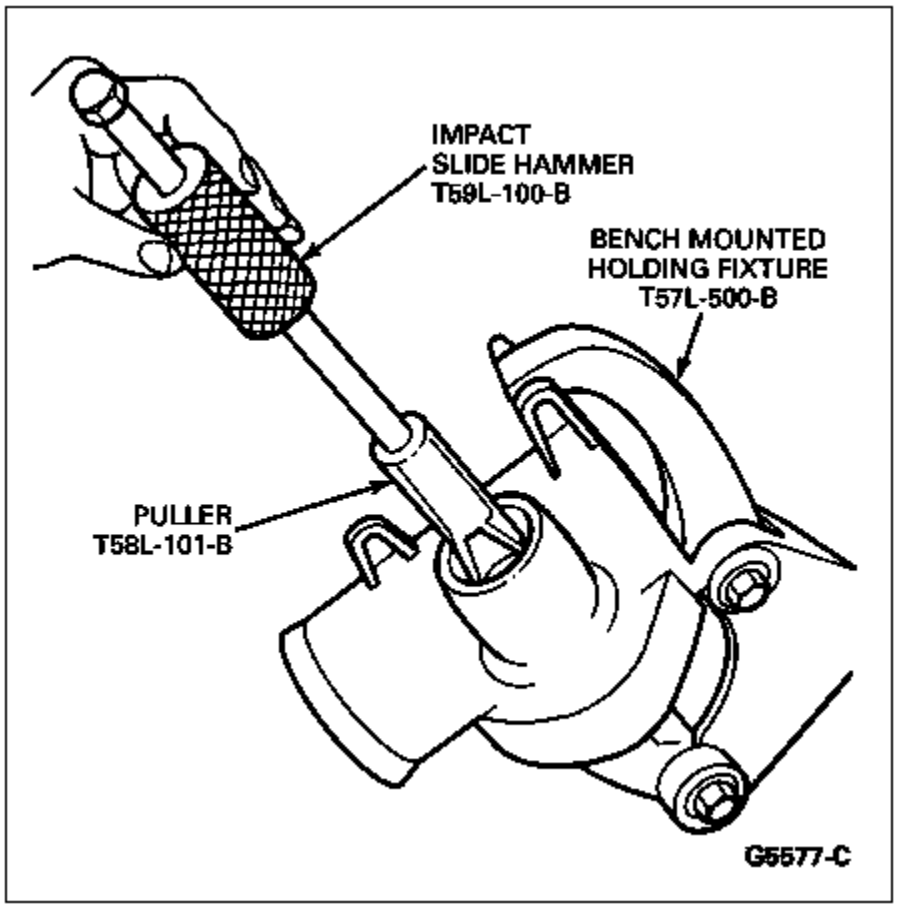
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Bench Mounted Holding Fixture	T57L-500-B
Puller	T58L-101-B
Impact Slide Hammer	T59L-100-B
Sector Shaft Seal Replacer	T77L-3576-A

Disassembly

1. Disassemble steering gear; refer to procedure in this section.
2. Remove the snap ring from the lower end of the steering gear housing (3548).
3. Remove dust seal using Puller T58L-101-B and Impact Slide Hammer T59L-100-B. Discard the seal.
4. Remove pressure seal in the same manner. Discard the seal.

tomsn048@gmail.com



Assembly

1. **NOTE: Proper seal installation tools and procedures must be used to prevent damage to seals during assembly.**

   Lubricate the new pressure seal and dust seal with Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-B and ESR-M159-A.

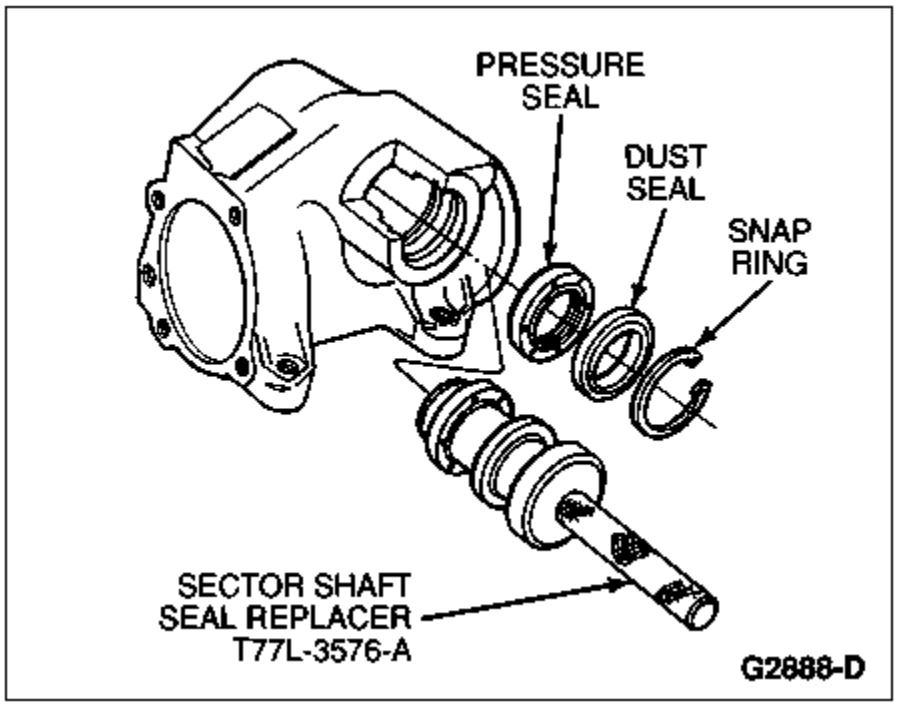
2. Apply Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-B and ESR-M159-A to the sector shaft seal bore.

3. Place the dust seal on Sector Shaft Seal Replacer T77L-3576-A so the raised lip of the seal is toward the tool.

4. **NOTE: Failure to use proper seal installation tools and procedures may damage the seals and cause a fluid leak.**

   Place the pressure seal on the tool with lip away from the tool. The flat back side of the pressure seal should be against the flat side of the dust seal.

tomsn048@gmail.com



5. **CAUTION: Do not bottom seals against bearing.**

   Insert the seal driver tool into the sector shaft bore and drive the tool until the seals clear the snap ring groove. The seal will not function properly when bottomed against the bearing.

6. Install snap ring in the groove in the steering gear housing.

7. Apply a generous amount of Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-B and ESR-M159-A, to the areas between the two seal lips.

8. Assemble the steering gear; refer to the procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Valve Housing

SPECIAL SERVICE TOOL(S) REQUIRED

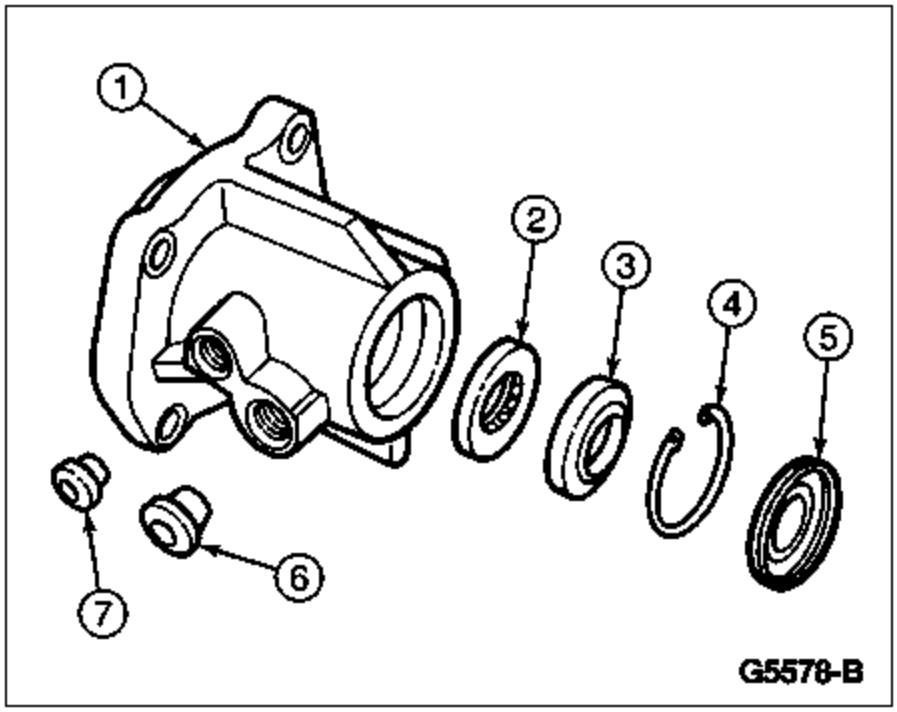
Description	Tool Number
Puller	T58L-101-B
Impact Slide Hammer	T59L-100-B
Bench Mounted Holding Fixture	T57L-500-B
Input Shaft Bearing/Seal Tool Set	T65P-3524-A1, T65P-3524-A2 and T65P-3524-A3
Brass Tube Seat Remover	T74P-3504-L
Brass Tube Seat Replacer	T74P-3504-M

CAUTION: Do not damage the housing when inserting and removing the tools.

Disassembly

1. Disassemble steering gear; refer to procedure in this section.

2. With worm shaft removed remove the dust seal from the valve housing using Puller T58L-101-B and Impact Slide Hammer T59L-100-B. Discard the seal.



tomsn048@gmail.com

Item	Part Number	Description
1	3A587	Valve Housing
2	—	Bearing (Part of 3D526)
3	3D526	Power Steering Input Shaft Seal
4	352109-S	Snap Ring
5	3D527	Power Steering Gear Input Shaft Dust Seal
6	374480-S	Output Tube Seat
7	374309-S	Inlet Tube Seat

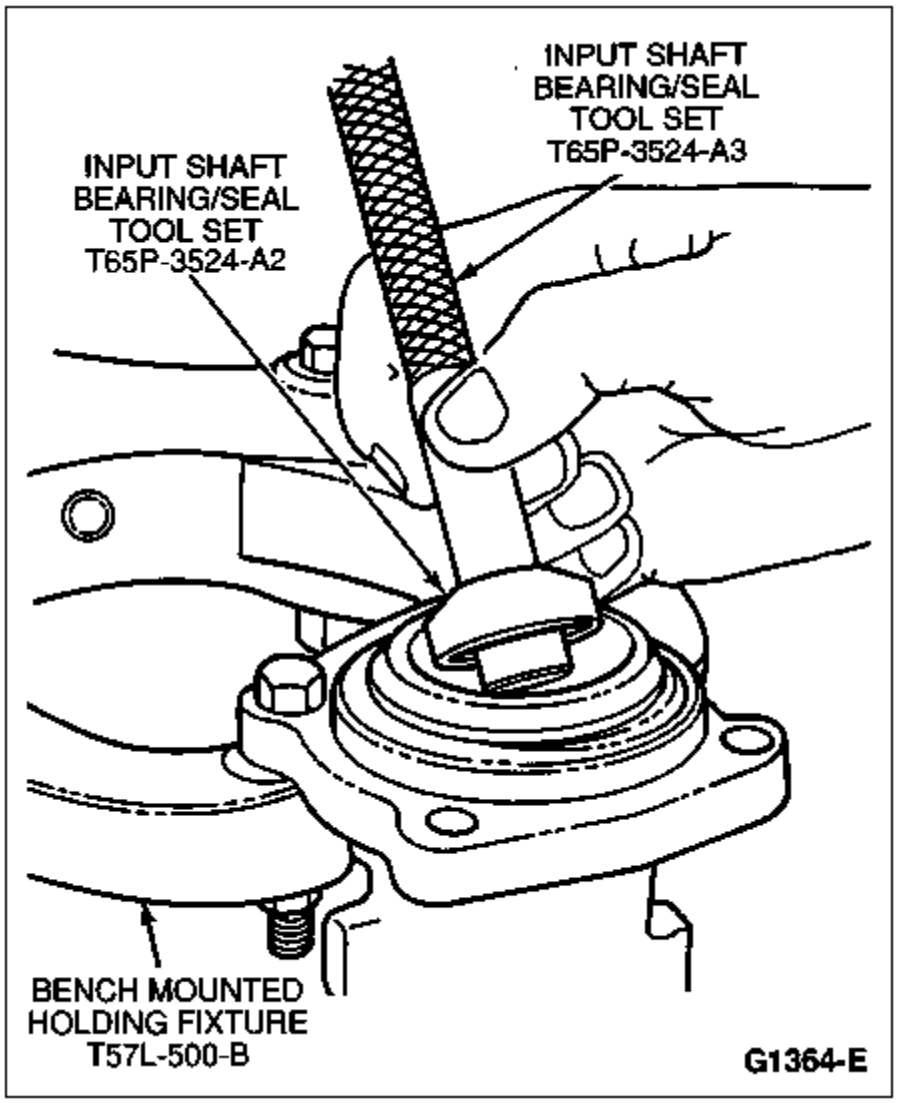
3. Remove the snap ring from the valve housing.

4. Turn Bench Mounted Holding Fixture T57L-500-B to invert valve housing.

5. Insert Input Shaft Bearing/Seal Tool Set T65P-3524-A2 and T65P-3524-A3 in the valve housing opposite the oil seal end and gently tap the bearing and seal out of the housing. Discard the seal.

6. Remove the fluid inlet and outlet tube seats with Brass Tube Seat Remover T74P-3504-L if they are damaged.

tomsn048@gmail.com



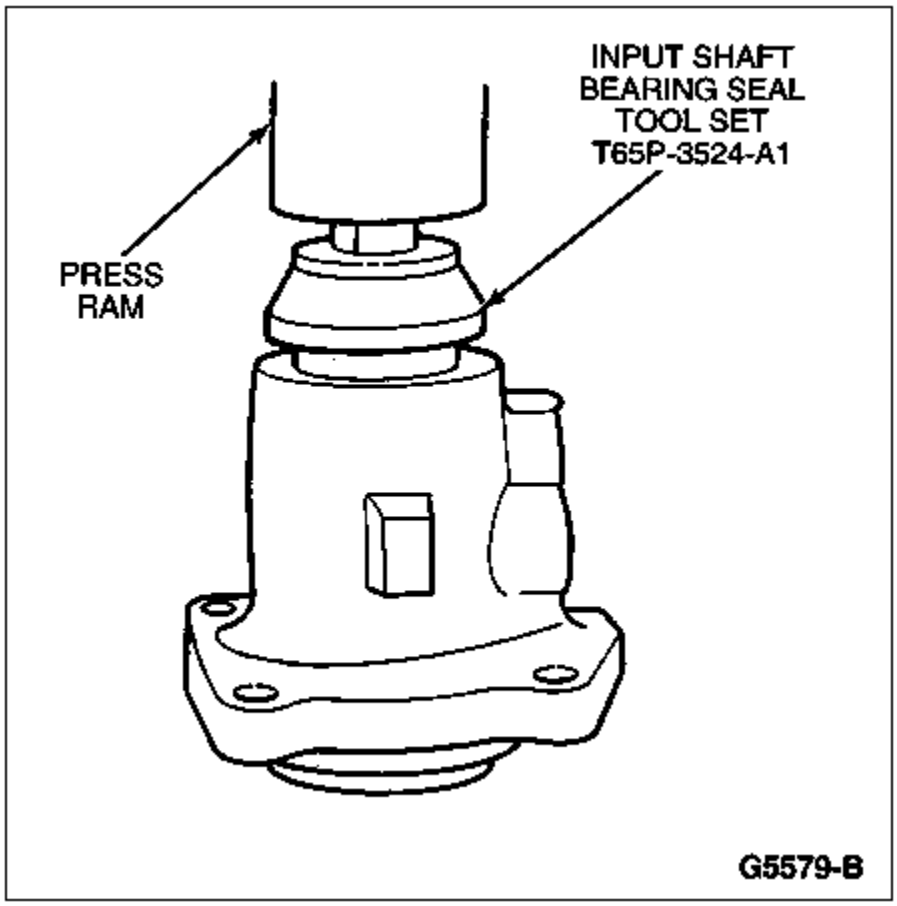
Assembly

1. Coat the fluid inlet and outlet tube seats with petroleum jelly or equivalent. Install seats in the housing with a Brass Tube Seat Replacer T74P-3504-M.

2. Coat the bearing and seal surface of the steering gear housing (3548) with petroleum jelly or equivalent.

3. Install the bearing with the metal side covering the rollers facing outward. Seat the bearing in the valve housing using Input Shaft Bearing/Seal Tool Set T65P-3524-A1. Be sure the bearing rotates freely.

tomsn048@gmail.com



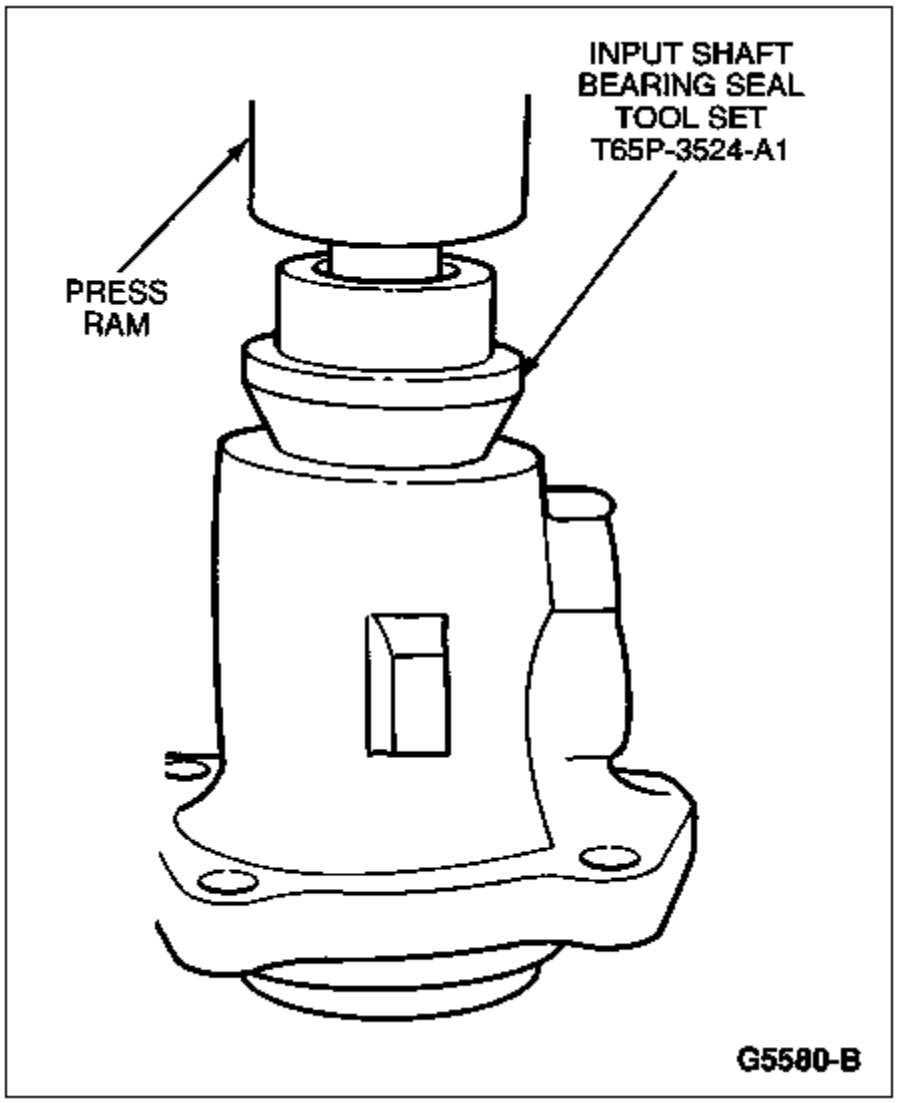
4. Dip a new oil seal in Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F and place it in the housing with the metal side facing outward. Drive the seal into the housing until the outer edge does not quite clear the snap ring groove.

5. Place the snap ring in the housing and drive on the ring using Input Shaft Bearing/Seal Tool Set T65P-3524-A1 until the snap ring seats in its groove.

6. Place the dust seal in the housing with the dished side (rubber side) facing out. Drive the dust seal into place using Input Shaft Bearing/Seal Tool Set T65P-3524-A1. When properly installed, the seal will be located behind the undercut in the power steering gear input shaft and control (3D517).

7. Apply a generous amount of Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-B and ESR-M159-A to the area between the two seals.

tomsn048@gmail.com



8. Assemble the steering gear; refer to the procedure in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Steering Gear

Cleaning

CAUTION: Do not clean, wash or soak in the cleaning solvent,

Disassembly and assembly of the steering gear and subassemblies must be made on a clean workbench. As in repairing any hydraulically operated unit, cleanliness is of utmost importance. The bench, tools, and parts must be kept clean at all times. Thoroughly clean the exterior of the unit with a suitable solvent and, when necessary, drain as much of the hydraulic fluid (or gear grease) as possible. Handle all parts very carefully to avoid nicks, burrs, scratches and dirt, which could make the parts unfit for use.

Inspection

1. Check input shaft bearing for damage. Replace if necessary.
2. Inspect the valve housing for scoring or burrs.
3. Inspect the tube seats (if equipped) in the pressure and return ports in the housing. If nicks, etc., are present replace tube seats.
4. Check all fluid passages for obstruction or leakage.
5. Inspect the steering gear housing for cracks, stripped threads, and mating surfaces for burrs. Inspect the piston bore of the housing for scoring. Check roller bearing for damage. If necessary, replace the housing.
6. Check the input shaft bearing after installation to be sure that it rotates without binding or roughness.
7. Check the pinion and rack teeth or sector shaft teeth and piston rack teeth for nicks and burrs.

tomsn048@gmail.com

tomsn048@gmail.com

In-Vehicle Adjustment

Adjust total on center load to eliminate excessive lash between the sector and rack teeth as follows. This is the only adjustment required.

1. With the engine (6007) off, turn the steering wheel (3600) from full right lock to full left lock, at least once.

2. Refer to the appropriate section of the service manual for proper steering wheel hub cover removal procedure.

3. Disconnect the steering gear sector shaft arm (3590) from the steering gear sector shaft (3575) using Pitman Arm Puller T64P-3590-F.

4. Attach an inch-pound torque wrench to the steering wheel hub nut and determine the torque required to rotate the power steering gear input shaft and control (3D517) back and forth across the center position (± 90 degrees).

5. Reset the meshload only, if the measured torque for total on-center load is less than 1.5 Nm (13 lb-in). If reset is required, loosen the adjuster locknut and turn the sector shaft adjuster screw until the measured total on-center load torque is 2.0 Nm (18 lb-in). Hold the sector shaft screw in place and tighten the locknut to 48-61 Nm (35-44 lb-ft).

6. Recheck torque readings and replace the steering gear sector shaft arm. Torque the nut to 230-310 Nm (170-228 lb-ft).

7. Verify no binding condition in steering throughout full lock to lock travel. Verify customer concern is resolved.

8. Replace steering wheel hub cover.

tomsn048@gmail.com

tomsn048@gmail.com

Rotary Valve Centering Check

1. **NOTE: The only service that can be performed on the control valve assembly is the replacement of the four Teflon® seals on the valve sleeve and replacement of the control valve housing.**

   Install a 0-13,789 kPa (0-2000 psi) pressure-gauge (Power Steering Analyzer D79L-33610-A or equivalent) in the pressure line between the power steering pump outlet port and the integral steering gear inlet port. Be sure that the valve on the gauge is fully open.

2. **NOTE: Refer to Section 11-00 , Fill Process, for proper filling procedures.**

   Check the fluid level in the reservoir and add Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F if necessary.

3. Start the engine and turn the steering wheel from stop to stop to bring the steering fluid to normal operating temperature. Turn off the engine and recheck the fluid level. Add Premium Power Steering Fluid E6AZ-19582-AA or equivalent meeting Ford specification ESW-M2C33-F if necessary.

4. With the engine running at approximately 1000 rpm and the steering wheel centered, attach an inch-pound torque wrench to the steering wheel nut. Apply sufficient torque in each direction to get a gauge reading of 1723 kPa (250 psi).

5. The torque wrench readings should be the same in both directions at 1723 kPa (250 psi). If the difference between the readings exceeds 0.68 Nm (6 lb-in), remove the steering gear and replace the shaft and control assembly (3D517).

6. **NOTE: A hissing noise is a normal characteristic of rotary valve steering gears and in no way affects steering. Do not replace the shaft and control assembly unless the hiss is EXTREMELY objectionable. A replacement valve will also exhibit slight noise, and is not usually a cure for the complaint. Any metal-to-metal contacts, such as column grounding, coupling grounding, or sheet metal to steering components will transmit valve hiss noise into the passenger compartment.**

   When performing the valve centering check outside the vehicle, use the procedures described above, except take the torque and pressure readings at the right and left stops instead of either side of center.

   The only service that can be performed on the 3D517 worm end valve assembly is the replacement of the four valve sleeve O-rings on the valve sleeve and replacement of the control valve housing.

Spindle Connecting Rod or End, Front Wheel

Replace the tie rod end (3A130) if the tie rod end is loose in the socket or the tie rod end is bent. Replace boot seal if any nicks, cuts or tears are present. **Do not attempt to straighten a bent tie rod end.**

Removal

1. Raise the vehicle on a hoist with the wheels in the straight-ahead position. Refer to Section 00-02 .
2. Remove the nut and cotter pin from the tie rod end on the steering sector shaft arm drag link (3304).
3. Remove the tie rod end from the tie rod adjusting sleeve (3281) using Pitman Arm Puller T64P-3590-F.
4. Loosen the bolts on the tie rod adjusting sleeve. Count the number of turns it takes to remove tie rod end.

Installation

1. Install the tie rod end into the tie rod sleeve the same number of turns it took to remove it. Tighten the tie rod adjusting sleeve nuts to 40-57 Nm (30-42 lb-ft). Be certain that tie rod adjusting sleeve clamps (3287) are pointed down ± 45 degrees.
2. Position the tie rod end in the steering sector shaft arm drag link. Maintain the front wheel (1007) and steering wheel in the straight-ahead position. Install nut and tighten to 70-100 Nm (51-73 lb-ft).
3. Install new cotter pins.
4. Check toe-in and adjust toe-in and clear vision as described in Section 04-00 .

Adjusting Sleeve

Replace the tie rod end (3A130) if it is loose in the socket or the tie rod end is bent. Replace boot seal if any nicks, cuts or tears are present. **Do not attempt to straighten a bent tie rod end.**

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F

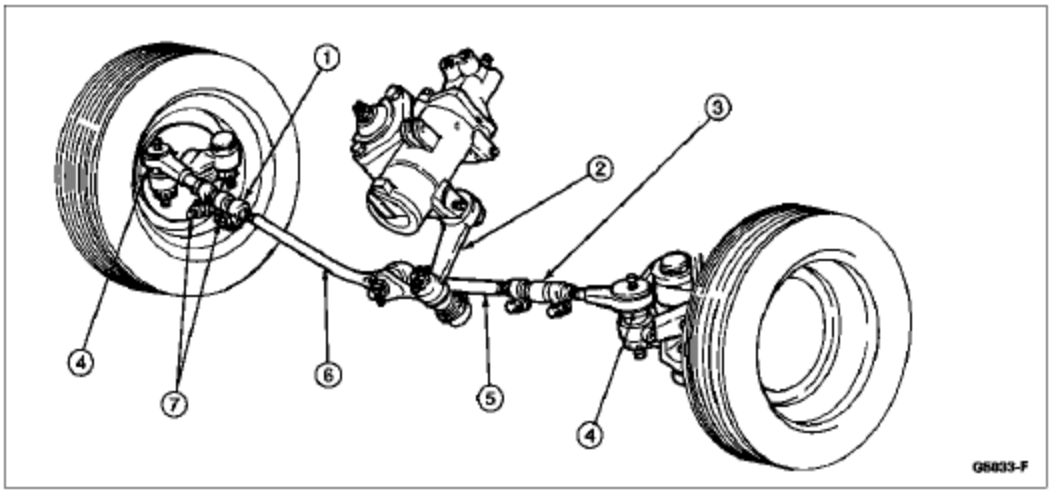
Removal

1. Raise the vehicle on a hoist with the wheels in the straight-ahead position. Refer to Section 00-02 .
2. Remove the nut and cotter pin from the tie rod end at the front wheel spindle (3105).
3. Remove the tie rod end from the front wheel spindle using Pitman Arm Puller T64P-3590-F.
4. Loosen the nuts on the adjacent tie rod adjusting sleeve (3281). Count the number of turns it takes to remove the tie rod end from the tie rod adjusting sleeve.

Installation

1. Install the tie rod end into the tie rod adjusting sleeve the same number of turns it took to remove it to aid in adjusting toe-in. Loosely assemble the tie rod end in the front wheel spindle.
2. Tighten adjusting sleeve nuts to 40-57 Nm (30-42 lb-ft). Make sure the tie rod adjusting sleeve clamps (3287) are pointed down ± 45 degrees.
3. With the front wheel (1007) and steering wheel (3600) in the straight-ahead position, install tie rod ball stud nut and tighten to 70-100 Nm (51-73 lb-ft).
4. Install new cotter pins.
5. Check toe-in and set toe-in as described in Section 04-00 .

Tie Rod Adjusting Sleeve and Front Wheel Spindle Connecting Rod or End

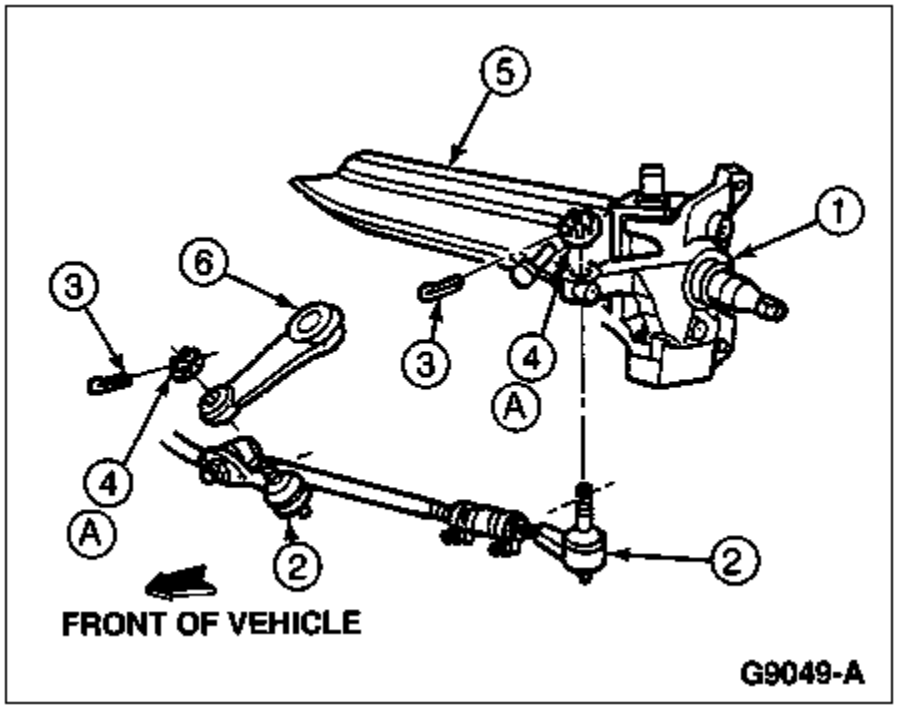


Item	Part Number	Description
1	3281	Spindle Connecting Rod Tube
2	3590	Steering Gear Sector Shaft Arm
3	3281	Tie Rod Adjusting Sleeve
4	3A131	Front Wheel Spindle Connecting Rod or End
5	3B008	Steering Tie Rod and Link Assembly
6	3304	Steering Sector Shaft Arm Idler Arm Rod
7	3287	Front Wheel Spindle Connecting Rod Clamp

Steering Sector Shaft Arm Drag Link

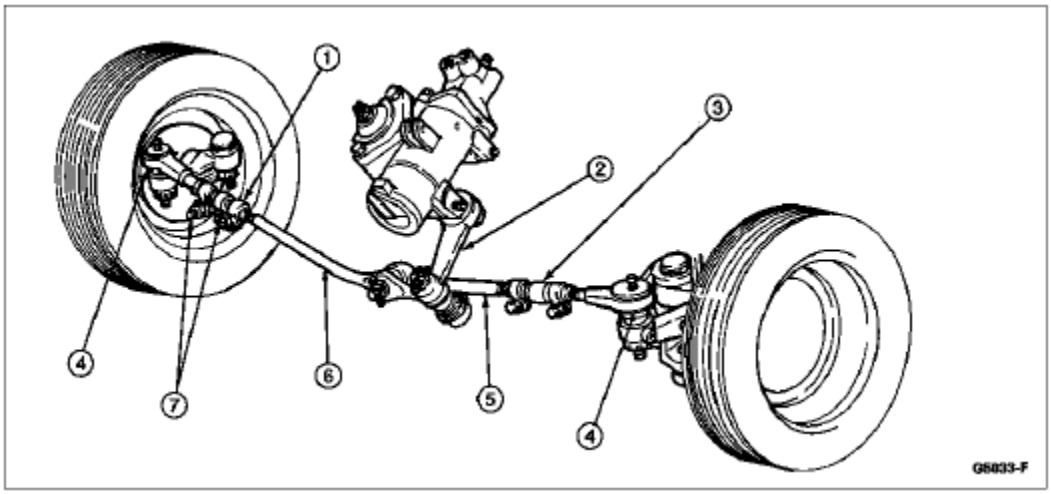
Replace the steering sector shaft arm drag link (3304) if either the tie rod end (3A130) is loose or the steering sector shaft arm drag link is bent or the threads of the tie rod adjusting sleeve clamp (3287) are loose or damaged. Replace boot seal if any nicks, cuts or tears are present. **Do not attempt to straighten a steering sector shaft arm drag link.**

Steering Sector Shaft Arm Drag Link, Ranger (4x2)



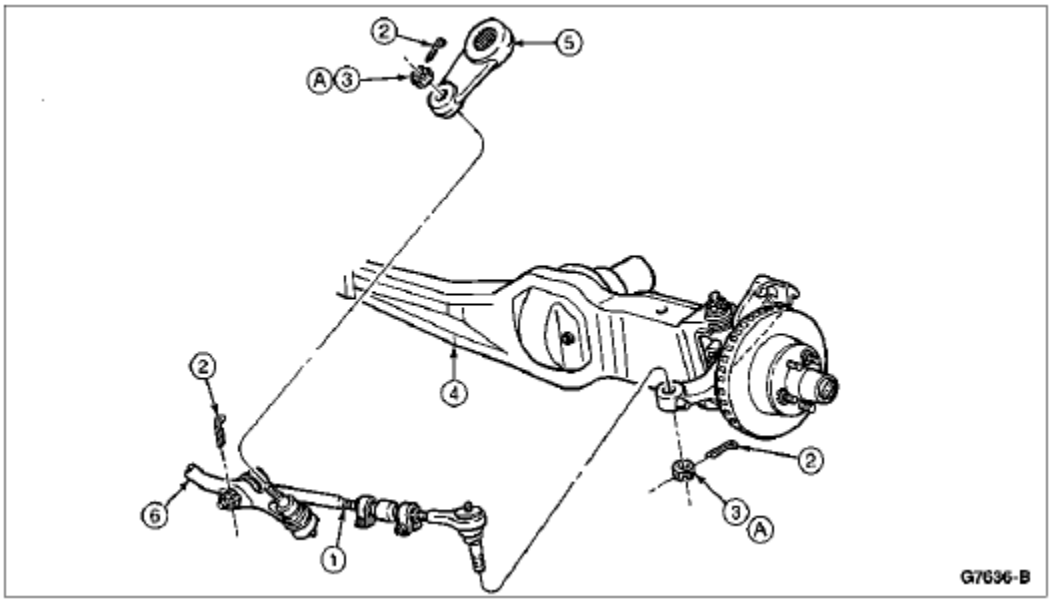
Item	Part Number	Description
1	3105	Front Wheel Spindle
2	3B008	Steering Tie Rod and Link Assembly
3	N642569-S36	Cotter Pin
4	N800895-S52	Nut
5	3006/3007	Axle Assembly (RH/LH)
6	3590	Steering Gear Sector Shaft Arm
A	—	Tighten to 70-100 Nm (51-73 Lb-Ft)

Steering Sector Shaft Arm Drag Link Tie Rod Adjusting Sleeve and Front Wheel Spindle Connecting Rod or End



Item	Part Number	Description
1	3281	Spindle Connecting Rod Tube
2	3590	Steering Gear Sector Shaft Arm
3	3281	Tie Rod Adjusting Sleeve
4	3A131	Front Wheel Spindle Inner Connecting Rod or End
5	3B008	Steering Tie Rod and Link Assembly
6	3304	Steering Sector Shaft Arm Drag Link
7	3287	Front Wheel Spindle Connecting Rod Clamp

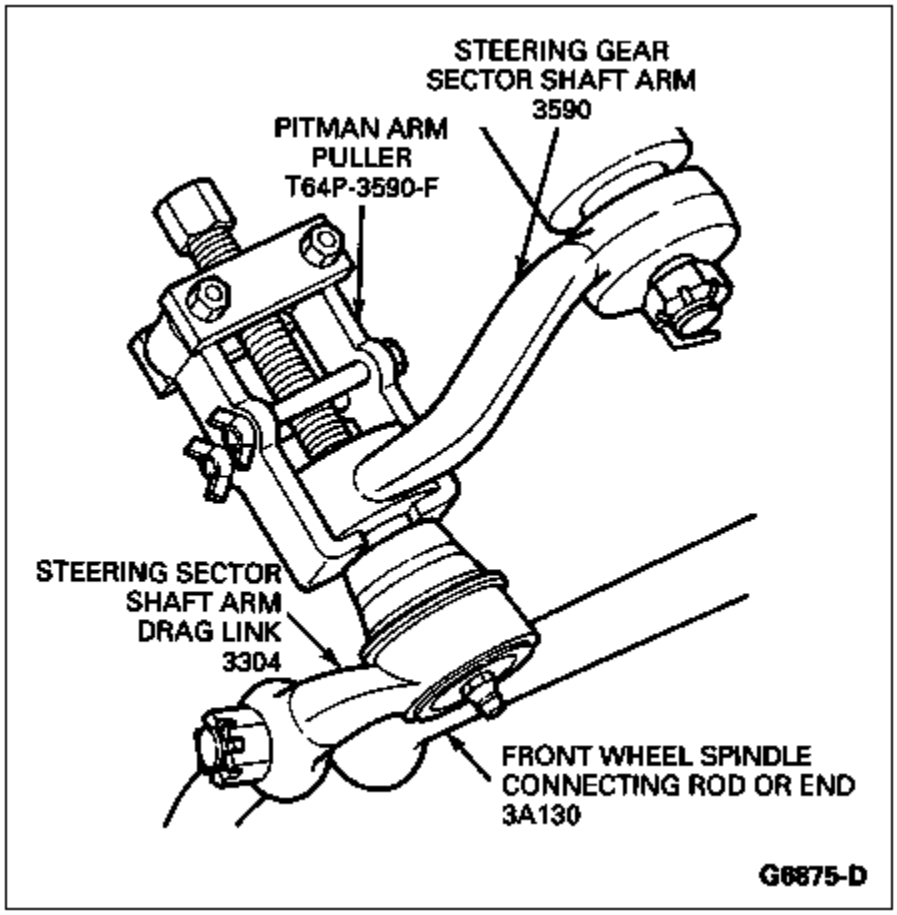
Steering Sector Shaft Arm Drag Link, Ranger 4x4



Item	Part Number	Description
1	3A130	Tie Rod End
2	N642569-S36	Cotter Pin
3	N800895-S56	Nut
4	3002	Front Axle Assembly
5	3590	Pitman Arm
6	3304	Steering Sector Shaft Arm Drag Link
A	—	Tighten to 70-100 Nm (51-73 Lb-Ft)

Removal

1. Raise the vehicle on a hoist. Refer to Section 00-02 .
2. Remove the cotter pins and nuts from the tie rod end at the steering gear sector shaft arm (3590) and tie rod end.
3. Remove the tie rod ends from the steering gear sector shaft arm drag link using Pitman Arm Puller T64P-3590-F.



4. Loosen the bolts on the tie rod adjusting sleeve (3281). Count the number of turns it takes to remove the steering sector shaft arm drag link.

Installation

Must orient drag link to steering gear sector shaft arm before tightening clamp.

1. Install the steering sector shaft arm drag link the same number of turns it took to remove it from the tie rod adjusting sleeve.

2. Position the tie rod end in the steering gear sector shaft arm drag link. Position the steering tie rod ball stud in the steering sector shaft arm drag link. Install nuts and tighten to 70-100 Nm (51-73 lb-ft).

3. Tighten the adjusting sleeve nuts to 40-57 Nm (30-42 lb-ft). Be certain that tie rod adjusting sleeve clamps point down ± 45 degrees.

4. Install new cotter pins.

5. Check toe-in and adjust toe-in as described in Section 04-00 .

Steering Gear Sector Shaft Arm

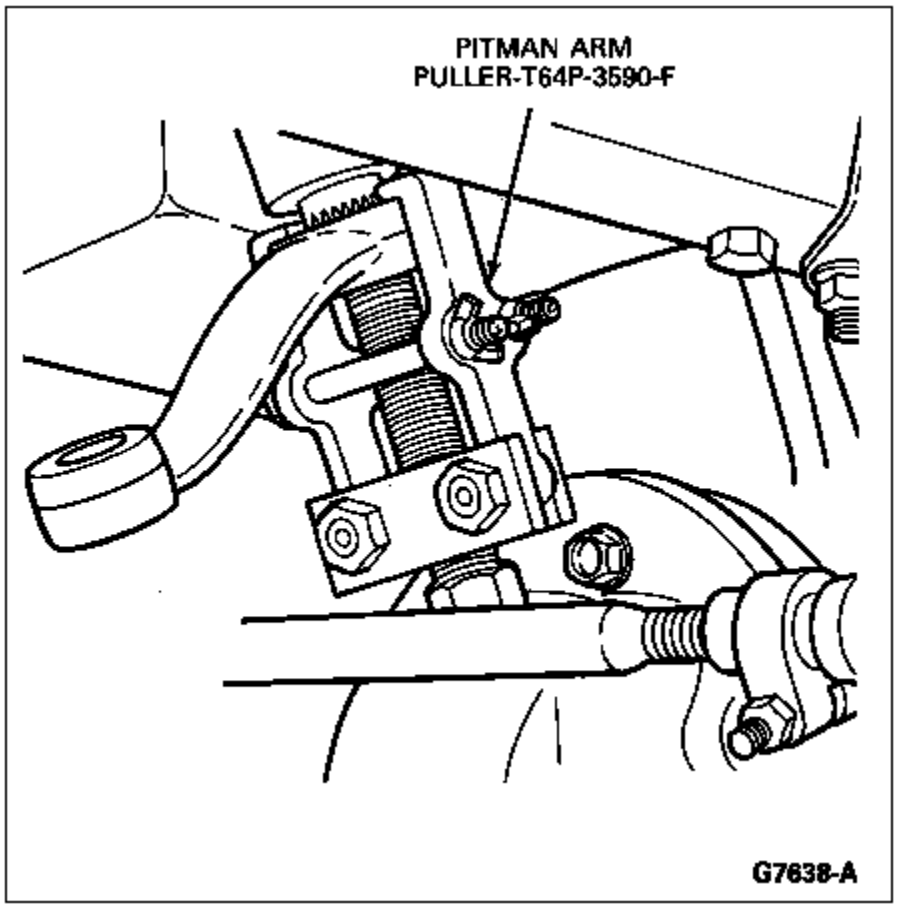
Replace the steering gear sector shaft arm (3590) if it is bent. Also check the steering sector shaft arm drag link (3304), tie rod end (3A130), tie rod adjusting sleeves (3281) and tie rod ends for signs of damage. Replace damaged steering linkage as required. **Do not attempt to straighten the steering gear sector shaft arm or any other steering linkage components.**

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F

Removal

1. Remove the cotter pin and nut from the tie rod end at the steering gear sector shaft arm.
2. Remove the tie rod end from the steering gear sector shaft arm using Pitman Arm Puller T64P-3590-F.
3. Remove the steering gear sector shaft arm attaching nut and washer from steering gear output/sector shaft.
4. Remove the steering gear sector shaft arm from the steering gear output/sector shaft using Pitman Arm Puller T64P-3590-F. Remove the tool from the steering gear sector shaft arm.



Installation

1. Install the new steering gear sector shaft arm on the steering gear output/sector shaft indexing blind splines in arm to those on sector shaft. Install the steering gear sector shaft arm attaching washer and nut. Tighten the nut to 230-310 Nm (170-228 lb-ft).

2. Install the tie rod end into the steering gear sector shaft arm. Maintain the steering wheel and wheels (1007) in the straight-ahead position. Make sure the tie rod end is seated in the taper to prevent rotation while tightening.

3. Tighten the nut to 70-100 Nm (51-73 lb-ft).

4. Install a new cotter pin.

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	Lb-Ft
Drag Link to Tie Rod Ball Stud Nut	70-100	51-73
Drag Link to Pitman Arm Ball Stud Nut	70-100	51-73
Steering Gear Sector Shaft Arm to Steering Gear Nut	230-310	170-228
Adjusting Sleeve Nuts	40-57	30-42
Tie Rod to Spindle Ball Stud Nut	70-100	51-73

Steering Column

NOTE: All fasteners are important in that they could affect the performance of vital parts and systems, and/or could result in major service expenses. They must be replaced with new fasteners of the same part number if replacement becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during assembly to ensure proper functioning of these parts.

The steering column is of a modular construction and features easy to service electrical switches.

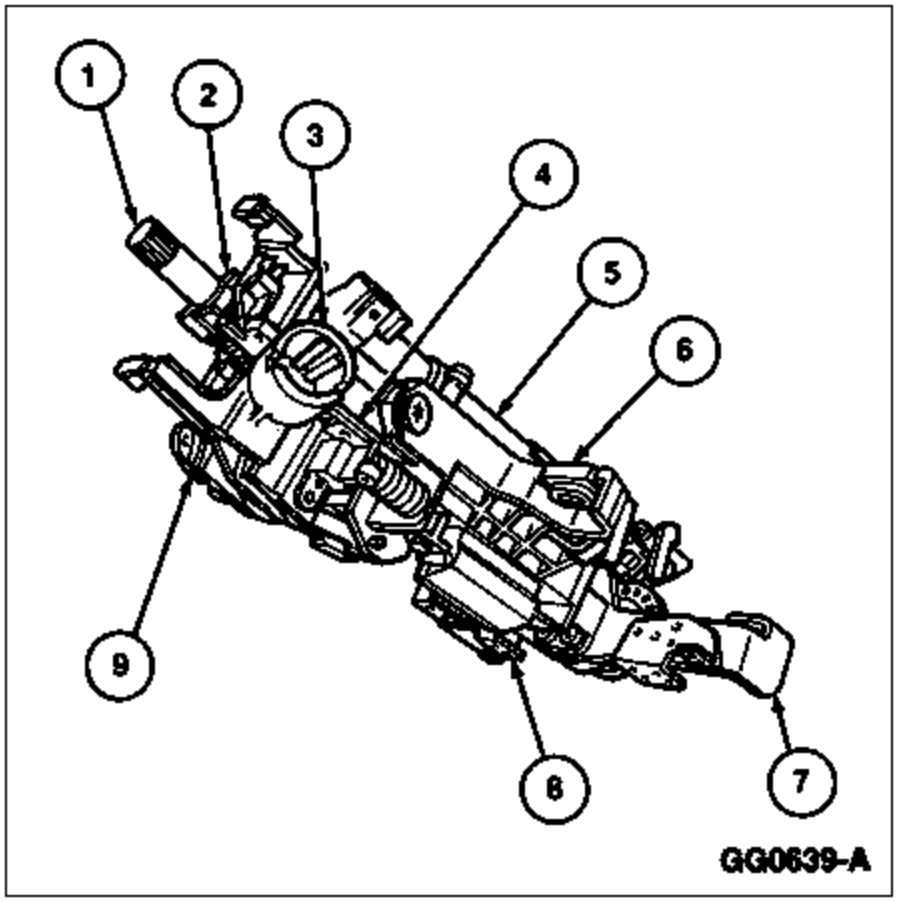
The structural part of the steering column is made of magnesium die castings.

At the lower end, the steering column is attached to the instrument panel support by a bend bracket. The bend bracket is designed so that during a collision:

a. The steering column will remain stationary during air bag deployment.
b. If, after air bag deflation, the driver should strike the steering column, the bend bracket will bend in a controlled manner absorbing the impact of the driver striking the column and reducing injury.

The upper end of the steering column is attached to the instrument panel support by shear modules. They are designed to shear if, during a collision, the driver should strike the steering column after air bag deployment and deflation. This allows the bend bracket to absorb the force of the impact as described above.

Tilt Steering Column, Ranger



Item	Part Number	Description
1	3524	Steering Shaft
2	13318	Turn Indicator Cancel Cam
3	—	Ignition Lock Cylinder Pocket (Part of 3511)
4	3511	Lock Cylinder Housing
5	3F723	Steering Actuator Housing
6	—	Shear Module (Part of 3F723)
7	3676	Bend Bracket
8	11572	Ignition Switch
9	3D544	Steering Column Release Lever

Fixed and Tilt Columns

Both fixed and tilt columns are similar in design. On the tilt column, a latch mechanism is included to allow unlatching, raising, and lowering the upper third of the steering column with the steering wheel. The tilt column has pivot screws and a universal joint in the steering shaft to allow tilting. On a fixed column, the steering shaft is rigid.

A unique steering column-mounted shift mechanism is used. It has the transmission shift selector position insert (7A216) plate located away from the gearshift lever (7210) and interacts with the gearshift lever through a linkage system. This system incorporates a brake shift interlock which prevents shifting out of Park unless the brake pedal (2455) is depressed.

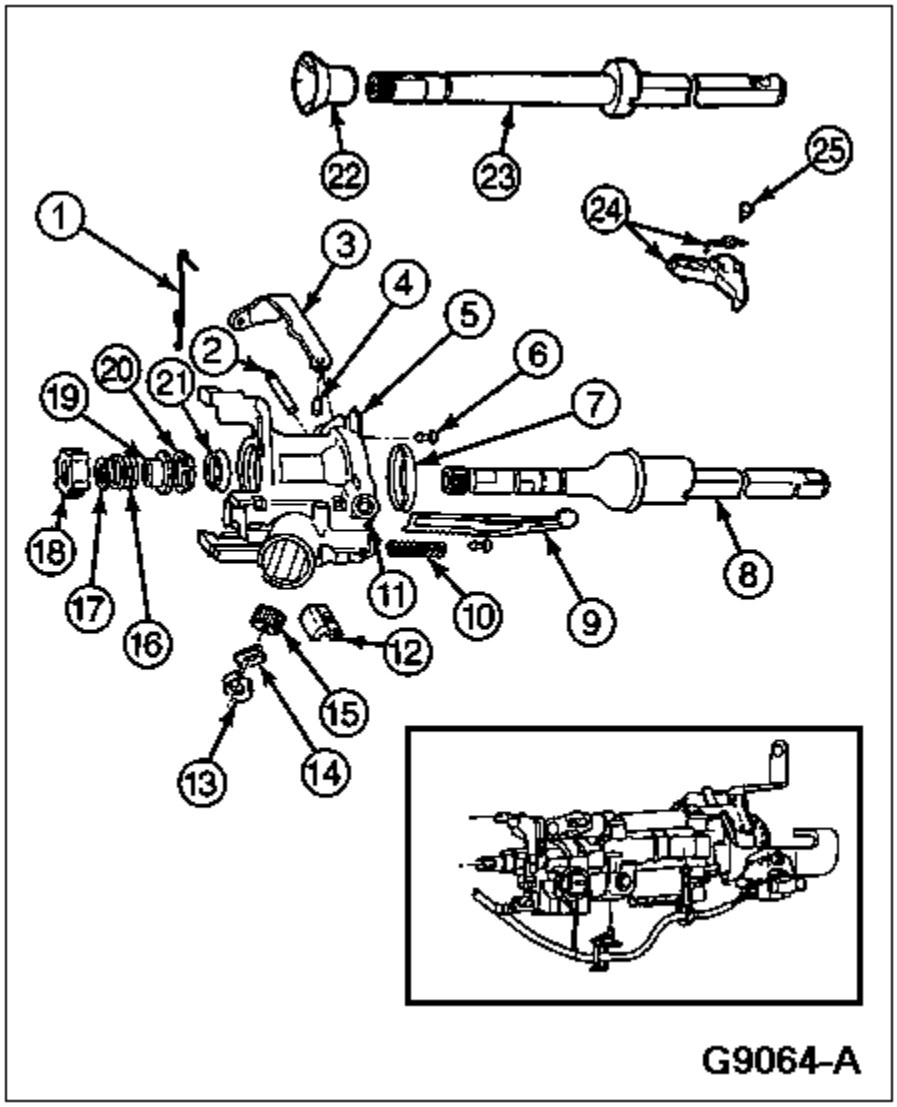
Steering Column with Air Bag

The steering column incorporates a driver side air bag module (043B13) in the steering wheel (3600). Refer to Section 01-20B for passive restraint information.

Steering Column Lock

The steering column is equipped with a lock mechanism which locks the steering wheel (3600), ignition switch, and gearshift lever (7210) when the ignition switch lock cylinder (11582) is turned to the LOCK position.

Lock Cylinder Housing Assembly, Steering Column



Item	Part Number	Description
1	3D655	Steering Column Position Spring
2	N808114-S	Pin, Knurled Straight, M4.7 x 3.97mm x 53.8mm

23	3E696	Steering Column Lock Spring
24	3E691	Steering Column Shaft Lock Pawl

Steering Wheel with Air Bag

CAUTION: Do not remove the steering column, steering wheel (3600), and driver side air bag module (043B13) as an assembly from the vehicle unless the column is locked to prevent rotation. Lower end of steering shaft should be wired to prevent the steering wheel from being rotated and causing the air bag sliding contact (14A664) to become misindexed.

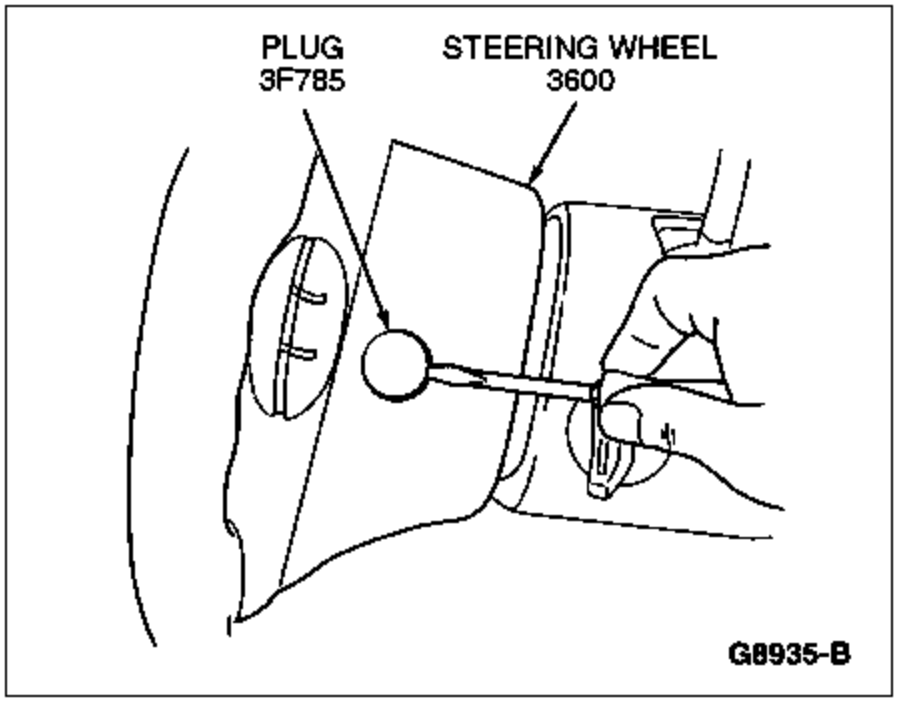
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Differential Side Bearing Puller	T77F-4220-B1

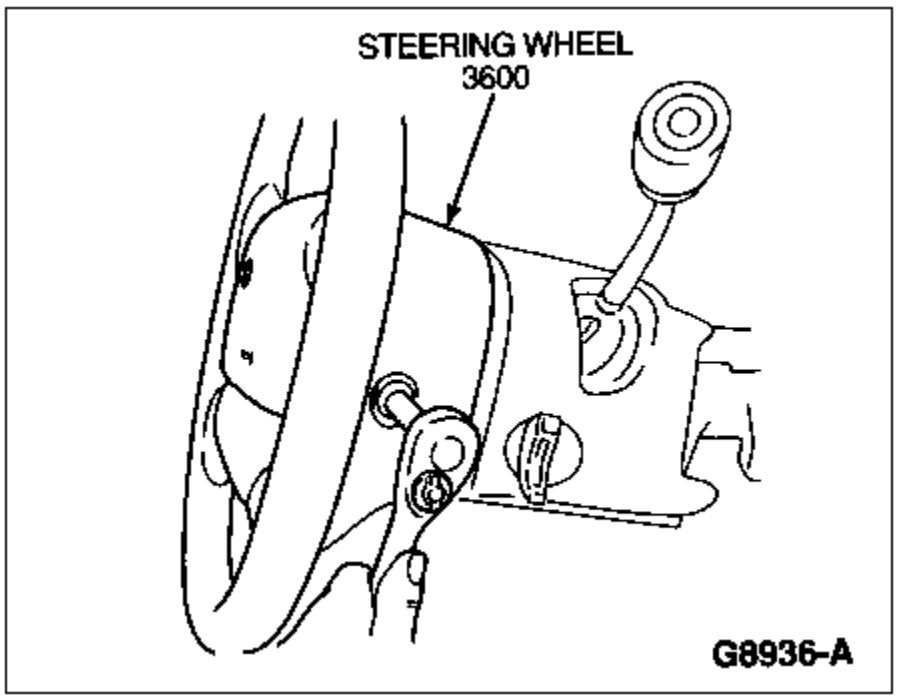
Removal

WARNING: THE ELECTRICAL CIRCUIT FOR AIR BAG DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR A MINIMUM OF ONE MINUTE TO DE-ENERGIZE THE BACKUP POWER SUPPLY PRIOR TO SERVICING OR REPLACING ANY AIR BAG SYSTEM COMPONENTS.

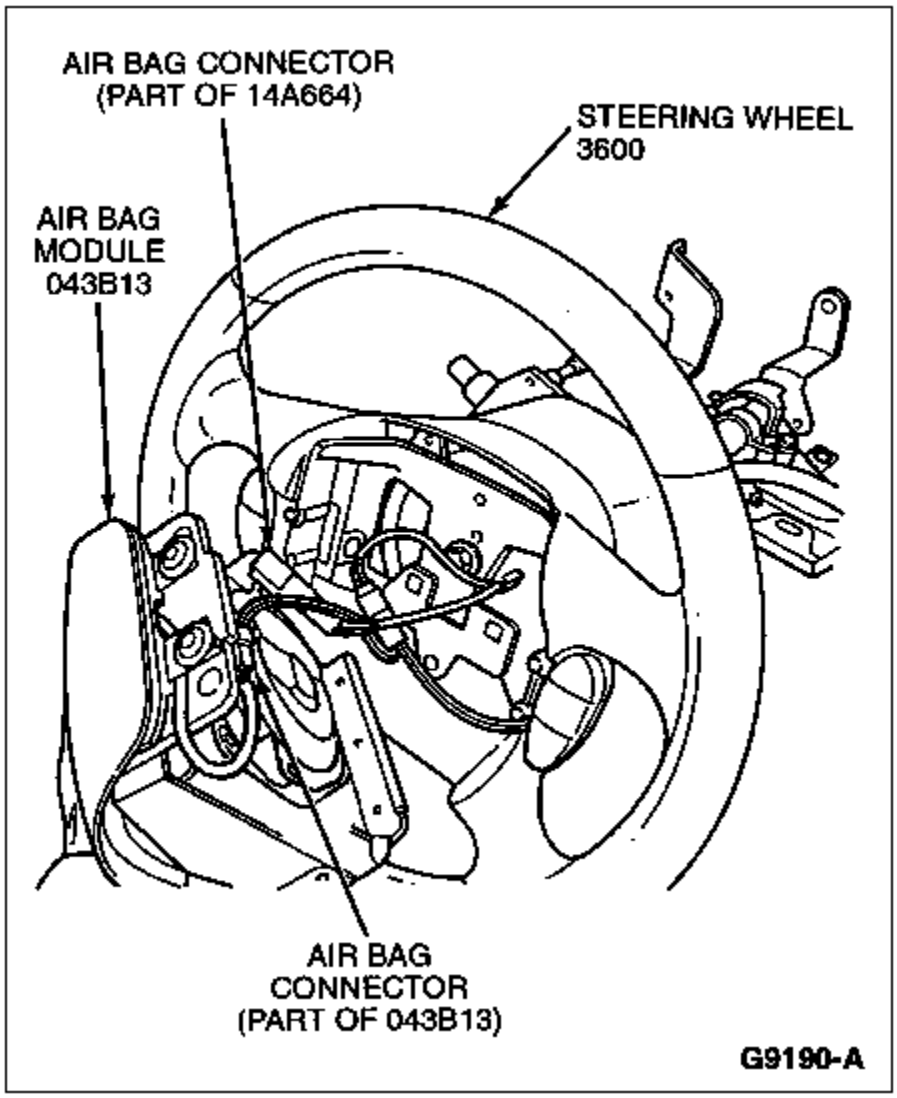
1. Center front wheels (1007) to the straight-ahead position.
2. Disconnect battery to starter relay cable (14300) and wait at least one minute to let the air bag backup power supply discharge. Refer to Section 01-20B .
3. Pry out two plugs covering driver side air bag module screws on sides of steering wheel.



4. Remove two driver side air bag module retaining screws on side of steering wheel from driver side air bag module, and lift driver side air bag module away from steering wheel.



5. Disconnect driver side air bag wire harness connector at the air bag sliding contact, horn control wire harness connector, and, if equipped, speed control harness connector.



6. Loosen, but do not remove, steering wheel retaining bolt approximately 2 to 3 turns.
7. Install Differential Side Bearing Puller T77F-4220-B1 at the areas marked PULL near the loosened steering wheel retaining bolt.
8. **CAUTION: Be sure air bag sliding contact assembly wire harness does not get caught on steering wheel assembly when lifting steering wheel off steering shaft.**

   Pull steering wheel loose and remove Differential Side Bearing Puller T77F-4220-B1.
9. Remove and discard original steering wheel bolt.
10. Remove steering wheel while routing wires from air bag sliding contact through steering wheel.

Installation

NOTE: If a new air bag sliding contact is being installed, remove the plastic lock tool after

intermediate shaft is connected to steering gear.

1. Make sure the vehicle's front wheels are in the straight-ahead position.

2. **CAUTION: Be sure wiring does not get trapped between steering wheel and air bag sliding contact.**

   Route air bag sliding contact wire harnesses through steering wheel opening at the three o'clock position. Position steering wheel on steering shaft so the alignment marks on wheel and shaft are aligned. Be sure air bag contact wire is not pinched.

3. Install new steering wheel retaining bolt and tighten to 34-46 Nm (25-34 lb-ft).

4. Connect horn/speed control wire harness to air bag sliding contact wire harness. Connector is located on right side of steering wheel retaining bolt.

5. Connect air bag sliding contact wire harness to driver side air bag module and position air bag into steering wheel. Install driver side air bag module retaining bolts.

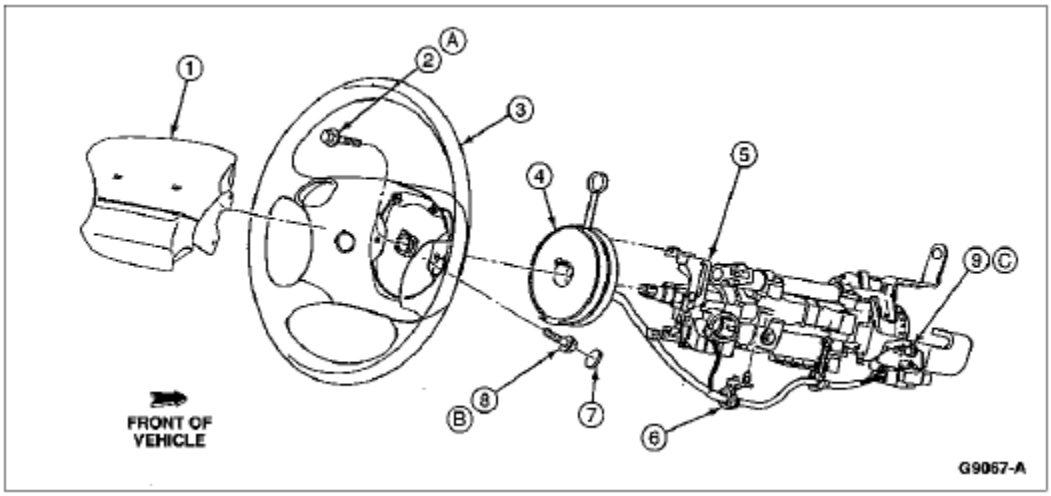
6. Hold driver side air bag module in position in steering wheel while bolts are being torqued to ensure proper fit. Tighten bolts to 7.6-10.4 Nm (67-92 lb/in).

7. Install two cover plugs by snapping into holes on sides of steering wheel.

8. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal driving symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more for the powertrain control module to relearn the strategy.**

   Connect battery to starter relay cable. Verify air bag warning indicator.

Steering Wheel with Air Bag



Item	Part Number	Description

1	043B13	Driver Side Air Bag Module
2	N807493-S100	Torx® Head Screw, M10-1.5 x 18
3	3600	Steering Wheel
4	14A664	Air Bag Sliding Contact
5	3C529	Steering Column
6	—	Clip (Part of 14A664)
7	3F785	Plug
8	N808944-S424	Bolt
9	N805375-S36MG	Bolt
A	—	Tighten to 34-46 Nm (25-33 Lb-Ft)
B	—	Tighten to 7.6-10.4 Nm (61-92 Lb-In)
C	—	Tighten to 10.2-13.8 Nm (7.5-10.1 Lb-Ft)

Steering Column, Fixed and Tilt

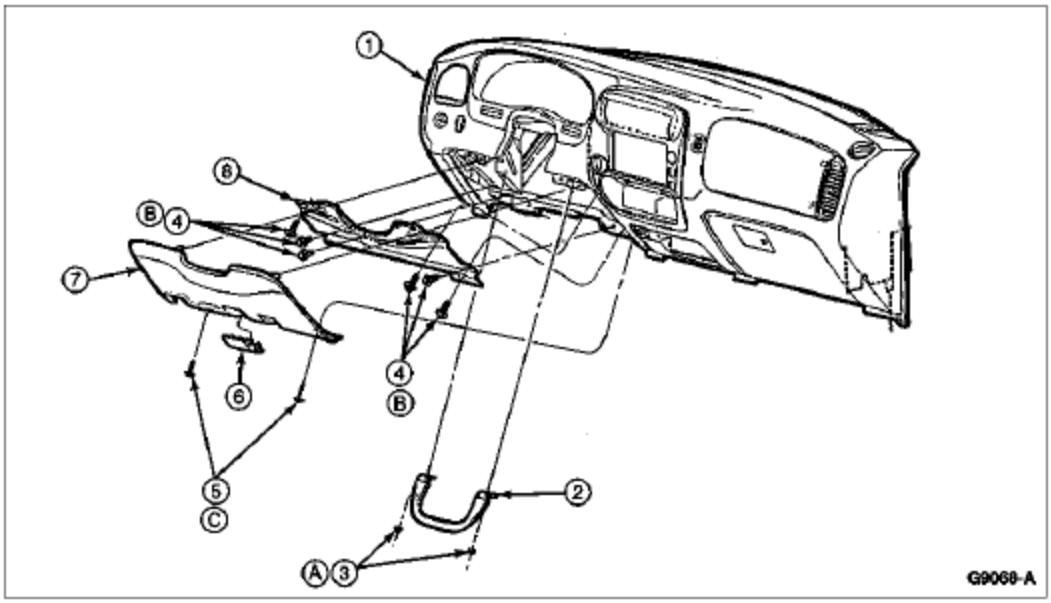
Removal

WARNING: THE ELECTRICAL CIRCUIT NECESSARY FOR AIR BAG SYSTEM DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND A BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR A MINIMUM OF ONE MINUTE TO DE-ENERGIZE THE BACKUP POWER SUPPLY PRIOR TO REMOVING ANY OF THE AIR BAG SYSTEM COMPONENTS.

NOTE: All components of the steering column are assembled with fasteners which are designed to prevent loosening due to vibrations associated with normal vehicle operation.

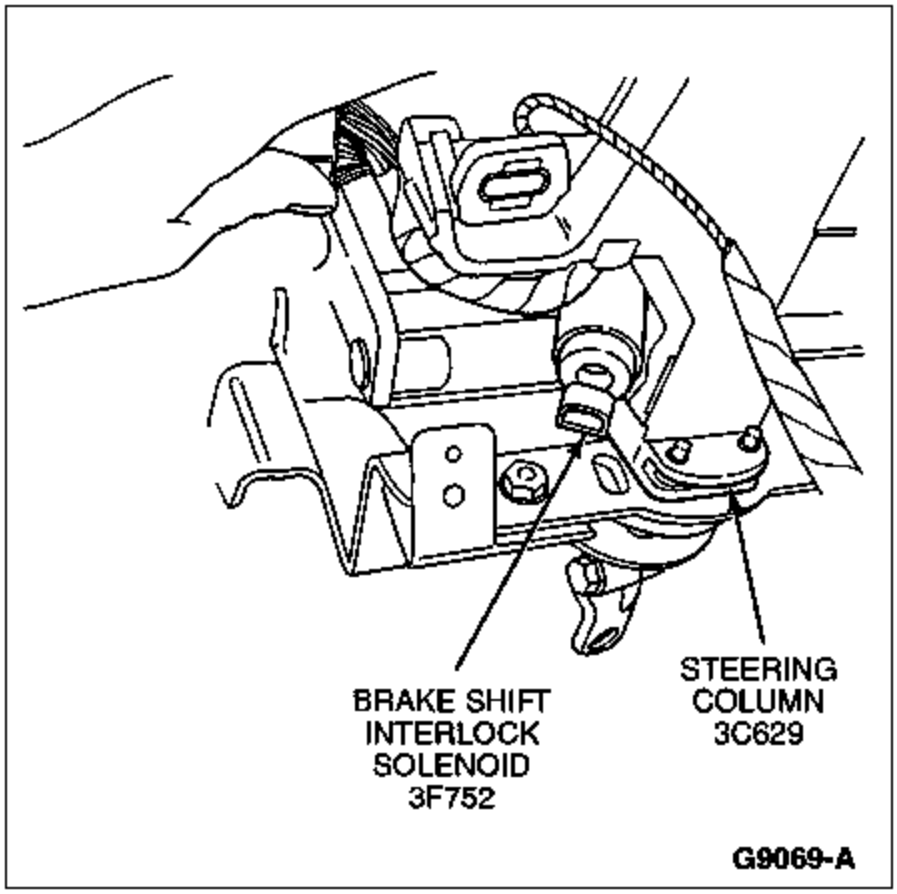
1. Park vehicle with the wheels (1007) in a straight-ahead position.
2. Disconnect the battery to starter relay cable (14300) and wait for one minute before beginning to remove steering column assembly.
3. Remove steering wheel (3600) as outlined in this section.
4. Remove two screws and instrument panel steering column cover (04459).
5. Remove six screws and instrument panel reinforcement (017A28).
6. Remove two screws and steering column opening center reinforcement.

Instrument Panel Steering Column Cover and Reinforcement

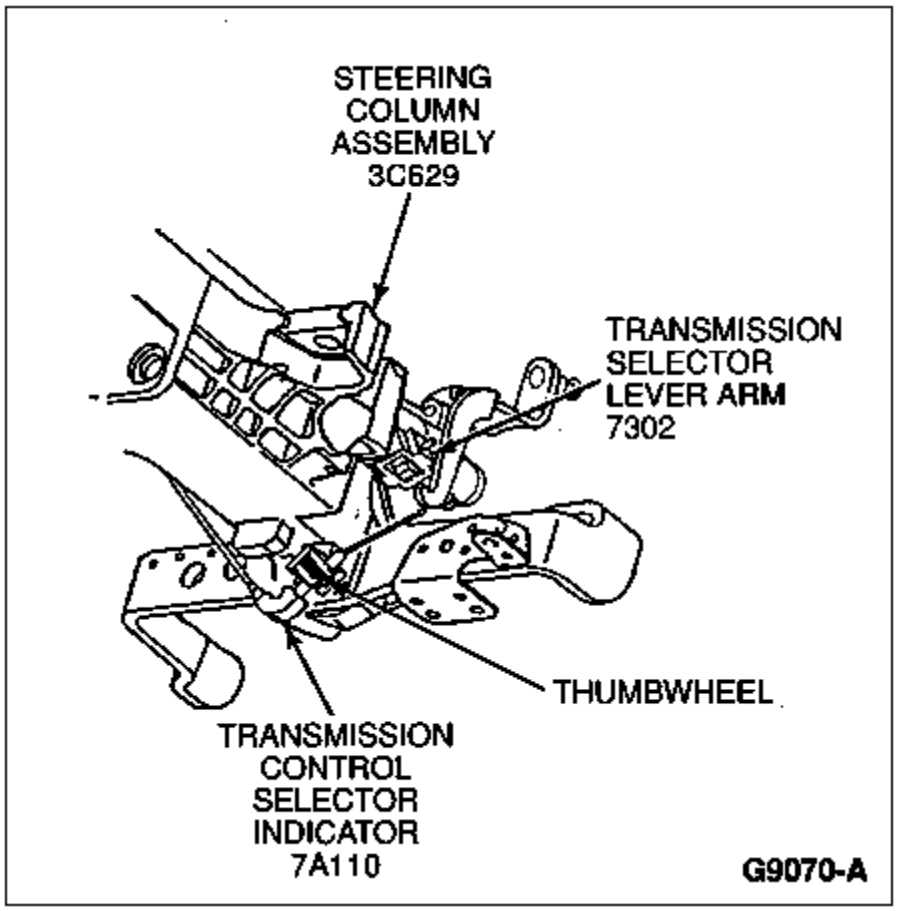


Item	Part Number	Description
1	04320	Instrument Panel
2	044C86	Instrument Panel Steering Column Opening Center Reinforcement
3	N806423-S58	Nuts
4	N606677-S36	Screw
5	N807122-S411	Screw
6	044D82	Instrument Panel Access Hole Cover
7	04459	Instrument Panel Steering Column Cover
8	017A28	Instrument Panel Reinforcement
A	—	Tighten to 13-17 Nm (115-150 Lb-In)
B	—	Tighten to 10-14 Nm (88-123 Lb-In)
C	—	Tighten to 2.1-2.9 Nm (19-25 Lb-In)

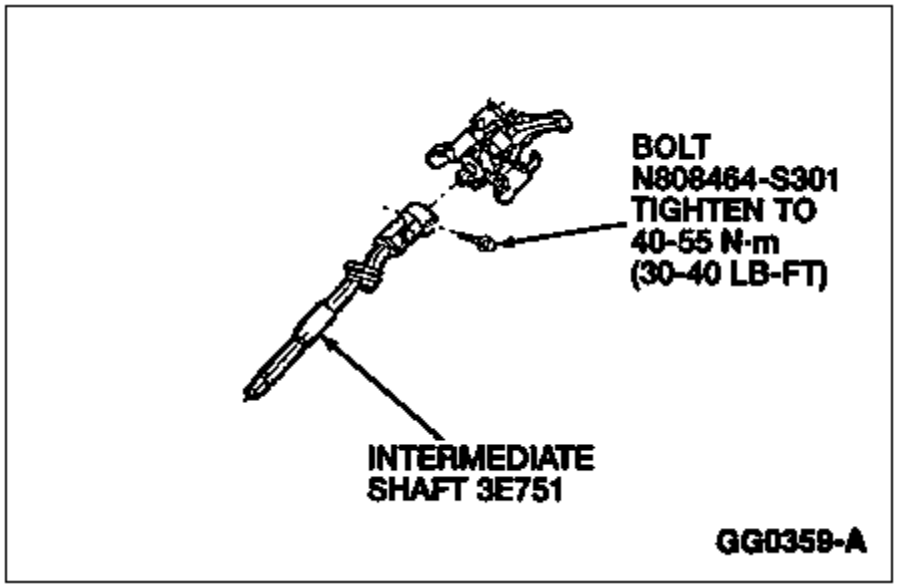
7. Disconnect electrical connectors between main wiring (14401) and steering column. Disconnect brake shift interlock solenoid.



8. Disconnect transmission control selector indicator loop from transmission column shift selector tube (7212). Remove screw and transmission range indicator (7A110) from steering column.



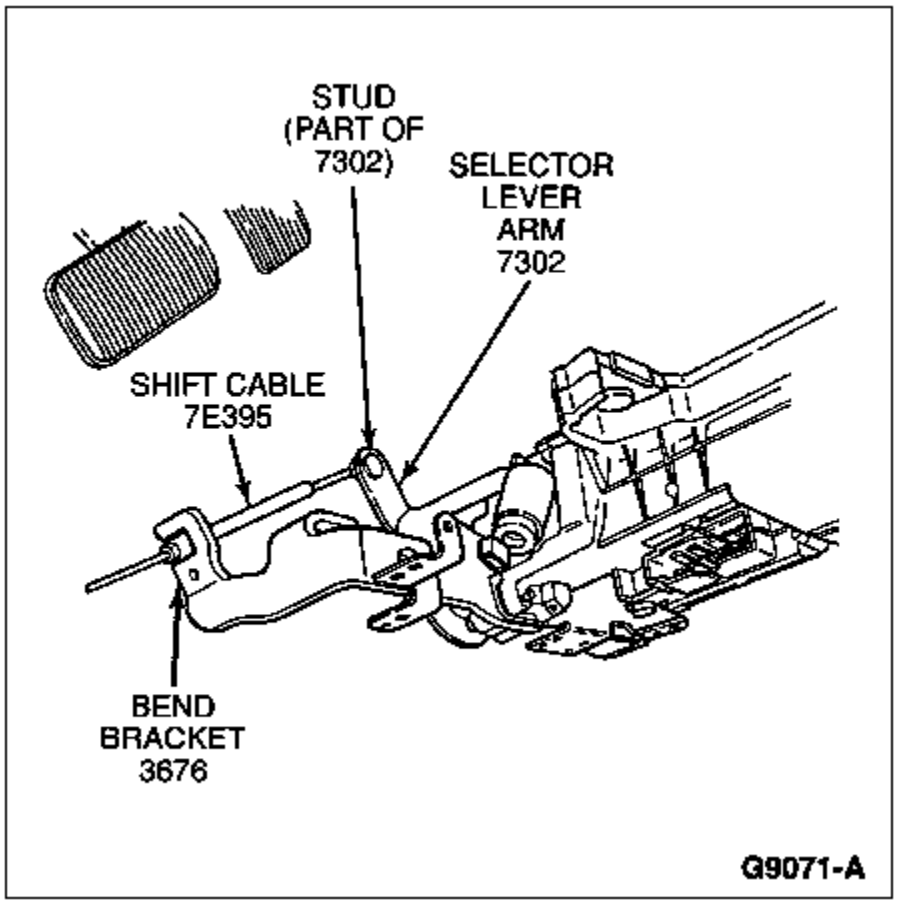
9. Remove steering shaft-to-intermediate shaft universal joint pinch bolt.



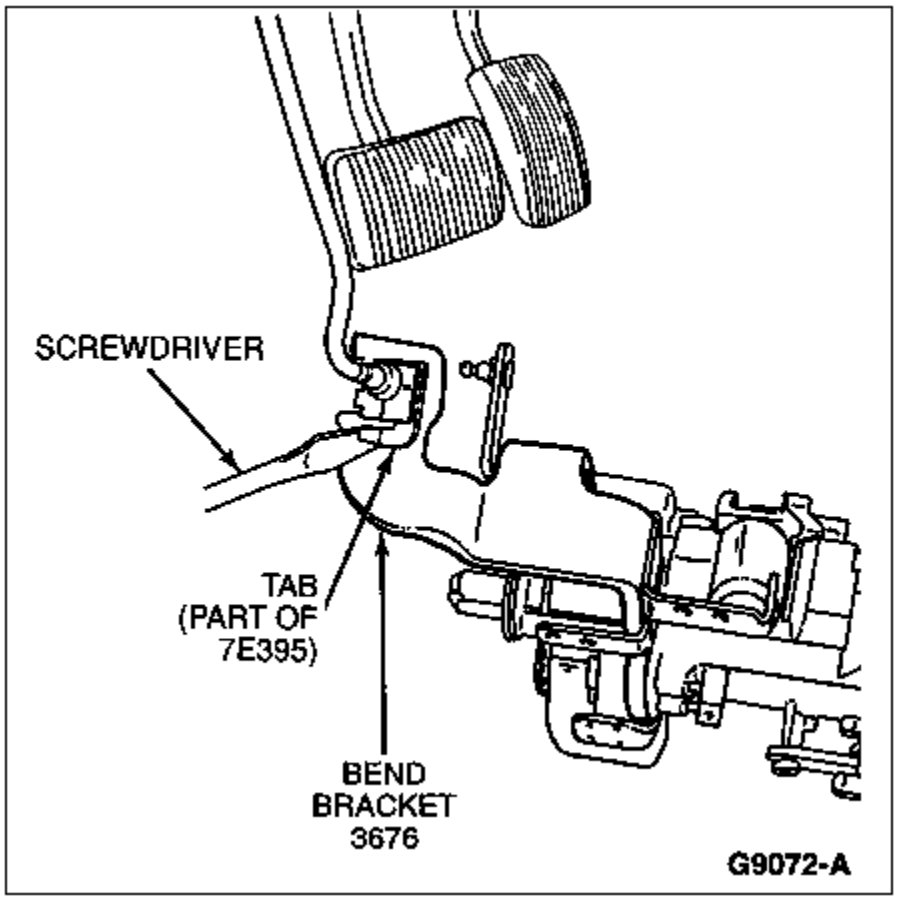
10. Remove four nuts securing steering column to instrument panel reinforcement (04545).

11. Lower steering column to floor.

12. Using screwdriver, snap shift cable off of selector lever arm.



13. Using screwdriver, lift tab on shift cable retainer and remove shift cable from bend bracket.



SCREWDRIVER
TAB
(PART OF
7E395)
BEND
BRACKET

14. Remove steering column from vehicle.

Installation

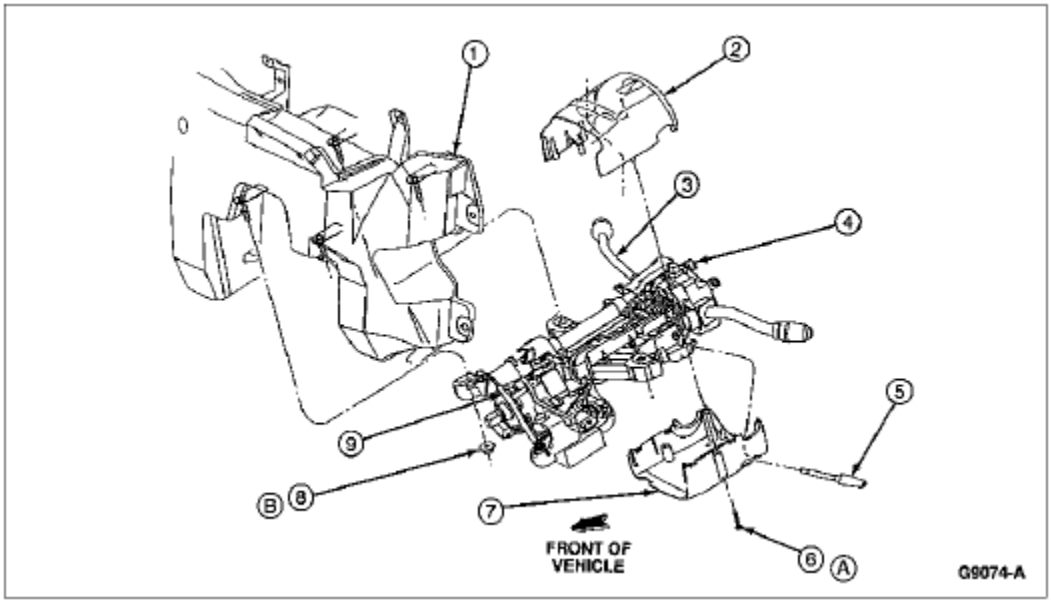
1. Position steering column on floor of vehicle.
2. Push shift cable retainer into slot on bend bracket and snap shift cable end onto shaft of selector lever arm.
3. Insert steering column shaft into universal joint, (part of intermediate shaft) making sure cutout in steering column shaft aligns with universal joint pinch bolt hole.
4. Raise steering column into position onto instrument panel reinforcement studs.
5. Install instrument panel steering column opening brace.
6. Install four nuts securing steering column. Tighten to 13-17 Nm (10-12 lb/ft).
7. Install steering column shaft-to-universal joint pinch bolt. Tighten to 40-55 Nm (30-40 lb-ft).
8. Install transmission range indicator. Connect cable loop to transmission column shift selector lever.
9. Connect main wiring to steering column electrical connectors. Connect shift lock actuator (3Z719).

10. Install instrument panel steering column cover reinforcement and tighten screws to 10-14 Nm (88-123 lb-in).

11. Install instrument panel steering column cover and tighten screws to 2.1-2.9 Nm (19-25 lb-in).

12. Install steering wheel as outlined in this section.

Steering Column Installation



Item	Part Number	Description

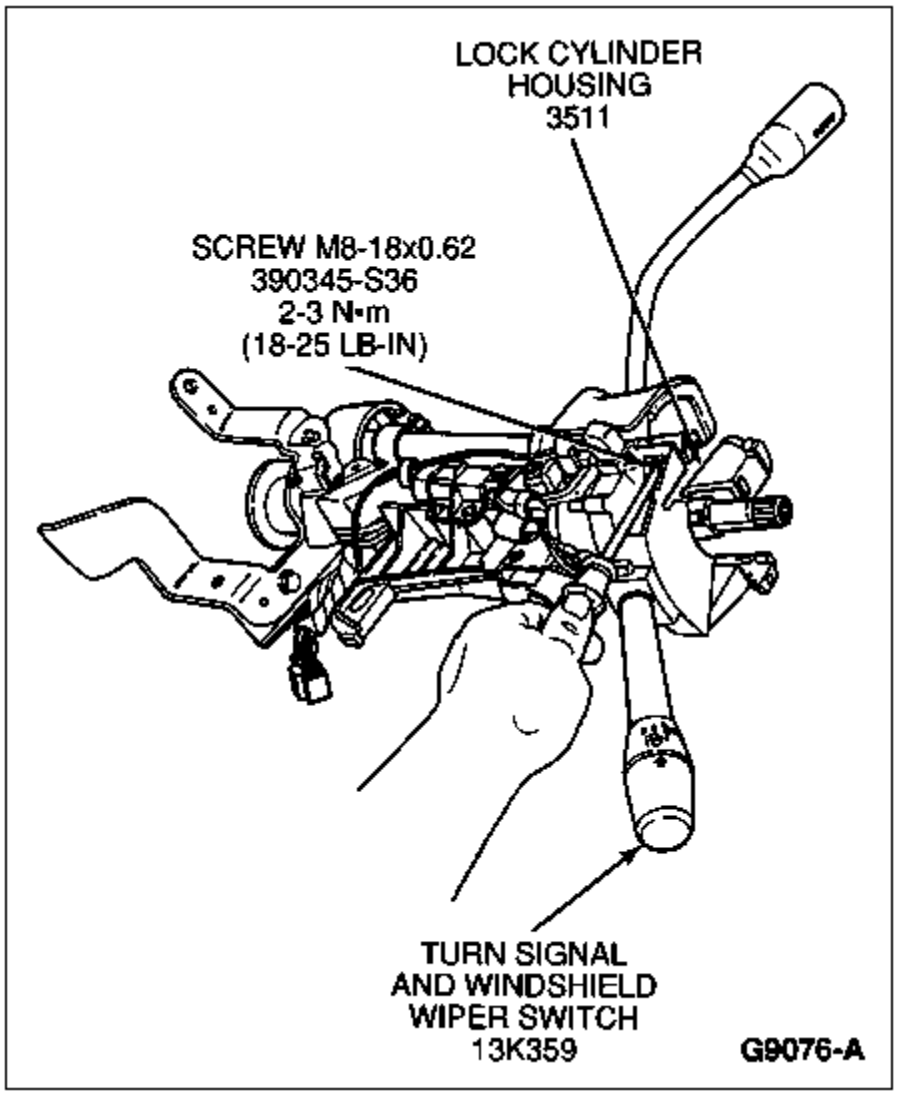
Multi-Function Switch

Removal

WARNING: THE ELECTRICAL CIRCUIT FOR AIR BAG DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR A MINIMUM OF ONE MINUTE TO DE-ENERGIZE THE BACKUP POWER SUPPLY.

1. Disconnect battery to starter relay cable (14300) and wait at least one minute for air bag backup power supply to discharge before beginning work. Refer to Section 01-20B .
2. Remove upper and lower steering column shrouds (3530) as outlined in this section.
3. Remove two self-tapping screws retaining multi-function switch (13K359) to steering column tube casting. Disengage multi-function switch from casting.



4. Disconnect the three electrical connectors.

Installation

1. Install three electrical connectors to full engagement.

2. Align turn signal and windshield wiper switch mounting holes with corresponding holes in steering column tube casting. Install two self-tapping screws, making sure to start screws in the previously tapped holes. Tighten to 2-3 Nm (18-25 lb-in).

3. Install upper steering column shroud and lower steering column shroud with screws. Tighten to 0.7-1.1 Nm (7-9 lb-in).

4. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns it adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery to starter relay cable.

5. Check tilt lock lever and multi-function switch for proper operation.

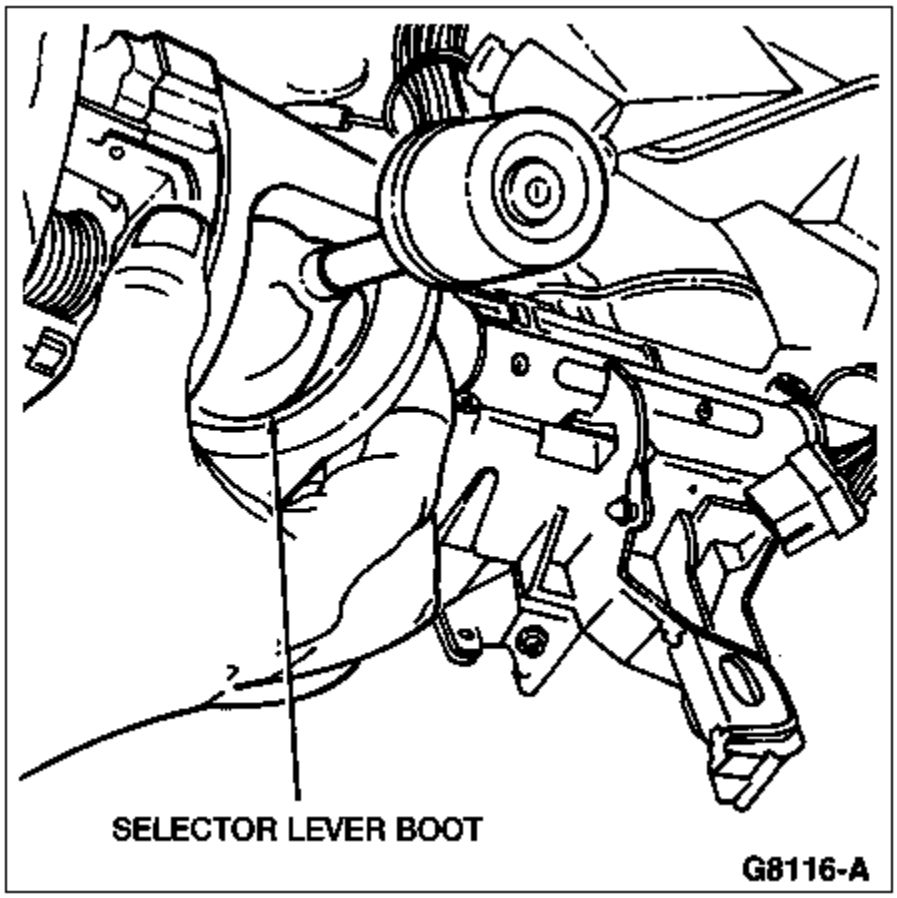
Gear Shift Lever

Column Shift

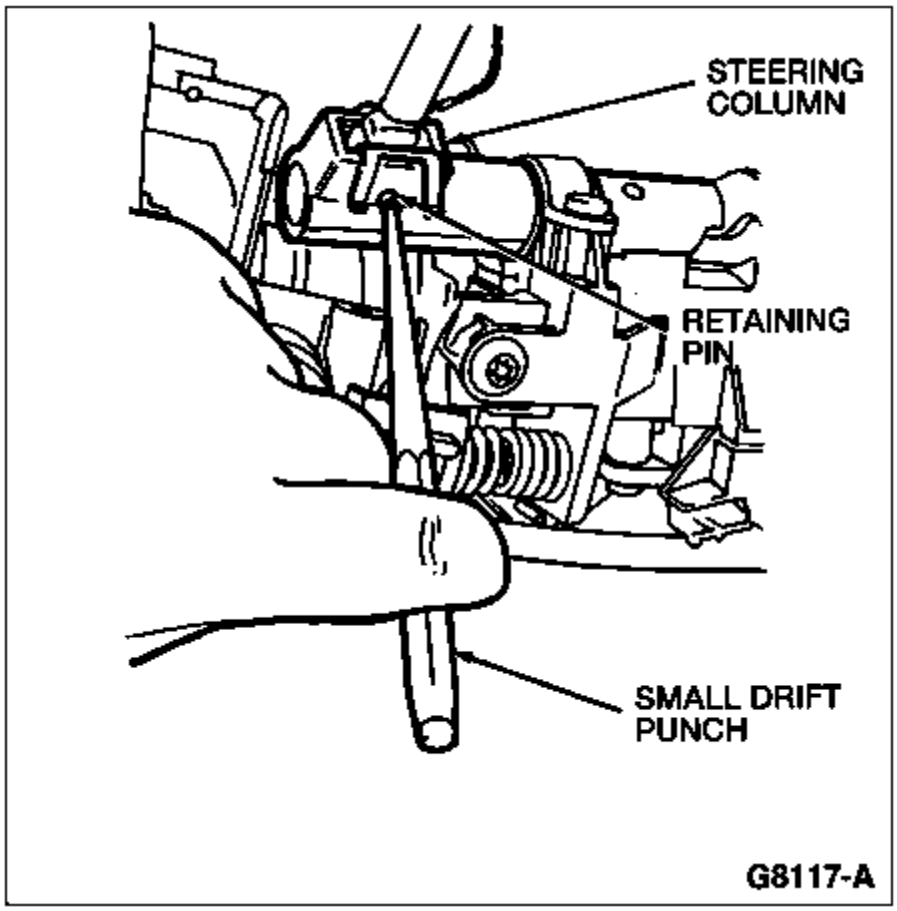
Removal and Installation

WARNING: THE ELECTRICAL CIRCUIT FOR AIR BAG DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR A MINIMUM OF ONE MINUTE BEFORE BEGINNING WORK TO DE-ENERGIZE THE BACKUP POWER SUPPLY.

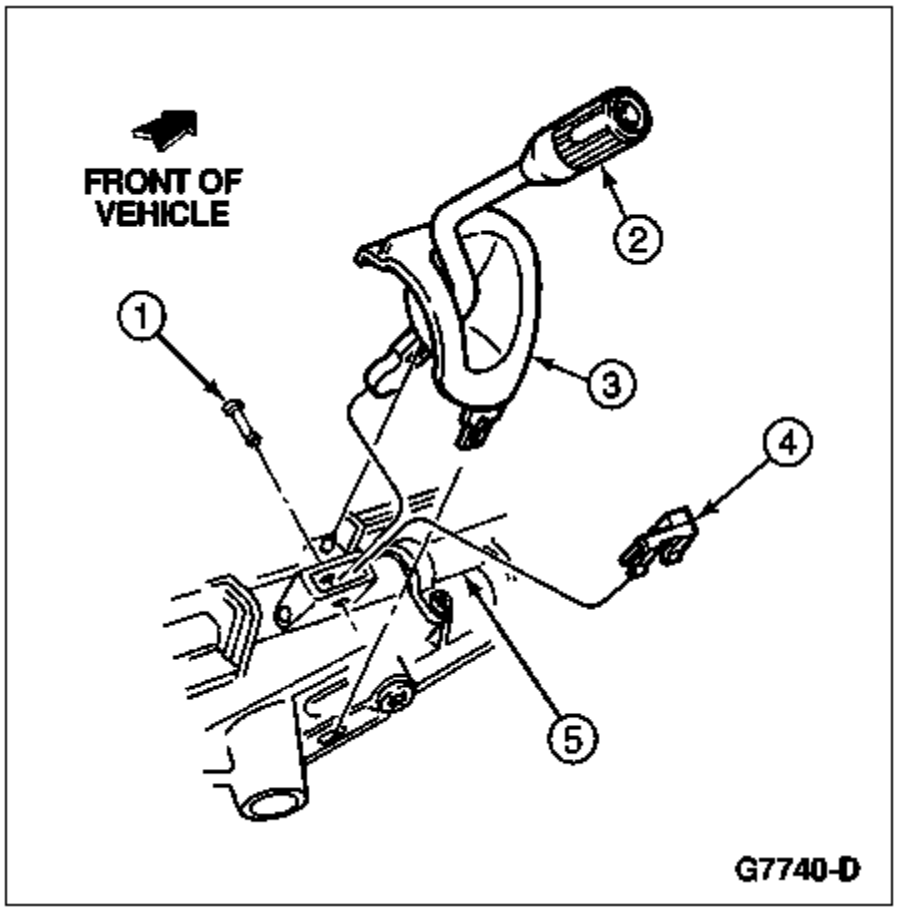
1. Disconnect battery to starter relay cable (14300) and wait at least one minute for air bag backup power supply to discharge before beginning work. Refer to Section 01-20B .
2. Remove upper and lower steering column shrouds (3530) as outlined in this section.
3. Disconnect the overdrive on/off switch electrical connector.
4. Remove the selector lever boot.



5. Use a small drift punch or suitable tool and drive the retaining pin from the steering column.



6. Remove the gearshift lever (7210) from the steering column.
7. To install, reverse the removal procedure.



Item	Part Number	Description
1	7G357	Gearshift Lever Pin
2	7210	Gearshift Lever
3	3513	Steering Column Opening Weather Seal
4	7C464	Clip
5	7212	Transmission Column Shift Selector Tube

Steering Shaft, Upper

Removal and Installation

To remove upper steering shaft, refer to Steering Column disassembly in this section.

Steering Shaft, Intermediate

Removal

1. **CAUTION: Steering column should be in the locked position, or the lower end of the steering column is to be secured or wired in such a way as to prevent the steering column or steering wheel (3600) from rotating and damaging the air bag sliding contact (14A664).**

   Remove the bolt securing the intermediate shaft and lower shaft, at the midpoint connection. Collapse the lower shaft. Discard original bolt.

2. Remove the bolt securing the intermediate shaft to the steering column assembly. Remove the intermediate shaft from inside the vehicle. Discard original bolt.

3. Remove the bolt securing the lower shaft to the steering gear input shaft. Remove lower shaft from vehicle.

Installation

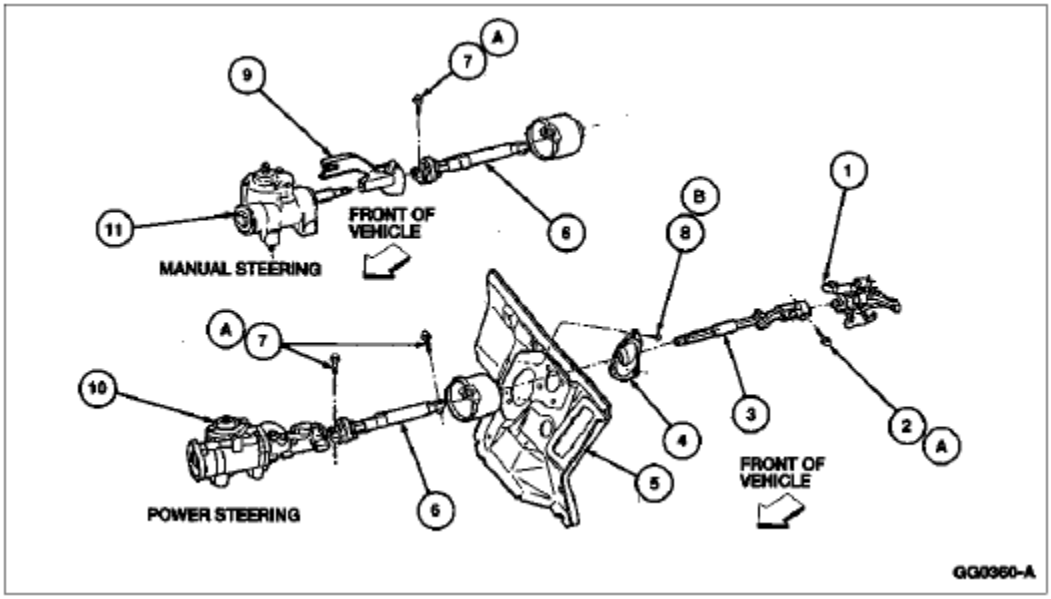
1. **NOTE: Use new bolt to attach intermediate shaft to steering gear input shaft and steering column shaft to intermediate shaft.**

   Install lower shaft on to the steering gear input (part of steering gear) shaft. Install new bolt and tighten bolt to 40-55 Nm (30-40 lb-ft).

2. Install intermediate shaft through the steering column opening weather seal (3513) and onto the steering column assembly. Install new bolt and tighten to 40-55 Nm (30-40 lb-ft).

3. Extend lower shaft and connect the upper shaft. Install and tighten bolt to 40-55 Nm (30-40 lb-ft).

Steering Column, Intermediate Shaft Installation



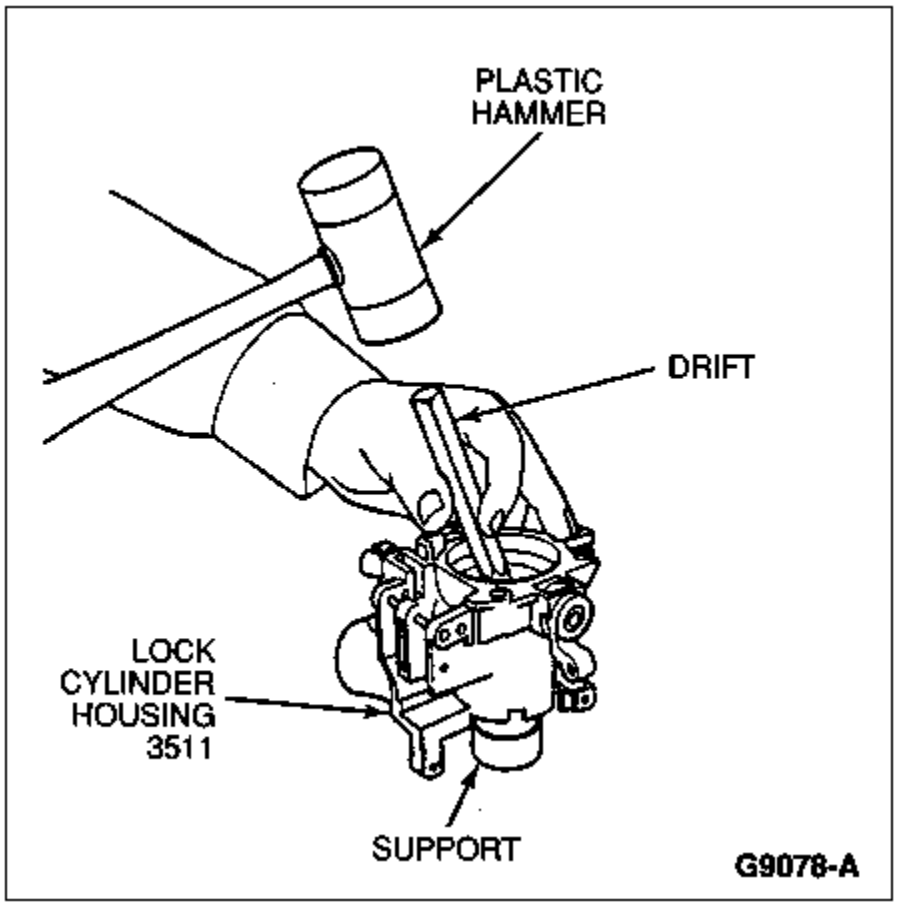
Item	Part Number	Description
1	3C529	Steering Column
2	N808464-S301	Bolt, M10-1.5 x 35
3	3B676	Steering Gear Intermediate Shaft
4	3513	Steering Column Opening Weather Seal
5	01610	Dash Panel
6	3A525	Steering Gear Lower Shaft
7	N803942-S100	Bolt, M10-1.5 x 35
8	N805375-S36MG	Screw, M6-1 x 20
9	3F540	Steering Shaft U-Joint Shield
10	3504	Steering Gear (Power)
11	3504	Steering Gear (Manual)
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 15-20 Nm (11-14 Lb-Ft)

Steering Column Lock Housing Bearing

Upper

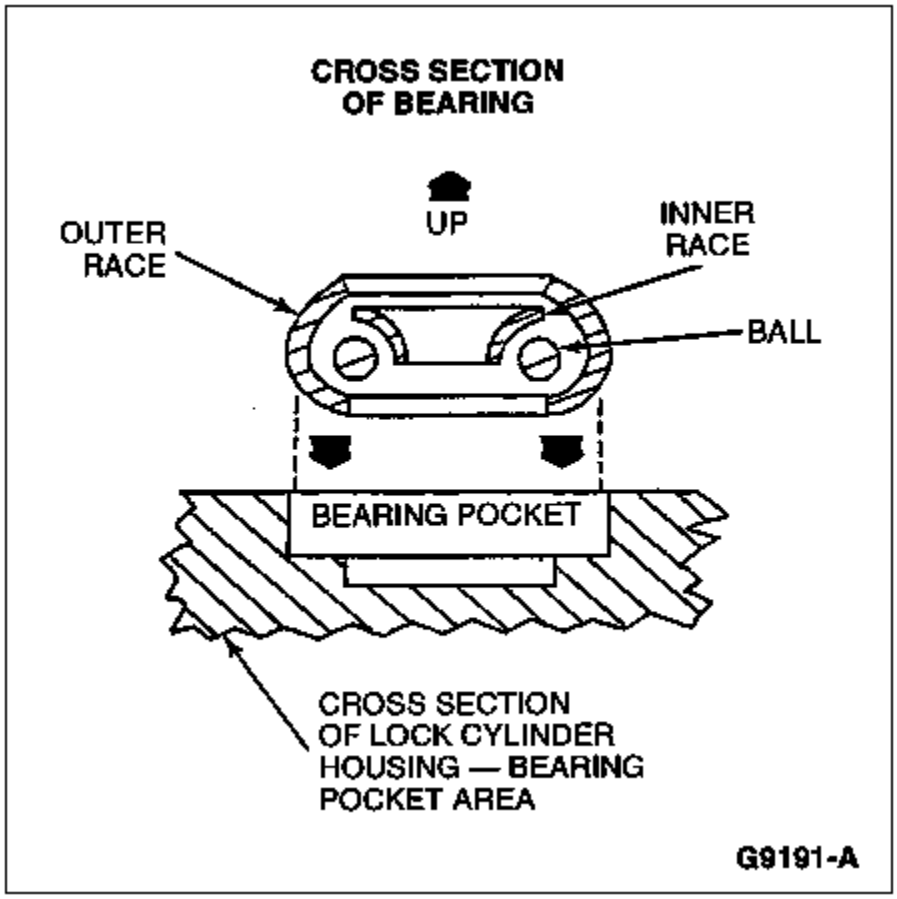
Removal

1. Remove lock cylinder housing from steering column as described in this section.
2. Suitably support lock cylinder housing and tap out small steering column upper bearing with an appropriate drift and a plastic hammer.

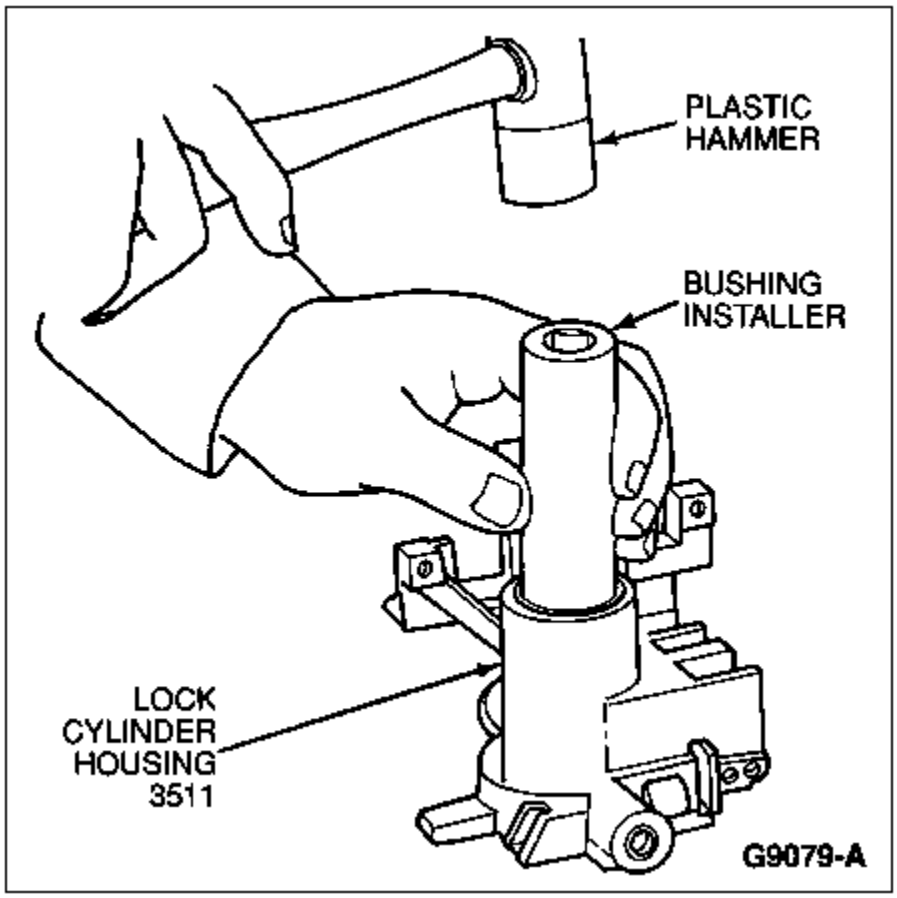


Installation

1. Suitably support lock cylinder housing. Position small steering column upper bearing so that the inner race is "up." Tap into place with a plastic hammer and a bushing driver installer or socket the same size as outer race of steering column bearing.



CROSS SECTION
OF BEARING
UP
OUTER
RACE
INNER
RACE
BALL
BEARING POCKET
CROSS SECTION
OF LOCK CYLINDER
HOUSING — BEARING
POCKET AREA
G9191-A



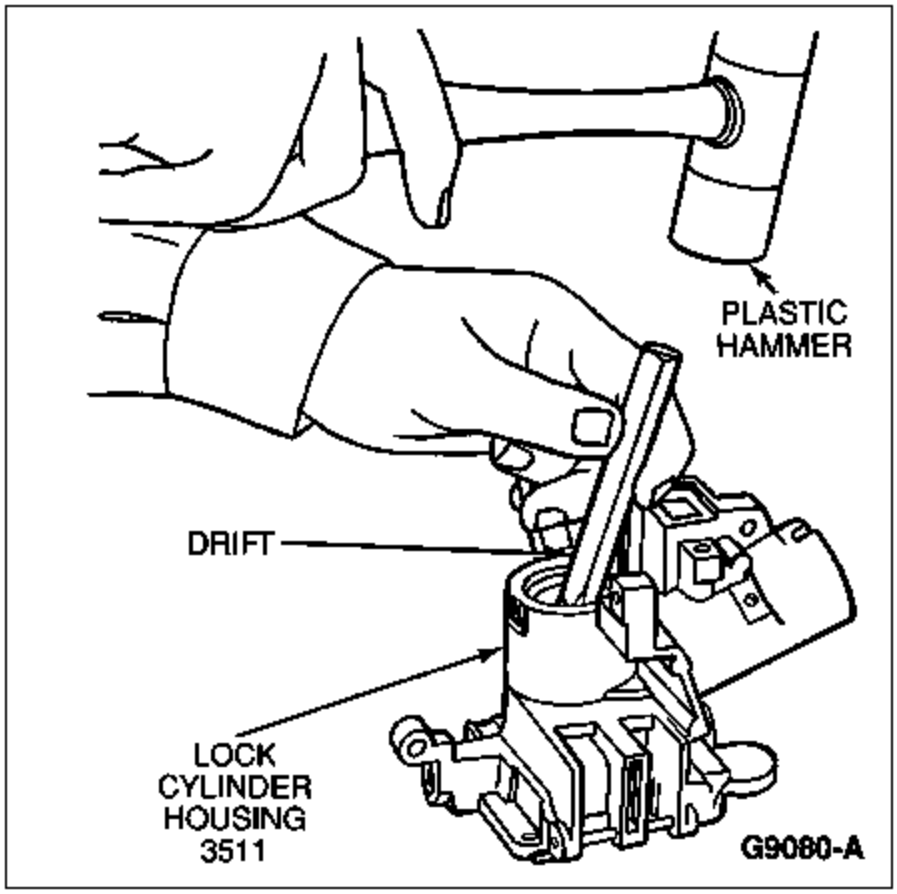
2. Install lock cylinder housing on steering column tube (3514) as outlined.

Intermediate

Removal

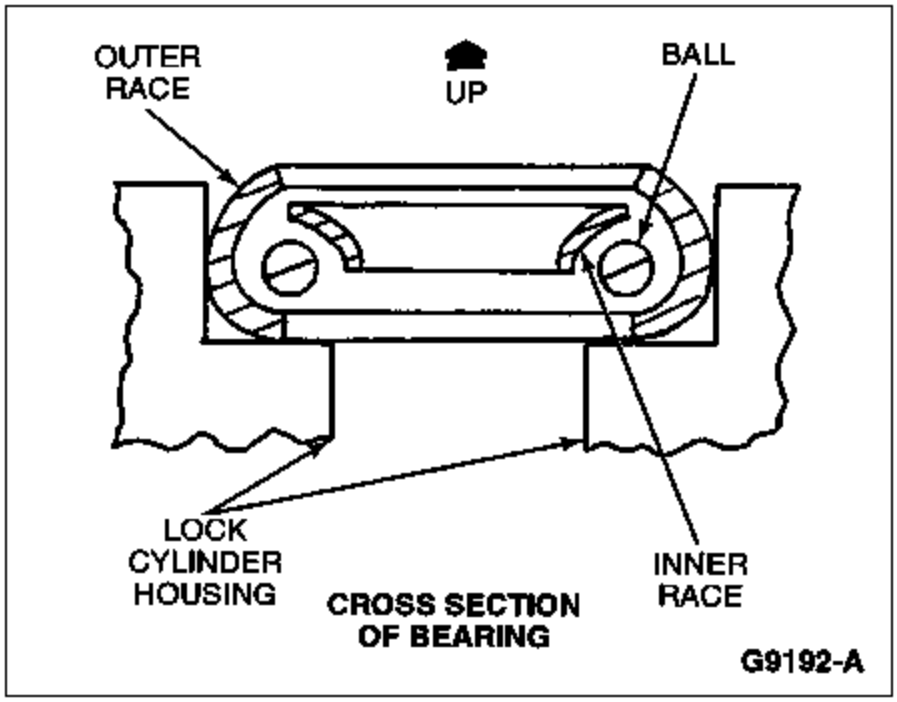
1. Remove lock cylinder housing as described in this section.

2. Set lock cylinder housing flat on workbench and tap steering column bearing loose with suitable drift and a plastic hammer.

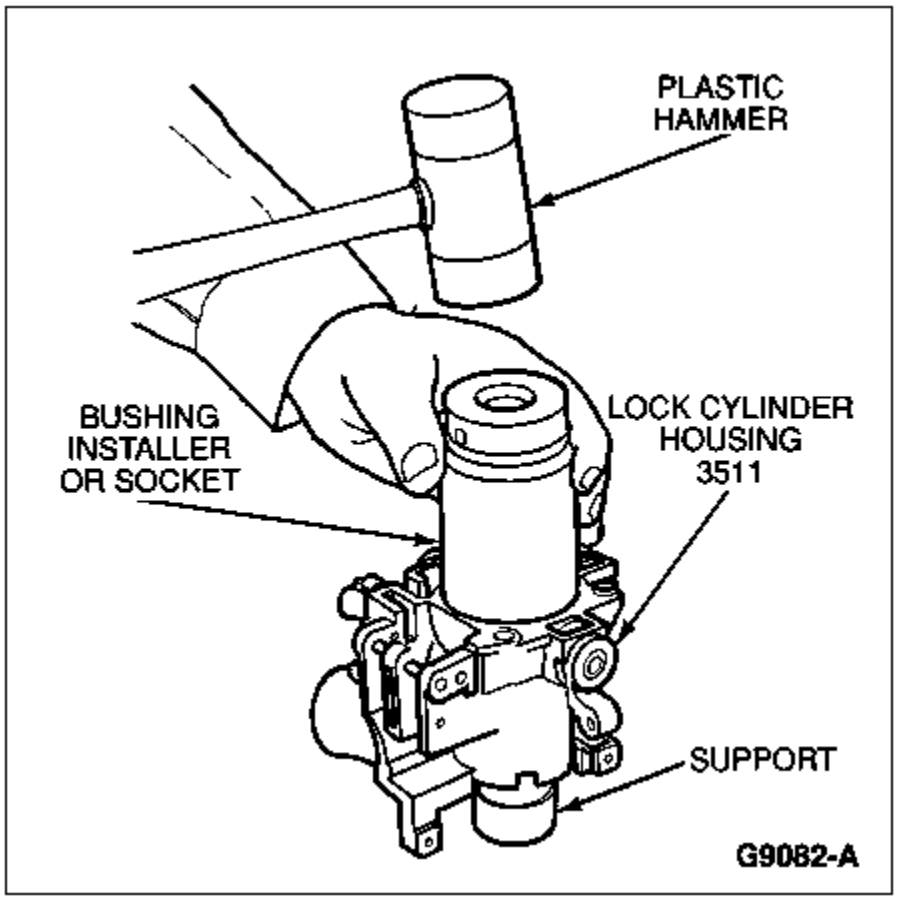


Installation

1. Support lock cylinder housing on workbench.
2. Position steering column bearing so that the inner race will face up (inner race fully visible in up position), or out from lock cylinder housing, when installed.



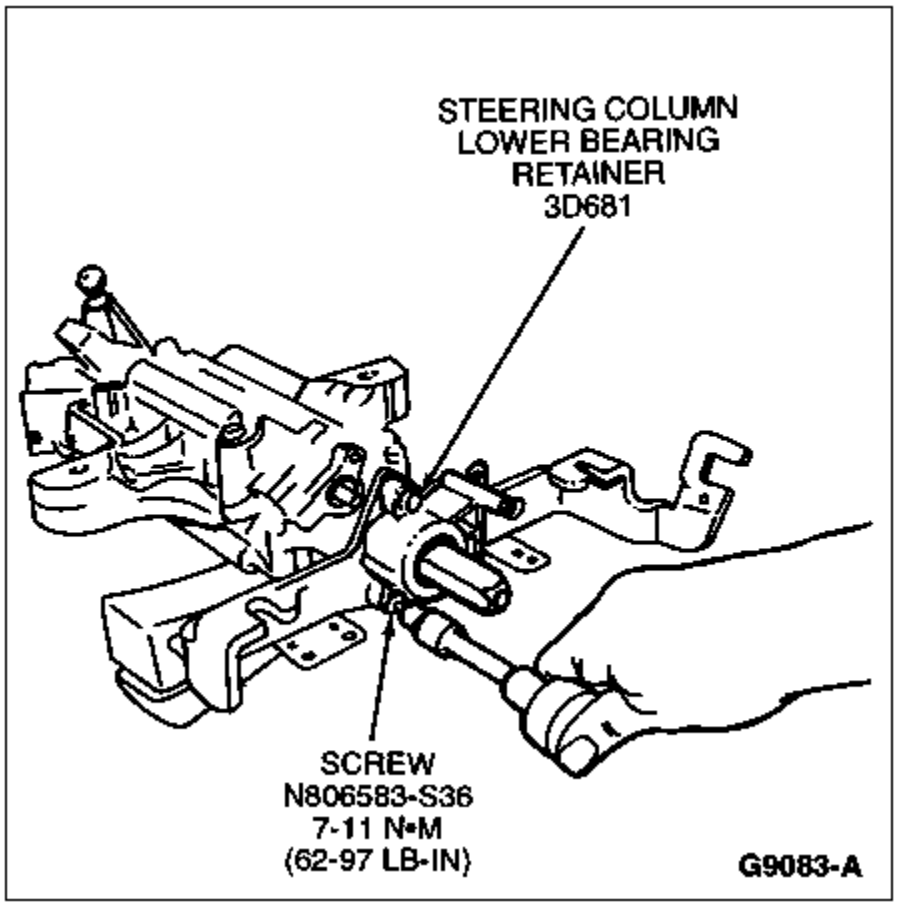
3. Using a socket or bushing driver the same size as outer race of steering column bearing, tap steering column bearing into lock cylinder housing with a plastic hammer until fully seated.



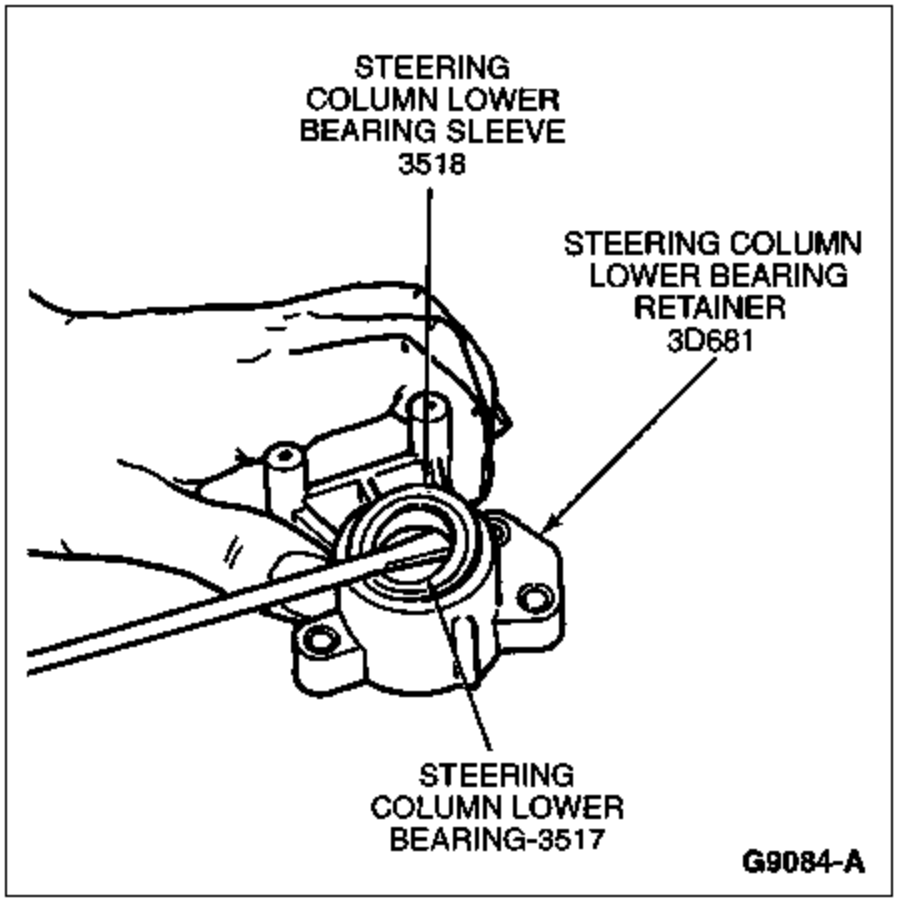
Lower

Removal

1. Remove steering column lower bearing retainer (3D681) as outlined in this section.

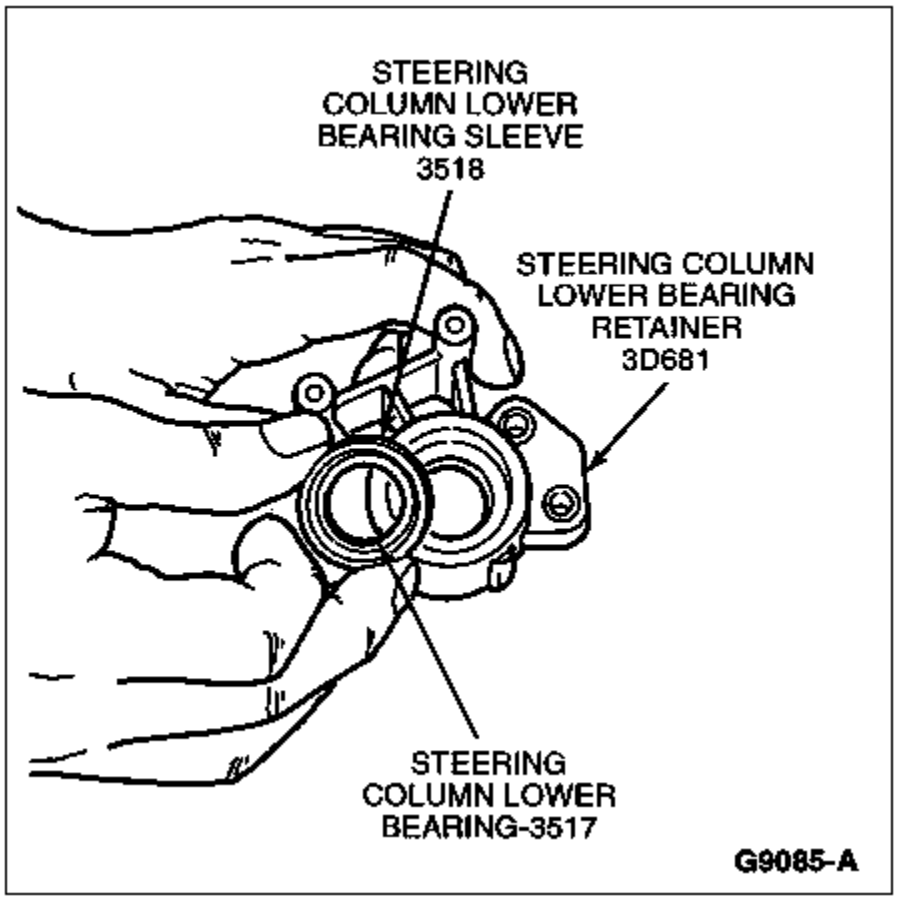


2. Remove steering column lower bearing and steering column lower bearing sleeve from steering column lower bearing retainer by hand.



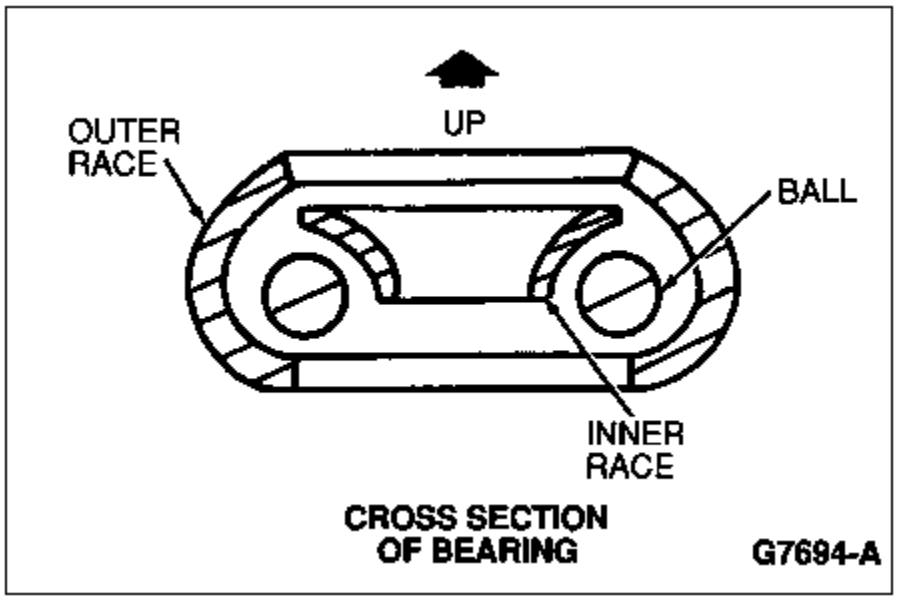
Installation

1. Inspect flexible steering column lower bearing. Replace if damaged.
2. Position steering column lower bearing sleeve in steering column lower bearing retainer.



3. Press in assembled steering column lower bearing and steering column tube bearing sleeve with thumb pressure until seated. Inner race should face toward engine (inner race should be fully visible when bearing retainer is installed on steering column) when installed in the vehicle.

4. Install steering column lower bearing retainer on steering column as outlined in this section.



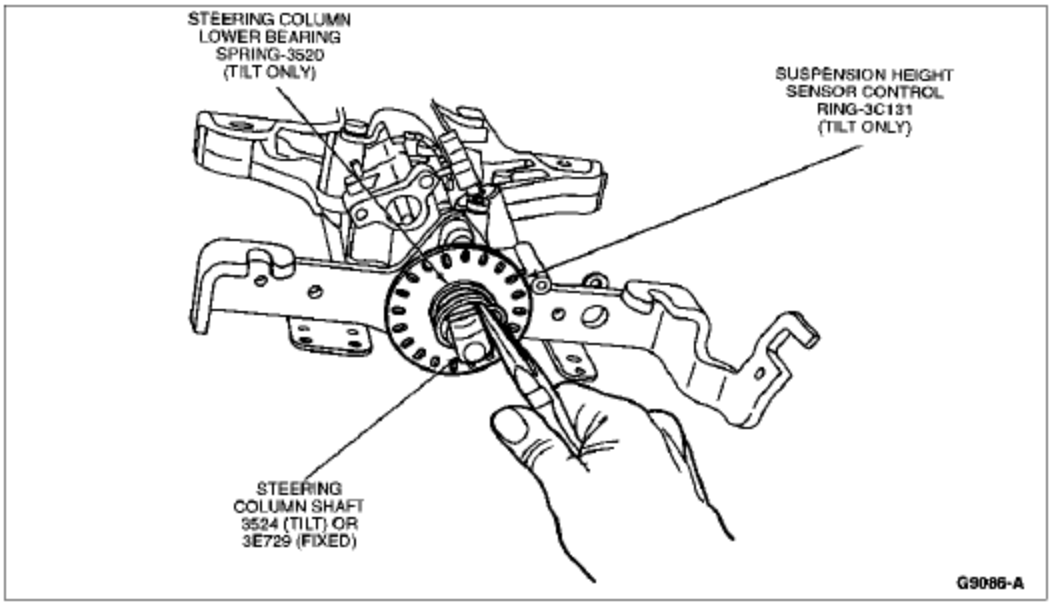
Bearing Retainer

Lower

Removal

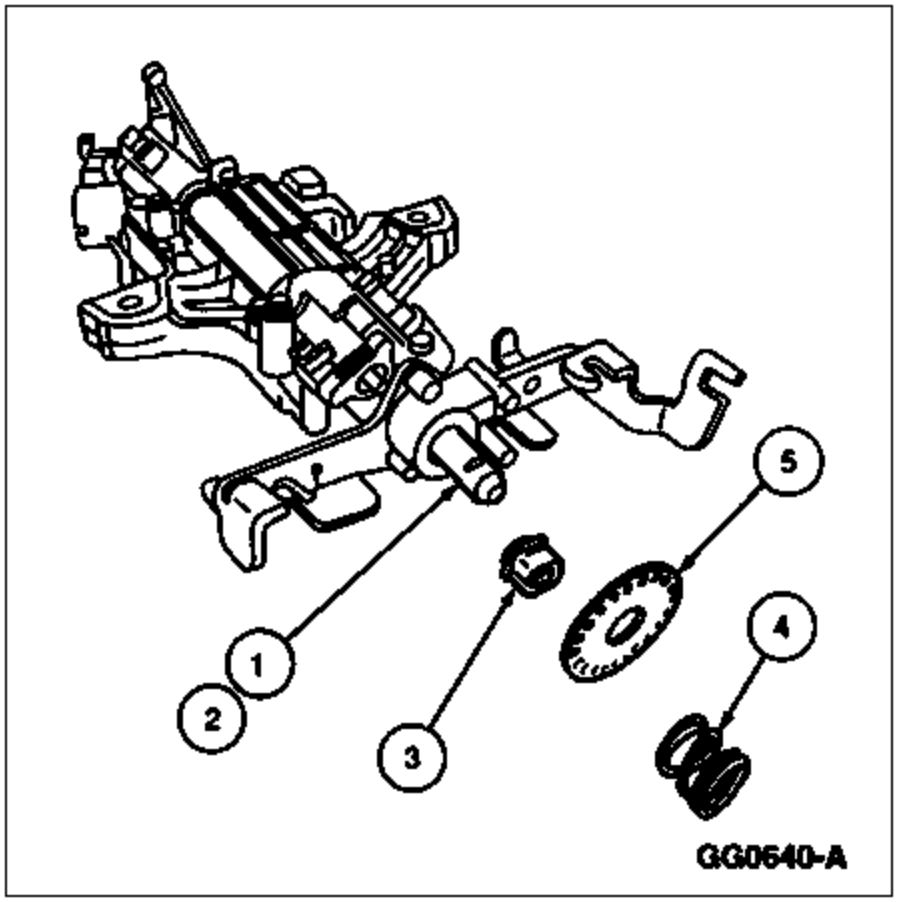
1. Remove steering column as outlined in this section.
2. Using pliers, remove steering column lower bearing spring on tilt columns or bearing retainer (3C610) on fixed columns.

Steering Column Lower Bearing Spring (Tilt Only)



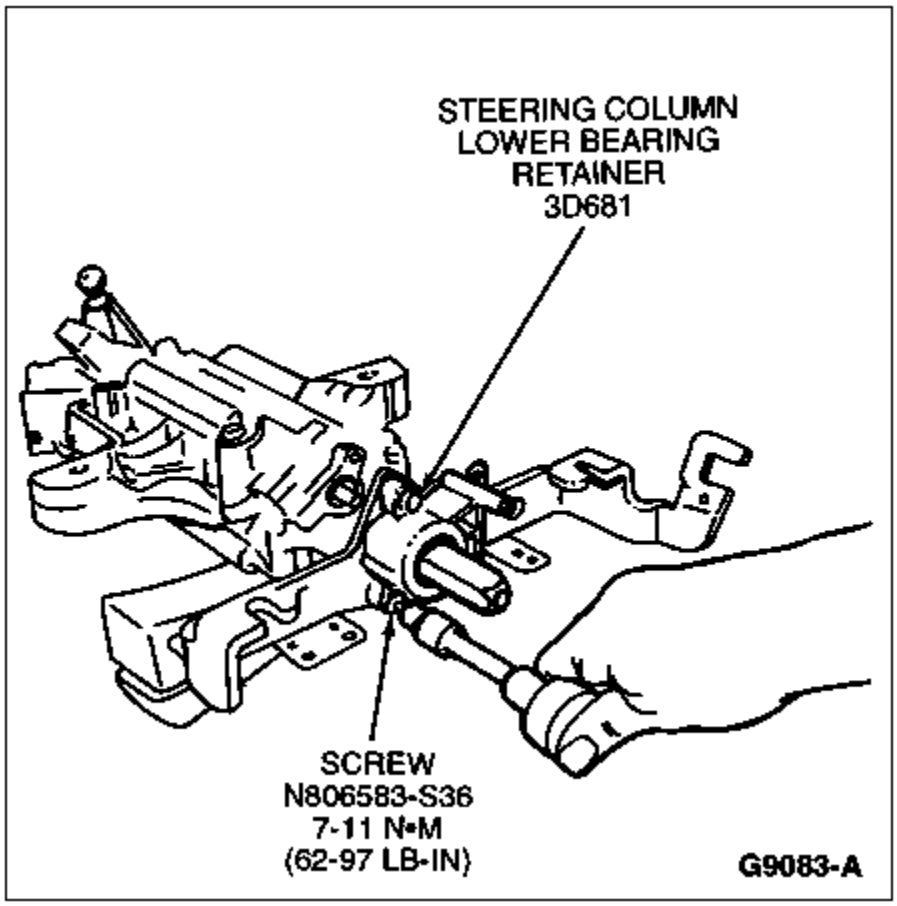
3. Remove suspension height sensor control ring (3C131) (tilt only) and steering column lower bearing tolerance ring.

Suspension Height Sensor Control Ring (Tilt Only)



Item	Part Number	Description
1	3524	Steering Column Shaft (Tilt)
2	3E729	Steering Column Shaft (Fixed)
3	3L539	Steering Column Upper Bearing Tolerance Ring
4	3520	Steering Column Upper Bearing Spring
5	3C131	Suspension Height Sensor Control Ring

4. Remove three screws and steering column lower bearing retainer (3D681).



5. For tilt column installation, reverse removal procedure.

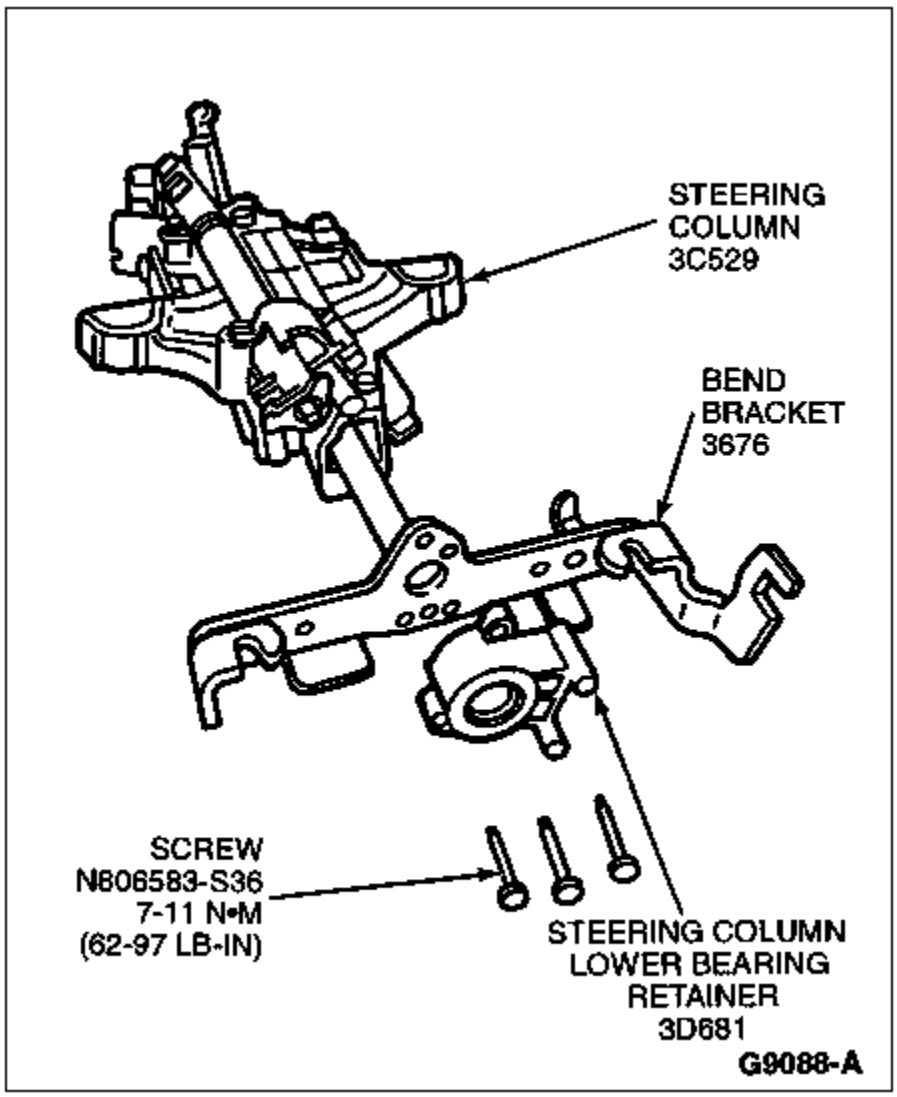
6. For fixed column installation, compress upper shaft spring to allow bearing retainer to be seated in its grooves in the lower end of the steering shaft.

Support Brackets, Steering Column

Bend Bracket

To remove bend bracket, remove steering column lower bearing retainer (3D681) as outlined in this section, then remove bend bracket. The same screws secure the steering column lower bearing retainer and the bend bracket.

Steering Column Lower Bearing Retainer and Bend Bracket

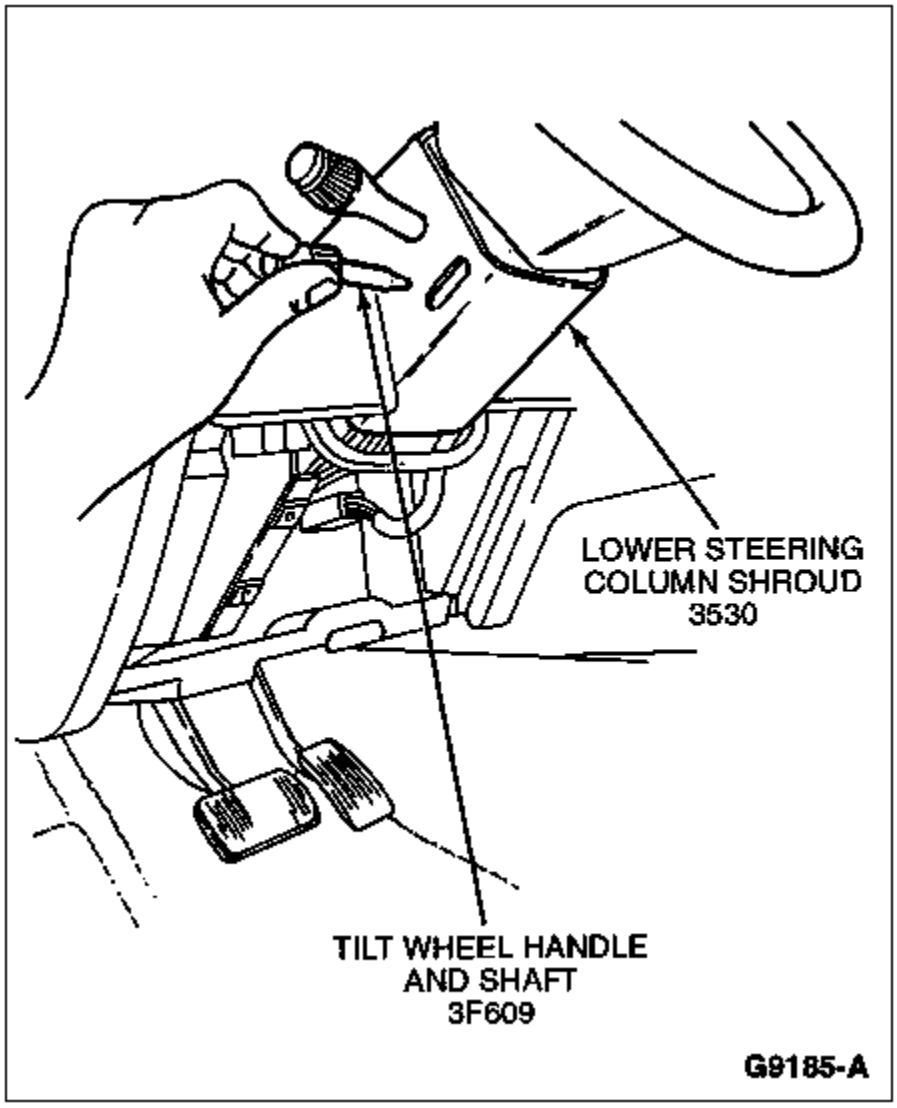


Tilt Wheel Handle and Shank

Removal and Installation

1. To remove tilt wheel handle and shank (3F609), rotate the tilt wheel handle and shank counterclockwise.

2. To install, position tilt wheel handle and shank and rotate clockwise until tight.



Air Bag Sliding Contact

Removal

WARNING: THE ELECTRICAL CIRCUIT FOR AIR BAG DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR A MINIMUM OF ONE MINUTE BEFORE BEGINNING WORK TO DE-ENERGIZE THE BACKUP POWER SUPPLY.

1. Make sure the vehicle's front wheels (1007) are facing straight ahead, and the steering wheel (3600) is oriented in the straight-ahead position. If the steering wheel is turned, the new air bag sliding contact (14A664) to be installed (which is locked in its shipping orientation) will not line up with the steering column casting and shaft.

2. Disconnect the battery to starter relay cable (14300). Wait at least one minute before proceeding, to allow the air bag backup power supply to discharge.

3. Remove steering wheel as described in this section.

4. Remove upper and lower steering column shrouds (3530) as described in this section. (Unscrew tilt lock lever to remove lower steering column shroud, if so equipped.)

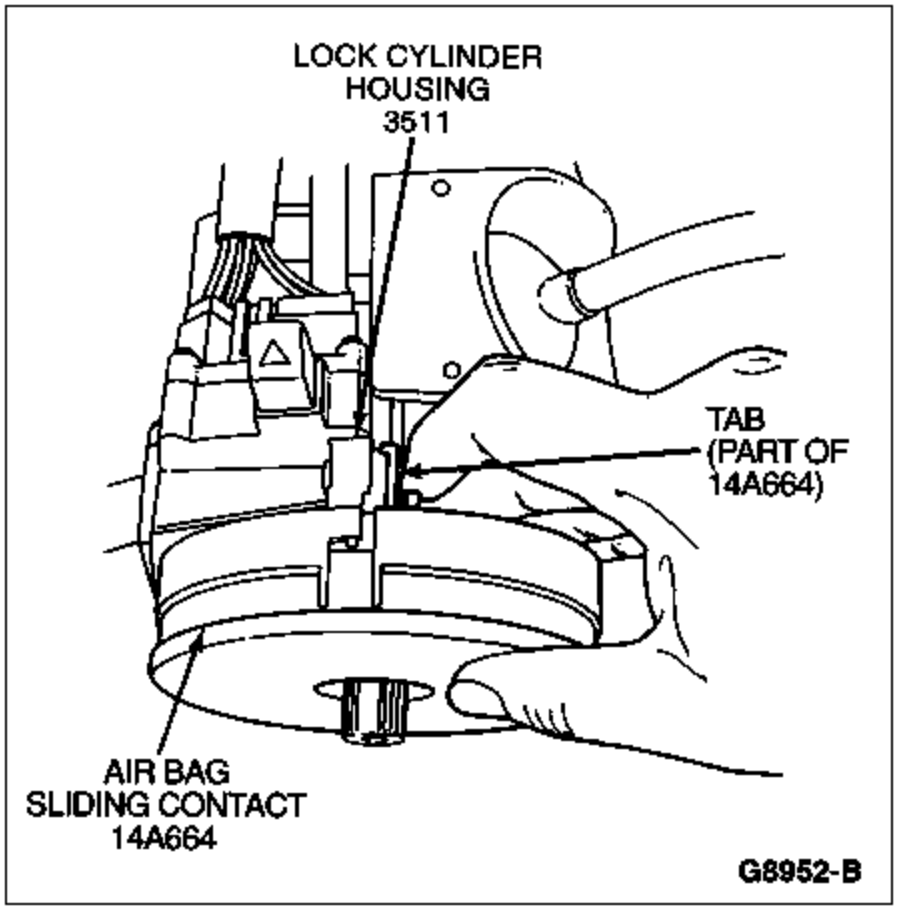
5. Remove ignition switch lock cylinder as described in this section. Remove key warning chime contact from lock cylinder casting by pulling out.

6. Remove ground wire eyelet bolt (N805375) from steering column bend bracket hole.

7. Remove the two air bag sliding contact down lead wire harness hanger clips from the steering column casting.

8. Disconnect the two air bag sliding contact lower wire harness electrical connectors from the instrument panel wiring harness at the steering column bend bracket, and remove connectors from bend bracket (remove ground wire eyelet bolt N805375).

9. Remove the air bag sliding contact from the steering column by prying the three snaps back from the small ramps on the steering column lock cylinder housing as the air bag sliding contact is pulled away from the housing. The snaps are located at the 12 o'clock, 3 o'clock, and 6 o'clock positions on the back of the air bag sliding contact.



Installation

1. Make sure the vehicle's front wheels are straight ahead and the steering column shaft alignment mark (punch mark on end of shaft) is at the 12 o'clock position.

2. If a new air bag sliding contact is being installed, orient the air bag sliding contact prior to installation by depressing the yellow hub lock with your finger and rotating the white hub approximately 1/4 turn clockwise until the arrow lines up with the shaft lock (yellow loop). Release hub lock.

3. If a new air bag sliding contact is being installed, position the new air bag sliding contact with the shaft lock (yellow loop) at the top, and slide the new air bag sliding contact onto the steering column shaft. (If the old air bag sliding contact is being reinstalled, position the black housing so that the three pins on the back side lineup with the three holes in the steering column lock cylinder housing at 12 o'clock, 3 o'clock, and 6 o'clock.) Push the air bag sliding contact firmly until the three guide pins on the back of the air bag sliding contact engage the holes in the steering column lock cylinder housing, and the three snaps on the back of the air bag sliding contact engage the three ramps on the steering column lock cylinder housing.

4. Push the two wire hanger clips into the steering column casting.

5. Install the down lead harness wire connectors in the original locations on the steering column lower bend bracket and connect to the instrument panel wiring harness.

6. Route the ground wire from the air bag sliding contact lower 6-pin wiring connector to the steering column bend bracket hole, and secure the eyelet to the bend bracket with bolt (N805375).

7. Install the key warning chime wire (first remove black protective cover from the connector) into the key lock cylinder by pushing firmly until it snaps into place.

8. Reinstall the upper and lower steering column shrouds. Reinstall tilt lever.

9. Reinstall the steering wheel as outlined in this section. Connect steering wheel wiring connector to air bag sliding contact.

10. Unlock the air bag sliding contact by pulling up on the yellow loop at the top of the air bag sliding contact to remove.

11. Connect driver air bag to air bag sliding contact connector. Place driver side air bag module (043B13) into steering wheel and install air bag retaining bolts. Hold driver side air bag module in position in steering wheel while bolts are being tightened to ensure proper fit.

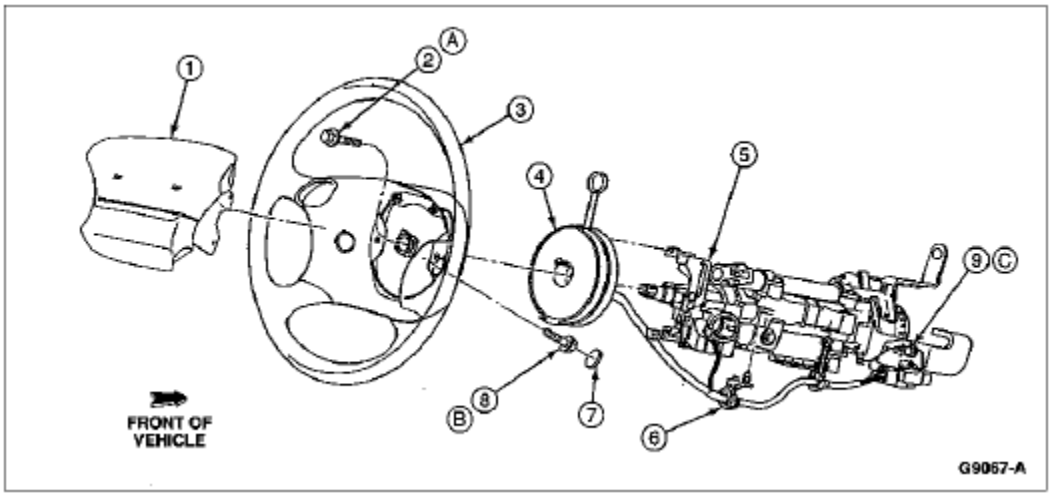
12. Reinstall two steering wheel cover plugs by snapping into holes on sides of steering wheel.

13. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven to relearn the strategy.**

    Connect battery to starter relay cable. Refer to Section 01-20B .

14. Verify air bag warning indicator operation.

Steering Wheel with Air Bag



Item	Part Number	Description
1	043B13	Driver Side Air Bag Module
2	N807493-S100	Torx® Head Screw, M10-1.5 x 18
3	3600	Steering Wheel
4	14A664	Air Bag Sliding Contact
5	3C529	Steering Column

6	—	Clip (Part of 14A664)
7	3F785	Plug
8	N808944-S424	Bolt
9	N805375-S36MG	Bolt
A	—	Tighten to 34-46 Nm (25-33 Lb-Ft)
B	—	Tighten to 7.6-10.4 Nm (67-92 Lb-In)
C	—	Tighten to 10.2-13.8 Nm (7.5-10.1 Lb-Ft)

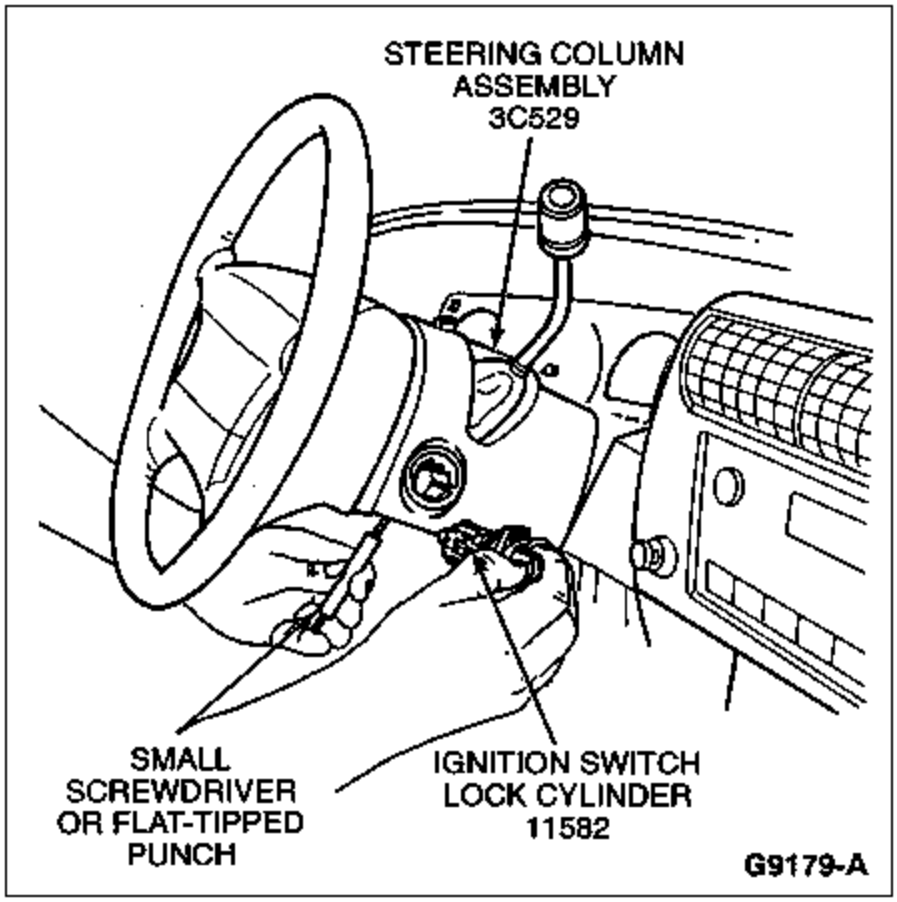
Ignition Switch Lock Cylinder

NOTE: The following procedure applies to vehicles that have functional lock cylinders and keys. If key numbers are known, the proper key can be made.

Lock Cylinder Functional

Removal

1. Disconnect battery ground cable (14301).
2. Turn lock cylinder key to RUN position.
3. Remove lower shroud as outlined in this section under shroud removal.
4. Place a 3.17mm (1/8-inch) diameter wire pin or small drift punch in hole in steering column under lock cylinder. Depress retaining pin while pulling out on lock cylinder to remove it from housing of steering column.



Installation

1. Install lock cylinder by turning it to RUN position and depressing retaining pin. Insert lock cylinder into steering column housing. Make sure ignition switch lock cylinder is fully seated and aligned in interlocking washer before turning key to OFF position. This will permit retaining pin of ignition lock cylinder to extend into hole of steering column.

2. Rotate lock cylinder, using key, to make sure of correct mechanical operation in all positions.

3. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more for powertrain control module to relearn the strategy.**

   Connect battery ground cable.

Lock Cylinder Non-Functional

Removal

NOTE: The following procedure applies to vehicles in which the ignition lock is inoperative and the ignition switch lock cylinder (11582) cannot be rotated due to a lost or broken key, unknown key number, or a cap that has been damaged or broken to the extent that the ignition switch lock cylinder cannot be rotated.

1. Disconnect battery ground cable.

2. Using channel lock or vise grip pliers, twist cap until it separates from the ignition switch lock cylinder.

3. Remove lower shroud as outlined in this section under shroud removal.

4. Prick-punch pin and drill out with 1/8-inch bit. Do not drill deeper than 13mm (1/2 inch). Put a piece of masking tape 13mm (1/2 inch) from tip on bit. Take care not to damage housing.

5. Using a 3/8-inch diameter drill, drill down middle of ignition lock key slot approximately 44mm (1-3/4 inch) until ignition switch lock cylinder breaks loose from breakaway base of ignition switch lock cylinder. Remove ignition switch lock cylinder and drill shavings from lock cylinder housing.

6. Remove column lock gear retainer, steering column lock housing bearing (3E700) and steering column lock gear (3E717). Thoroughly clean all drill shavings and other foreign materials from lock cylinder housing.

7. Carefully inspect lock cylinder housing for damage from the above operation. If damage is apparent, lock cylinder housing must be replaced.

Installation

1. Replace lock cylinder housing, if damaged.

2. Install steering column lock gear, steering column lock housing bearing and column lock gear retainer.

3. Install trim and electrical parts.

4. Install new ignition switch lock cylinder as described in this section.

5. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable.

6. Check operation of lock cylinder.

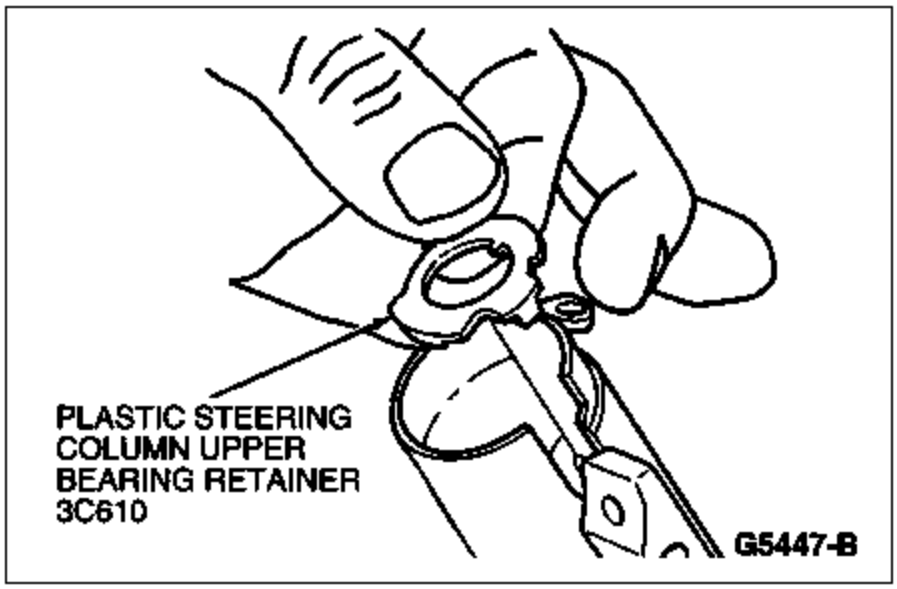
Ignition Lock Drive Gear

Removal

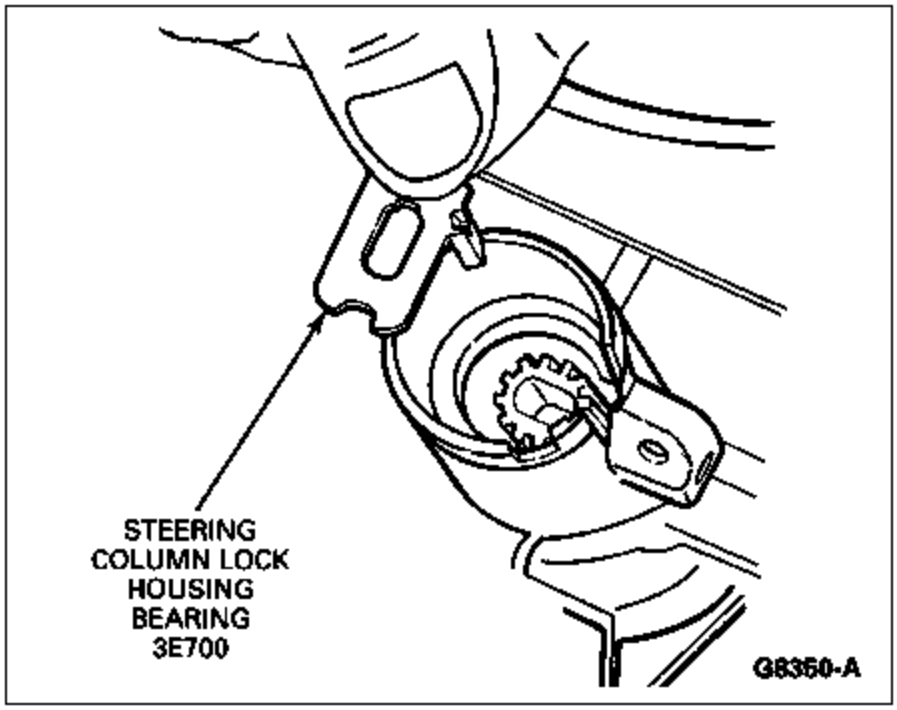
1. **CAUTION: Carefully note the position of the column lock gear retainer prior to removal.**

   Rotate ignition switch lock cylinder (11582) to RUN position. Using a 1/8-inch drift, press lock cylinder retaining pin through access hole and remove ignition switch lock cylinder.

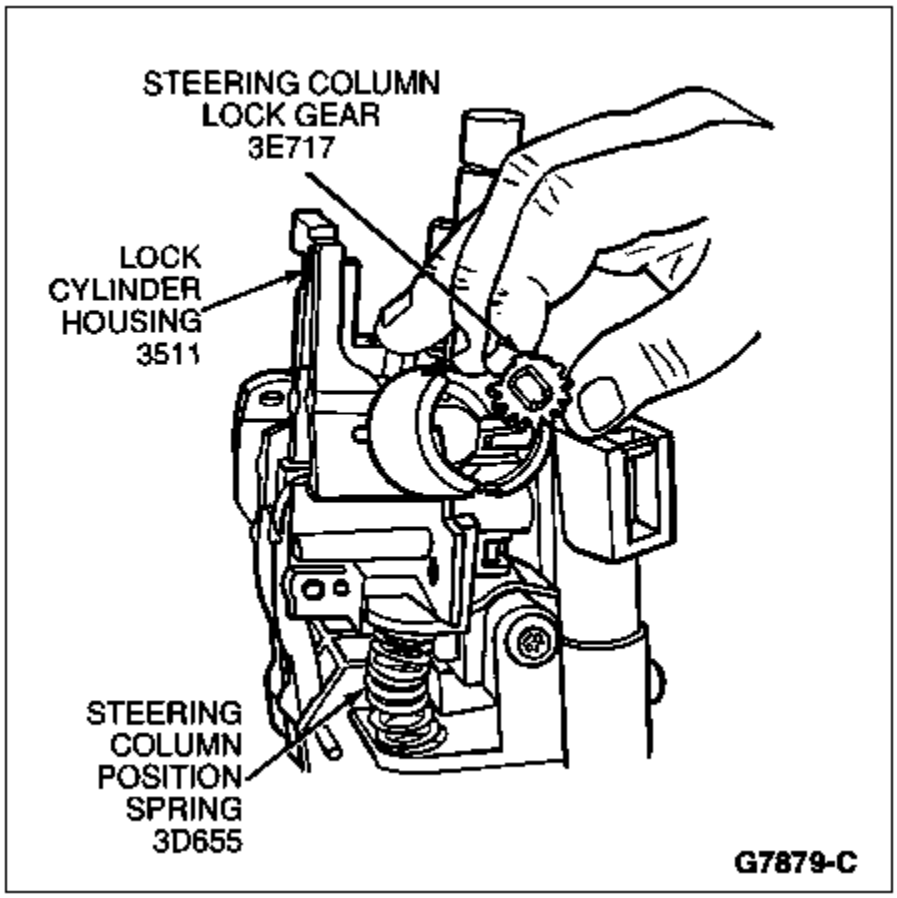
2. Remove column lock gear retainer by inserting a screwdriver or similar tool, with a 90 degree bend on the tip, between steering column upper bearing retainer and steering column lock housing bearing (3E700) and by prying upward.



3. Insert tip of a screwdriver into Double-D slot of steering column lock housing bearing, then rotate 90 degrees. Remove steering column lock housing bearing.



4. Remove steering column lock gear (3E717). Carefully note relationship of steering column lock gear to position of rack teeth.



Installation

1. Position steering column lock gear in base of lock cylinder housing in the same position as that noted during removal procedure. The position of steering column lock gear is correct if last tooth on steering column lock gear is meshed with last tooth on steering column lock lever actuator (3E715).

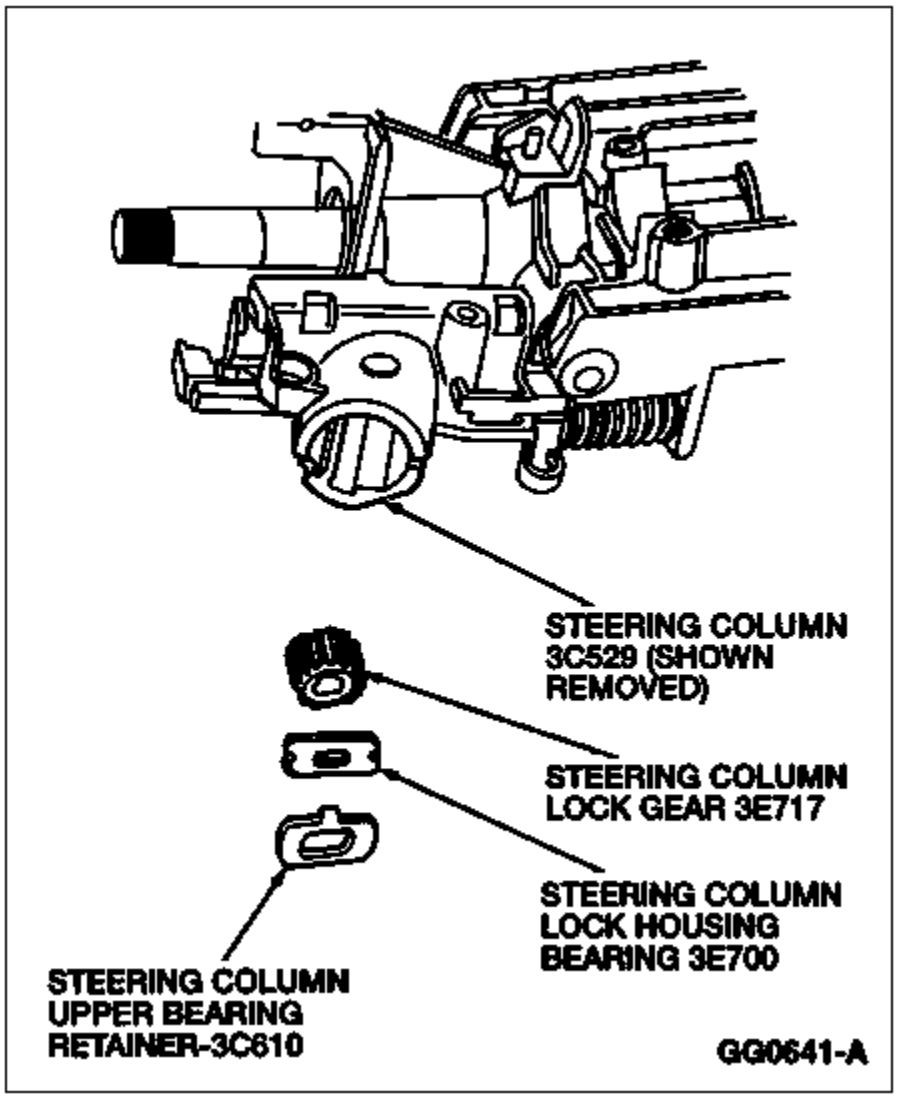
2. Position bearing retainer (3C610) in lock cylinder housing. Insert tip of a screwdriver into Double-D slot of steering column lock housing bearing, then rotate 90 degrees.

3. Press blue plastic column lock gear retainer into steering column lock cylinder housing. Make sure column lock gear retainer is in its original position.

4. Line up flats of steering column lock gear with flats of washer by pulling down on the steering column lock lever actuator.

5. Install ignition switch lock cylinder.

6. Check for proper start in Park and Neutral. Also, check to make sure start circuit cannot be actuated in Drive or Reverse positions and the steering column tube is locked in Lock position.



STEERING COLUMN 3C529 (SHOWN REMOVED)
STEERING COLUMN LOCK GEAR 3E717
STEERING COLUMN LOCK HOUSING BEARING 3E700
STEERING COLUMN UPPER BEARING RETAINER-3C610
GG0641-A

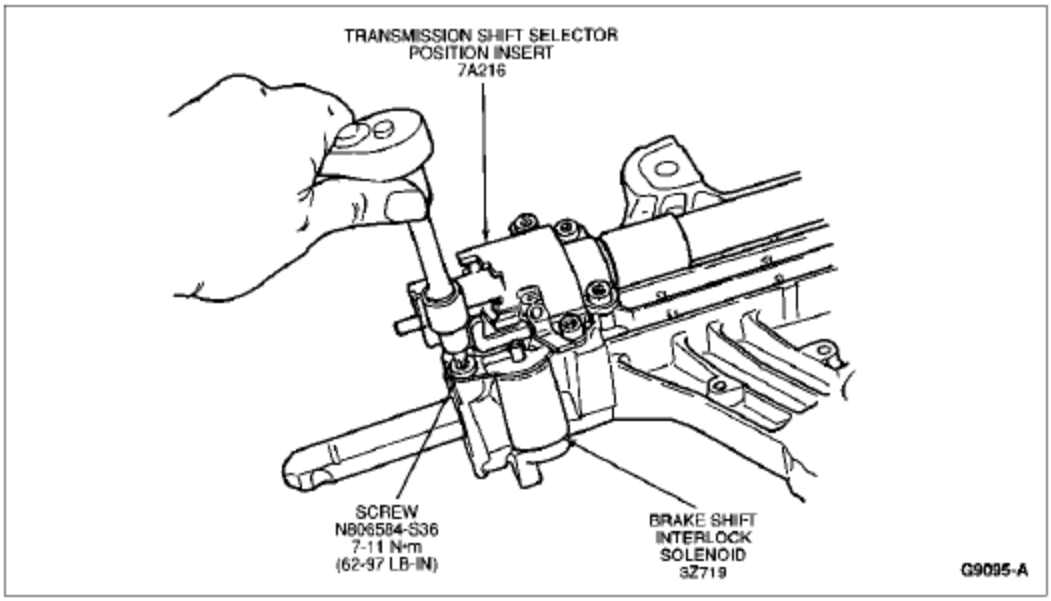
Brake Shift Interlock Solenoid

Removal and Installation

1. Remove steering column as outlined in this section.
2. **NOTE: Brake shift interlock solenoid is retained to the transmission shift selector position insert (7A216) with a pushnut.**

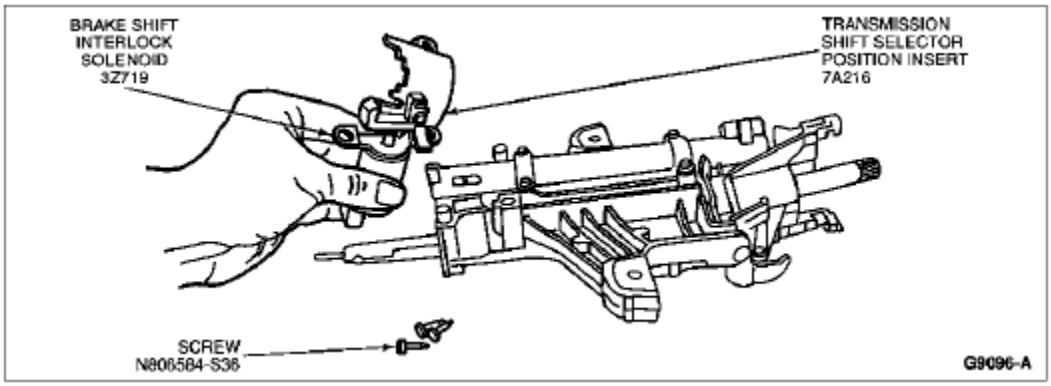
   Remove three screws attaching brake shift interlock solenoid and transmission shift selector position insert.

Brake Shift Interlock Solenoid Retainer Screws

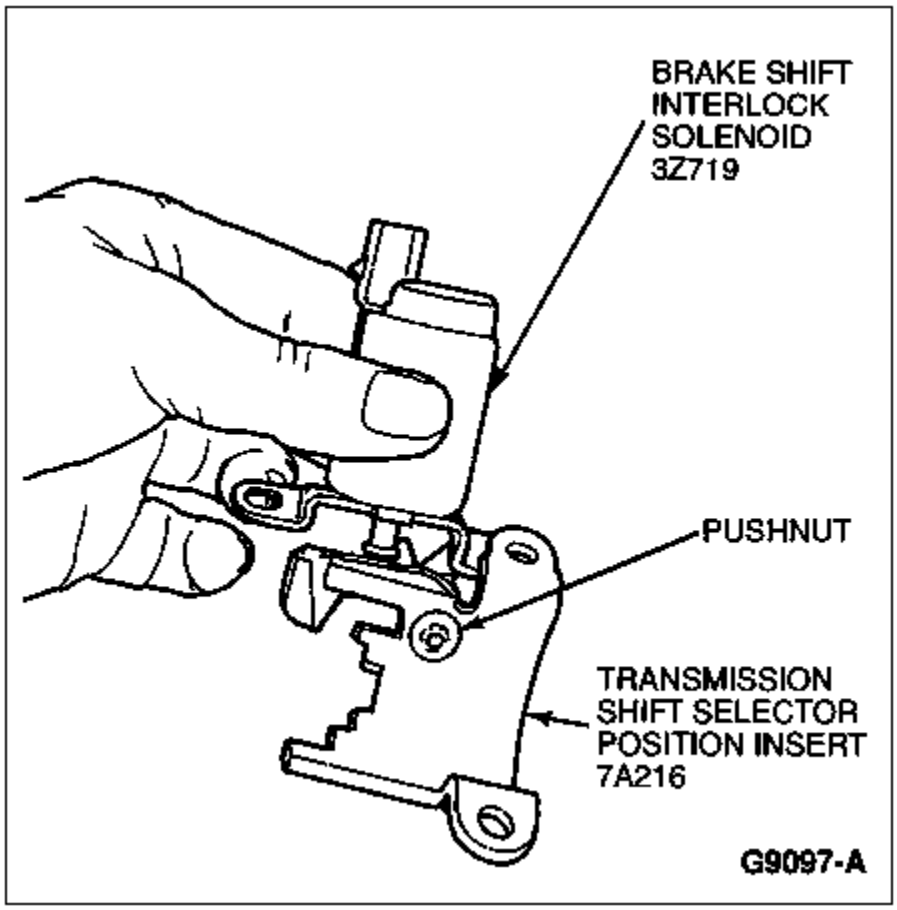


3. Remove brake shift interlock solenoid and transmission shift selector position insert.

Brake Shift Interlock Solenoid



4. If necessary, remove pushnut and separate brake shift interlock solenoid from transmission shift selector position insert.



To install, reverse removal procedures. Tighten attaching screws to 7-11 Nm (62-97 lb-in).

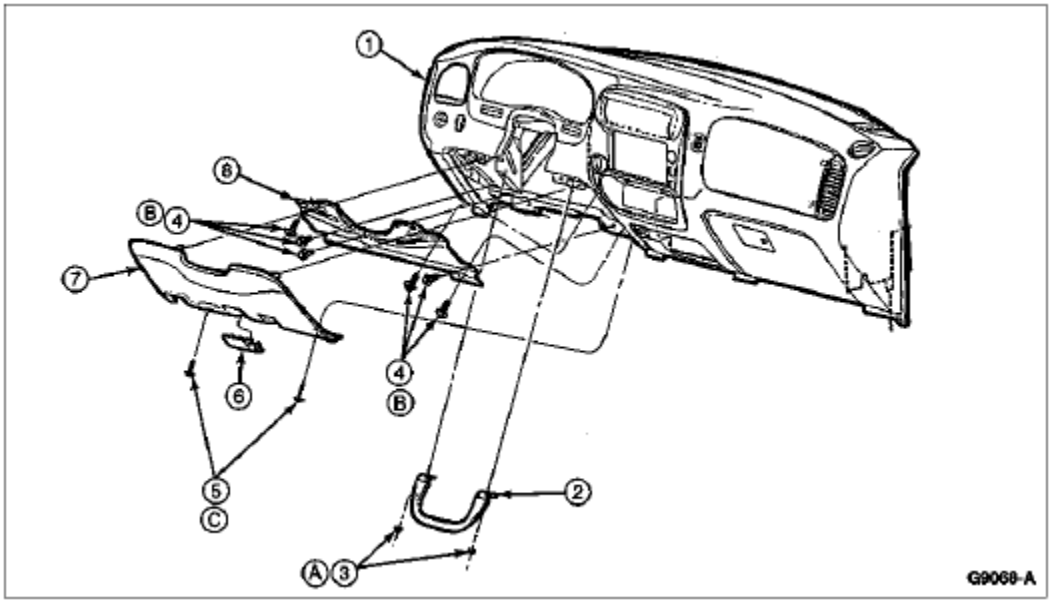
Steering Column Shroud

Lower

Removal

1. Disconnect battery ground cable (14301).
2. Remove two screws and instrument panel steering column cover (04459).
3. Remove three screws and instrument panel steering column cover reinforcement.

Instrument Panel Steering Column Cover and Reinforcement

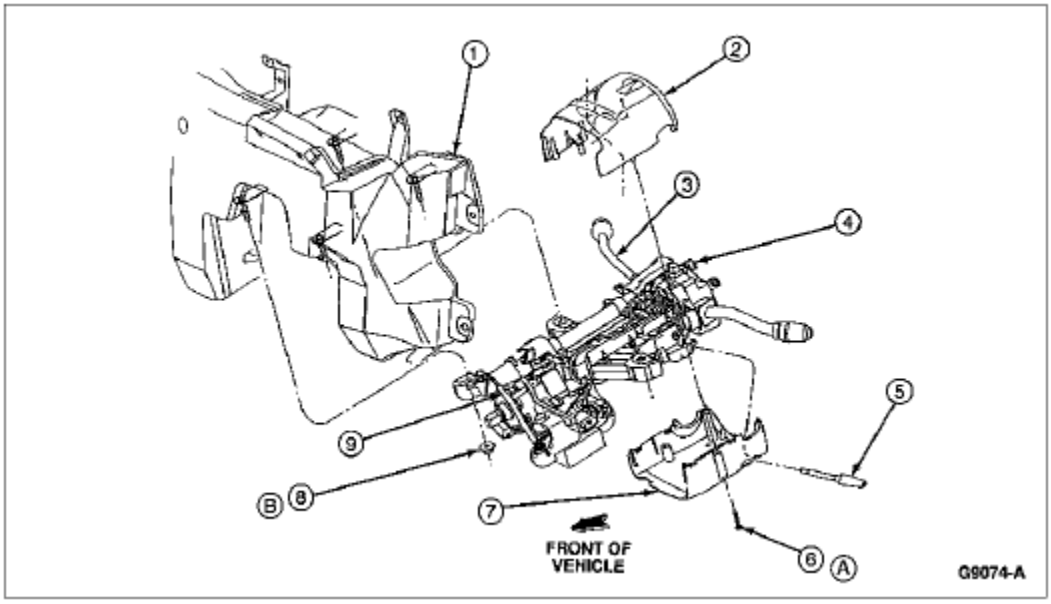


Item	Part Number	Description
1	04320	Instrument Panel
2	044C86	Instrument Panel Steering Column Opening Center Reinforcement
3	N806423-S58	Nuts
4	N606677-S36	Screw
5	N807122-	Screw

	S411	
6	044D82	Instrument Panel Access Hole Cover
7	04459	Instrument Panel Steering Column Cover
8	017A28	Instrument Panel Reinforcement
A	—	Tighten to 13-17 Nm (115-150 Lb-In)
B	—	Tighten to 10-14 Nm (88-123 Lb-In)
C	—	Tighten to 2.1-2.9 Nm (19-25 Lb-In)

4. Unscrew and remove tilt wheel handle and shank (3F609), if equipped.
5. Remove retaining screws and lower steering column shroud (3530).

Steering Column Installation



Item	Part Number	Description
1	04545	Instrument Panel Reinforcement
2	3530	Steering Column Shroud (Upper)
3	7210	Gearshift Lever
4	3C529	Steering Column
5	3F609	Tilt Wheel Handle and Shank
6	55929-S2	Screw
7	3530	Steering Column Shroud (Lower)

8	N806423-S58	Nut
9	7E395	Shift Cable and Bracket
A	—	Tighten to .7-1.1 Nm (6.2-9.7 Lb-In)
B	—	Tighten to 13-17 Nm (10-12 Lb-Ft)

Installation

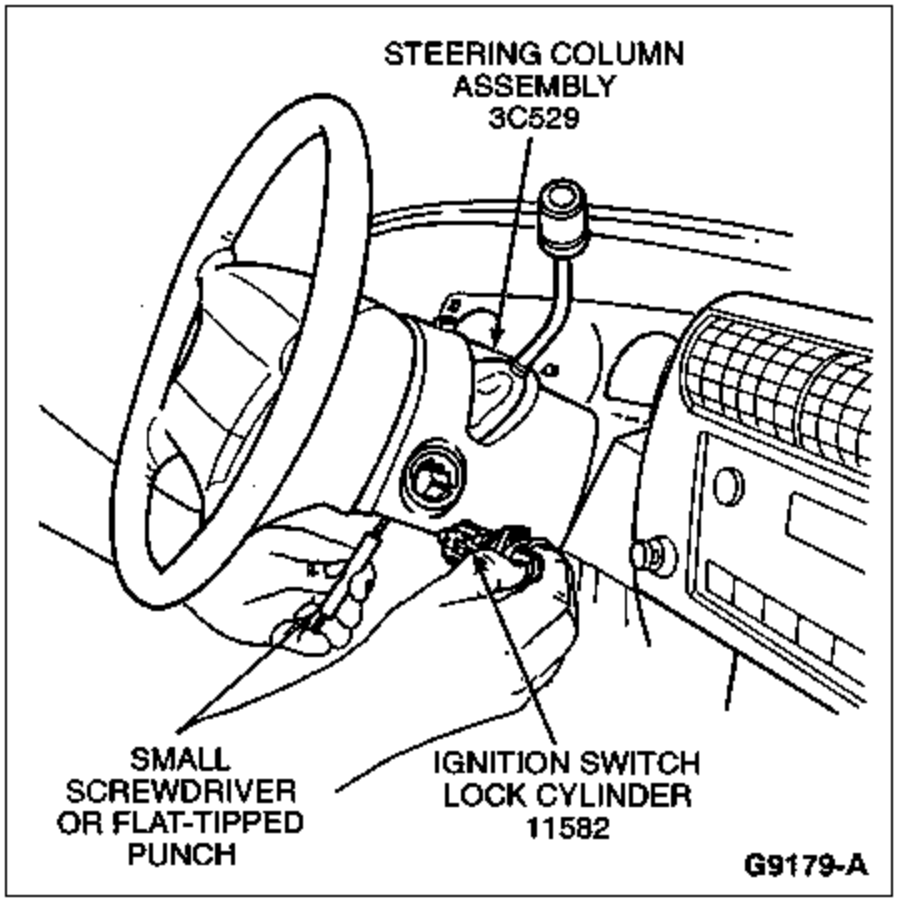
1. Position lower steering column shroud into place on upper steering column shroud.
2. Install retaining screws and tighten to 0.7-1.1 Nm (7-9 lb-in).
3. Install tilt wheel handle and shank, if equipped with tilt wheel.
4. Install instrument panel steering column cover reinforcement and retaining screws. Tighten screws to 10-14 Nm (88-123 lb-in).
5. Install instrument panel steering column cover and two screws. Tighten to 2.1-2.9 Nm (19-25 lb-in).
6. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Reconnect battery ground cable.

Upper

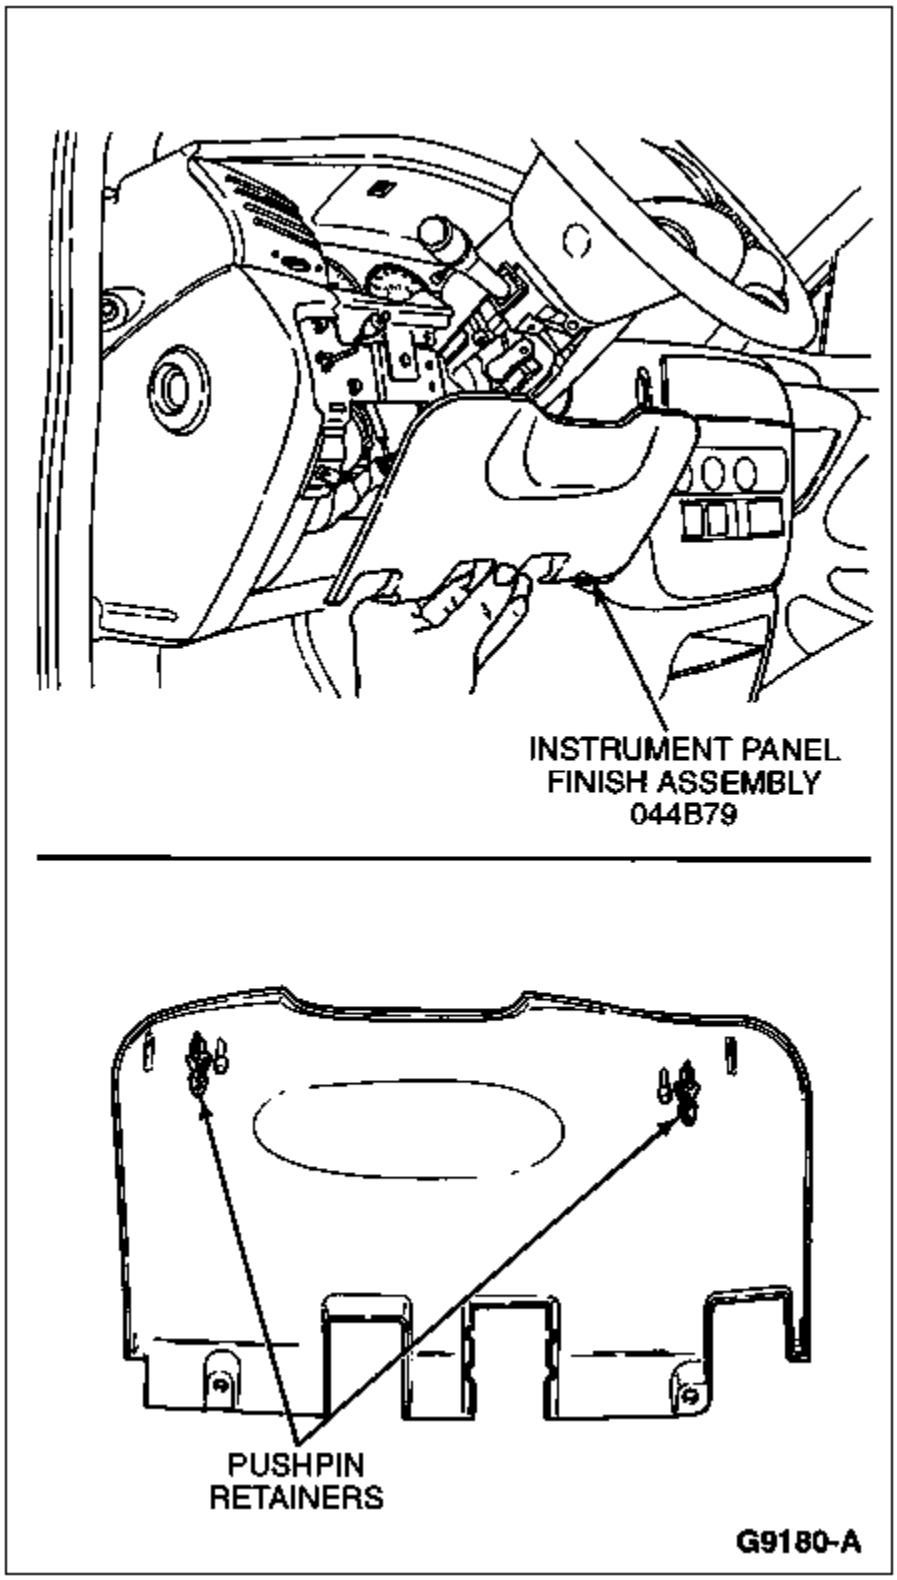
Removal and Installation

1. Remove lower steering column shroud as outlined above.
2. Turn ignition switch lock cylinder (11582) to RUN position.
3. Using flat-tipped punch, push on button below ignition switch lock cylinder and pull out ignition switch lock cylinder.



4. Pull off knob (18519).

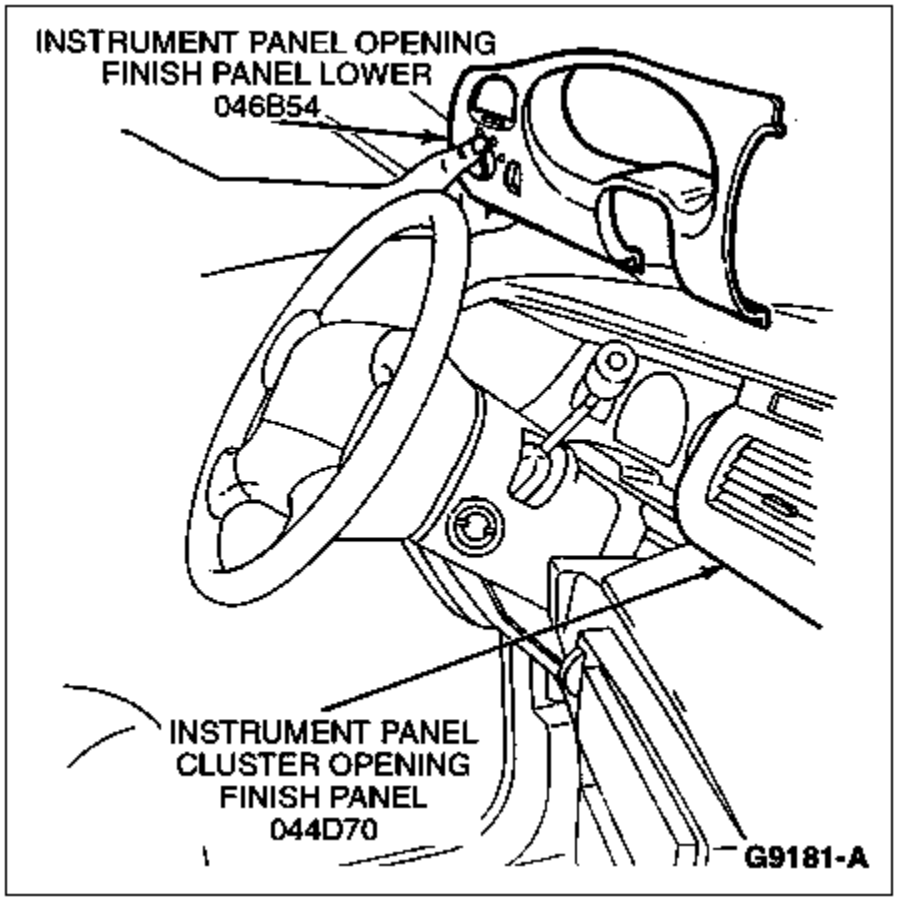
5. Using wide-blade screwdriver, pry loose left-hand instrument panel finish panel (04338). Twist 45 degrees and remove headlamp switch electrical connector from instrument panel finish panel.



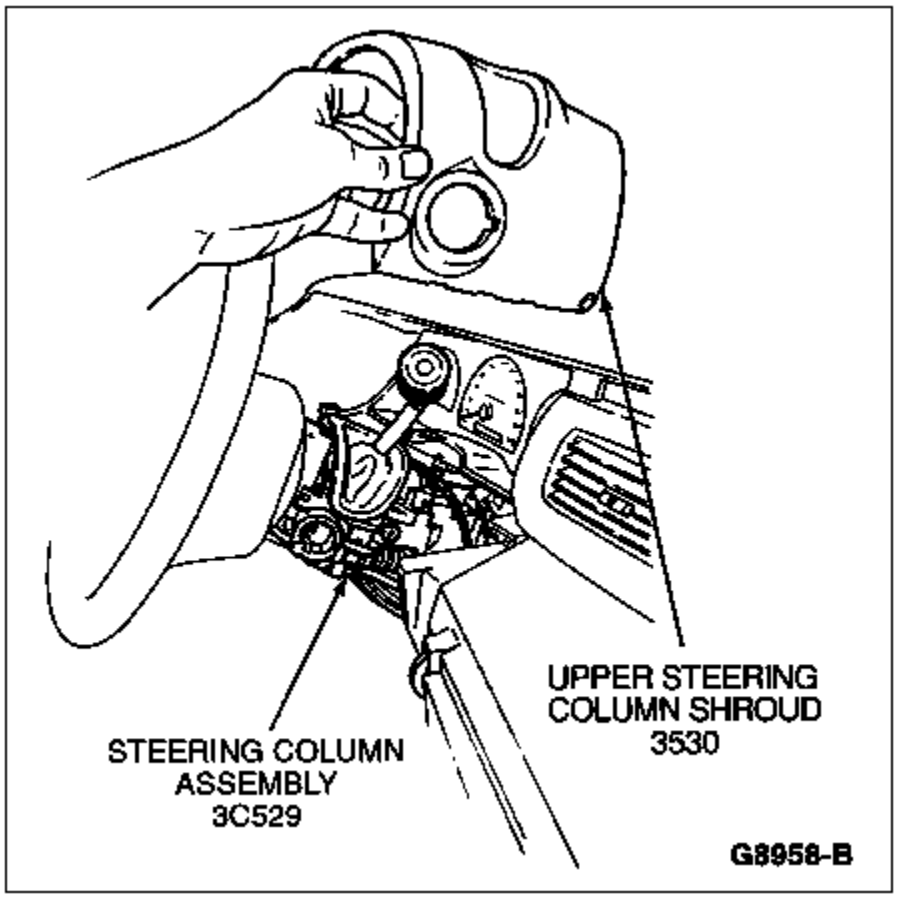
6. Remove retaining screws securing instrument panel lower center finish panel.

7. Using wide-blade screwdriver, pry loose instrument panel lower center finish panel. Pull lower finish panel away from instrument panel assembly.

8. Remove two screws securing lower instrument panel opening finish panel. Pry panel loose. Hold instrument panel finish panel (044D70) while prying loose right side of lower instrument panel finish panel. Remove finish panel.



9. Remove upper steering column shroud.



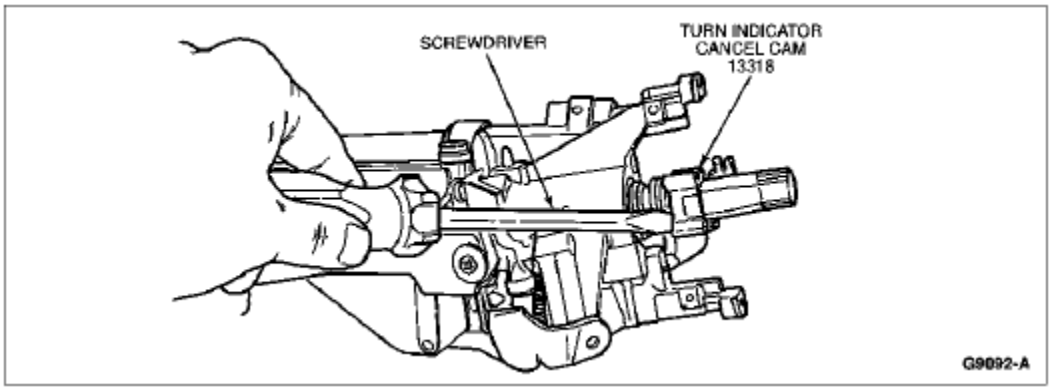
10. To install, reverse removal procedure. Ignition switch lock cylinder simply pushes back in. Tighten instrument panel finish panel screws to 2.1-2.9 Nm (19-25 lb-in).

Turn Signal Cancel Cam Service

Removal

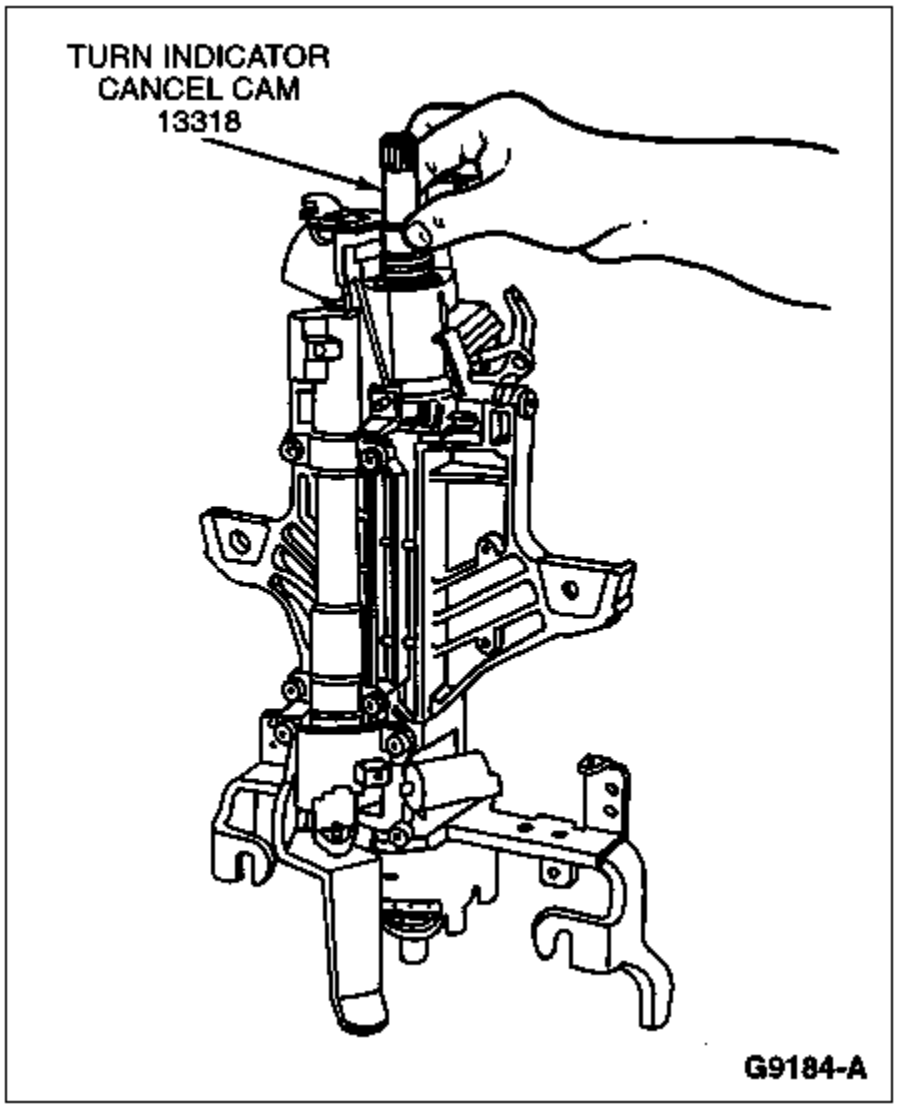
1. Remove steering wheel (3600) as outlined in this section.
2. Remove air bag sliding contact (14A664) as outlined in this section.
3. Unplug multi-function switch (13K359).
4. Remove two screws and multi-function switch.
5. Using screwdriver, pry loose turn indicator cancel cam (13318) and remove.

Turn Indicator Cancel Cam Removal



Installation

1. Push on turn indicator cancel cam with flush surface "up."
2. Install multi-function switch and tighten screws to 2.1-2.9 Nm (19-25 lb-in).
3. Plug in multi-function switch.
4. Install air bag sliding contact.
5. Install steering wheel as outlined in this section.

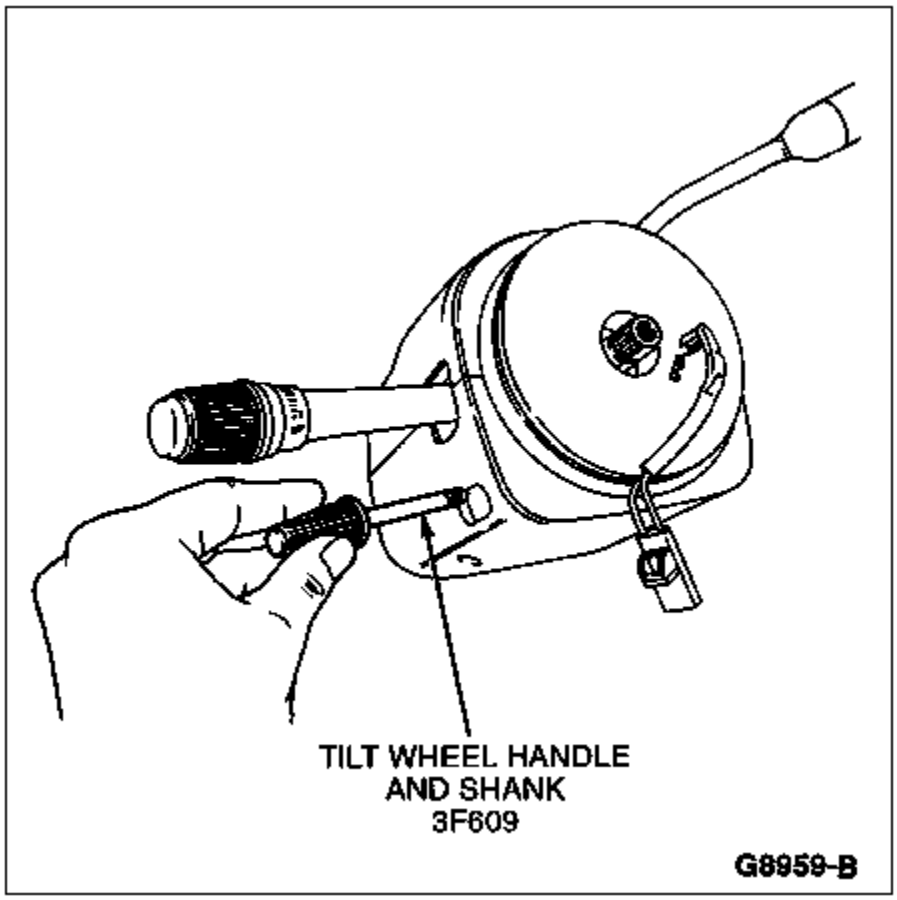


TURN INDICATOR
CANCEL CAM
13318
G9184-A

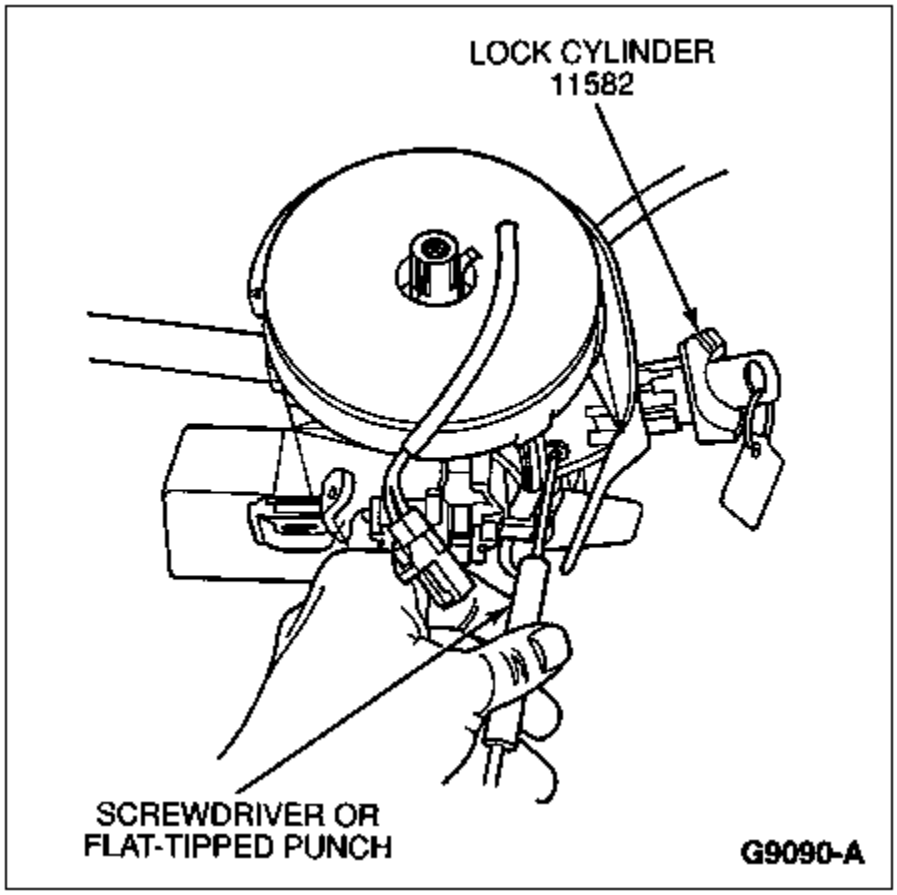
Steering Column

Disassembly

1. Remove instrument panel cover and reinforcement from vehicle as described in this section.
2. Unscrew and remove tilt wheel handle and shank (3F609), if equipped.



3. Remove three screws and lower steering column shroud (3530).
4. Turn ignition switch lock cylinder (11582) to RUN position.
5. Using flat-tipped punch, push on button below ignition switch lock cylinder and pull out ignition switch lock cylinder.



6. Remove upper steering column shroud.

7. **CAUTION: Be sure air bag sliding contact internal lock is engaged. Hub should not turn more then 45 degrees in either direction.**

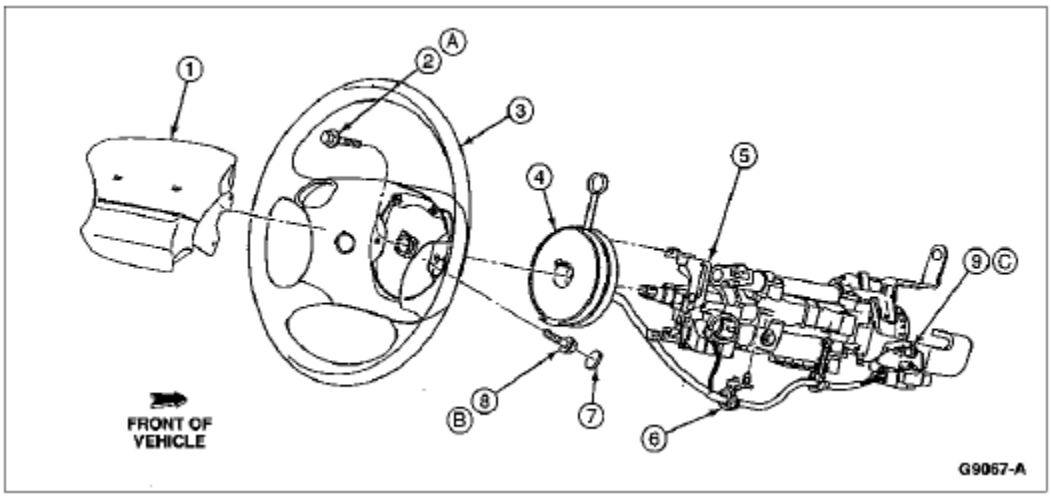
   Using door trim removal tool, remove air bag sliding contact electrical connectors from bend bracket.

8. **CAUTION: Do not remove wire harness clips from wire bundle.**

   Using door trim removal tool, disconnect two wire harness clips from steering column.

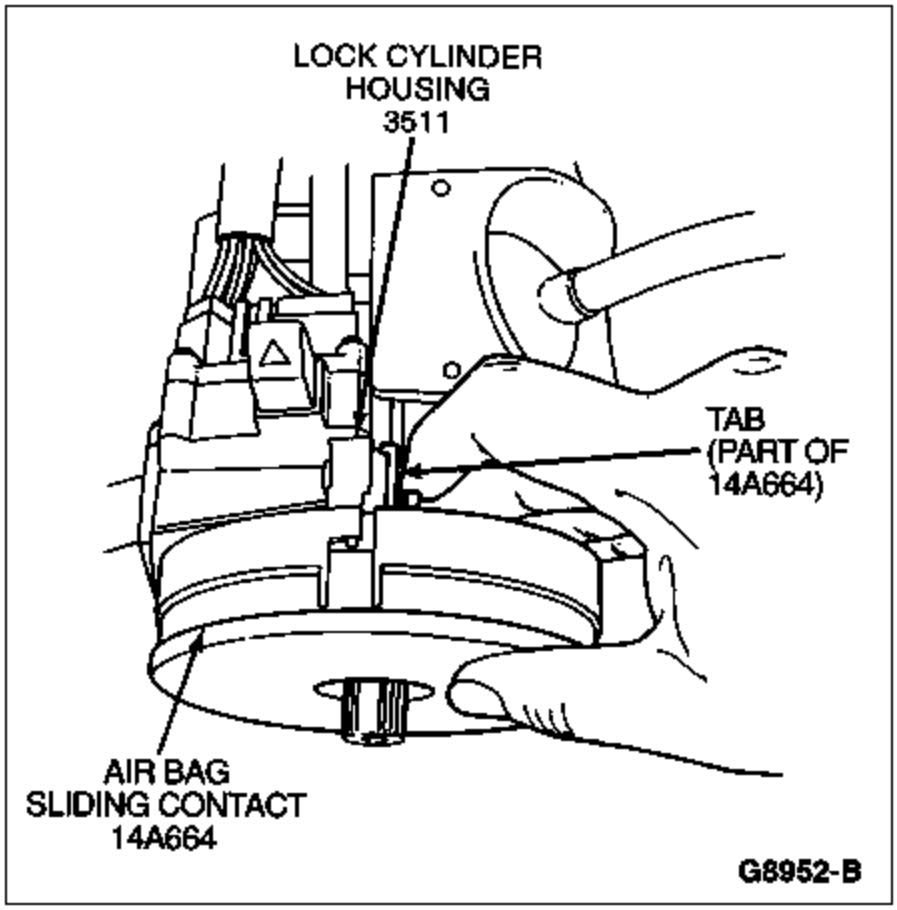
9. Remove key warning chime contact and anti-theft contact from ignition lock cylinder pocket of lock cylinder housing.

Steering Wheel with Air Bag

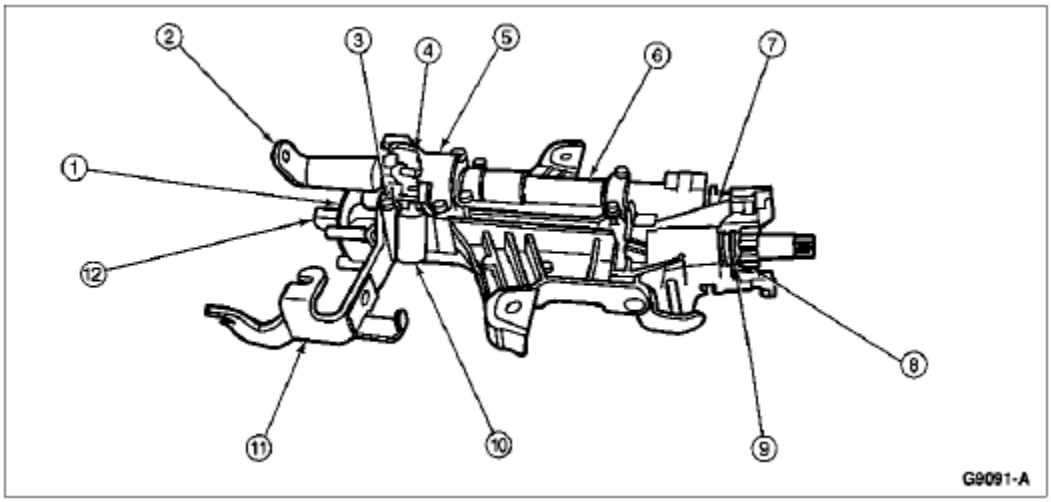


Item	Part Number	Description
1	043B13	Driver Side Air Bag Module
2	N807493-S100	Torx® Head Screw, M10-1.5 x 18
3	3600	Steering Wheel
4	14A664	Air Bag Sliding Contact
5	3C529	Steering Column
6	—	Clip (Part of 14A664)
7	3F785	Plug
8	N808944-S424	Bolt
9	N805375-S36MG	Bolt
A	—	Tighten to 34-46 Nm (25-33 Lb-Ft)
B	—	Tighten to 7.6-10.4 Nm (67-92 Lb-In)
C	—	Tighten to 10.2-13.8 Nm (7.5-10.1 Lb-Ft)

10. Remove air bag sliding contact (14A664) by pushing snap back at 6 o'clock position, then 3 o'clock position, then 12 o'clock position and remove from steering shaft.



Steering Column

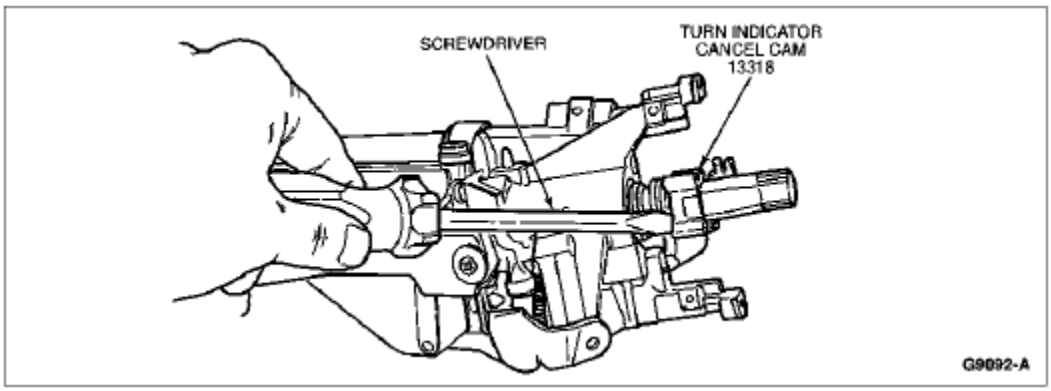


Item	Part Number	Description
1	3C131	Suspension Height Sensor Control Ring
2	7302	Transmission Selector Lever Arm and Support

3	3D681	Steering Column Lower Bearing Retainer
4	7A216	Transmission Shift Selector Position Insert
5	—	Attachment Point (Part of 7302)
6	7212	Transmission Column Shift Selector Tube
7	3511	Steering Column Lock Cylinder Housing
8	13318	Turn Indicator Cancel Cam
9	3520	Steering Column Upper Bearing Spring
10	3Z719	Brake Shift Interlock Solenoid
11	3676	Steering Column Bend Bracket
12	3520	Steering Column Bearing Spring (Tilt Only)

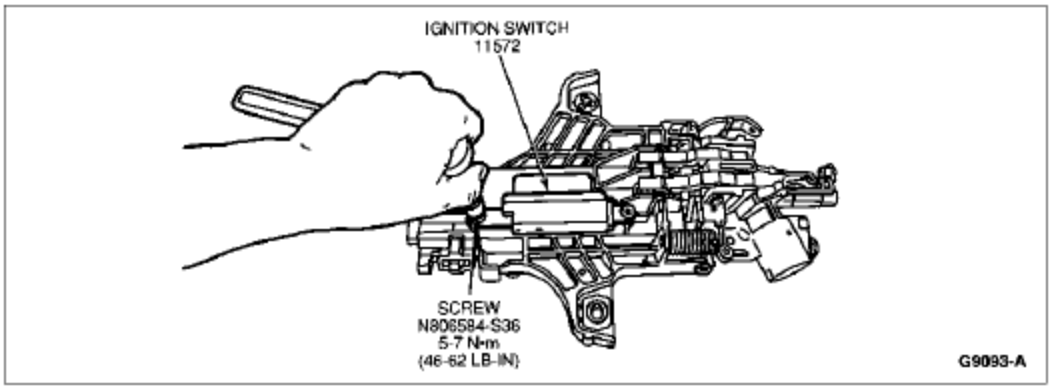
11. Remove turn indicator cancel cam (13318) by pushing up with flat-bladed screwdriver. Note direction of flush surface.

Turn Indicator Cancel Cam Removal



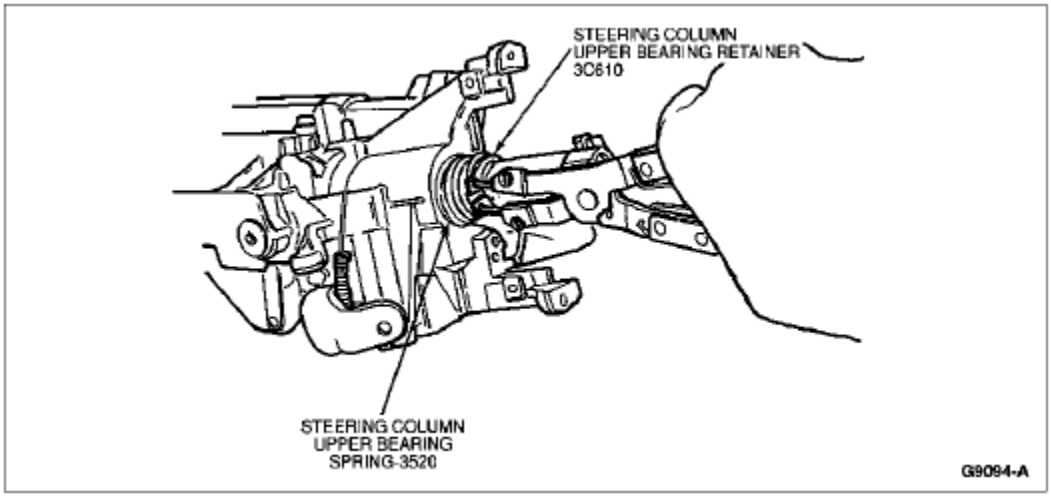
12. Remove ignition switch.

Ignition Switch Removal



13. Remove upper bearing retainer snap ring and steering column upper bearing spring (3520).

Steering Column Upper Bearing Spring and Upper Bearing Retainer



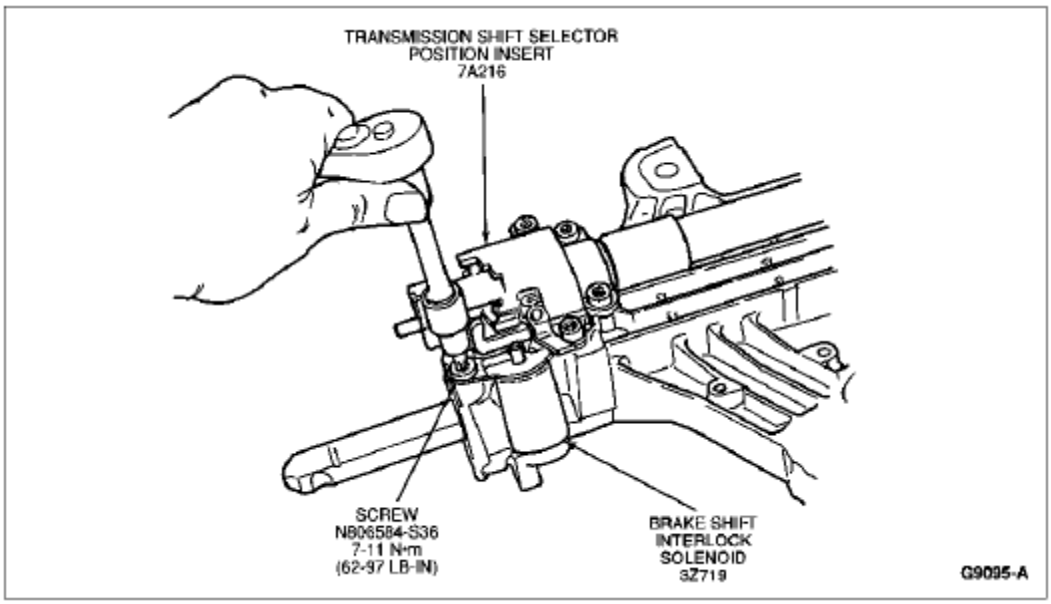
14. Remove steering column bearing sleeve (3518) and steering column bearing tolerance ring (3L539).

15. Remove gearshift lever (7210).

16. **NOTE: Brake shift interlock solenoid is retained to the transmission shift selector position insert (7A216) with a pushnut.**

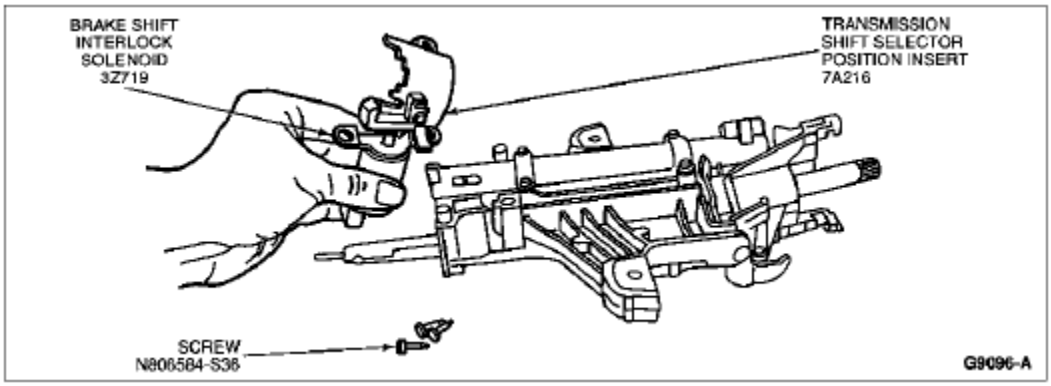
    Remove three screws attaching brake shift interlock solenoid and transmission shift selector position insert.

Brake Shift Interlock Solenoid Screws

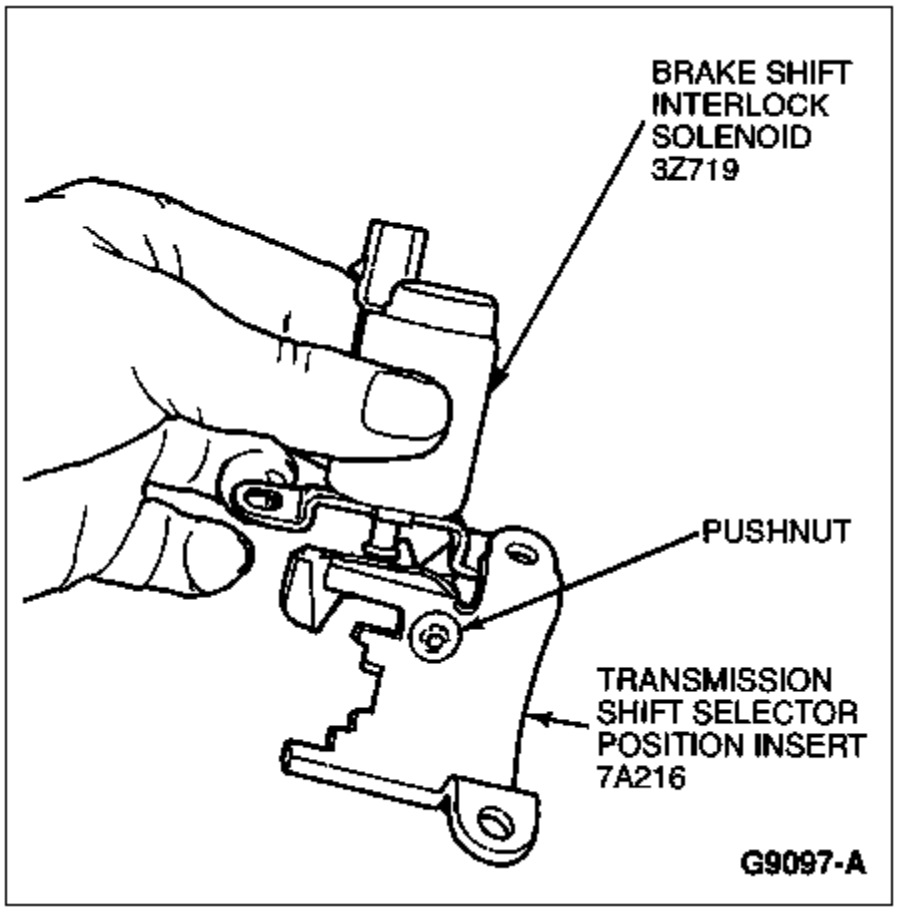


17. Remove brake shift interlock solenoid and transmission shift selector position insert together.

Transmission Shift Selector Position Insert

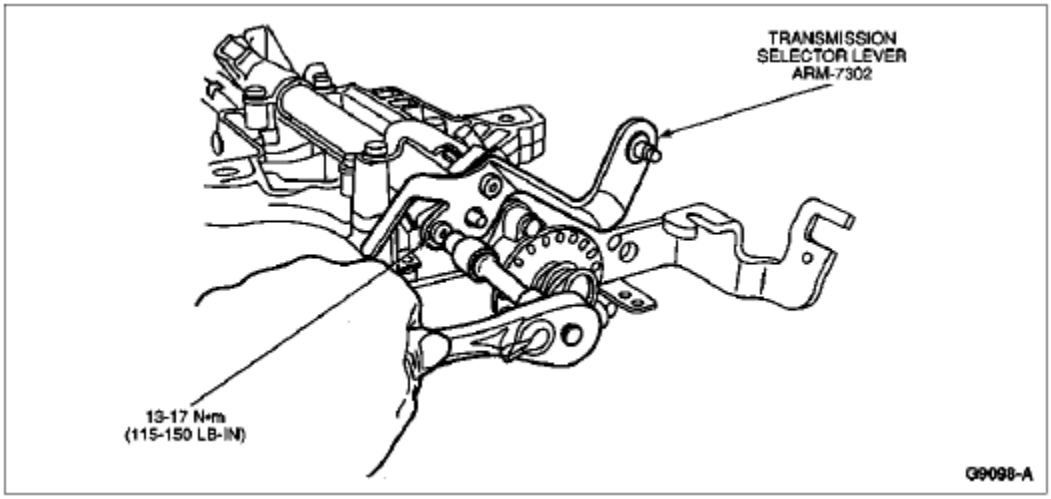


18. If necessary, remove pushnut and separate brake shift interlock solenoid and transmission shift selector position insert.

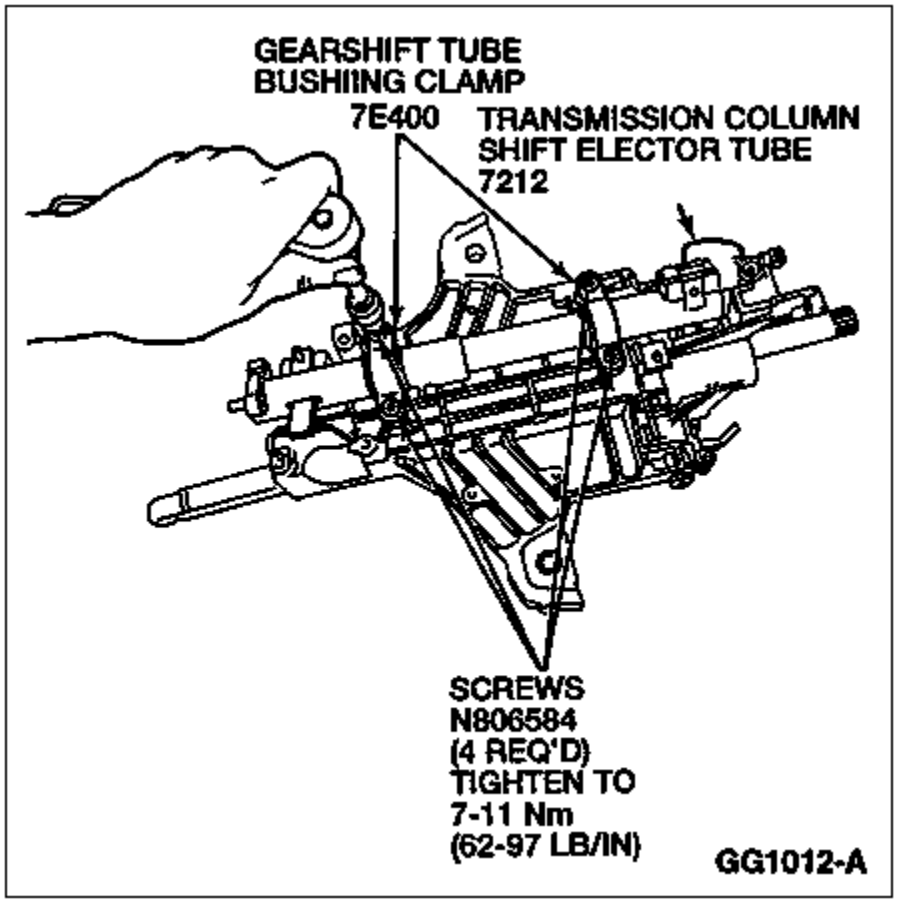


19. Remove two screws and transmission control selector arm.

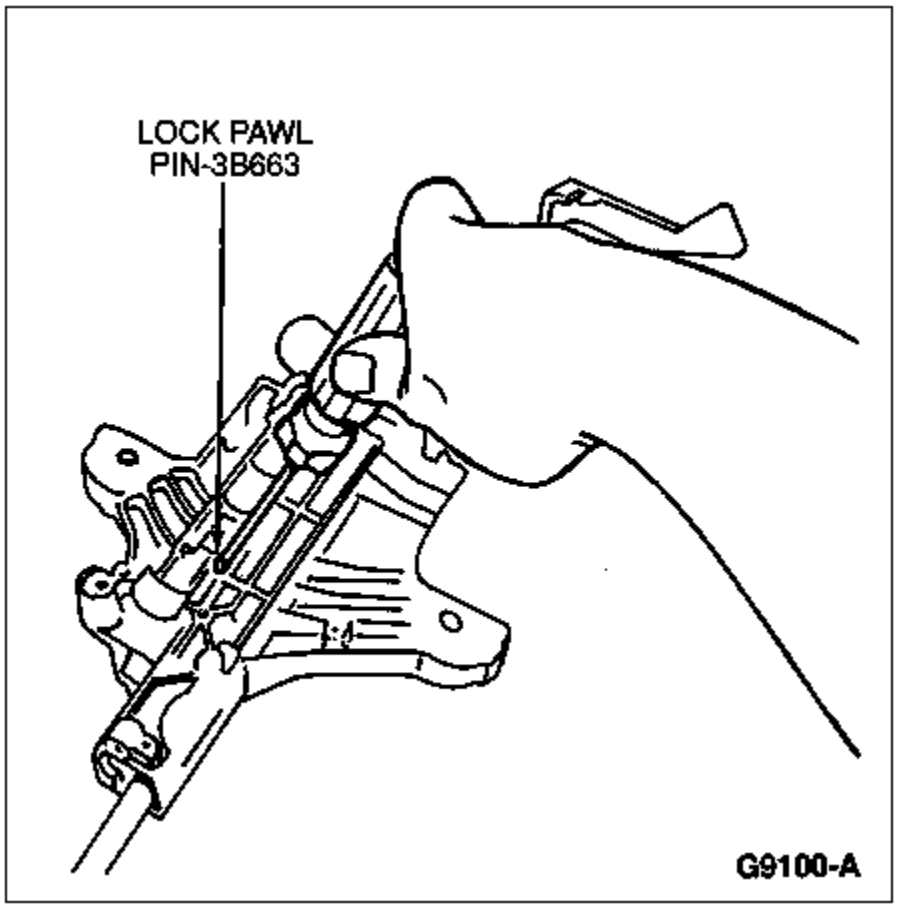
Transmission Selector Lever Arm



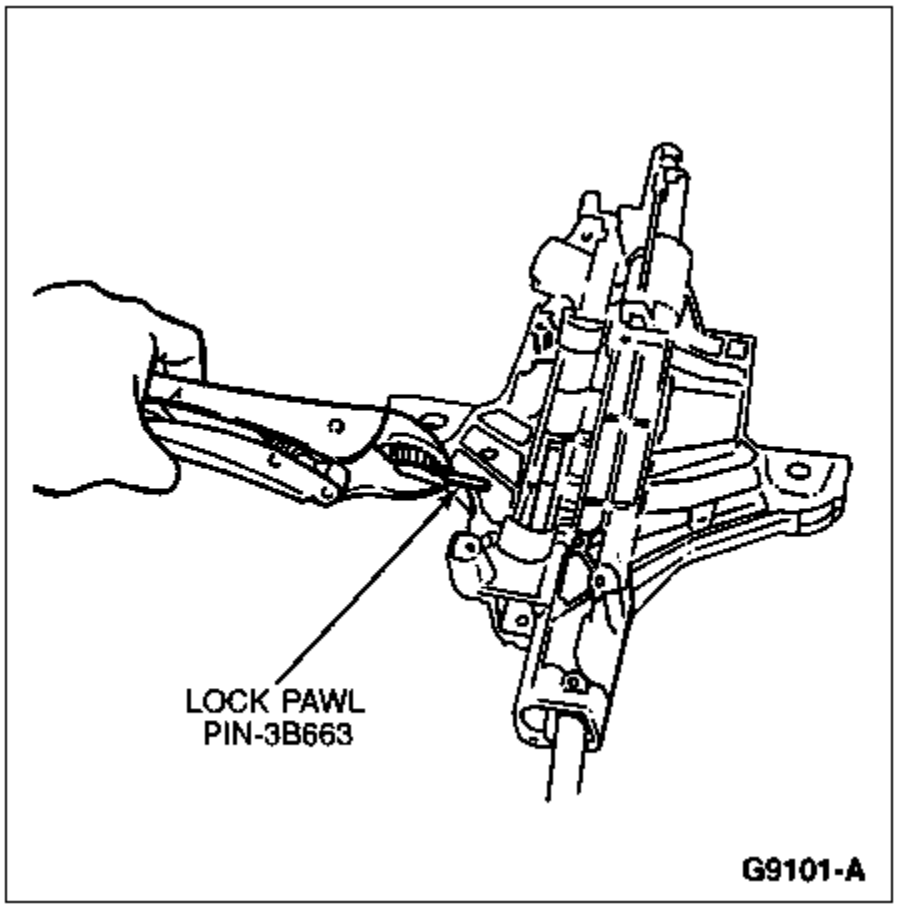
20. Remove four screws, two gearshift tube bushing clamps (7E400), transmission column shift selector tube (7212) and assembled parts.



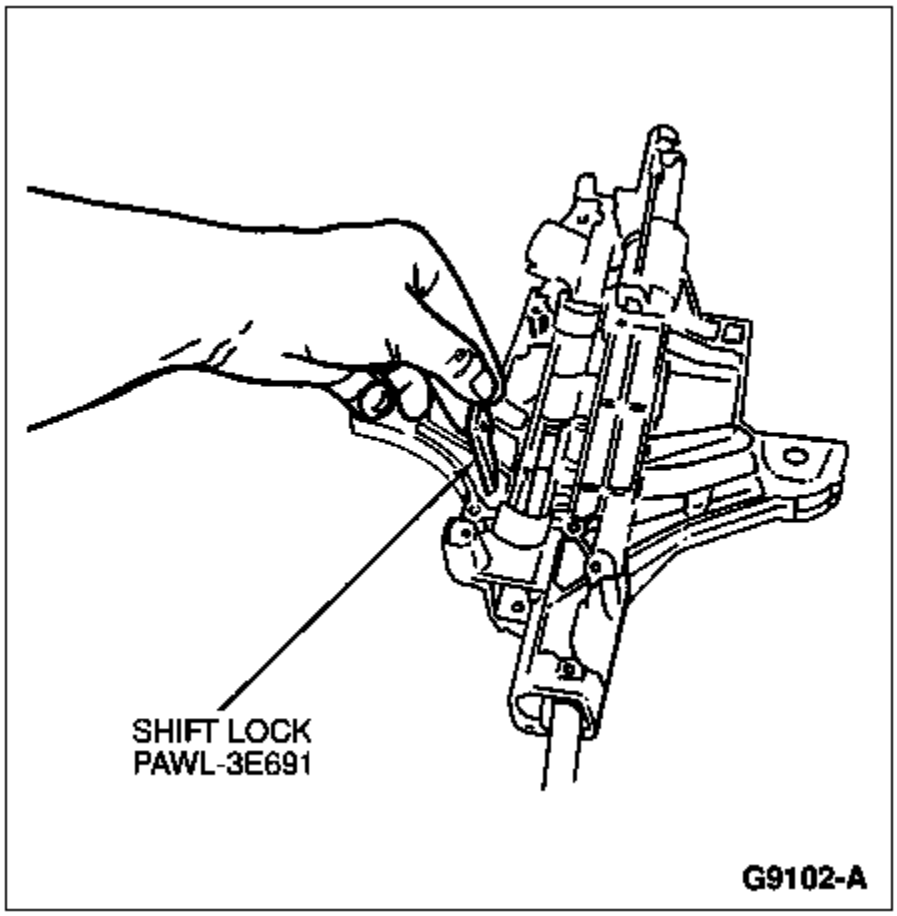
21. Pry on end of steering column lock lever pin (3B663) which is sticking out.



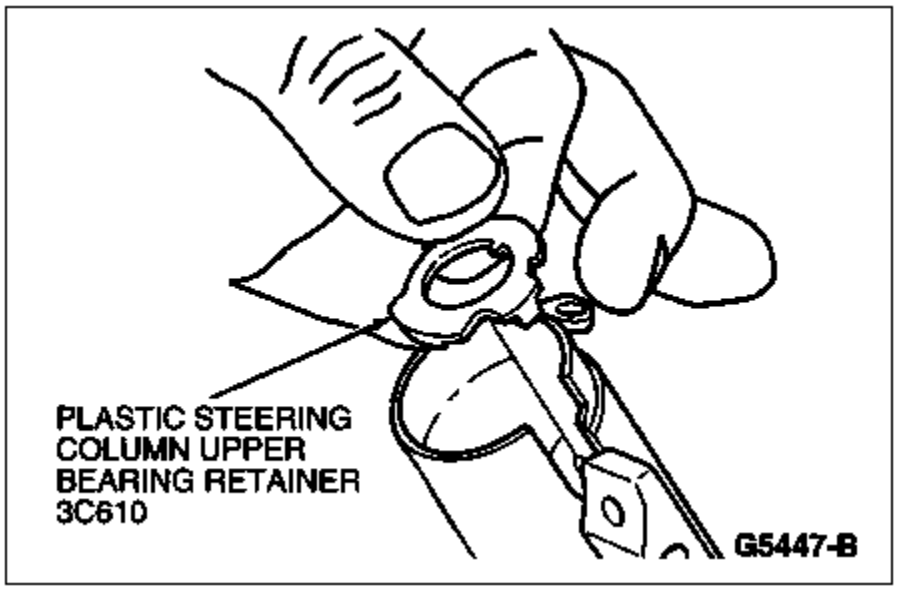
22. Pull steering column lock lever pin with Vise-Grips®.



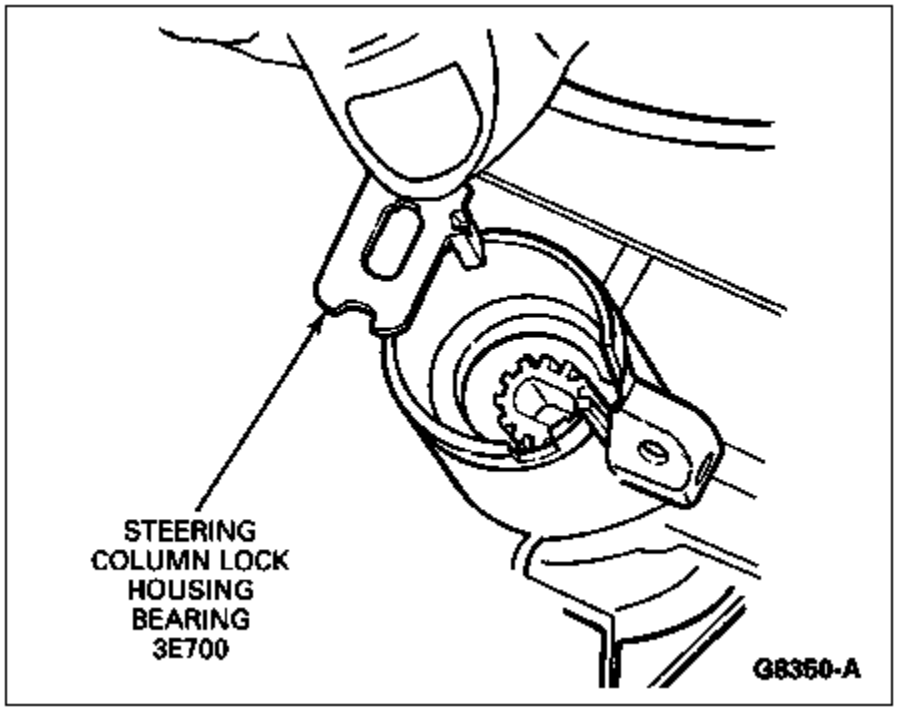
23. Remove column shift lock pawl.



24. Remove plastic bearing retainer from bore of lock cylinder.



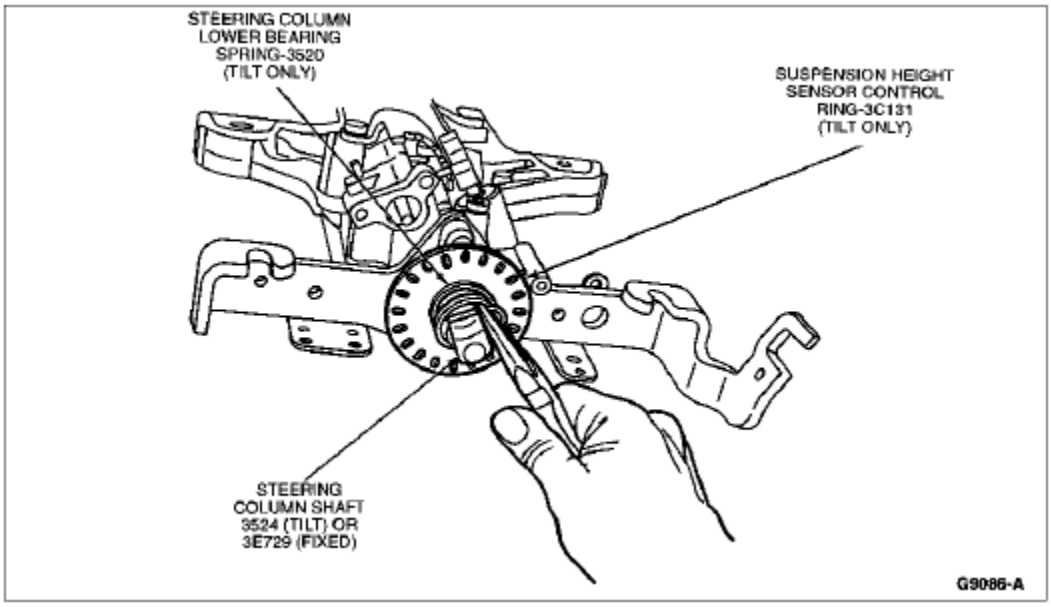
25. Remove steering column lock housing bearing (3E700) from lock cylinder bore.



26. Remove steering column lock gear (3E717).

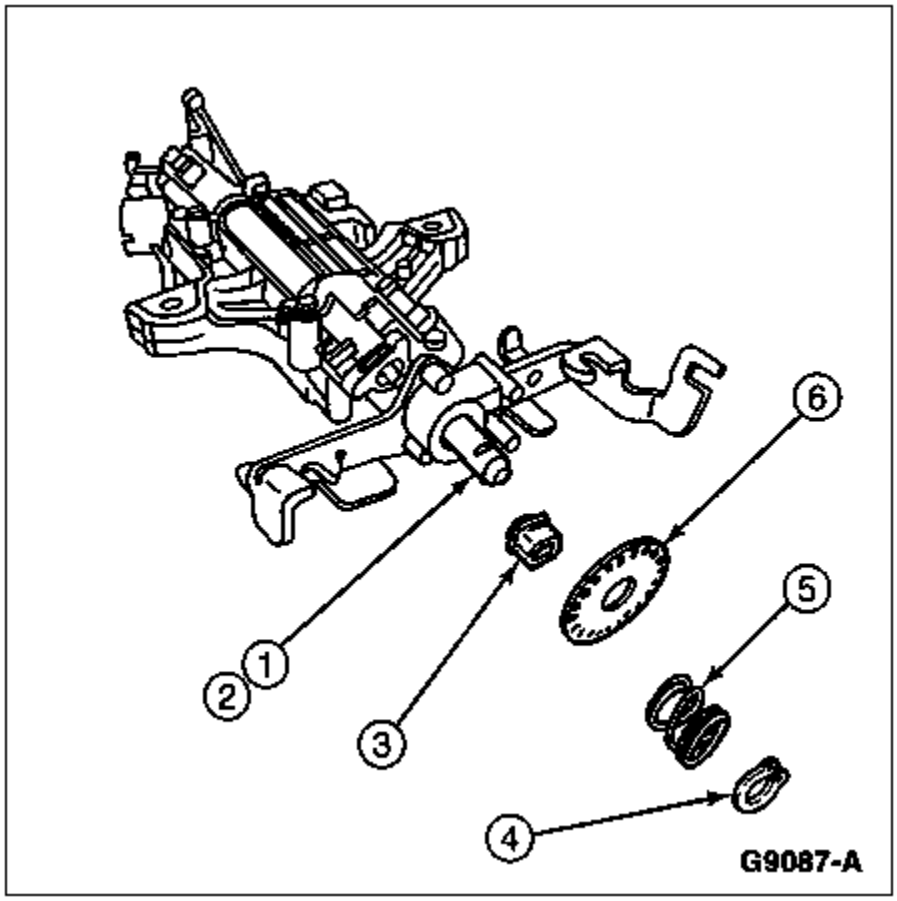
27. On tilt column, remove steering column lower bearing spring. Using long-nose pliers, lift spring out of grooves in steering shaft and pull off.

Steering Column Lower Bearing Spring (Tilt Only)



28. Remove suspension height sensor control ring (3C131) and lower column bearing tolerance ring.

Suspension Height Sensor Control Ring

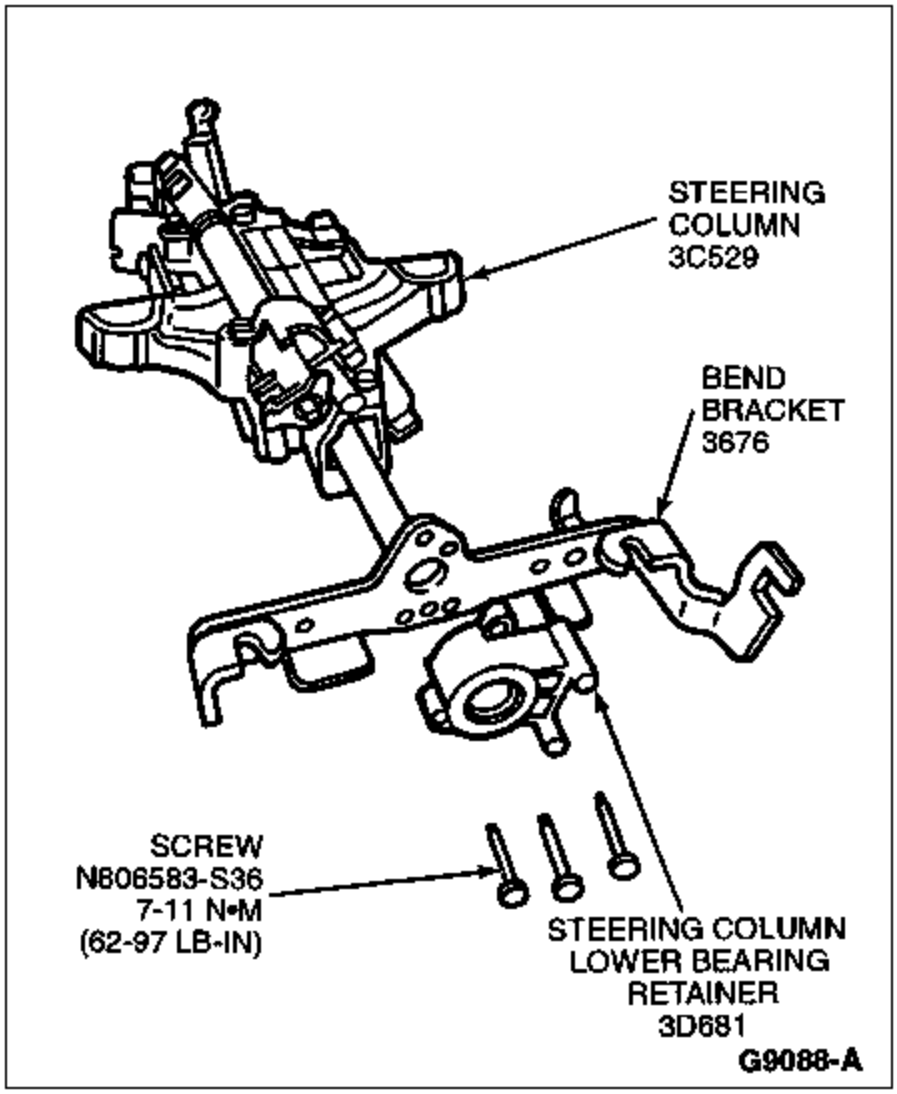


Item	Part Number	Description
1	3524	Steering Gear Column Shaft (Tilt)
2	3E729	Steering Gear Column Shaft (Fixed)
3	3L539	Steering Column Upper Bearing Tolerance Ring
4	3C610	Bearing Retainer (Fixed Only)
5	3520	Steering Column Upper Bearing Spring
6	3C131	Suspension Height Sensor Control Ring

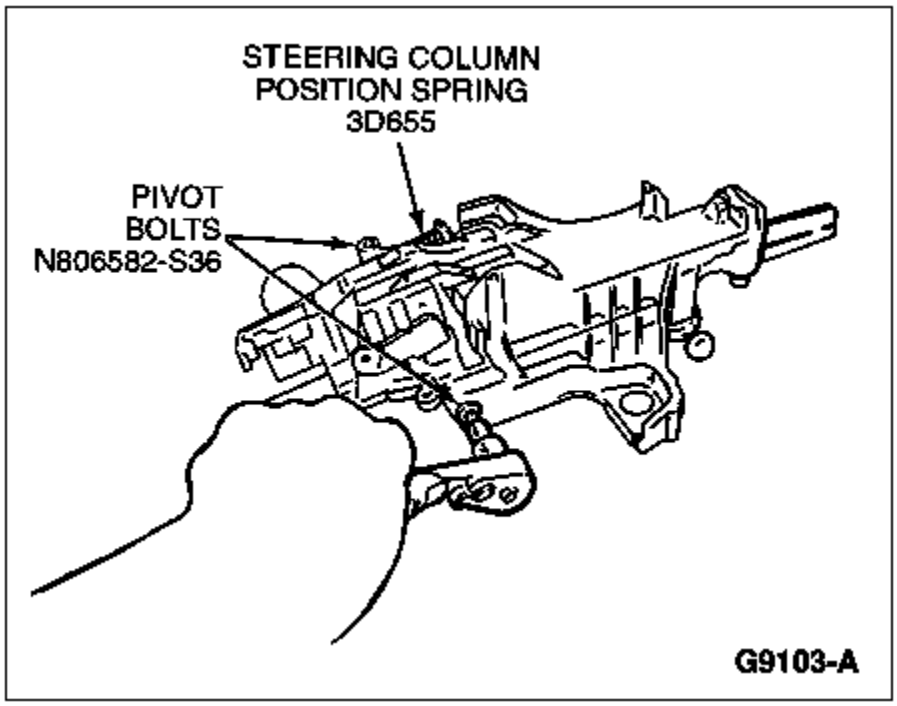
29. On fixed column, remove steering column bearing retainer and steering column tolerance ring.

30. Remove steering column lower bearing retainer (3D681) and steering column bend bracket.

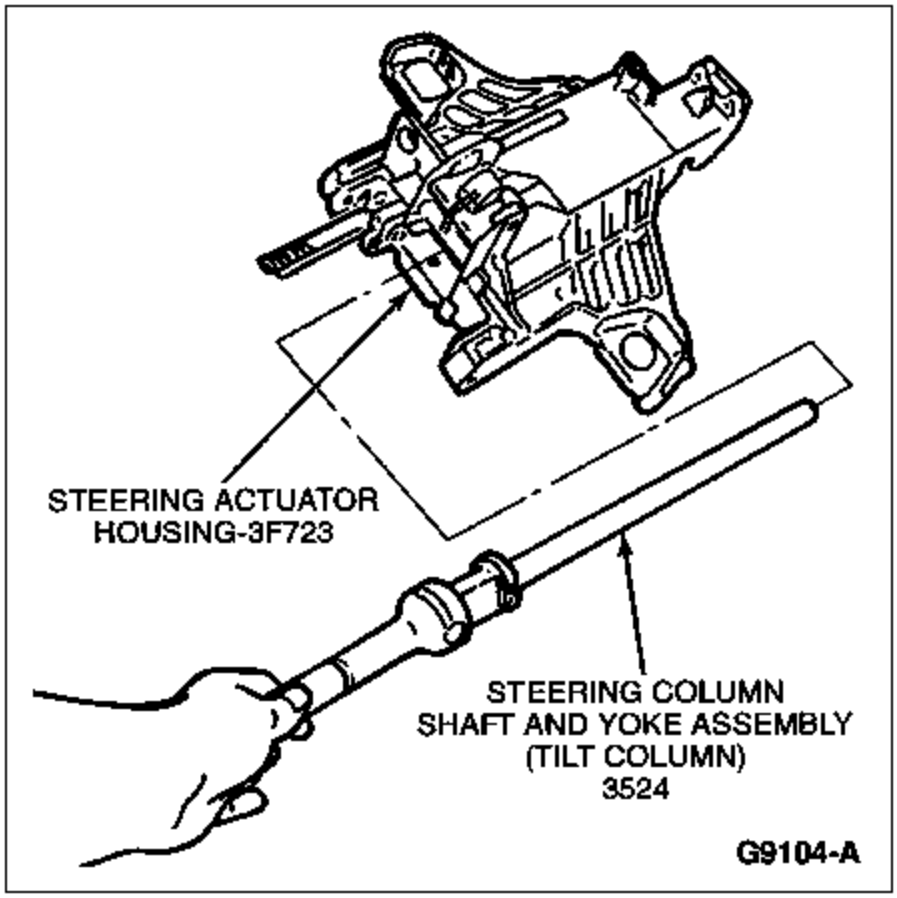
Steering Column Lower Bearing Retainer and Bend Bracket



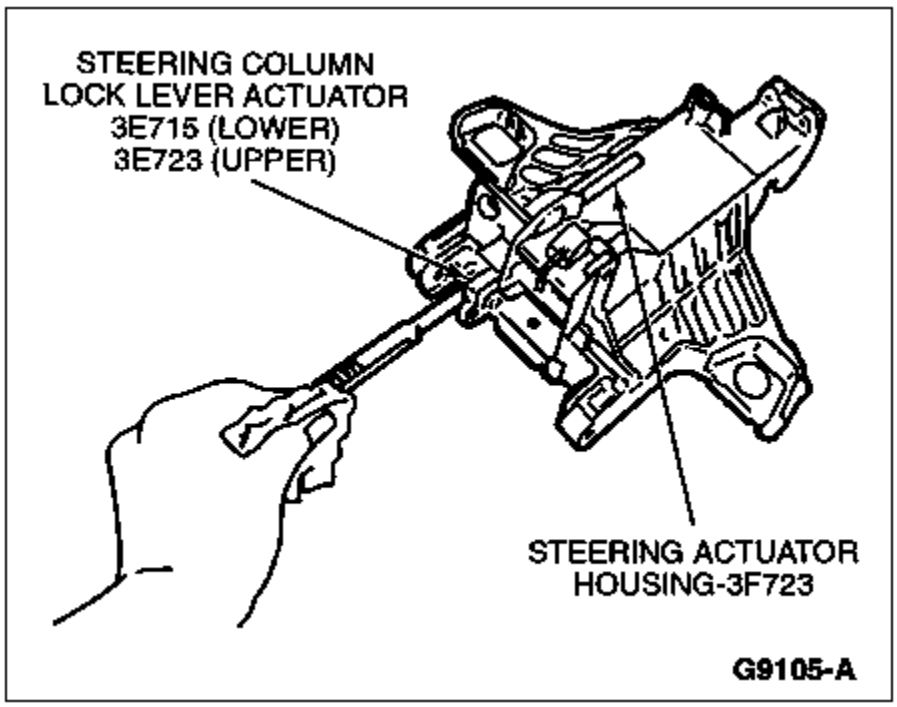
31. Remove two pivot bolts. Use caution as steering column position spring (3D655) will release when bolts are removed. Remove lock cylinder housing.



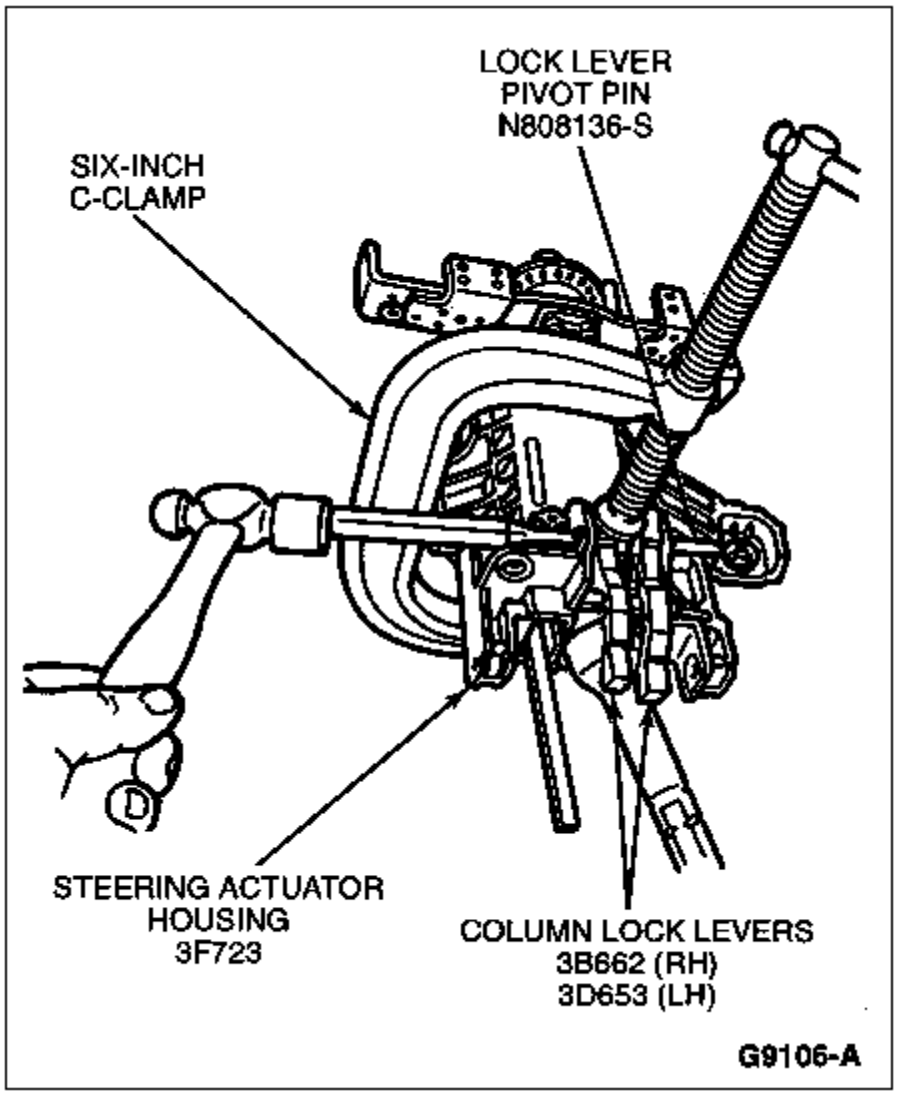
32. Remove steering shaft from steering column.



33. Remove upper and lower steering column lock actuators.

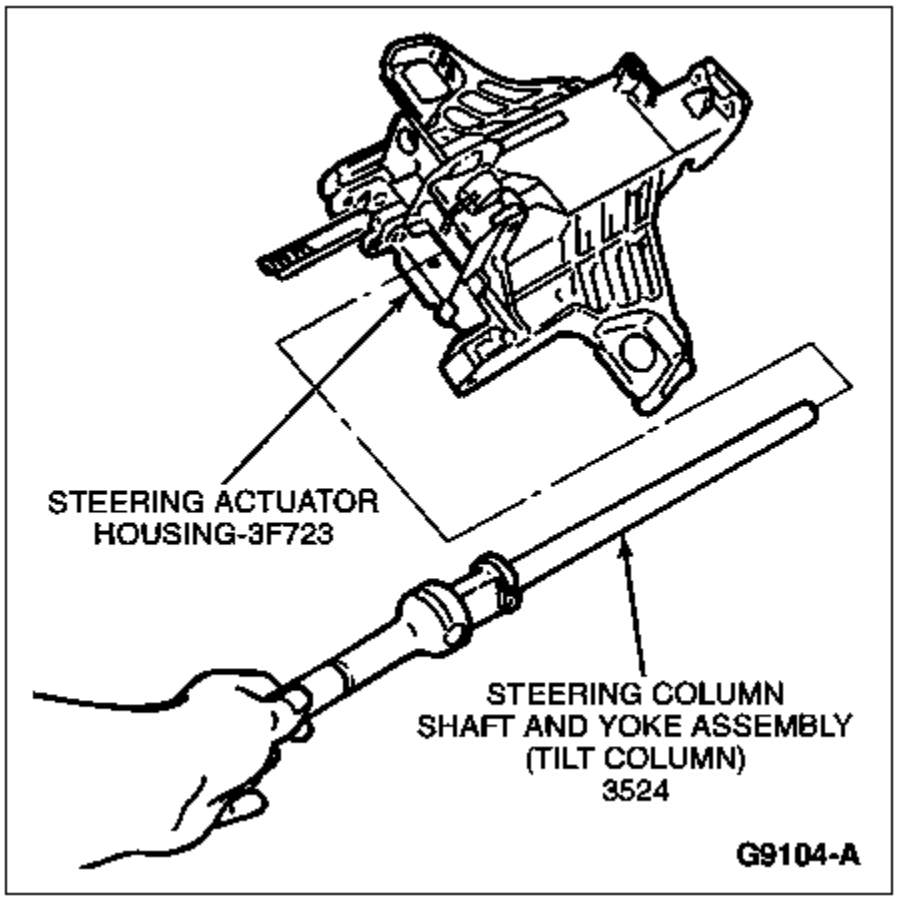


34. On tilt columns, secure locating levers with a six-inch C-clamp. Remove tilt lock lever pivot pin using a drift. Slowly release spring tension by loosening C-clamp and remove steering column locking levers and springs.

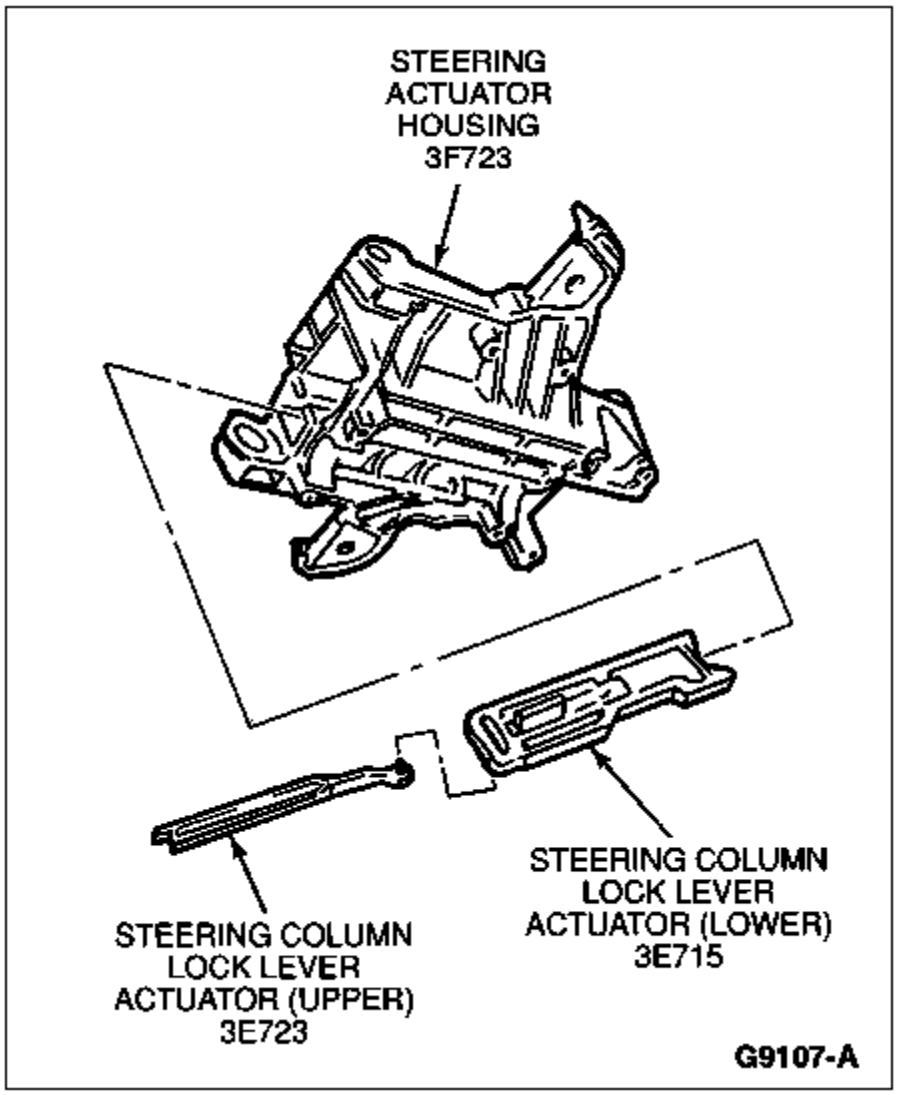


Assembly

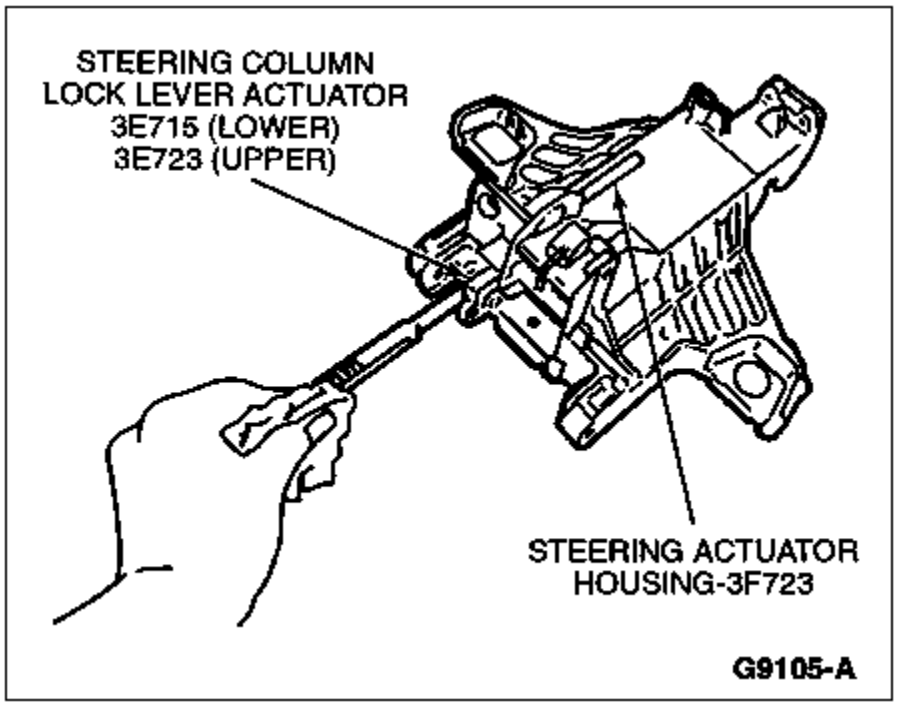
1. With actuator housing upside down, slide steering shaft into steering actuator housing.



2. Lubricate lower steering column lock lever actuator (3E715) and upper steering column lock lever actuator with Ignition Lock Grease F0AZ-19584-A or equivalent meeting Ford specification ESA-M1C232-A.

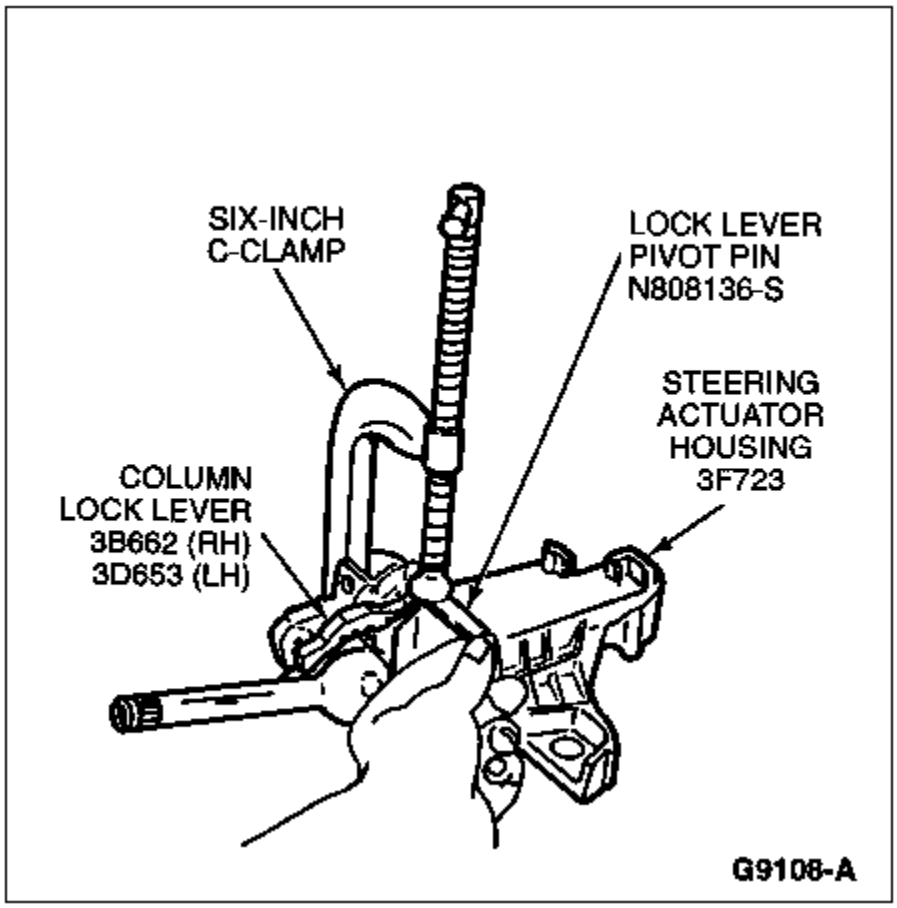


3. Put together lower steering column lock lever actuator and upper steering column lock lever actuator and slide into place in steering actuator housing.

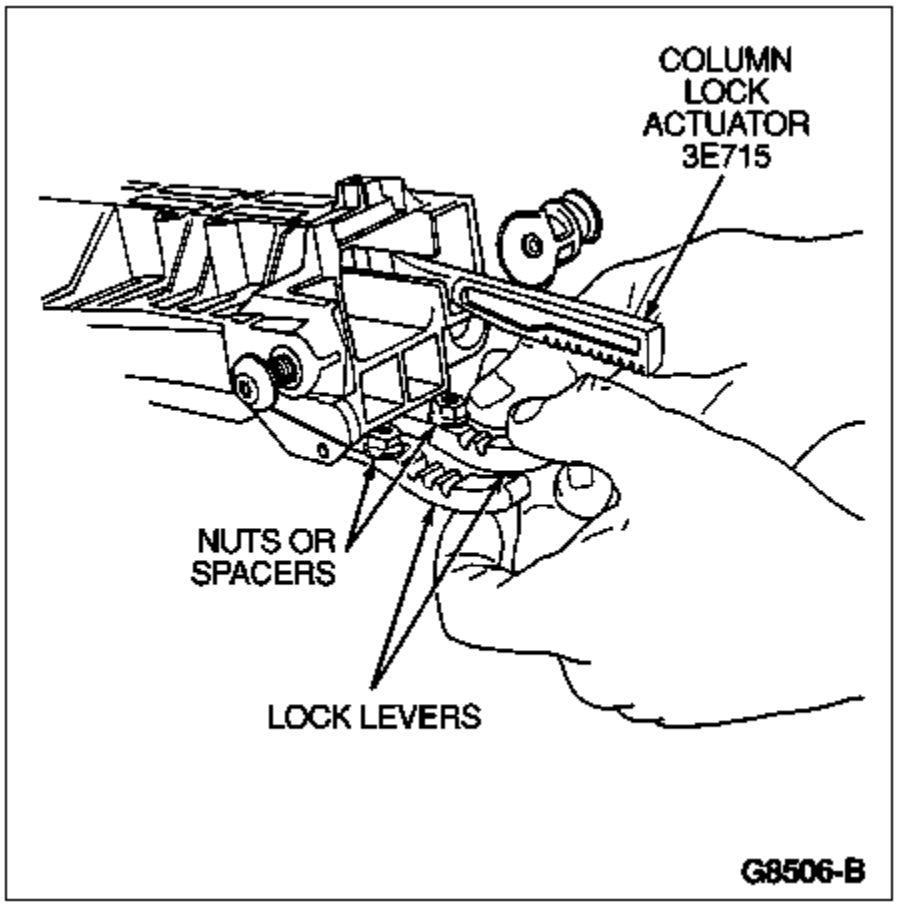


4. **NOTE: Remember, steering column actuator housing is upside down.**

   Position steering column position lock spring (3B768) and left (your right) column lock lever. Using approximately 150mm (six-inch) C-clamp, compress steering column position lock spring while aligning pin hole in column lock lever with pin holes in steering actuator housing. Tap in lock lever pivot pin up to center pin support of steering actuator housing.



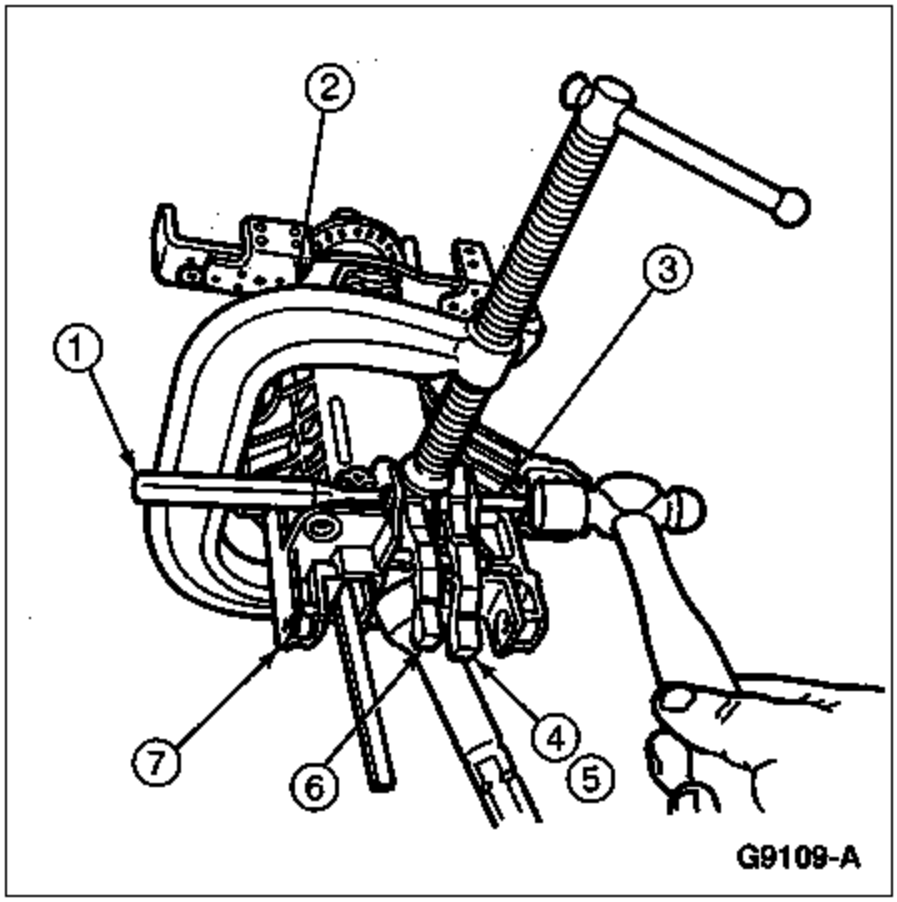
5. Insert a small nut between the column lock lever and steering actuator housing to hold up the column lock lever. Slowly loosen and remove C-clamp.



6. **NOTE: Remember that steering column actuator housing is upside down.**

   Position steering column position lock spring and right column lock lever. Using approximately 150mm (six-inch) C-clamp, compress steering column position lock spring while aligning pin hole in column lock lever with pin holes in steering actuator housing. Align with a punch; leave punch in place.

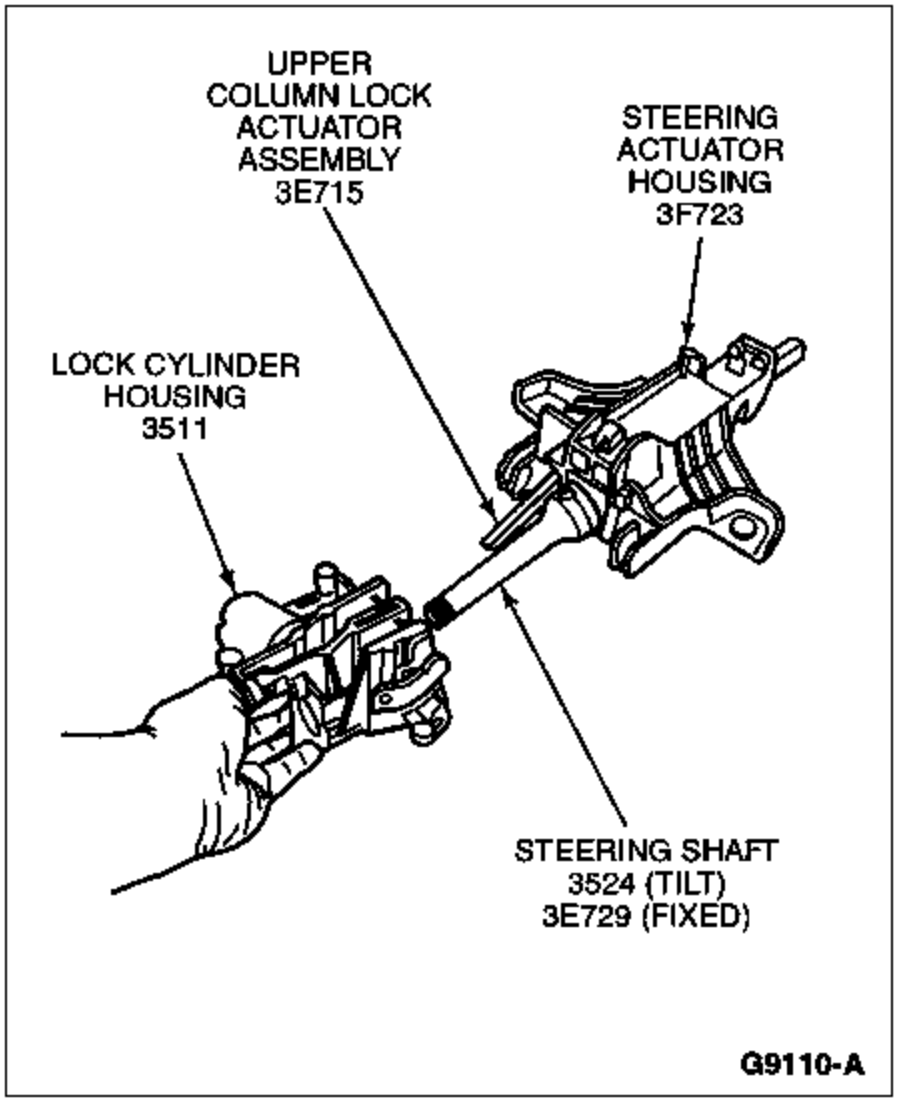
7. Tap in lock lever pivot pin, driving out punch at the same time, until left end of pin (your right) is flush with the pin support of the steering actuator housing.



Item	Part Number	Description
1	—	Punch
2	—	Six-Inch C-Clamp
3	N808136-S	Lock Lever Pivot Pin
4	3D653	Column Lock Lever, Tilt (Left)
5	3D653	Column Lock Lever, Fixed (Left)
6	3B662	Column Lock Lever, Tilt (Right)
7	3F723	Steering Actuator Housing

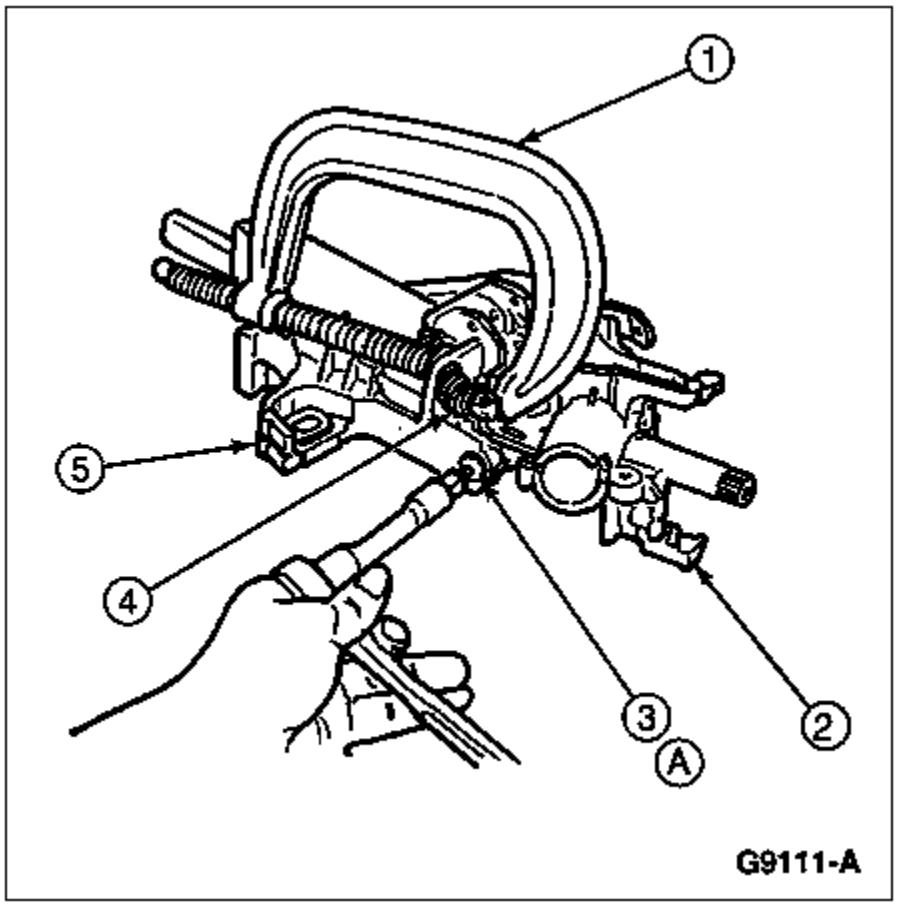
8. Position nut between right (your left) column lock lever and steering actuator housing. Slowly unscrew C-clamp and remove.

9. Position lock cylinder housing on steering shaft and upper steering column lock lever actuator.



10. On tilt column:

    a. Insert steering column position lock spring between lock cylinder housing and steering actuator housing.
    b. Position approximately 150mm (six-inch) C-clamp on outsides of column position spring pads.
    c. Tighten C-clamp drawing lock cylinder housing and steering actuator housing together, compressing steering column position lock spring. At the same time, use punch to align bushings in lock cylinder housing with threaded pivot bolt holes in steering actuator housing.
    d. Lubricate pivot bolts with grease meeting Ford specification ESB-M1C163-C.
    e. When holes and bushings are aligned, install pivot bolts and tighten to 18-26 Nm (14-19 lb-ft).
    f. Using long, thin screwdriver, remove nuts from underneath right and left column lock levers.
    g. Slowly loosen and remove C-clamp.

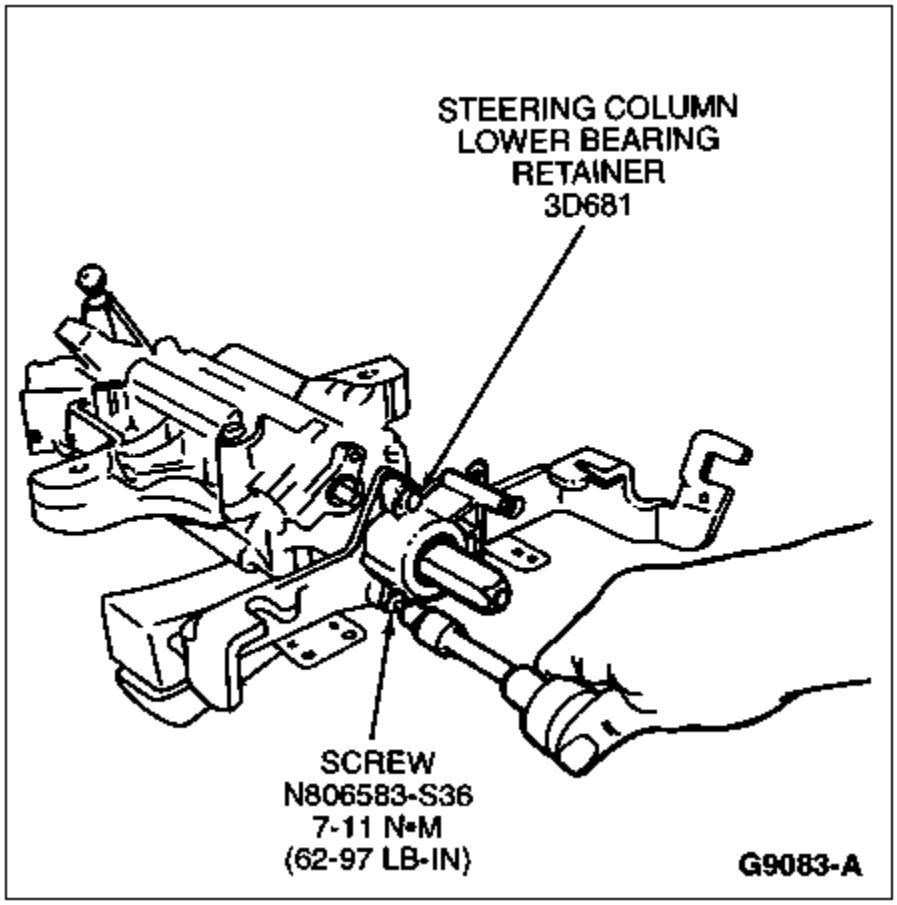


Item	Part Number	Description
1	—	Six-Inch C-Clamp
2	3511	Lock Cylinder Housing
3	N806582-S36	Pivot Bolt
4	3D655	Column Position Spring
5	3F723	Steering Actuator Housing
A	—	Tighten to 18-26 Nm (14-19 Lb-Ft)

11. On fixed column:

    a. Position lock cylinder housing on upper steering column lock lever actuator and steering shaft.
    b. Align bushings in lock cylinder housing with threaded pivot bolt holes in lock lever actuator housing.
    c. Lubricate pivot bolts with grease meeting Ford specification ESB-M1C163-C.
    d. When holes and bushings are aligned, install pivot bolts and tighten to 18-26 Nm (14-19 lb-ft).
    e. Using long, thin screwdriver, remove nut from underneath left column lock lever.

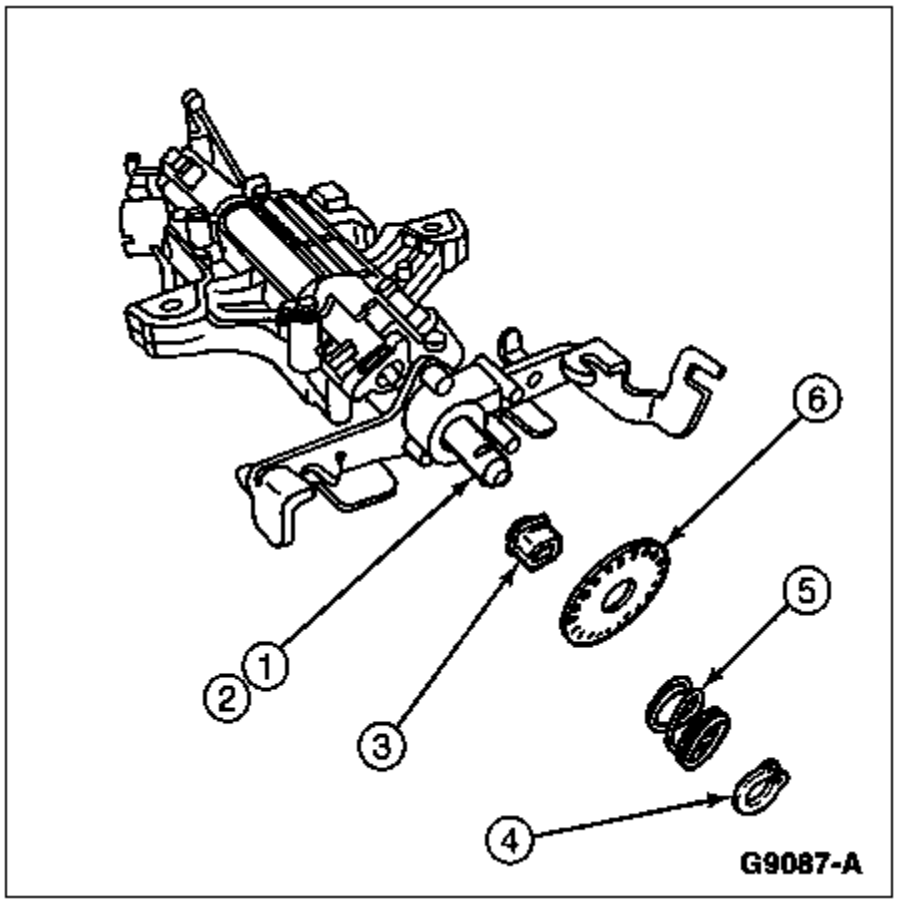
12. Install steering column lower bearing retainer and steering column lower mounting bracket. Tighten screws to 7-11 Nm (62-97 lb/in).



13. On tilt column: install suspension height sensor control ring, steering column bearing tolerance ring and steering column upper bearing spring to steering shaft.

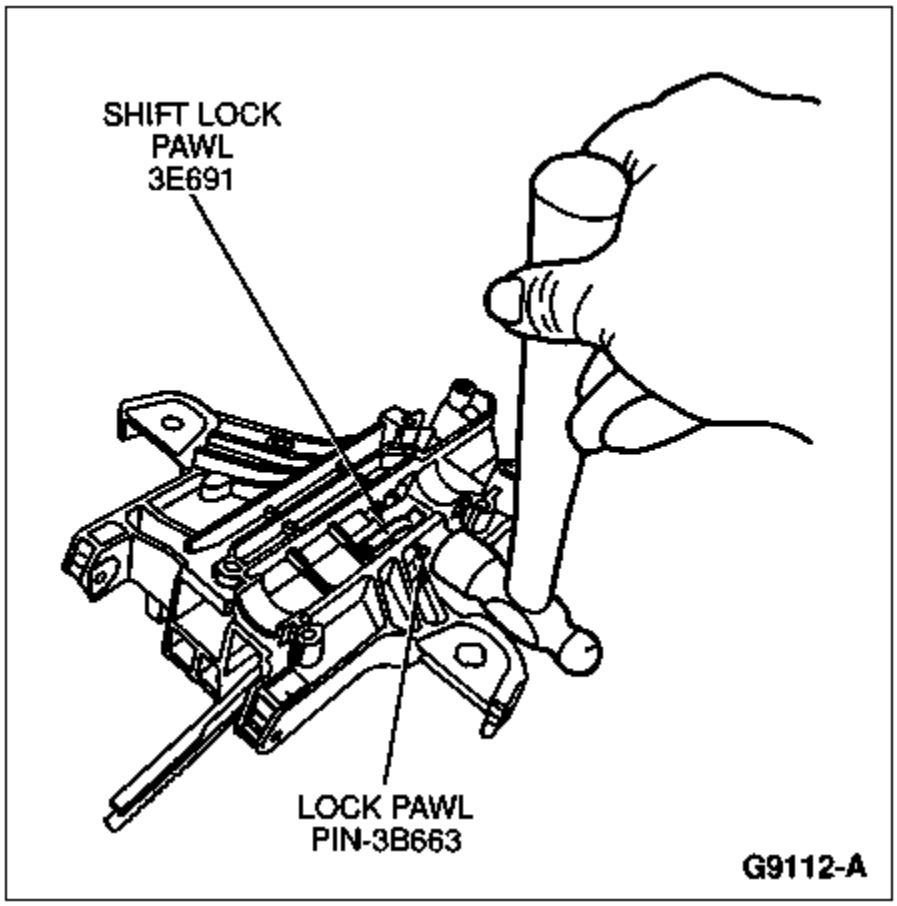
14. On fixed column: install steering column bearing tolerance ring and bearing retainer (3C610).

Suspension Height Sensor Control Ring

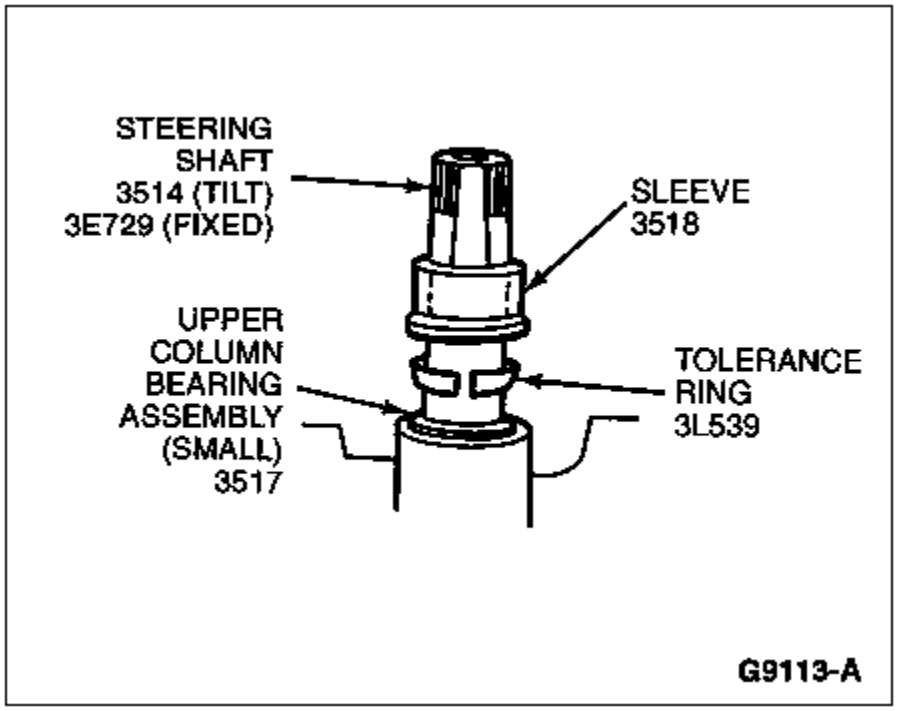


Item	Part Number	Description
1	3524	Steering Gear Column Shaft (Tilt)
2	3E729	Steering Gear Column Shaft (Fixed)
3	3L539	Steering Column Upper Bearing Tolerance Ring
4	3C610	Bearing Retainer (Fixed Only)
5	3520	Steering Column Upper Bearing Spring
6	3C131	Suspension Height Sensor Control Ring

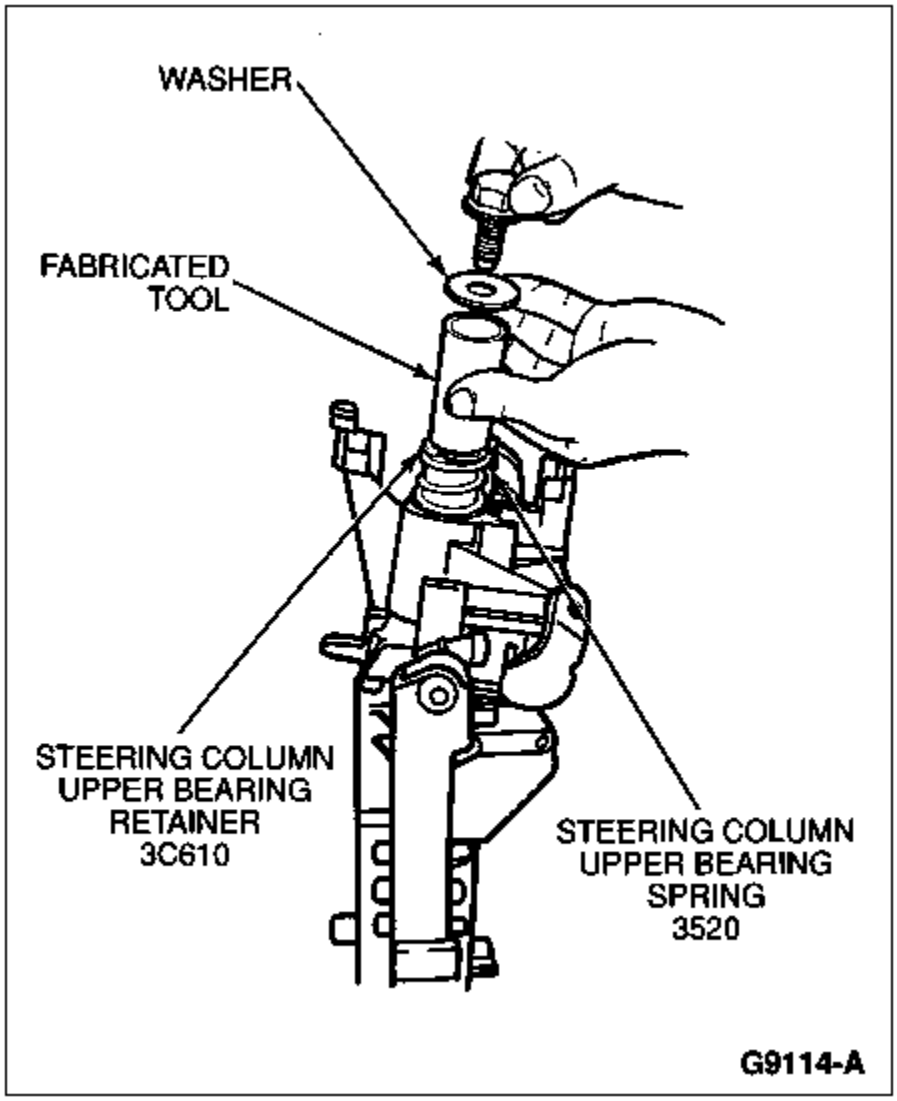
15. Position steering column lock pawl (3E691) in steering actuator housing (3F723) and install steering lock with small hammer. Tap steering lock pawl pin in until flush with steering actuator housing.



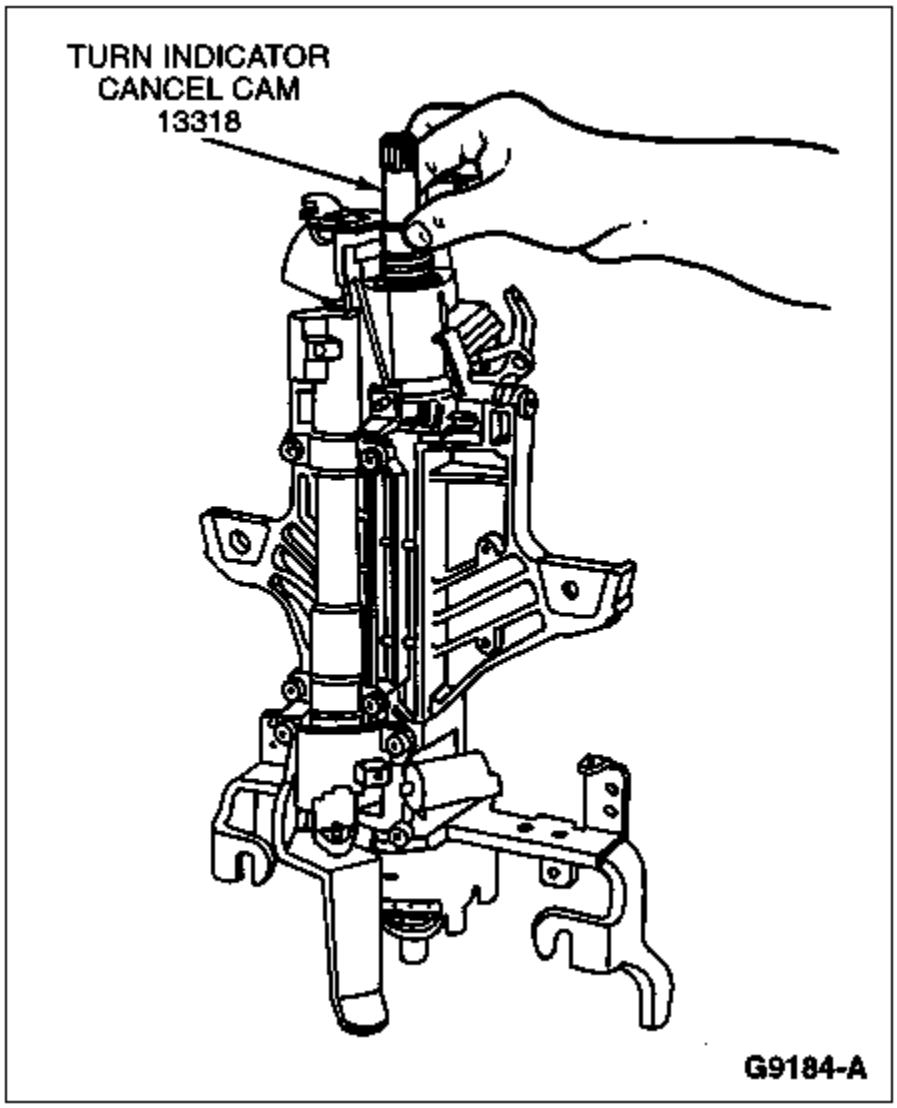
16. Install tolerance ring and sleeve over steering shaft to upper bearing.



17. Install steering column upper bearing spring and new snap ring on top side of steering column upper bearing spring using a 19mm (3/4-inch) I.D. by 63.5mm (2-1/2-inch) long PVC pipe.



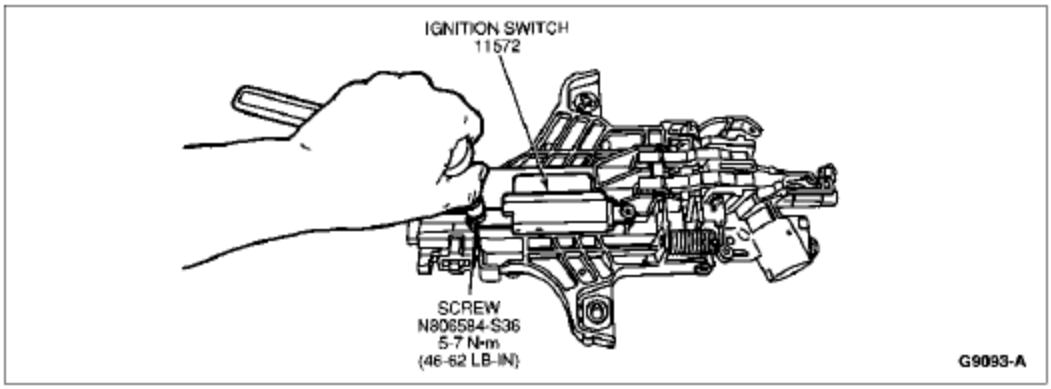
18. Install turn indicator cancel cam, flush surface "up."



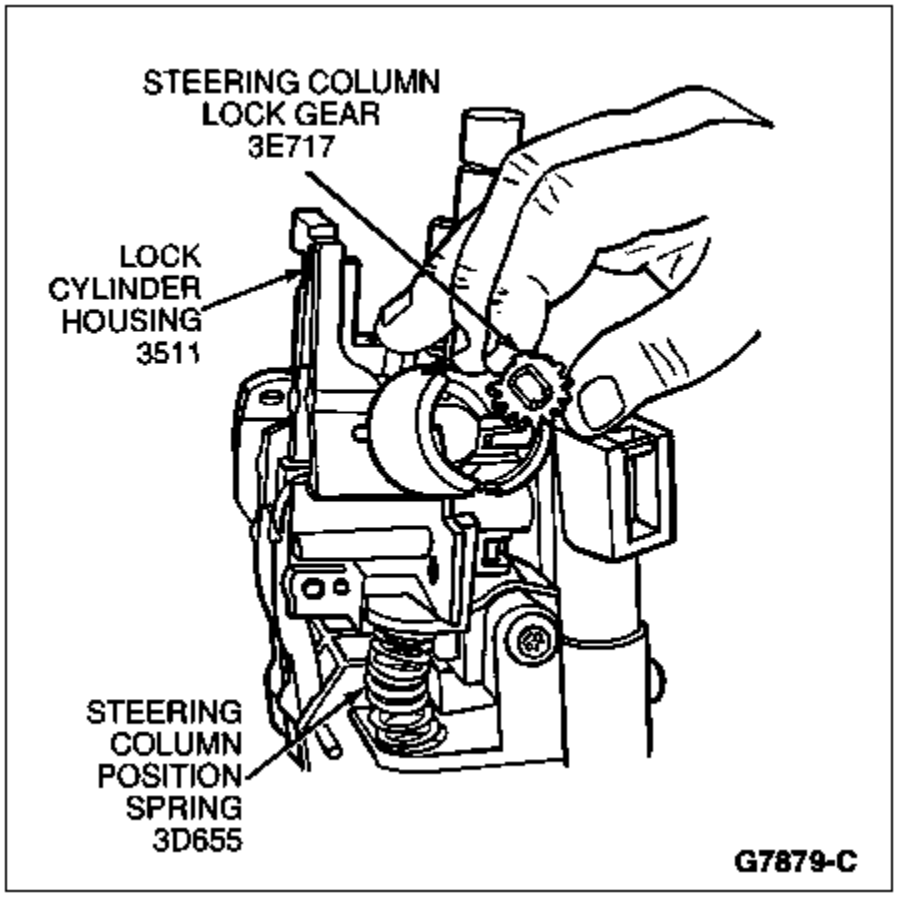
19. Install ignition switch. Align pin from ignition switch with slot in lock/column assembly. Position slot in lock/column assembly with index mark on casting. Ignition switch should be in RUN position.

20. Tighten two retaining screws to 5-7 Nm (46-62 lb-in).

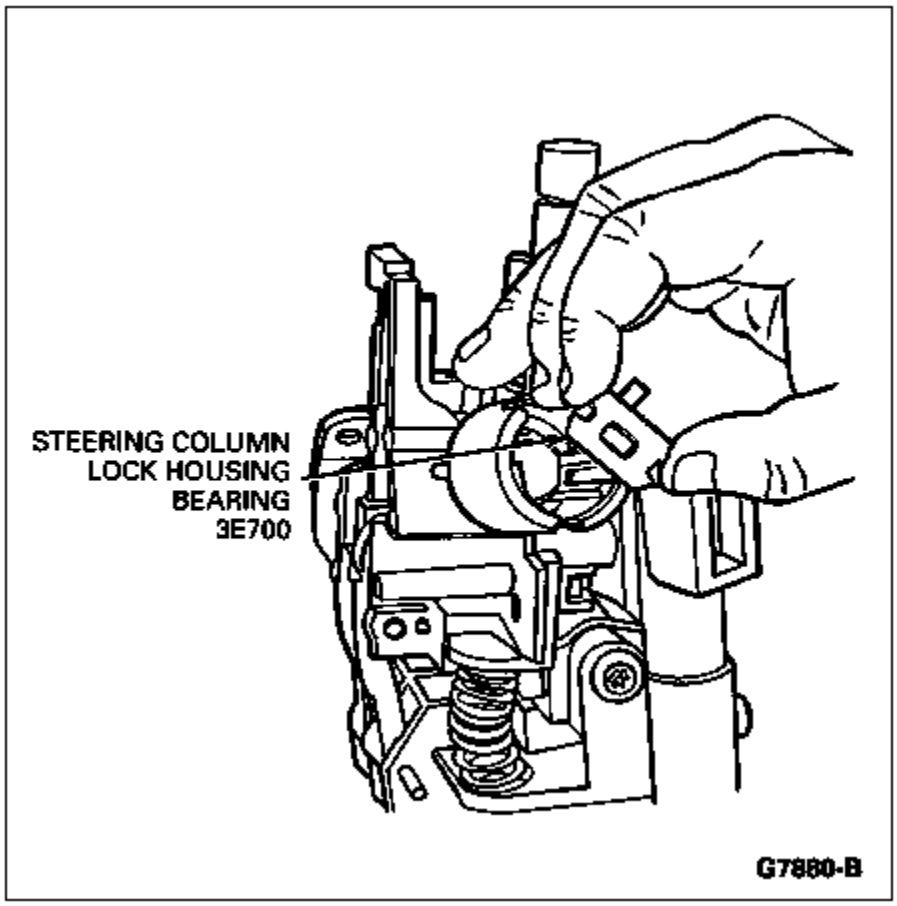
Ignition Switch



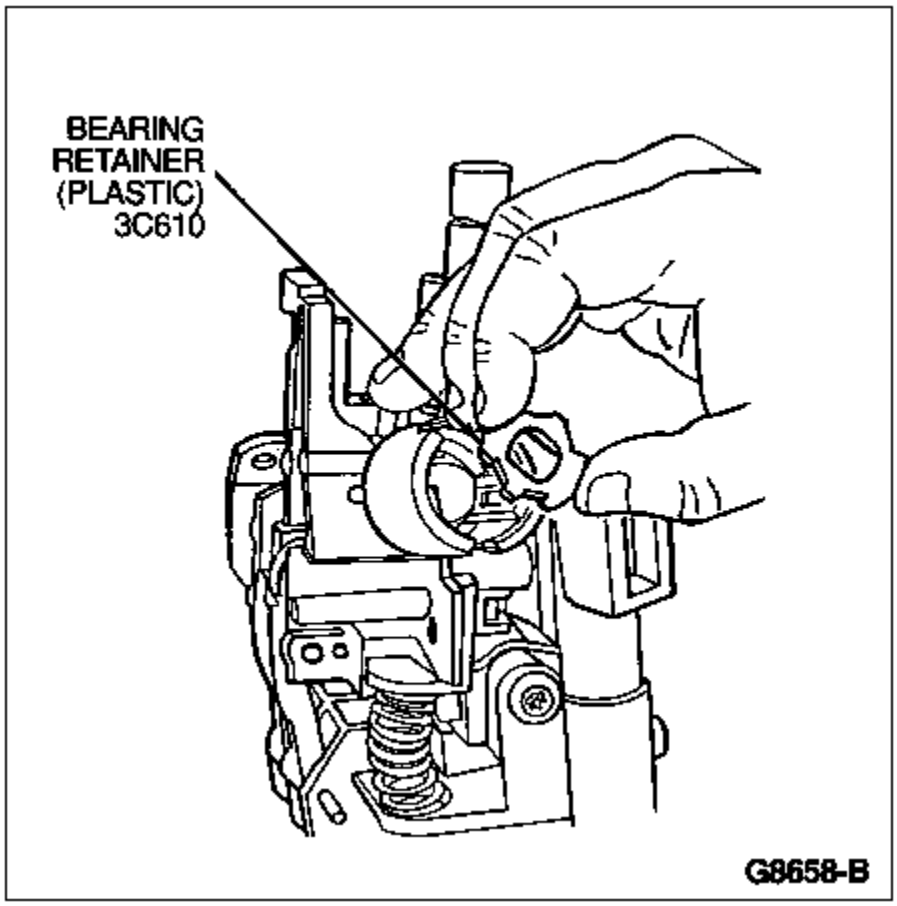
21. Install steering column lock gear. Coat gear with Ignition Lock Grease F0AZ-19584-A or equivalent meeting Ford specification ESA-M1C232-A.



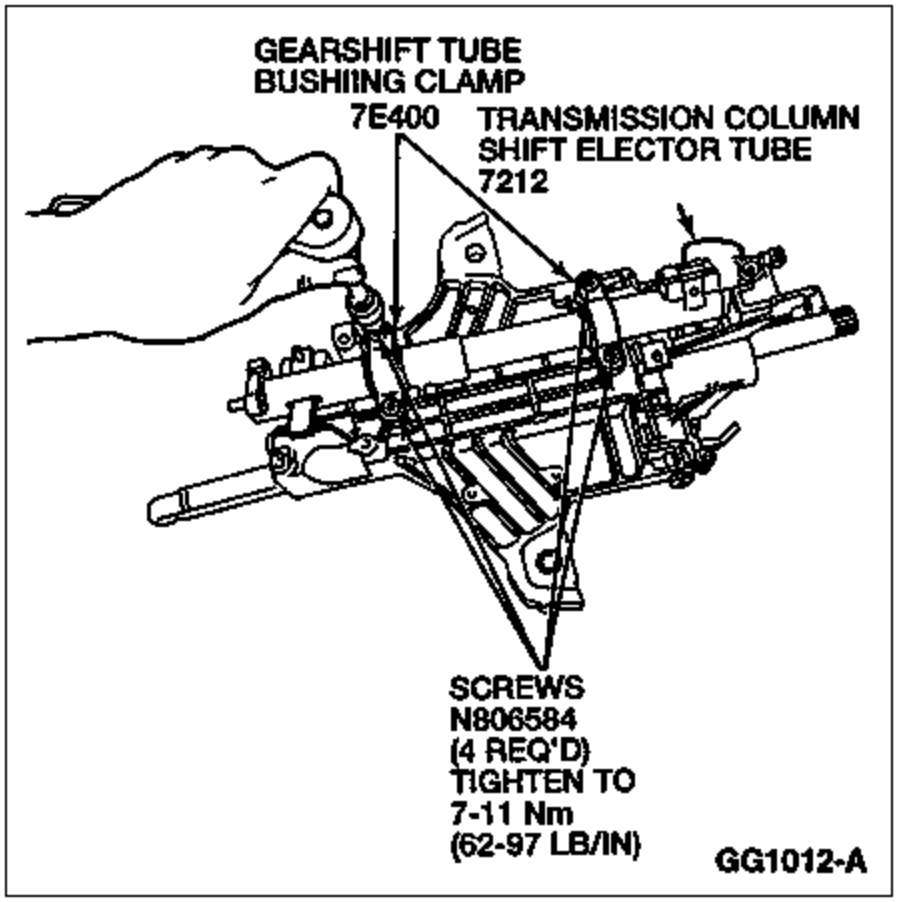
22. Lubricate steering column lock housing bearing. Lubricate with Ignition Lock Grease F0AZ-19584-A or equivalent meeting Ford specification ESA-M1C232-A. With actuator rack in 12 o'clock position, position bearing with tang inboard and in 5 o'clock position in lock cylinder. Insert tip of a screwdriver into double-D slot of bearing, then turn counterclockwise 90 degrees.



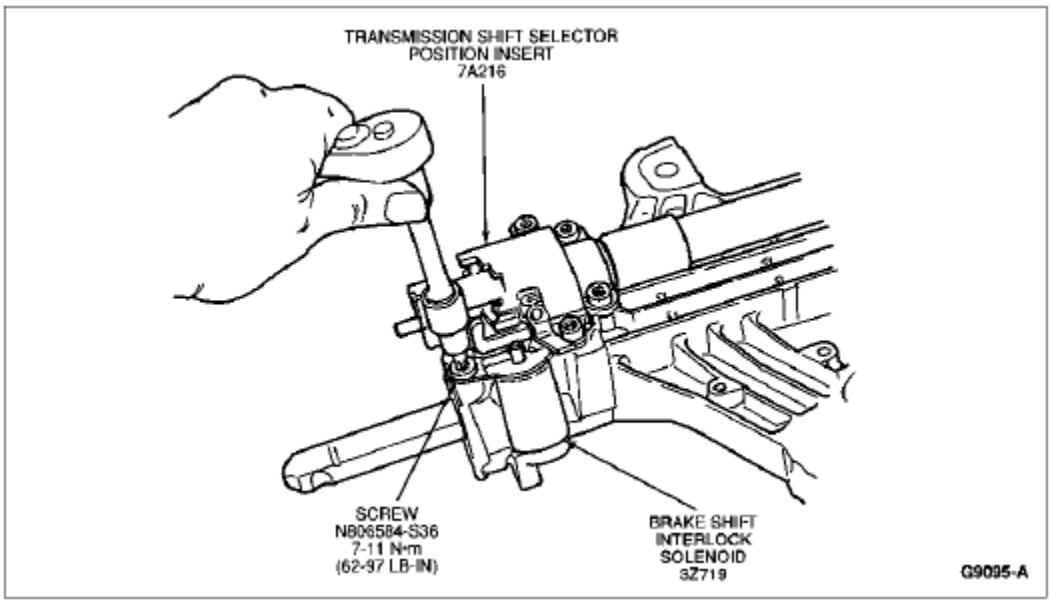
23. Install plastic bearing retainer.



24. Install shift control tube assembly (column shift only). Coat bushings with grease meeting Ford specification ESB-M1C163-C. Tighten screws to 7-11 Nm (62-97 lb/in).



Brake Shift Interlock Solenoid Screws



25. Install transmission shift selector position insert and brake shift interlock solenoid assembly. Tighten screws to 7-11 Nm (62-97 lb-in).

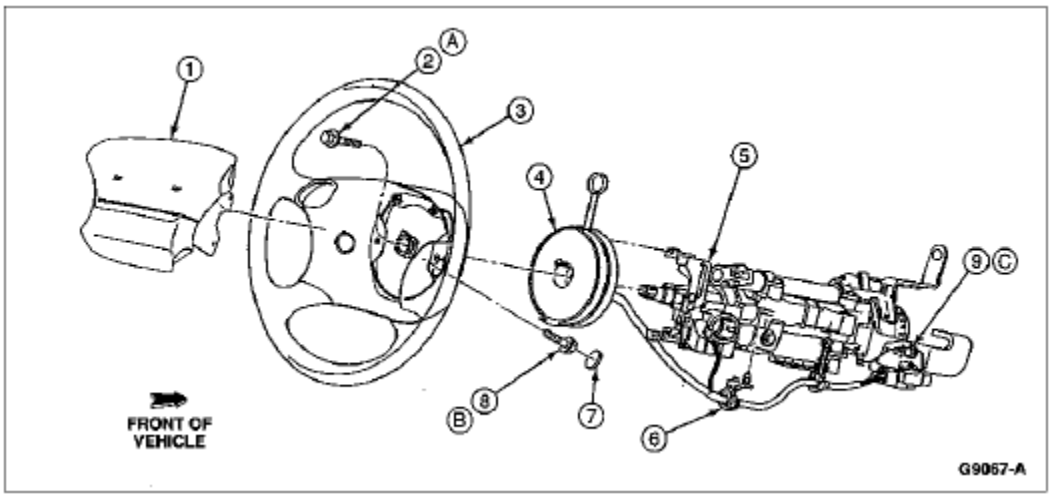
26. Align air bag sliding contact to column shaft and mounting tabs and slide onto shaft. Push on air bag sliding contact to snap three tabs onto lock cylinder housing.

27. Install air bag sliding contact connector retainers into holes in steering column.

28. Install air bag sliding contact retainers into holes in steering column bend bracket.

29. Install key warning chime contact and anti-theft contact into ignition lock cylinder pocket in lock cylinder housing. Make sure contacts do not slip out of ignition lock cylinder pocket.

Steering Wheel with Air Bag



Item	Part Number	Description
1	043B13	Driver Side Air Bag Module
2	N807493-S100	Torx® Head Screw, M10-1.5 x 18
3	3600	Steering Wheel
4	14A664	Air Bag Sliding Contact
5	3C529	Steering Column
6	390345-S424	Clip
7	3F785	Plug
8	N808944-S424	Bolt
9	N805375-S36MG	Bolt
A	—	Tighten to 34-46 Nm (25-33 Lb-Ft)
B	—	Tighten to 7.6-10.4 Nm (67-92 Lb-In)
C	—	Tighten to 10.2-13.8 Nm (7.5-10.1 Lb-Ft)

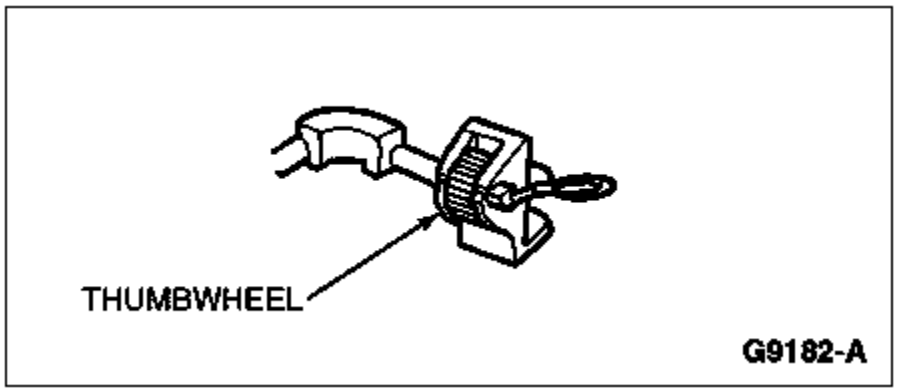
30. Install upper steering column shroud.

31. Push ignition switch lock cylinder into place.
32. Install lower steering column shroud.
33. Screw in tilt wheel handle and shank and tighten on tilt column.
34. Install steering column assembly as outlined in this section.

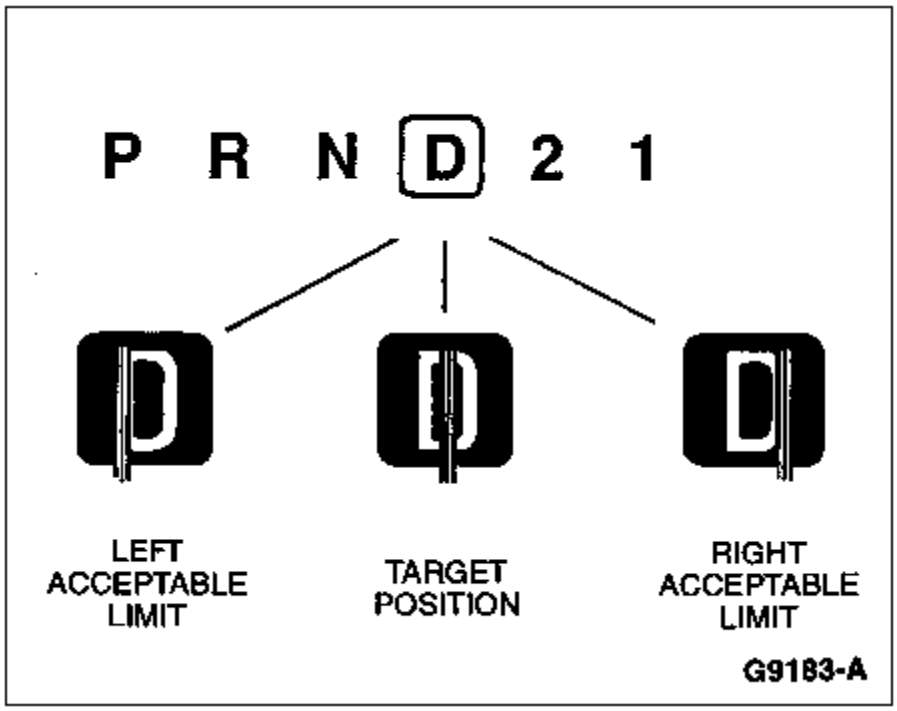
Transmission Range Indicator

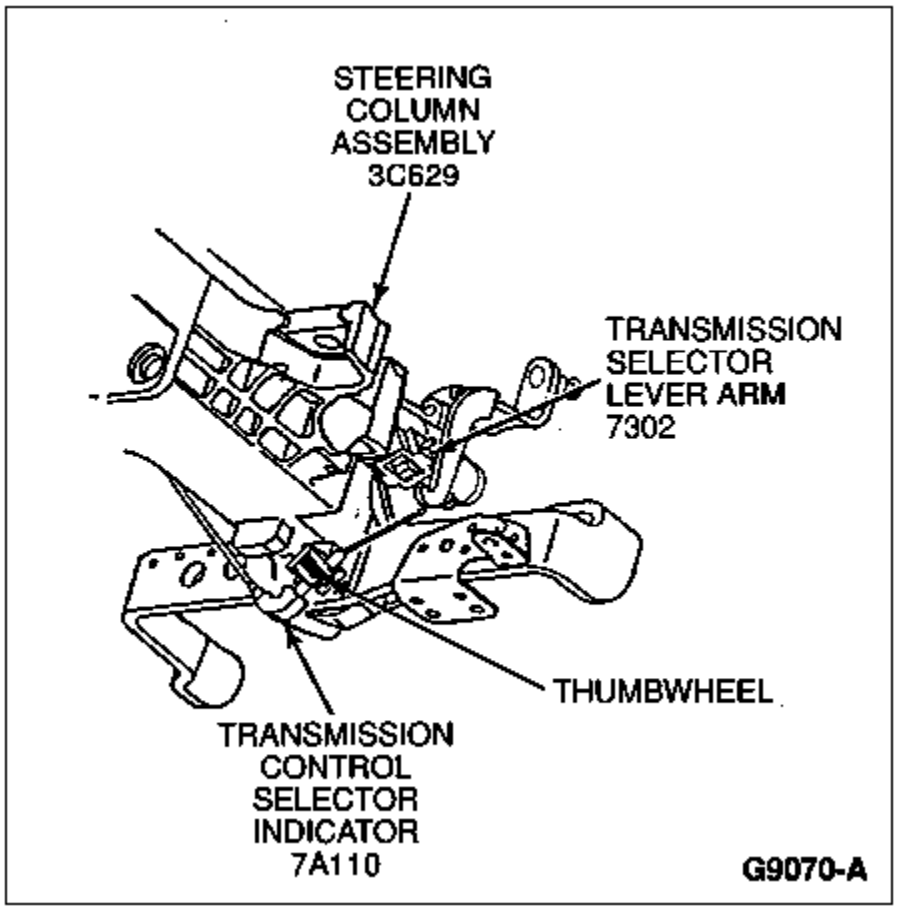
Use the following procedure to adjust the automatic transmission indicator flag:

1. Rotate gearshift lever (7210) clockwise until it bottoms out in first gear.
2. Rotate gearshift lever counterclockwise two detents (overdrive position).
3. Hang a three-pound weight on the gearshift lever.
4. Center pointer in the middle of (D) by rotating the thumbwheel located on right-hand side of steering column.



5. For "flag" type indicator, adjust the flag in the overdrive position by rotating the thumb wheel until no red is visible in the calibration window. The flag must fully cover the overdrive symbol after adjustment.
6. Remove three-pound weight from gearshift lever.





Functional Test

Road test vehicle making sure pointer is positioned as shown when vehicle is operating in indicated range.

Multi-Function Switch

The multi-function switch (13K359) provides electrical switching for the turn signal, headlamp dimmer, headlamp flash-to-pass, hazard warning, windshield washer and windshield wiper. The multi-function switch is mounted on the left side of the steering column.

tomsn048@gmail.com

Turn Signal Switch

The turn indicator lever is located on the LH side of the upper steering column. To operate the turn signal(s), the ignition switch lock cylinder must be in the RUN position. To indicate a normal full turn, move the turn indicator lever to the end-of-travel position for the turn desired. The lever will remain in position without effort until the turn is completed, at which time the turn indicator cancel cam will automatically cancel the turn signal.

The turn indicator lever also has a lane change feature. To operate the lane change feature, move and hold the turn indicator lever to the first stop position when changing lanes. When the lane maneuver is completed, release the turn indicator lever and it will return to its normal position.

tomsn048@gmail.com

Ignition Switch, Blade Type

The ignition switch (11572) has blade-type terminals that engage with one multiple connector. The multiple connector is secured to the ignition switch by an attaching bolt integral with the wiring connector.

The lock cylinder positions are ACC, LOCK, OFF, RUN and START. With column shift automatic transmissions, the lock cylinder key can be removed from the lock cylinder only when the shift lever is in PARK position and the key is in LOCK position. The ACC position operates while the steering and transmission systems remain locked. Turning the key to OFF position shuts off the engine without locking the steering or transmission systems.

tomsn048@gmail.com

Wiper Control Switch, Intermittent

The wiper switch is located in the knob at the end of the turn indicator lever. To operate the wiper, the key lock cylinder must be in the RUN position. In addition to OFF there are two fixed speed wiper positions: LO, (low), HI, (high) and an interval position. The positions are selected by rotating the knob actuator relative to the turn indicator lever. If interval position is selected, the time between wiper cycles will decrease as the knob is rotated away from OFF position and will increase as the knob is rotated toward OFF position. The time interval between wipes will vary depending on the knob's position from OFF position.

tomsn048@gmail.com

Windshield Washer Switch

The washer switch is located at the end of the turn indicator lever. To operate the washer, the ignition switch lock cylinder must be in the RUN position. To actuate the washer, push the end of the turn indicator lever toward the steering column. Releasing the turn indicator lever will then turn off the washer. The windshield wiper blades will continue to operate for a few wipes and then automatically return to the wiper speed setting (OFF, LO, HI, INT) previously selected. Washer operation is available in all positions of wiper operation.

tomsn048@gmail.com

High Beam/Flash-to-Pass Switch

NOTE: Excessive force used to hold the turn indicator lever in the flash-to-pass function followed by quick release may result in incorrect headlamp dimmer selection of high beam. The driver must be cautioned to avoid this condition.

The turn indicator lever also operates the headlamp dimmer switch and the flash-to-pass feature. High beam is selected by pushing the turn indicator lever away from the driver to the STOP position.

To change the headlamp beam back, pull turn indicator lever toward driver until the switch is in the central position.

To operate the flash-to-pass feature, pull the turn indicator lever gently toward the driver. When the lever is released, it will return to the LO beam position. If driving without headlamps on, use of the flash-to-pass feature will turn on the high beams until the turn signal lever is released. If the headlamps are turned on, the low and high beams will be on until the turn signal lever is released.

NOTE: Excessive force used to hold the turn indicator lever in the flash-to-pass function followed by quick release may result in incorrect headlamp dimmer selection of high beam. The driver must be cautioned to avoid this condition.

Steering Column Switches, Aerostar

tomsn048@gmail.com

Hazard Flasher Switch

The hazard flasher system operates independently from the ignition switch lock cylinder. All turn signal lamps can be made to flash in unison by depressing and releasing the hazard actuation knob located on the steering column. The switch is identified by a "double triangle" symbol.

The actuator will move out or away from the steering column to the ON position. The hazard flasher system is turned off by first pushing in the actuator and then releasing the actuator. The actuator should remain in or toward the steering column in the OFF position.

NOTE: The turn signal system is deactivated when the hazard flasher system is on and turn indicator lever motion does not affect the hazard flasher system.

tomsn048@gmail.com

Brake-Shift Interlock Switch

The brake-shift interlock switch (used on automatic transmission-equipped vehicles) prevents moving the shift lever out of PARK position unless brake pedal is depressed.

The brake-shift interlock system consists of an electrical solenoid mounted at the base of the steering column. If the ignition key is in the run position, the solenoid continually runs unless the brake is depressed.

SUMMARY OF INTERLOCK OPERATIONAL STATUS

Ignition Switch Position	Ignition Interlock Shift Lever and Steering Wheel	Brake-Shift Interlock Status
Accessory	Locked	Shift Unlocked — No Power to Solenoid
Locked	Locked	Shift Unlocked — No Power to Solenoid
Off	Unlocked	Shift Unlocked — No Power to Solenoid
Run	Unlocked	Shift Locked (Unless Brake Pedal Is Depressed) — Power to Solenoid

If the brake circuit fuse is blown or the solenoid has internally shorted, the vehicle will not shift from the PARK position even if the ignition is on and brake pedal is depressed. The interlock can be temporarily overridden by the following procedure:

1. Apply parking brake.
2. Remove the ignition key.
3. Insert the ignition key and rotate one position clockwise (ignition off).
4. Shift the selector lever to NEUTRAL.
5. Start the vehicle.

If the vehicle is shifted into PARK, the above procedure must be repeated.

Symptom Chart — Ignition Switch Electrical Diagnosis

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

IGNITION SWITCH ELECTRICAL DIAGNOSIS

Condition	Possible Source	Action
• Ignition Switch Inoperative	• Main fuse in power distribution box is blown. • Short circuit in wiring.	• GO to Pinpoint Test A.
• No Power in ACC or RUN Position	• Fuse blown in I/P fuse panel. • Internal open circuit in ignition switch.	• GO to Pinpoint Test B.
• No Power in Start Position	• Fuses blown in I/P fuse panel. • Internal open circuit in ignition switch.	• GO to Pinpoint Test C.
• Multi-Function Switch Does Not Operate	• Turn signal cancel cam damaged. • Damaged hazard switch. • Damaged high beam and flash-to-pass switch. • Damaged wiper switch.	• GO to Pinpoint Test D.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: IGNITION SWITCH INOPERATIVE

A1 CHECK CIRCUIT PROTECTION

- On Aerostar vehicles, check for open fuse link B. On Ranger vehicles, check for open fuse 1 in power distribution box.

Is fuse link/fuse OK?

Yes	No
GO to **A2** .	REPLACE fuse link/fuse. REPEAT **A1** .

A2 CHECK POWER FEED

- Locate and disconnect the ignition switch connector.
- Measure the voltage between Circuit 37 (Y) on the wiring harness side and a known good ground.

Is the voltage 10 volts or greater?

Yes	No
REPLACE ignition switch.	REPAIR open in Circuit 37.

PINPOINT TEST B: NO POWER IN ACC OR RUN POSITION

B1 IGNITION SWITCH CONTINUITY CHECK

- Check ignition switch continuity. Refer to Component Tests in this section.

Did ignition switch pass continuity check?

Yes	No
REPAIR open in circuit from ignition switch to affected components.	REPLACE ignition switch.

tomsn048@gmail.com

PINPOINT TEST C: NO POWER IN START POSITION

C1 CIRCUIT PROTECTION

- If vehicle is an Aerostar, go to C2 .
- On Ranger, check fuse 15 in instrument panel fuse panel.

Is fuse OK?

Yes	No
GO to **C2** .	REPLACE fuse. If fuse opens again, REPAIR short to ground in Circuit 32.

C2 STARTER CIRCUIT FROM IGNITION SWITCH

- While holding ignition switch in START position, check for battery voltage at ST Circuit 33 (W/PK Aerostar; R/LB Ranger).

Is battery voltage present?

Yes	No
REFER to starter system diagnosis in Section 03-06 .	REPLACE ignition switch.

PINPOINT TEST D: MULTI-FUNCTION SWITCH DOES NOT OPERATE

D1 CHECK TURN SIGNAL LEVER POSITIONS

- Turn ignition switch to RUN position.
- Check turn signal lever in the RH and LH turn positions with steering wheel locked in the straight-ahead position. Lock the lever in position for each.
- Check lever by slightly holding it in the RH and LH turn positions. When releasing, observe whether lever springs back to normal position.
- Road test vehicle and observe turn signals for RH and LH turn positions while manually turning steering wheel for each position. Verify lever cancels when steering returns from desired turn position.

Does turn signal lever operate properly?

Yes	No
GO to **D2** .	If lever will not cancel, CHECK steering wheel cancel cam for damage. If lever is worn or damaged, REPLACE multi-function switch.

tomsn048@gmail.com

D2 CHECK HAZARD SWITCH

- Fully press hazard switch and release to turn on warning lamps. Verify switch operation. Fully press switch and release to turn off warning lamps. Verify switch operation.

Does hazard switch operate properly?

Yes	No
GO to **D3** .	If switch is worn or damaged, REPLACE.

D3 CHECK HIGH BEAM AND FLASH-TO-PASS

- Turn on headlamp bulbs.
- Press multi-function switch lever toward instrument panel to STOP position. Release lever. Verify high beams.
- Move lever back toward seat. Release lever. Verify low beams.
- Pull lever toward driver seat gently to flash-to-pass. Hold position. Verify both high and low beams are on. Release lever. Verify low beams.
- Turn off headlamp bulbs.
- Pull lever to flash-to-pass again and hold. Verify high beams come on. Release lever. Verify headlamp bulbs are off.

Does high beam, low beam and flash-to-pass operate?

Yes	No
GO to **D4** .	If lever is worn or damaged, REPLACE multi-function switch. If lamps are not lighting properly, CHECK lamps and lamp circuitry.

D4 CHECK WINDSHIELD WIPER AND WASH

- Rotate windshield wiper switch to low, high and interval positions. Verify rotation of switch and wiper operation. Turn switch to OFF position. Verify that switch rotates to OFF and wipers stop operation.
- Push the end of the switch in toward center of steering column to WASH position. Release WASH position. Verify wipers operate for a few wipes and return to OFF.
- Operate WASH in all speeds of wiper switch. Verify wipers return to selected speed after releasing from WASH position.

Does the windshield wiper switch and WASH operate properly?

Yes	No
Multi-function switch operates.	If switch or lever is worn or damaged, REPLACE multi-function switch.

tomsn048@gmail.com

tomsn048@gmail.com

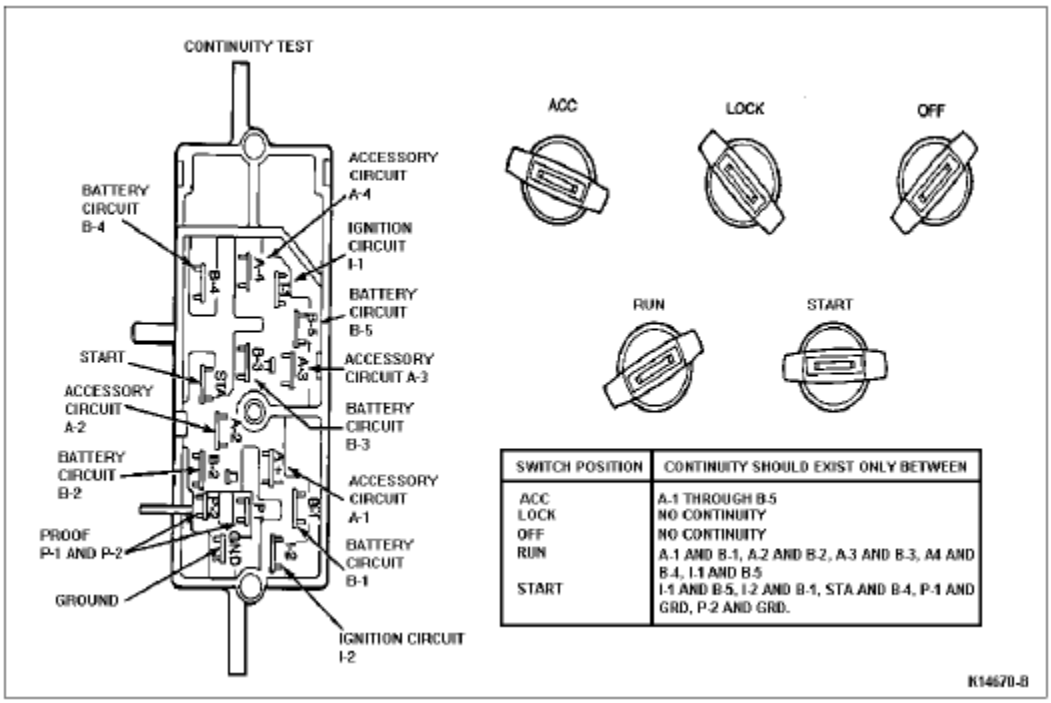
Component Tests

Ignition Switch Continuity Test

Disconnect the multiple connector from the ignition switch (11572). Test the ignition switch continuity as described in the following illustration. Connect a continuity tester or ohmmeter, such as Rotunda 73 Digital Multimeter 105-R0051 or equivalent, between the blade terminals indicated on the chart in the illustration.

For an "engine won't crank" condition, determine if the condition exists with the vehicle in the park and neutral position, (automatic transmission) or with the clutch pedal depressed (manual transmission). If the "no-crank" condition continues to occur, the transmission range sensor (automatic) or the clutch pedal position switch (CPP) (11A152) (manual) may be at fault.

Ignition Switch Continuity Test, Ranger and Aerostar



SWITCH POSITION	CONTINUITY SHOULD EXIST ONLY BETWEEN
ACC	A-1 THROUGH B-5
LOCK	NO CONTINUITY
OFF	NO CONTINUITY
RUN	A-1 AND B-1, A-2 AND B-2, A-3 AND B-3, A-4 AND B-4, I-1 AND B-5
START	I-1 AND B-5, I-2 AND B-1, STA AND B-4, P-1 AND GRD, P-2 AND GRD.

Ignition Switch Mechanical Test, Ranger and Aerostar

Test the mechanical operation of ignition switch by rotating ignition switch lock cylinder through all switch positions. The movement should feel smooth with no sticking or binding. The ignition switch should return from the START position back to the RUN position without assistance (spring return). If sticking or binding is encountered, check for the following:

- Burrs on the lock cylinder key

tomsn048@gmail.com

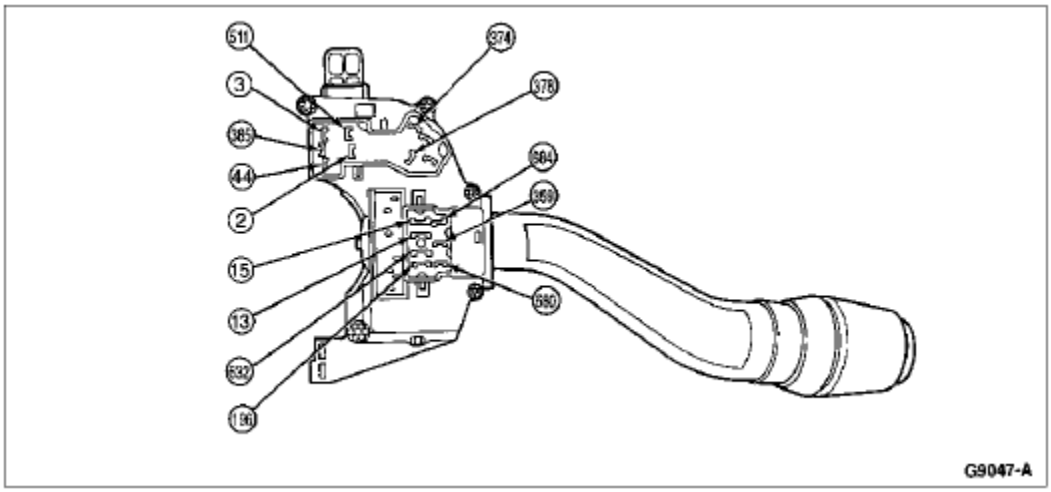
- Binding lock cylinder
- Shroud rubbing against lock cylinder
- Burrs or foreign material around the rack-and-pinion actuator in the lock cylinder housing
- Insufficient lube on actuator. (DO NOT apply lubricant to the inside of ignition switch)
- Binding ignition switch

Multi-Function Switch Continuity Test

Testing for electrical malfunctions can be accomplished using a continuity tester or ohmmeter such as Rotunda 73 Digital Multimeter 105-R0051, or equivalent.

Prior to testing, make sure hazard knob is pushed in fully to the OFF position. Disconnect the connector from the multi-function switch (13K359) and perform the following continuity checks.

Multi-Function Switch, Ranger



Circuit No.	Description
2	Turn Signal Lamps (RH)
3	Turn Signal Lamps (LH)
378	Trailer Park/Turn Relay (If Equipped) (RH)
374	Trailer Park/Turn Relay (If Equipped) (LH)

tomsn048@gmail.com

Multi-Function Switch

NOTE: Wiring for the multi-function switch (13K359) is routed under the PRNDL cable.

Removal

1. Disconnect battery ground cable (14301).
2. Remove the steering column shroud as described in Section 11-04B or Section 11-04A .
3. Remove two screws attaching the multi-function switch to the steering column casting. Disengage multi-function switch from casting.
4. On Ranger, disconnect the three electrical connectors, using caution not to damage the locking tabs. Do not damage the PRNDL cable. On Aerostar, disconnect the two electrical connections. Do not damage locking tabs.

Installation

1. On Ranger, install the three switch electrical connectors to full engagement. On Aerostar, install the two electrical connectors to full engagement.
2. Align the multi-function switch mounting holes with the holes in the steering column casting.
3. Install two self-tapping screws making sure to start the screws in the previously tapped holes. Tighten to 2-3 Nm (18-27 lb-in).
4. For automatic transmission, verify that the PRNDL adjustment is correct.
5. Install the steering column shroud as described in Section 11-04B or Section 11-04A .
6. Connect the battery ground cable.
7. Check the steering column for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

Ignition Switch

Ranger/Aerostar

1. Disconnect battery negative cable.
2. Remove attaching screws (2) and instrument panel steering column cover.
3. Remove attaching screws (4) and instrument panel reinforcement plate.
4. If equipped with an automatic transmission, remove PRND12 indicator cable attaching screw.
5. Remove steering column to brake pedal support bracket attaching screws (2).
6. Lower column until steering wheel rests on driver's seat.
7. Remove ignition switch attaching screws.
8. Disconnect wiring and remove ignition switch.

To install ignition switch, reverse removal procedure.

tomsn048@gmail.com

Flasher, Indicator

NOTE: When replacing the indicator flasher, make sure to install one having the same color-code and number as the one removed.

NOTE: Do not replace multi-function switch or wiring if:

- Turn signal lamps do not flash on demand with ignition key turned on, or
- Indicator flasher makes normal pulsing noise, or
- Turn signal lamps prove satisfactory when bench-tested or checked by activating brake stoplamp switch for rear only.

Removal and Installation

To remove the indicator flasher, grasp indicator flasher and pull straight out. To replace flasher, align indicator flasher terminals to connector and push straight in.

1. Check the power at indicator flasher output terminal (pulsing noise indicates power is coming into the indicator flasher).

2. If there is **no or very weak power** at the indicator flasher output terminal (12-volt test lamp will not light or is dim), **replace the indicator flasher.**

tomsn048@gmail.com

Brake-Shift Interlock Switch

Removal

1. Remove steering column as described in Section 11-04A or Section 11-04B .
2. Unclip wire terminal from solenoid.
3. Remove insert plate and solenoid by removing three retaining screws.
4. Pry off clip.

Installation

NOTE: The clip which retains the solenoid to the insert plate should not be replaced for service. The clip's sole purpose is an assembly aid for the assembly plant.

1. Position insert plate/solenoid assembly to the steering column and tighten the screws.
2. Install the steering column in the vehicle as described in Section 11-04A or Section 11-04B .

tomsn048@gmail.com

Ignition Switch

1. Install ignition switch (11572).
2. Align pin from switch with slot in lock/column assembly.
3. Position slot in lock/column assembly with index mark on casting. Ignition switch should be in RUN position.
4. Tighten two screws to 5.3-7.2 Nm (50-63 lb-in).

tomsn048@gmail.com

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	Lb-In
Multi-Function Switch Screws	2-3	18-27

Climate Control System

This section provides some basic principles and covers some of the service procedures which apply to all compact truck air conditioning systems. In sequence, the text deals with principles, diagnosis and testing procedures, and finally those unique procedures that apply to servicing the refrigerant system.

Immediately following coverage of basic principles, the text provides a diagram of the major components in a refrigerant system. The text continues after the diagram with a detailed description of each major component.

Automotive air conditioning is a process which uses an electro-mechanical system to apply those scientific principles which work together to produce a desirable comfort level in the passenger compartment of a vehicle. These principles are Heat Transfer, Latent Heat of Vaporization, the Effects of Pressure and Temperature Changes and the effects of Relative Humidity. The text which follows highlights the content of these principles.

tomsn048@gmail.com

Heat Transfer

If two substances of different temperature are placed near each other, the heat in the warmer substance will always travel to the colder substance until both are of equal temperature. For example, a cake of ice in an ice box does not communicate its coldness to the bottle of milk standing nearby. Rather, the heat in the warm milk automatically flows into the ice.

To determine the amount of heat that transfers from one substance to another, we use the British Thermal Unit or BTU. One BTU is the amount of heat required to raise the temperature of one pound of water -17.2° C (1℉). For example, to raise the temperature of o ne pound of water from 0℃ (32℉) to 100°C (212℉) , one BTU of heat must be added for each degree rise in temperature or a total of 180 BTUs of heat. Conversely, in order to lower the temperature of one pound of water from 100°C (212℉) to 0℃ (32°F) , 180 BTUs of heat must be removed from the water.

tomsn048@gmail.com

Latent Heat of Vaporization

When a liquid boils (changes to a gas) it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (changes back to a liquid) it gives off heat without lowering the temperature of the resulting liquid.

For example, place one pound of water at 0°C (32°F) in a container over a flame. With each BTU of heat that the water absorbs from the flame, its temperature rises -17.2°C (1°F). Thus, after it has absorbed 180 BTUs of heat, the water reaches a temperature of 100°C (212°F). Even though the flame continues to give its heat to the water, the temperature of the water remains at 100°C (212°F). The water, however, starts to boil or change from the liquid to the gaseous state. It continues to boil until the water has passed off into the atmosphere as vapor. If this vapor were checked with a thermometer, it also would show a temperature of 100°C (212°F). In other words, there was a rise of only 82.2°C (180°F) [from 0-100 (from 32 to 212)] in the water and vapor temperature even though the flame applied many more than 180 BTUs of heat. In this case, the heat is absorbed by the liquid in the process of boiling and disappears in the vapor. If the vapor were brought in contact with cool air, the hidden heat would flow into the cooler air as the vapor condensed back to water. Scientists refer to this natural law as the latent (hidden) heat of vaporization.

Water has a latent heat of vaporization of 970 BTUs and a boiling point of 100°C (212°F). This means that one pound of water at 100°C (212°F) will absorb 970 BTU's of heat in changing to vapor at 100°C (212°F). Conversely, the vapor will give off 970 BTUs of heat in condensing back to water at 100°C (212°F).

This tremendous heat transfer that occurs when a liquid boils or a vapor condenses forms the basic principle of all conventional refrigeration systems.

For a liquid to be a refrigerant, it must also have a low boiling point. That is, the temperature at which it boils must be lower than the substance to be cooled. Refrigerant-134a is the liquid most commonly used in automotive air conditioning systems because in an open container it boils at -26.2°C (-15.1°F). Here is a liquid that boils or vaporizes well below passenger compartment temperatures and, in vaporizing, will absorb tremendous amounts of heat without getting any warmer itself.

tomsn048@gmail.com

Effect of Pressure on Boiling or Condensation

As refrigerant passes through an air conditioning system, it flows under high-pressure conditions, first as a high-pressure vapor between the compressor and A/C condenser core (19712), then, as a high-pressure liquid between the A/C condenser core and the A/C evaporator core orifice (19D990). It is converted to a low-pressure system between the A/C evaporator core orifice and the refrigerant return port in the A/C compressor (19703). As pressures in the closed refrigerant circuit vary, temperatures will also vary. As pressures increase, temperatures also increase; as they decrease, temperatures also decrease.

tomsn048@gmail.com

Safety Precautions

The refrigerant R-134a is a hydrofluorocarbon refrigerant. R-134a is noncorrosive, nonexplosive, nonflammable and has a slight ether-like odor. R-134a is heavier than air. Although it is classified as a safe refrigerant, certain precautions must be observed to protect the parts involved and the person working on the unit.

Use only R-134a refrigerant. Due to environmental concerns, when the air conditioning system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. R-134a must never be removed without the appropriate equipment or released into the atmosphere. Use of a recovery machine dedicated for R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the air conditioning system.

Avoid breathing A/C refrigerant and lubricant vapor or mist. If accidental system discharge occurs, ventilate the work area before resuming service.

Liquid R-134a, at normal atmospheric pressures and temperatures, evaporates so quickly that it has the tendency to freeze anything it contacts. For this reason, **be very careful to prevent any liquid refrigerant from coming in contact with the skin and especially the eyes. Should any liquid refrigerant get into the eyes or on the skin, immediately flush eyes and skin with plenty of water for at least 15 minutes. Remove contaminated clothing and shoes. Call a physician.**

Refrigerant R-134a is always under pressure. Because the system is tightly sealed, heat applied to any part could cause this pressure to build up excessively. **To avoid a dangerous explosion, keep away from open flames, glowing metal surfaces, blow torch, steam cleaning and welding.**

Make sure that containers are never heated to over 52°C (125°F). Containers should be stored and installed in accordance with all state and local ordinances.

When admitting R-134a into the refrigerant system, always keep the tank in an upright position. If the tank is on its side or upside down, liquid R-134a will enter the system and may damage the compressor.

Refrigerant R-134a should not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.

tomsn048@gmail.com

tomsn048@gmail.com

Service Precautions

Observe the following service precautions.

1. Never open or loosen a connection before discharging the system.
2. When loosening a connection, if any residual pressure is evident, allow it to leak off before opening the fitting.
3. Evacuate a system which has been opened to replace a component or one which has discharged through leakage before charging.
4. Seal open fittings with a cap or plug immediately after disconnecting a component from the system.
5. Clean the outside of the fittings thoroughly before disconnecting a component from the system.
6. Do not remove the sealing caps from a replacement component until ready to install.
7. Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil only in a clean, moisture-free container.
8. Install a new seal ring before connecting an open fitting. Coat the fitting and seal with refrigerant oil before connecting.
9. When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges which may chafe the line.
10. Tighten fittings only to specifications. The steel and aluminum fittings used in the refrigeration system will not tolerate over-tightening.
11. When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.
12. Do not open a refrigerant system or uncap a replacement component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component which is cooler than the surrounding air.
13. Keep service tools and the work area clean to avoid contamination of a refrigerant system.

tomsn048@gmail.com

tomsn048@gmail.com

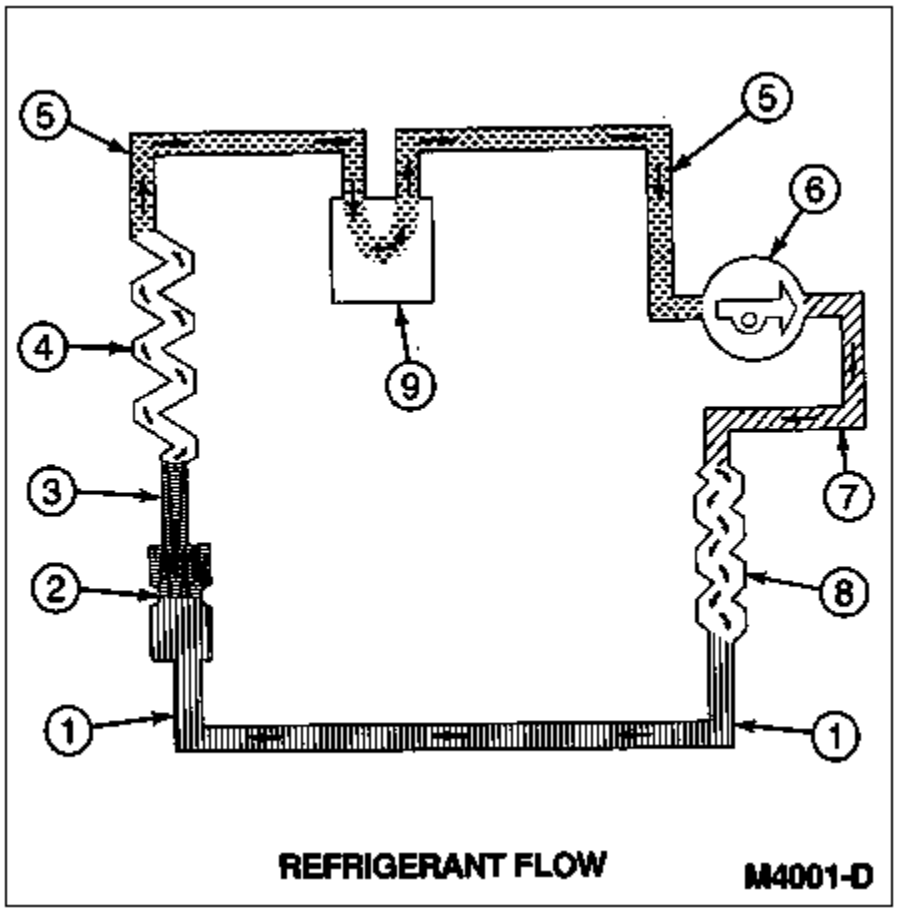
A/C Refrigerant System Operation

Refrigerant Flow

During stabilized conditions (air conditioning system shutdown), refrigerant system pressures are equalized on both the high and low pressure sides of the system.

When the blower motor (18527) is on and the function selector lever is in any air conditioner position, the A/C clutch field coil (2987) is energized and the clutch plate is pulled into contact with the compressor clutch pulley. The clutch plate and hub assembly then rotates the compressor shaft.

When the compressor shaft is rotated, the pistons are alternately moved back and forth with respect to their cylinder bores. As each piston is pulled through its cylinder bore, the pressure in the cylinder suddenly reduces to a pressure (or vacuum) considerably lower than the refrigerant vapor pressure on the suction side of the refrigerant system. The higher refrigerant system vapor pressure overcomes the suction reed valve spring pressure, forcing itself through the reed valve and into the lower pressure (or vacuum) area inside the compressor cylinder. The spring pressure on the reed valve closes the valve when the refrigerant system suction vapor pressure and the compressor cylinder vapor pressure are equalized.



tomsn048@gmail.com

Item	Part Number	Description
1	—	High Pressure Liquid
2	19D990	A/C Evaporator Core Orifice (Creates Restriction)
3	—	Low Pressure Liquid
4	19860	A/C Evaporator Core
5	—	Low Pressure Vapor
6	19703	A/C Compressor
7	—	High Pressure Vapor
8	19712	A/C Condenser Core
9	19C836	Suction Accumulator/Drier

As each piston is forced into its respective cylinder bore, the refrigerant vapors from the suction side of the refrigerant system are compressed into a decreasingly smaller area, thus increasing the refrigerant vapor pressure and also raising the refrigerant vapor temperature. The higher refrigerant vapor pressure now assists in sealing the suction reed valve closed and also opens the discharge (high pressure) reed valve as the cylinder pressure exceeds the higher pressure side of the refrigerant system. When the compressed higher pressure and temperature refrigerant vapor is discharged into the high pressure side of the refrigerant system, the discharge reed valve spring pressure and the high side refrigerant pressure closes and seals the reed valve, thus preventing the discharge gas from entering the compressor cylinder. The compressor's refrigerant vapor compression cycle then begins again.

The high pressure and high temperature compressor discharge refrigerant gas is released into the top of the A/C condenser core (19712), via the compressor's discharge hose. The A/C condenser core, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing of the A/C condenser core.

Liquid refrigerant from the A/C condenser core exits from the bottom of the A/C condenser core and enters the high pressure liquid line and then the inlet side of the A/C condenser core. The inlet filter screen of the A/C evaporator core orifice (19D990) removes coarse contaminant particulates, which may be present in the liquid refrigerant, before the liquid refrigerant enters the calibrated opening of the A/C evaporator core orifice. The outlet end of the A/C evaporator core orifice has a fine mesh filter with four open side slots in the body, upstream from the filter. This filter removes fine contaminants and causes some of the refrigerant to exit through the non-filtered side slots. The side slots and filter act as a refrigerant flow noise suppressor.

Pressure in the A/C evaporator core (19860) is reduced as a result of the restriction at the A/C evaporator core orifice. The pressure is lowered and the liquid refrigerant passes through the A/C evaporator core orifice and enters the A/C evaporator core at a low pressure and as a cold liquid. As airflow passes over the plate/fin sections of the A/C evaporator core, the refrigerant inside absorbs the heat and changes into a vapor.

Compressor suction draws the vaporized refrigerant and oil mixture into the suction accumulator/drier (19C836) where the heavier oil-laden vapors fall to the bottom and the lighter vapors and oil mixture continue their path to the A/C compressor (19703) via the top of the vapor return tube. A desiccant bag, located inside the suction accumulator/drier, absorbs and retains moisture which may be circulating in the refrigerant system. The heavier oil-laden refrigerant also returns to the A/C compressor through a small liquid bleed hole near the bottom of the vapor return tube. The liquid bleed hole provides a controlled second opportunity for the accumulated refrigerant and oil mixture to revaporize as it passes through the opening to re-enter into the main vapor flow path to the suction side of the A/C compressor.

As a general observation, it is known that the more heat there is in the air, the more moisture (water vapor) the air can hold. It is also known that warm air holding its maximum vapor content will, if it is chilled, condense and form drops of water. The temperature at which this condensation occurs is called the dew point. In percentage figures, the dew point is known as 100% relative humidity. Relative humidity can be

tomsn048@gmail.com

defined as the measured percentage of moisture in a given sample of air compared with the maximum amount of moisture that the same sample of air can hold at the same temperature.

The direct effect of relative humidity on driver and passenger comfort is almost common knowledge. If the humidity is low, the air has the capacity to absorb moisture up to the point where it reaches its dew point. This capacity to absorb includes the perspiration produced by the body.

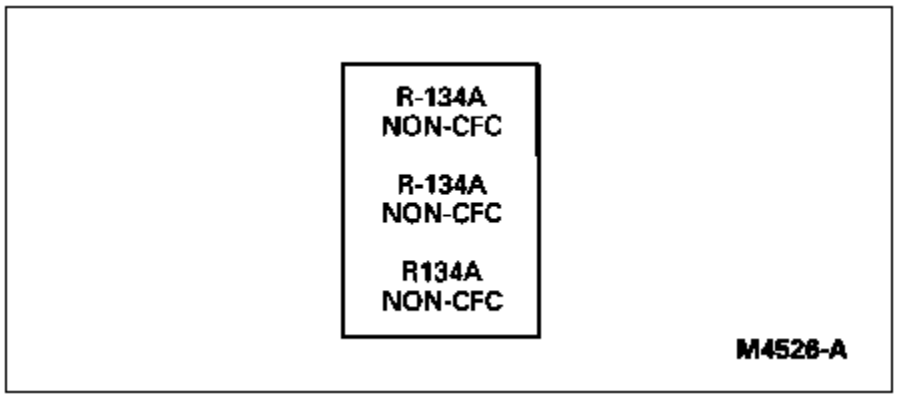
When the dew point is reached, absorption capacity no longer exists. As a result, body heat causes discomfort in the form of unabsorbed perspiration.

Air conditioning does two things to cope with the problems of high heat and humidity: (1) it cools the air to a comfortable level, and (2) it lowers the relative humidity to a comfortable percentage below the dew point.

Refrigerant Systems

All Ford Motor Company vehicles currently in production offer R-134a refrigerant systems.

The label stating A/C refrigerant use in the vehicle is attached in the engine compartment so the proper service procedure and equipment can be referenced in the service manual. An R-134a refrigerant system will have gold R-134a NON-CFC tags in addition to the refrigerant charge tag.



CAUTION: If a component has been used with R-12, it cannot be used again in an R-134a system. If used in an R-134a system, it cannot be put into an R-12 system. Contamination can occur and performance can be adversely affected because each system uses a different oil designed for that system.

Individual descriptions of the components shown are not provided in this section of the manual. They are covered in detail in Sections 12-03A and 12-03B. Detailed FS-10 compressor coverage is provided in Section 12-03D . Exceptions to these referrals are those parts and equipment which are most directly involved in the diagnosis of concerns, testing of system performance, and handling of refrigerant.

A/C Compressor and A/C Clutch Assemblies

The FS-10 is a swash-plate design 10-cylinder aluminum compressor utilizing the tangential design of mount. The compressor mainshaft is driven by a belt from the engine crankshaft pulley. A one-piece lip-type seal (replaceable from the front of the compressor) is used to seal the A/C compressor (19703) at the shaft opening of the A/C compressor assembly. Five double-acting pistons, positioned axially around the compressor shaft, operate within the cylinder assembly. The pistons are actuated by a swash plate that is pressed on the compressor shaft. The swash plate changes the rotating action of the shaft to provide a reciprocating driving force to each of the five pistons. This driving force is applied, through shoes, to the midpoint of each of the double-ended pistons.

Reed-type discharge valves are assembled on the valve plate that is located with the suction reed valve between the cylinder assembly and the head at each end of the A/C compressor. The heads are connected to each other by gas-tight passageways through the cylinder assembly, that direct the refrigerant gas to the suction and discharge ports located in the rear head.

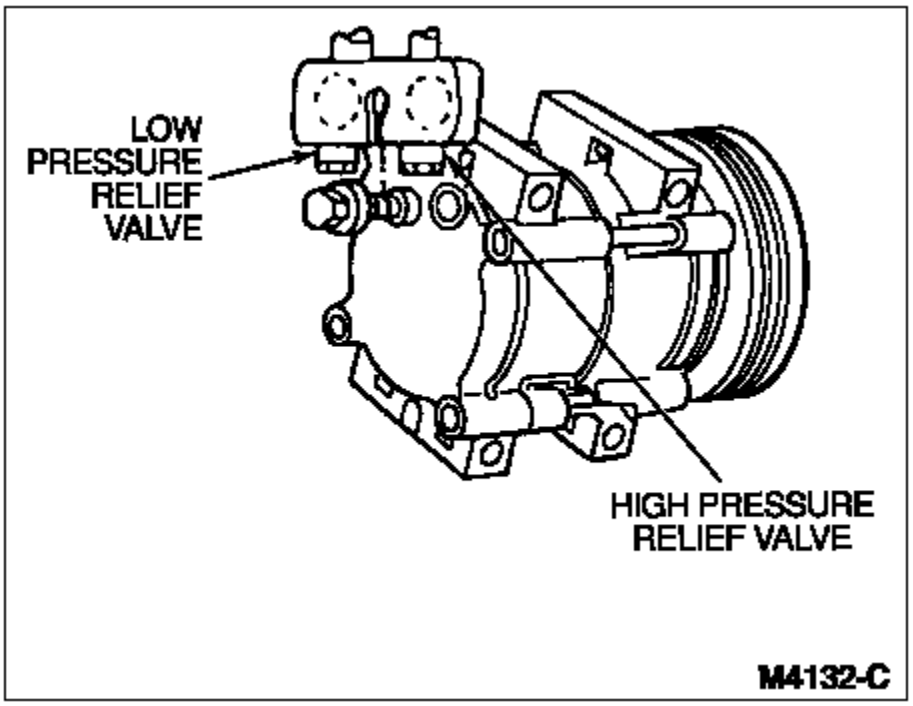
A magnetic clutch is used to drive the compressor shaft. When voltage is applied to the clutch field coil, the clutch plate and hub assembly (which is solidly coupled to the compressor shaft) is drawn rearward by magnetic force toward the pulley that rotates freely on the compressor front head casting. The magnetic force locks the clutch plate and hub assembly and the pulley together as one unit. The compressor shaft then turns with the pulley. When voltage is removed from the clutch field coil, springs in the clutch plate and hub assembly move the clutch plate away from the pulley. As a result, the clutch plate and hub assembly and the compressor shaft cease to rotate.

tomsn048@gmail.com

Refrigerant System Protection

A/C Compressor Pressure Relief Valve

Under extreme pressure conditions, the A/C compressor pressure relief valve (19D644) located in the discharge manifold at the top of the A/C compressor (19703), will momentarily open, allowing refrigerant vapor to escape. This relieves excessive pressure that might damage the A/C compressor. The A/C compressor pressure relief valve closes as soon as pressure is lower than the relief setting. This prevents loss of the complete refrigerant charge.



A/C Pressure Cutoff Switch

The A/C pressure cutoff switch is located in the discharge line between the A/C compressor and the A/C condenser core (19712). The A/C pressure cutoff switch has two sets of contacts. One electrical contact is normally closed.

- When compressor head pressure rises to approximately 3242 kPa (450 psi), the contacts open and the A/C compressor operation is shut off.
- When head pressure drops to approximately 1724 kPa (250 psi), the contacts again close and allow operation of the A/C compressor.
- Shutting down A/C compressor operation prior to the A/C compressor pressure relief valve set point 3103 kPa (450 psi) ensures containment of the refrigerant in the A/C system.

tomsn048@gmail.com

tomsn048@gmail.com

A/C Condenser Core

The A/C condenser core (19712) is a component of the refrigerant system that removes heat from the system by transferring it to the outside air. This heat transfer takes place when the high-pressure vapor delivered by the A/C compressor (19703) to the A/C condenser core is changed by the condensation process to a high-pressure liquid as it leaves the A/C condenser core. It is important to remember that the amount of heat given up by the A/C condenser core will exactly match the amount of heat absorbed by the A/C evaporator core (19860).

tomsn048@gmail.com

Spring Lock Coupling

A spring lock coupling is used to make some refrigerant line connections. The spring lock coupling is a refrigerant line coupling held together by a garter spring inside a circular cage. When the spring lock coupling is connected together, the flared end of the female fitting slips behind the garter spring inside the male fitting cage. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage.

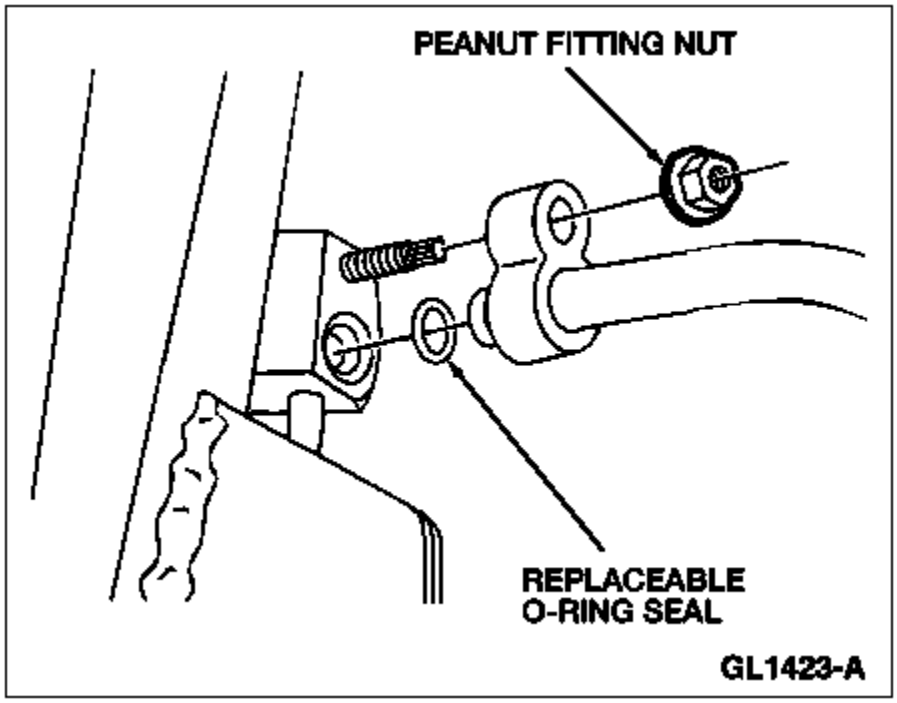
Two O-rings are used to seal between the two halves of the spring lock coupling. These O-rings are made of special material and must be replaced with an O-ring made of the same material. Use only the O-rings specified in the illustration.

tomsn048@gmail.com

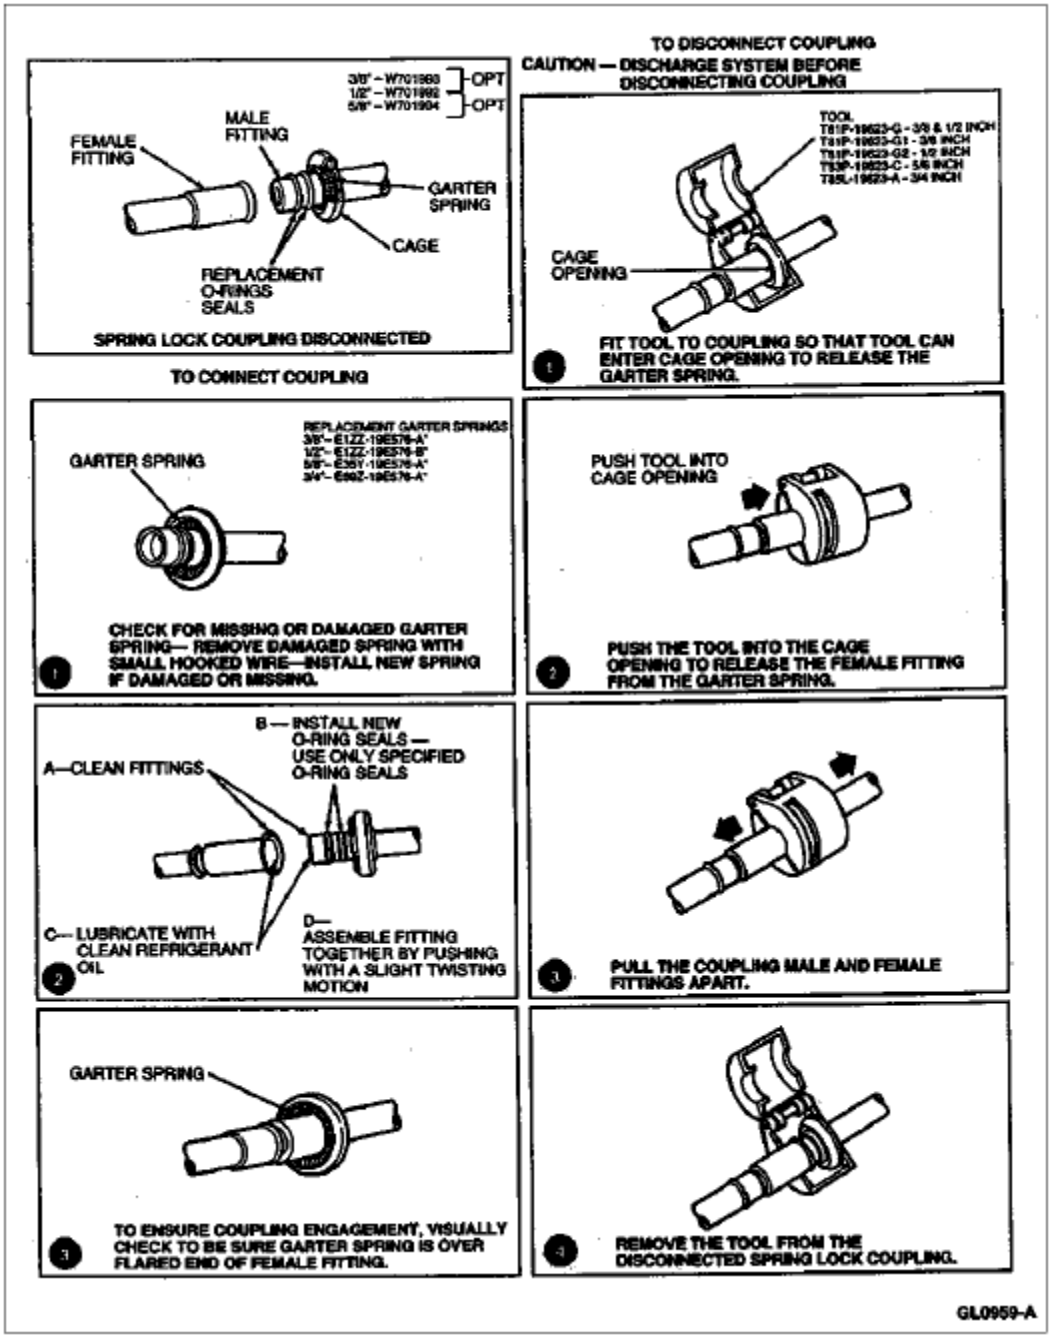
Peanut Fitting

The peanut fitting is used for refrigerant line coupling. a replaceable O-ring is housed inside. The fitting is retained by a nut and a replaceable stud.

Peanut Fitting



tomsn048@gmail.com



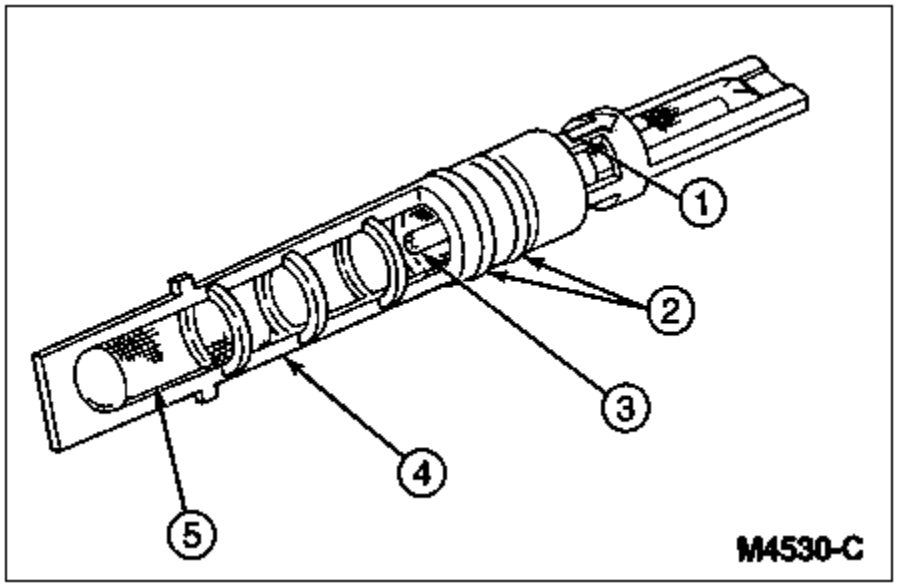
tomsn048@gmail.com

tomsn048@gmail.com

A/C Evaporator Core Orifice

The A/C evaporator core orifice (19D990) is located in the inlet tube and has filter screens on the inlet and outlet ends of the tube body. The filter screens act as strainers for the liquid refrigerant flowing through the fixed orifice opening. O-rings, on the tube body, prevent the high pressure liquid refrigerant from bypassing the orifice. Adjustment or repairs cannot be made to the A/C evaporator core orifice and it must be replaced as a unit.

The A/C evaporator core orifice is a restriction between the high and low pressure refrigerant and meters the flow of liquid refrigerant into the A/C evaporator core (19860). Temperature is controlled by sensing the pressure within the A/C evaporator core with an A/C cycling switch (19E561). The A/C cycling switch cycles the A/C compressor (19703) on or off as necessary to maintain the pressure within specified limits.



Item	Part Number	Description
1	—	Flow Direction
2	YF-1369	O-Rings (See Note)
3	—	Inside Diameter 0.067 Inch (Part of 19D990)
4	—	Color Code Blue (Part of 19D990)
5	—	Fine Mesh Screen (Part of 19D990)

NOTE: Service replacement includes O-rings. Replacement O-rings available from Motorcraft only.

tomsn048@gmail.com

tomsn048@gmail.com

A/C Evaporator Core

The A/C evaporator core (19860) is functionally a heat exchanger in which the refrigerant absorbs heat from the surrounding air as it passes over the outer surface of the core. The refrigerant, when it is delivered through the circuit to the A/C evaporator core, is in a low-pressure liquid form. Then, as a result of the evaporation process, the liquid is converted to a low-pressure vapor and simultaneously the metal surfaces of the core are cooled.

tomsn048@gmail.com

Suction Accumulator/Drier

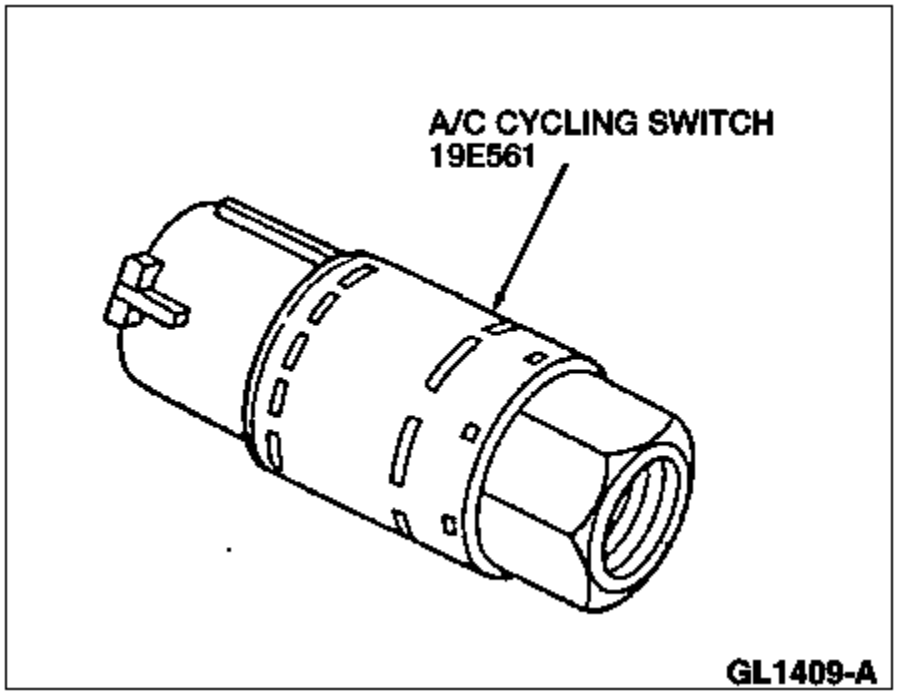
The suction accumulator/drier (19C836) is a canister that receives the output of low-pressure vapor from the A/C evaporator core (19860).

The heavier, incoming oil-laden vapor settles to the bottom of the canister from which it feeds, at a controlled rate, into the compressor suction line through a bleed hole and filter. The refrigerant and oil mixture, upon entering the compressor suction line, further vaporizes, thereby preventing A/C compressor (19703) damage by eliminating the potential for refrigerant slugging.

tomsn048@gmail.com

A/C Cycling Switch

The A/C cycling switch (19E561) is mounted on a Schrader valve-type fitting on the side of the suction accumulator/drier (19C836) in Aerostar vehicles, and on the top of the suction accumulator/drier in Ranger and Explorer vehicles. A valve depressor, located inside the threaded end of the A/C cycling switch, depresses the Schrader valve stem as the A/C cycling switch is mounted and allows the suction pressure inside the accumulator/drier housing to control operation. The electrical contacts are normally open when the suction pressure is at or below 23±1 psi; they will close when the suction pressure rises to approximately 40-60 psi or above. Lower ambient temperatures (below 8°C or 46°F), during cold weather seasons, will also open the contacts due to the pressure/temperature relationship of the refrigerant in the system. The electrical contacts control the circuit to the A/C compressor (19703) A/C clutch field coil (2987) when the function selector lever is set for air conditioner operation. When the contacts are closed, the A/C clutch field coil is energized and the A/C clutch (2884) is engaged to drive the A/C compressor. When the contacts are open, the A/C compressor A/C clutch field coil is de-energized, the A/C clutch is disengaged and the A/C compressor does not operate. The A/C cycling switch, when functioning properly, will control the pressure at a point where the plate/fin surface temperature will be maintained slightly above freezing, which prevents icing and the blockage of airflow.



tomsn048@gmail.com

tomsn048@gmail.com

Special Service Equipment

The refrigerant system has a high-pressure (discharge) and a low-pressure (suction) gauge port valve.

CAUTION: Do not use R-12 special tools and equipment when servicing an R-134a system. Doing so may cause damage to the R-134a A/C system.

CAUTION: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

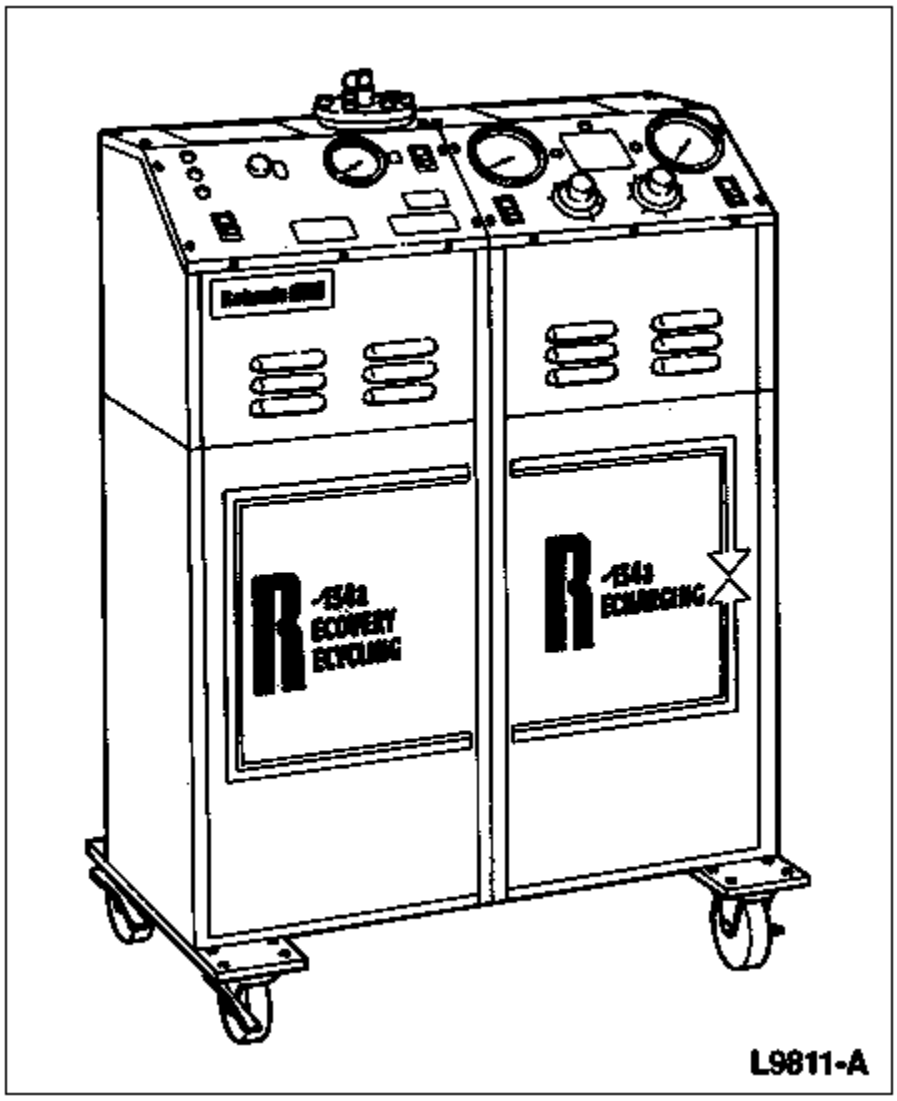
NOTE: Hoses should have shutoff devices or check valves within 305mm (12 inches) of the hose end to minimize the introduction of non-condensable gases (air) into the recycling station and to minimize the amount of refrigerant released when the hose(s) is (are) disconnected.

R-134a systems require the use of special servicing equipment designed specifically for R-134a systems. R-12 servicing equipment cannot be used when servicing R-134a A/C systems. R-134a special service equipment includes R-134a recovery/recycling/recharging station, R-134a leak detector, R-134a vacuum pump and R-134a manifold gauge set.

Ford Motor Company supports the efficient use, recovery, and recycling of R-134a in specified vehicle air conditioners. Ford Motor Co. recommends the use of a U.L. approved recovery/recycling device such as Rotunda R-134a A/C Service Center (or other device which meets SAE Standard J1991) during any air conditioning system repair and recharge procedure which requires the air conditioning system to be discharged.

Rotunda R-134a A/C Service Center

tomsn048@gmail.com



Additional information and a typical procedure for operating a refrigerant recovery device follows:

Refrigerant recovery systems and recycling stations are in use in an increasing number of automotive air conditioning service facilities. The use of such equipment makes possible the recovery and use of air conditioning system refrigerant after contaminants and moisture have been removed.

If a refrigerant recovery or recycling station is used, the following general procedures should be observed, in addition to the operating instructions provided by the equipment manufacturer.

1. Connect the refrigerant recycling station hose(s) to the vehicle air conditioning service ports and the recovery station inlet fitting.

2. Turn the power to the recycling station on to start the recovery process. Allow the recycling station to pump the refrigerant from the system until the station pressure goes into a vacuum. On some stations the pump will be shut off automatically by a low pressure switch in the electrical system. On other units it may be necessary to manually turn off the pump.

3. Once the recycling station has evacuated the vehicle air conditioning system, close the station inlet valve (if so equipped). Then, switch off the electrical power.

tomsn048@gmail.com

4. Allow the vehicle air conditioning system to remain closed for about two minutes. Observe system vacuum level as shown on the gauge. If the pressure does not rise, disconnect the recycling station hose(s).

5. If the system pressure rises, repeat the above three steps until the vacuum level remains stable for two minutes.

6. Perform required service operations, evacuate and recharge the air conditioning system.

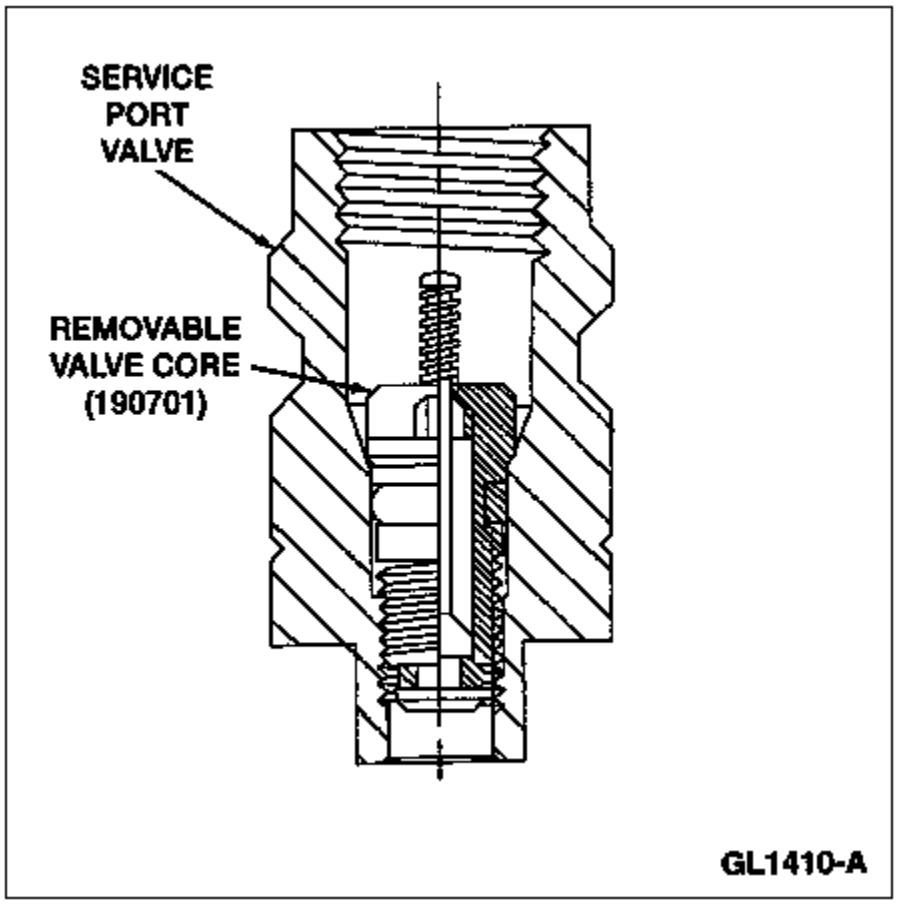
   The refrigerant system has a high-pressure (discharge) and a low-pressure (suction) gauge port valve. They provide access to both sides (high-pressure and low-pressure) of the system for service hoses and a manifold gauge set so system pressures can be read.

---

tomsn048@gmail.com

Service Gauge Port Valves

The service valve in the A/C compressor to condenser discharge line (19972) allows access to the high pressure side of the system for attaching a service hose and pressure gauge.



The service valve on the suction accumulator/drier (19C836) allows access to the low pressure side of the system for attaching a service hose and pressure gauge.

Inspection and Verification

Obstructed air passages, broken drive belts (8620), disconnected or broken wires, damaged A/C clutch (2884), or loose or broken mounting brackets and certain refrigerant leaks may be located by visual inspection of the parts.

A refrigerant leak will usually appear as an oily residue at the leakage point in the system. The oily residue soon picks up dust or dirt particles from the surrounding air and appears greasy. Through time, this will build up and appear to be a heavy dirt-impregnated grease.

Most common leaks are caused by damaged or missing O-ring seals at the various hose and component connections. When these O-rings are replaced, lubricate the new O-rings with refrigerant oil. Be careful to prevent shop towel lint from contaminating the internal surfaces of the connection. Leakage may occur at a spring lock coupling if the wrong O-rings are used. Use **only** the O-rings listed in the Ford Master Parts Catalog for the spring lock coupling being serviced.

Another type of leak may appear at the internal Schrader-type air conditioner charging valve core in the service gauge port valve fittings. If tightening the valve core does not stop the leak, replace it with a new air conditioner charging valve core or equivalent.

Missing A/C charging valve caps (19D702) can also cause a refrigerant leak. If this important primary seal is missing, dirt will enter the area of the air conditioner charging valve core. When the service hose is attached, the valve compressor in the end of the service hose forces the dirt into the valve seat area and the dirt will destroy the sealing surface of the air conditioner charging valve core. When a A/C charging valve cap is missing, clean the protected area of the air conditioner charging valve core and install a new A/C charging valve cap.

CAUTION: A/C charging valve caps must be installed finger-tight. If tightened with pliers, the sealing surface of the service gauge port valve may be damaged.

Symptom Chart — Climate Control System, Service

CLIMATE CONTROL SYSTEM, SERVICE

Condition	Possible Source	Action
• Insufficient, Erratic, or No Heat or Defrost	• Low radiator coolant level due to coolant leaks.	• CHECK radiator cap pressure. REPLACE if below minimum pressure as marked on cap. FILL to specified coolant level. PRESSURE TEST for engine cooling system and heater system leaks. SERVICE as required.
	• Engine overheating.	• CHECK radiator cap. REPLACE if below minimum pressure as marked on cap. REMOVE bugs, leaves, etc. from radiator or condenser fins. • CHECK for: ▪ Loose drive belt ▪ Sticking thermostat ▪ Incorrect ignition timing ▪ Water pump impeller damage ▪ Restricted cooling system • SERVICE as required. REFER to Group 03.
	• Loose drive belt.	• REPLACE if cracked or worn and/or ADJUST tension. REFER to Section 03-05 .
	• Thermostat.	• CHECK coolant temperature at radiator filler neck. If under 170°F, REPLACE thermostat. REFER to Section 03-03 .
	• Plugged or partially plugged heater core.	• CLEAN and BACKFLUSH engine cooling system and heater core.
	• Loose or improperly adjusted heater temperature cables.	• ADJUST to specifications. REFER to Section 12-02A or Section 12-02B .
	• Kinked, clogged, collapsed, soft, swollen, or decomposed engine cooling system or heater system hoses.	• REPLACE damaged hoses and BACKFLUSH engine cooling system, then heater system, until all particles have been removed. REFER to Section 03-03 .
	• Blocked air inlet.	• CHECK cowl air inlet for leaves, foreign material, etc. REMOVE as required. CHECK internal blower inlet screen (on vehicles so equipped) for leaves and foreign material.
• Blower Motor Does Not Operate Properly	• Blower motor.	• CHECK fuse. CONNECT a No. 10 gauge (or larger diameter) jumper wire directly from the positive battery terminal to the positive lead (orange wire) of the blower

tomsn048@gmail.com

		motor. If the blower motor runs, the problem must be external to the blower motor. If the blower motor will not run, CONNECT a No. 10 gauge (or larger diameter) jumper wire from the heater blower motor black lead to a good ground. If the blower motor runs, the trouble is in the ground circuit. On vehicles with ground side switching, CHECK the heater blower motor switch resistor, the heater blower motor switch and the harness connections. SERVICE as required. If blower motor still will not run, the blower motor is inoperative and should be replaced.
	• Heater blower motor switch resistor. • Wire harness to blower motor.	• CHECK continuity of resistors for opens or shorts (self-powered test lamp). SERVICE or REPLACE as required. • CHECK for proper installation of harness connectors. CHECK wire-to-terminal continuity. CHECK continuity of wires in harness for shorts, opens, abrasions, etc. SERVICE as required. GO to Pinpoint Test H .
• Improper/Erratic Direction of Airflow From Outlets	• Vacuum leak. • Loose or disconnected vacuum hose. • Damaged. • Misrouted vacuum connections.	• REPLACE or REPAIR system components, as required. GO to Pinpoint Test A .
• Insufficient, Erratic or No Heat	• Heater core. • Broken or out of adjustment function or temperature control cables. • Vacuum leak.	• GO to Heater Core Tests in this section. • REFER to Section 12-02A or Section 12-02B . • GO to Pinpoint Test B .
• Defrost Always On	• Vacuum system failure. • Heater air cable and/or function control switch not working properly.	• GO to Pinpoint Test C . • REFER to Section 12-02A or Section 12-02B .
• A/C Does Not Operate	• Wiring circuit failure.	

tomsn048@gmail.com

	• Defective A/C clutch. • A/C clutch.	• GO to Pinpoint Test D .
• A/C Always On	• Electrical circuits. • Function control switch.	• GO to Pinpoint Test E .
• Insufficient A/C Cooling	• A/C clutch. • Leaks in system. • Low refrigerant charge.	• GO to Pinpoint Test F .
• No Operation In All Function Settings	• Electrical circuits.	• GO to Pinpoint Test G .
• No Blower Operation, Constant Blower or Improper Operation	• Electrical circuit, blower motor, resistor or switch.	• GO to Pinpoint Test H , Pinpoint Test J , Pinpoint Test K , Pinpoint Test L , and Pinpoint Test M for specific condition.
• Noise in Climate Control System	• Vacuum leak.	• GO to Pinpoint Test N and Pinpoint Test P for specific condition.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: IMPROPER/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

A1 NO VENT OPERATION

- Check vacuum source tube (black) for being pinched, split, kinked, or disconnected.

Is vacuum tube OK?

Yes	No
GO to **A2** .	SERVICE vacuum source tube (black). RESTORE vehicle. RETEST system.

A2 CHECK VEHICLE FOR VACUUM

- Start engine and allow to idle.
- Locate vacuum distribution block at engine.
- Disconnect A/C, heater vacuum source tube and check for vacuum.

Is vacuum present?

Yes	No
RECONNECT vacuum tube. GO to **A3** .	SERVICE vacuum distribution block. RESTORE vehicle. RETEST system.

A3 CHECK VENT VACUUM TUBES FOR LEAK

- Check in-line and control assembly multiple connectors for proper installation and connection.

Does vacuum hiss stop?

Yes	No
RESTORE vehicle. RETEST system.	GO to **A4** .

A4 CHECK FUNCTION CONTROL FOR LEAK

tomsn048@gmail.com

- Actuate function knob to all positions to determine which selector positions are leaking.

Do all positions leak?

Yes	No
GO to **A5** .	GO to **A6** .

A5 CHECK FUNCTION CONTROL VACUUM SUPPLY

- Pinch off source tube (black) at control assembly.

Did vacuum hiss stop?

Yes	No
REPLACE function control selector. RESTORE vehicle. RETEST system.	SERVICE source tube, vacuum harness. RESTORE vehicle. RETEST system.

A6 DETERMINE LEAKING HOSE(S)

- Determine what color hose is leaking in selected switch position.
- Pinch off suspect hose near respective vacuum control motor.

Did vacuum hiss stop?

Yes	No
REPLACE vacuum control motor. RESTORE vehicle. RETEST system.	GO to **A7** .

A7 CHECK VACUUM HARNESS FOR LEAK

- Carefully listen for location of vacuum leak.
- Pinch off suspect hose(s) one at a time, near control assembly, and/or in-line connector.

Did vacuum hiss stop?

Yes	No
SERVICE hose for cut or damage. RESTORE vehicle. RETEST system.	REPLACE function control switch. RESTORE vehicle. RETEST system.

PINPOINT TEST B: INSUFFICIENT, ERRATIC, OR NO HEAT

B1 CHECK FOR VACUUM TO FUNCTION CONTROL

tomsn048@gmail.com

- Start engine and allow engine to idle.
- Disconnect A/C, heater vacuum source tube (black), check for vacuum.

Is vacuum present?

Yes	No
GO to **B2** .	SERVICE vacuum source tube (black) as required. RESTORE vehicle. RETEST system.

B2 CHECK FLOOR PANEL DOOR OPERATION

- Actuate function control switch to the floor position.
- Locate heater air damper door vacuum control motor.
- Check for vacuum at blue tube and red tube.

Is vacuum present at each vacuum tube?

Yes	No
REPLACE heater air damper door vacuum control motor. GO to **B3** .	SERVICE suspect hose for cut or damage. RESTORE vehicle. RETEST system.

B3 CHECK HEATER FOR PROPER TEMPERATURE

- Allow engine to run until operating temperature is achieved.
- Actuate A/C control to floor position.
- Actuate temperature to full heat position.
- Actuate A/C, heater blower switch.

Is heater temperature OK?

Yes	No
GO to **B4** .	GO to Heater Core Test and SERVICE as outlined. RETEST system.

B4 CHECK A/C BLOWER MOTOR OPERATION

- Actuate A/C blower motor in all positions.

Did A/C blower motor operate properly?

Yes	No
RESTORE vehicle. RETEST system.	GO to Pinpoint Test H , Pinpoint Test J , Pinpoint Test K , Pinpoint Test L , or Pinpoint Test M for specific condition(s).

tomsn048@gmail.com

PINPOINT TEST C: DEFROST ALWAYS ON

NOTE: The air handling system is designed to provide defrost when no vacuum is applied to any of the three air door vacuum motors. This is done to prevent a situation where defrost cannot be obtained due to a system vacuum leak. Instead, a leak in the vacuum control circuit will send all airflow to the defroster outlets. This condition may occur during acceleration (slow leak), may exist at all times (large leak) and may happen only when certain specific functions are selected, indicating a leak in that portion of the circuit.

The vacuum hoses used in the passenger compartment control circuit are constructed from PVC plastic material. The vacuum hoses used in the engine compartment are constructed of Hytrel. Because of the materials used, the vacuum hoses should never be pinched off during diagnosis to locate a leak. Use Rotunda Vacuum Tester or equivalent to locate vacuum leaks. A wood golf tee can be used as a plug when it is necessary to plug one end of a vacuum hose for leak test purposes.

C1 CHECK SYSTEM AIRFLOW

- With engine running and blower motor on high, check system airflow in each function selector position to determine which position(s) have incorrect airflow.

Is airflow from the defroster outlets for all positions?

Yes	No
GO to C2.	GO to C13.

C2 CHECK VACUUM SUPPLY HOSE

- Check vacuum supply hose to be sure it is connected to both the engine manifold and vacuum check valve.

Is hose disconnected?

Yes	No
RECONNECT hose. GO to C1.	GO to C3.

C3 CHECK VACUUM SUPPLY HOSE FOR LEAK

- Disconnect vacuum supply hose from engine manifold fitting and from check valve. Plug one end of hose and leak test with vacuum pump.

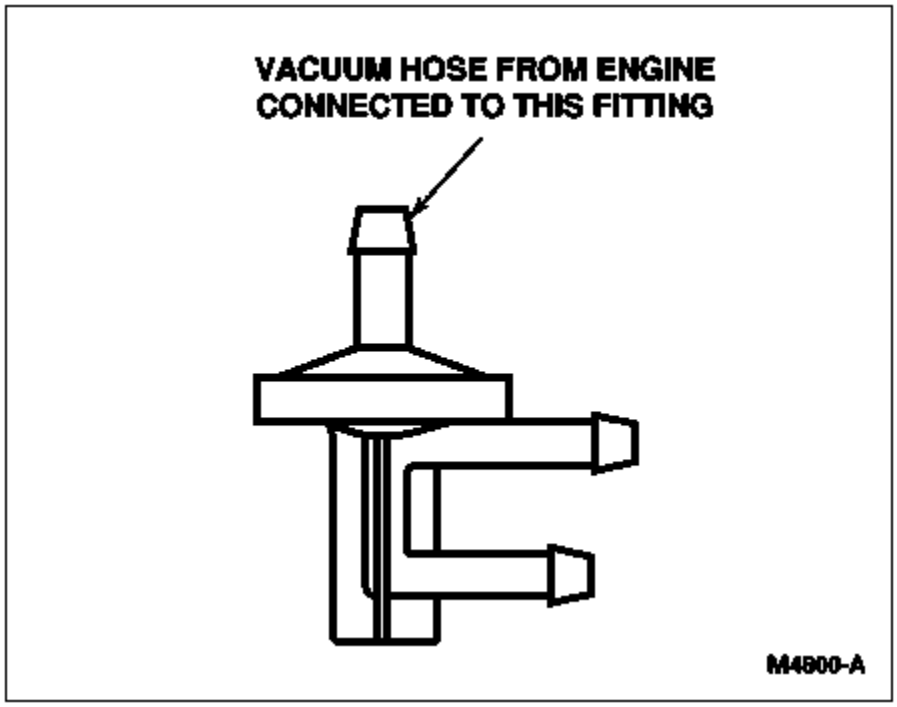
Does hose leak?

Yes	No
REPLACE or REPAIR as necessary. GO to C1.	CONNECT hose to manifold fitting. GO to C4.

tomsn048@gmail.com

C4 CHECK VACUUM CHECK VALVE

- Check vacuum check valve for correct installation by removing the reservoir hose and the control assembly source hose (one at a time) from check valve and check for vacuum. Engine must be running for this test.



Is vacuum available at both check valve ports?

Yes	No
RECONNECT both hoses. GO to C6 .	GO to C5 .

C5 INSPECT VACUUM CHECK VALVE

- Inspect vacuum check valve for an obstruction and/or proper operation. Airflow through the check valve should be in the direction toward engine (engine connection side is marked VAC).

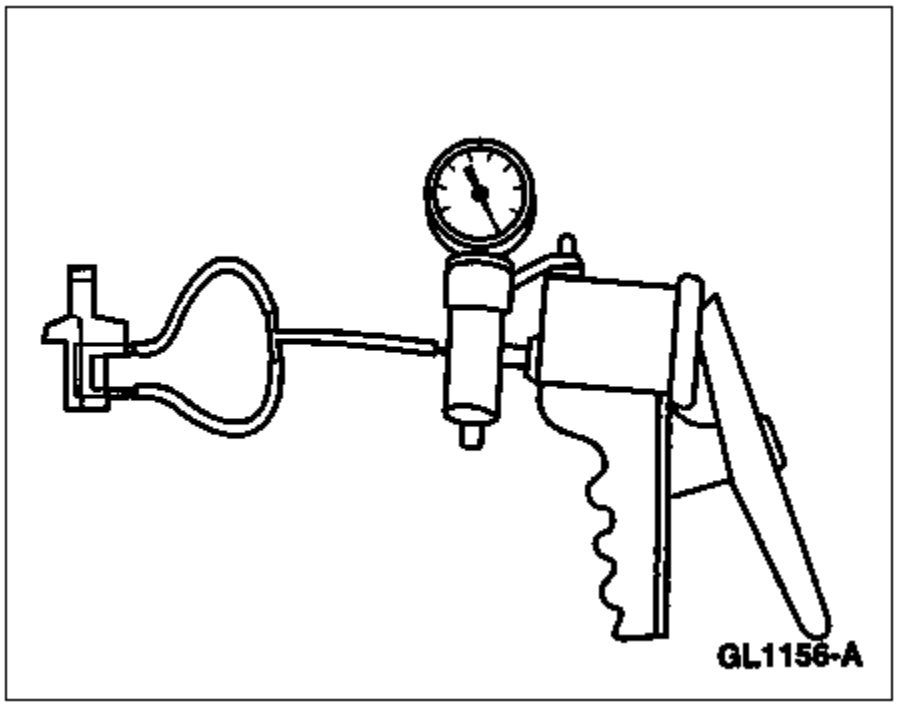
Is check valve plugged or obstructed?

Yes	No
REPLACE check valve. GO to C1 .	GO to C6 .

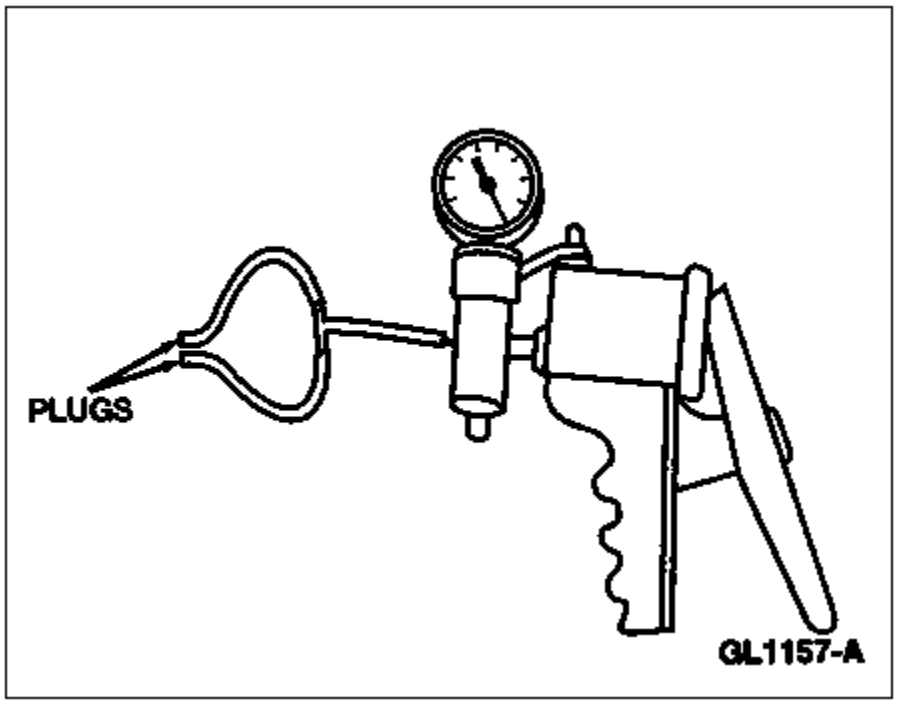
C6 LEAK TEST VACUUM CHECK VALVE

- Remove vacuum check valve from vehicle. Connect two hoses and a Tee fitting to outlet ports of check valve. Connect vacuum tester, Rotunda Model No. 014-R1054 or equivalent, to Tee fitting.

tomsn048@gmail.com



- Pump 15 inches vacuum on check valve and observe gauge reading. If vacuum loss exceeds 1 inch per minute, remove check valve from tester and plug vacuum hoses. Pull a vacuum with the tester to be certain hoses and tester are not cause of leak.



- If tester and hoses do not leak, check valve is cause of leak.

Does check valve lose more than 1 inch vacuum in one minute?

Yes	No

tomsn048@gmail.com

REPLACE check valve. GO to C1 .	REINSTALL check valve and GO to C7 .

C7 CHECK VACUUM RESERVOIR

- Connect vacuum tester to vacuum reservoir and leak test reservoir. Reservoir must hold vacuum.

Does reservoir leak?

Yes	No
REPLACE reservoir. GO to C1 .	CONNECT hose to reservoir. GO to C8 .

C8 CHECK SUPPLY HOSE FOR LEAK

- Disconnect and plug black supply hose at control assembly. Disconnect other end of supply hose from check valve and leak test hose with vacuum tester.

Does supply hose leak?

Yes	No
REPAIR or REPLACE hose. GO to C1 .	REMOVE plug and RECONNECT vacuum hoses. GO to C9 .

C9 CHECK CONTROL ASSEMBLY

- Disconnect vacuum harness at in-line multiple connector near control. Plug all vacuum hoses except black. Connect vacuum tester to black hose. Select each function position, apply 15 inches vacuum and check for vacuum drop. Drop should not exceed 1 inch vacuum per minute for any function position.

Does drop exceed 1 inch vacuum per minute?

Yes	No
NOTE function positions where vacuum drops. GO to C10 .	GO to C11 .

C10 LEAK TEST CONTROL ASSEMBLY

- Remove vacuum harness from control assembly. Connect vacuum tester to control supply port and plug control port that indicated a leak in Step C9. Select function positions noted in Step C9 and apply 15 inches vacuum after selecting each position. Vacuum drop should not exceed 1/2 inch per minute.

Does vacuum drop exceed 1/2 inch in one minute?

Yes	No

tomsn048@gmail.com

REPLACE control assembly. GO to C1 .	GO to C12 .

C11 CHECK SUPPLY HOSE

- Disconnect black supply hose from check valve. Connect vacuum tester to supply hose and operate tester as if pulling a vacuum. If tester can pull a vacuum, hose is plugged. If tester pulls a partial vacuum, hose is restricted.

Is hose plugged or restricted?

Yes	No
REPLACE supply hose. GO to C1 .	GO to C15 .

C12 LEAK TEST JUMPER VACUUM HARNESS

- Plug one end of vacuum hose that indicated a leak in Step C9. Apply 15 inches vacuum to hose and observe vacuum gauge. Vacuum should not drop.

Does vacuum drop?

Yes	No
REPAIR and/or REPLACE vacuum jumper harness. GO to C1 .	CHECK connection of vacuum harness to control assembly for leak. REPAIR as necessary. GO to C1 .

C13 EVALUATE SYSTEM AIRFLOW

Is the airflow in Step C1 correct for each function position?

Yes	No
GO to C14 .	GO to C15 .

C14 ISOLATE LEAKING VACUUM CIRCUIT

- Repeat Step C1 and accelerate engine speed for each function position.

Does airflow go to defrost during acceleration?

Yes	No
GO to C19 .	GO to C15 .

C15 REVIEW VEHICLE HISTORY

tomsn048@gmail.com

Did system function properly prior to this concern?

Yes	No
GO to C18.	GO to C16.

C16 CHECK VACUUM HOSES

- Check each vacuum hose to be sure it is not plugged.

Is a hose plugged?

Yes	No
REPAIR or REPLACE as necessary. GO to C1.	GO to C17.

C17 CHECK VACUUM HARNESS

- Compare vacuum hose colors in each vacuum harness to the vacuum schematic. Refer to Electrical and Vacuum Troubleshooting Manual,Aerostar or Ranger.

Do the hose colors agree with the schematic?

Yes	No
GO to C18.	REPLACE vacuum harness. GO to C1.

C18 CHECK VACUUM CIRCUIT FOR KINKS

- Check vacuum circuit for pinched or kinked vacuum hose.

Is hose pinched or kinked?

Yes	No
REPAIR as necessary. GO to C1.	GO to C19.

C19 CHECK VACUUM CIRCUIT

- Check each vacuum hose connection to determine if it is partially connected or disconnected.

Is a vacuum hose connection disconnected or partially connected?

Yes	No
RECONNECT hose. GO to C1.	GO to C20.

tomsn048@gmail.com

C20 CHECK VACUUM HOSE

- Disconnect both ends of vacuum hose in suspected circuit. Plug one end and leak test with vacuum tester.

Does vacuum hose leak?

Yes	No
REPAIR or REPLACE hose. GO to **C1** .	GO to **C21** .

C21 CHECK VACUUM MOTOR

- Check vacuum control motor for leaks with vacuum tester.

Does motor hold vacuum?

Yes	No
GO to **C22** .	REPLACE vacuum control motor. GO to **C1** .

C22 CHECK VACUUM MOTOR INSTALLATION

- Check attachment of vacuum motor arm to damper door.

Is motor arm attached to door or door crank arm?

Yes	No
CHECK for binding or damaged damper door. REPAIR as necessary. GO to **C1** .	CONNECT motor arm to door and/or crank arm and CHECK operation. GO to **C1** .

PINPOINT TEST D: A/C DOES NOT OPERATE

D1 CHECK COMPRESSOR CLUTCH

- Prepare vehicle as follows:
  - Connect manifold gauge.
  - Set function control at MAX A/C.
  - Set blower switch on HIGH.
  - Set temperature lever full cold.
  - Close doors and windows.
  - Run engine at approximately 1500 rpm.

Does A/C clutch operate?

tomsn048@gmail.com

Yes	No
GO to **D16** .	GO to **D2** .

D2 CHECK VOLTAGE SUPPLY AT SWITCH

- Turn engine off. Leave ignition switch ON.
- Using a test lamp, check for voltage at Circuit 296 (W/P) Aerostar or 326 (W/P) Ranger at A/C heater control switch.

Did test lamp illuminate?

Yes	No
GO to **D5** .	GO to **D3** .

D3 CHECK VOLTAGE SUPPLY TO SWITCH

- Using a test lamp, check voltage at output side of Fuse 18 (15A) Ranger or Fuse 6 (20A) Aerostar.

Did test lamp illuminate?

Yes	No
SERVICE the W/P wire. RESTORE vehicle. RETEST system.	GO to **D4** .

D4 CHECK CIRCUIT 296 (W/P) OR 326 (W/P) FOR SHORT

- Disconnect A/C heater control switch.
- Using an ohmmeter, Rotunda 73 Digital Multimeter 105-R0051 or equivalent, connect one lead to output side of Fuse 18 (15A) Ranger or 6 (20A) Aerostar. Connect second lead to a known good ground.

Is resistance 5 ohms or less?

Yes	No
SERVICE the W/P wire. REPLACE Fuse 18 (15A) Ranger or Fuse 6 (20A) Aerostar. RESTORE vehicle. RETEST system.	RESTORE vehicle. GO to **D1** .

D5 CHECK A/C, HEATER CONTROL SWITCH

- Reconnect A/C, heater control switch.
- Using a test lamp, check voltage at Pin 3 Circuit 348 (P).

Did test lamp illuminate?

tomsn048@gmail.com

Yes	No
If Aerostar, GO to D6 . If Ranger, GO to D7 .	REPLACE A/C, heater control switch. RESTORE vehicle. RETEST system.

D6 CHECK CLUTCH CYCLING PRESSURE SWITCH

- Disconnect A/C cycling switch.
- Start engine, A/C should be in MAX A/C mode.
- Using a jumper wire, connect one end to Pin 1 at cycling switch connector. Connect second lead to Pin 2 at A/C cycling switch.
- Observe A/C clutch.

Did A/C clutch engage?

Yes	No
REPLACE A/C cycling switch. Do not discharge system. Switch has a Schrader valve. RESTORE vehicle. RETEST system.	GO to D10 .

D7 CHECK THE A/C LOW PRESSURE SWITCH

- Disconnect the A/C low pressure switch.
- Start engine, A/C should be in MAX A/C mode.
- Using a jumper wire, connect one end to circuit 348 (P) and the other end to circuit 441 (R/Y) of the A/C low pressure switch connector.
- Observe A/C clutch.

Did A/C clutch engage?

Yes	No
REPLACE the A/C low pressure switch. RETEST system.	GO to D8 .

D8 CHECK CIRCUIT 441 (R/Y)

- Turn engine off.
- Disconnect the A/C high pressure switch.
- Using Rotunda 73 Digital Multimeter 105-R0051, or equivalent, check circuit 441 (R/Y) for open between the A/C low and high pressure switch, and between A/C low pressure switch 441 (R/Y) for short.

Is there a short or an open?

Yes	No
SERVICE circuit 441 (R/Y) for short or an open. RETEST system.	GO to D9 .

tomsn048@gmail.com

D9 CHECK THE A/C HIGH PRESSURE SWITCH

- Reconnect the A/C low pressure switch.
- Start engine, A/C should be in MAX A/C mode.
- Using a jumper wire, connect one end to circuit 441 (R/Y) and the other to Circuit 198 (T/Y) of the A/C high pressure switch connector.
- Observe A/C clutch.

Did A/C clutch engage?

Yes	No
REPLACE A/C high pressure switch. RETEST system.	GO to **D10** .

D10 CHECK POWER SUPPLY TO A/C

- Using a test lamp, check Circuit 348 (P) at A/C cycling switch Aerostar or A/C low pressure switch Ranger connector.

Did test lamp illuminate?

Yes	No
GO to **D11** .	SERVICE circuit 348 (P) for open circuit or short to ground.

D11 CHECK CIRCUIT 198 (T/Y)

- Disconnect the WOT cut out relay.
- Using a Rotunda 73 Digital Multimeter 105-R0051, check Circuit 198 (T/Y) between the A/C cycling switch Aerostar or A/C high pressure switch Ranger connector and WOT cutout relay connector for open, and between WOT cutout relay connector and known good ground for short.
- Measure resistance.

Is there an open or a short?

Yes	No
REPAIR circuit 198 (T/Y). RETEST system.	GO to **D12** .

D12 CHECK THE WOT CUTOUT RELAY

- Perform the Relay component test for the WOT cutout relay in this section.

Is the relay OK?

tomsn048@gmail.com

Yes	No
GO to **D13** .	REPLACE the WOT cutout relay. RETEST system.

D13 CHECK THE A/C CLUTCH FIELD COIL

- Disconnect the A/C clutch field coil.
- Using a Rotunda 73 Digital Multimeter 105-R0051, check the resistance between the A/C clutch field coil terminals.
- Measure resistance.

Is the resistance 5 ohms or less?

Yes	No
GO to **D14** .	REPLACE the A/C clutch field coil. RETEST system.

D14 CHECK CIRCUIT 347 (BK/Y)

- Using Rotunda 73 Digital Multimeter 105-R0051, check circuit 347 (BK/Y) between the WOT cutout relay and the A/C clutch field coil for an open, and check circuit 347 (BK/Y) between the WOT cutout relay and known good ground.
- Measure resistance.

Is there an open or a short?

Yes	No
REPAIR circuit 347 (BK/Y) as necessary. RETEST system.	GO to **D15** .

D15 CHECK A/C CLUTCH GROUND CIRCUIT

- Using an ohmmeter, Rotunda 73 Digital Multimeter 105-R0051 or equivalent, connected to ground, connect second lead to Circuit 57 (BK) at A/C clutch field coil connector.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Section 3A of the Powertrain Control/Emission Diagnostic Manual for diagnosis and testing of the powertrain control module (PCM).	SERVICE Circuit 57 (BK) for open circuit. RESTORE vehicle. RETEST system.

tomsn048@gmail.com

D16 CHECK A/C CLUTCH CYCLING

- Use refrigerant system pressure/clutch cycle rate and timing evaluation charts.
- After preparing vehicle as follows:
  - Connect manifold gauge set, Rotunda R134a Manifold Gauge Set 176-R032A or equivalent.
  - Set function control at MAX A/C.
  - Set blower switch on HIGH.
  - Set temperature lever full COLD.
  - Close doors and windows.
  - Use a thermometer to check temperature at center discharge register, record outside temperature.
  - Run engine at approximately 1500 rpm with A/C clutch engaged.
  - Stabilize with above conditions for 10-15 minutes.
- Check A/C clutch on/off time with watch. Refer to charts for normal clutch cycle timing rates.

Did A/C compressor cycle very rapidly?

Yes	No
If Aerostar, GO to **D17** . If Ranger, DISCHARGE system and service as outlined. RETEST system.	System OK.

D17 CHECK CLUTCH CYCLING SWITCH

- Using a jumper wire, bypass A/C cycling switch.
- Hand feel A/C evaporator inlet and outlet tubes.

Is outlet tube approximately same temperature -2°C, 4°C (28°F, 40°F) or slightly colder than inlet tube?

Yes	No
REPLACE A/C cycling switch. Do not discharge system. Switch has a Schrader valve. RESTORE vehicle. RETEST system.	DISCHARGE system and SERVICE as outlined. RETEST system.

PINPOINT TEST E: A/C ALWAYS ON

E1 TEST FUNCTION CONTROL OPERATION

- Place function control lever in OFF position.
- Turn ignition switch to RUN position.
- Check for voltage using Rotunda 73 Digital Multimeter 105-R0051 or equivalent between function control and A/C low pressure switch Ranger or A/C cycling switch Aerostar.

Is voltage present?

tomsn048@gmail.com

Yes	No
REPLACE function control switch.	GO to **E2** .

E2 CHECK FOR VOLTAGE AT COMPRESSOR

- Place function control lever in OFF position.
- Turn ignition switch to RUN position.
- Check for voltage at A/C compressor.

Is voltage present?

Yes	No
CHECK electrical circuits for exposed wires, chafing or exposed connectors. CORRECT all suspected sources. RETEST system.	System OK. EXPLAIN system operation to owner. INFORM owner that the A/C compressor operates in defrost mode as well as all A/C modes.

PINPOINT TEST F: INSUFFICIENT A/C COOLING

F1 CHECK COOLING OPERATION

Is the A/C system cooling properly?

Yes	No
EXPLAIN system operation to owner.	GO to **F2** .

F2 CHECK A/C COMPRESSOR CLUTCH

Does the A/C clutch engage?

Yes	No
GO to **F3** .	REFER to Pinpoint Test D .

F3 CHECK UNDER HOOD

- Check underhood for:
  - Low engine speed.
  - Fan shroud misalignment.
  - Fan clutch damage.
  - Engine cooling fan damage.
  - Airflow obstructions in front of grille or between the fins of theA/C condenser core or radiator.

tomsn048@gmail.com

- In-vehicle check for:
  - Blown fuse/proper operation of heater blower motor switch.
  - Electrical connections at the A/C control.

Does underhood check show a concern?

Yes	No
REPAIR CONCERN and GO to **F4** .	GO to **F5** .

F4 CHECK SYSTEM OPERATION

- Check system operation.

Is the A/C system cooling properly?

Yes	No
Condition corrected. GO to **F1** .	GO to **F5** .

F5 CHECK PRESSURE/CYCLE RATE

- Use Refrigerant System Pressure/Cycle Rate And Timing Evaluation Charts .
  - Connect gauge set, Rotunda 176-R032A or equivalent.
  - Set function at MAX A/C.
  - Set heater blower motor switch on HIGH.
  - Set temp lever full cool.
  - Close doors and windows.
  - Use a thermometer to check temperature at center discharge register. Record outside temperature.
  - Run engine at approximately 1500 rpm with A/C clutch engaged.
  - Stabilize at 23.9℃ (75℉) interior temperature wit h above conditions for 10-15 minutes.
- Check OFF/ON time of A/C clutch with watch. See Charts for normal cycle and timing rates.

Is cycling rate OK?

Yes	No
GO to **F6** .	GO to **F7** .

F6 CHECK PRESSURES

- Check system pressures.
- Compare readings with normal system pressure ranges.

Are system pressures normal?

Yes	No

tomsn048@gmail.com

System OK. GO to **F1** .	GO to Refrigerant System Pressure and Timing Evaluation Chart in this section and COMPARE observed pressures with chart. REPAIR as required and GO to **F4** . If A/C compressor cycles high or low (ON above 259 kPa [52 psi], OFF below 144 kPa [21 psi]) GO to **F7** .

F7 CHECK FOR LEAKS

- Leak check system.

Is leak found?

Yes	No
SERVICE, LEAK TEST, EVACUATE and CHARGE system. GO to **F1** .	Low refrigerant charge or moisture in system. DISCHARGE, EVACUATE and CHARGE system. GO to **F4** .

PINPOINT TEST G: NO OPERATION IN ALL FUNCTION SETTINGS

G1 TEST FUSE

- Check fuse for continuity using Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Does fuse test OK?

Yes	No
GO to **G2** .	REPLACE fuse with another of equal amperage rating. RETEST system.

G2 TEST FEED CIRCUIT

- Turn ignition switch to RUN position.
- Place function control lever in any ON position.
- Check for voltage from instrument panel fuse to A/C control circuit.

Is voltage present?

Yes	No
GO to **G3** .	LOCATE and SERVICE open or short in circuit. RETEST system.

tomsn048@gmail.com

G3 TEST FUNCTION CONTROL SWITCH

- Turn ignition switch to RUN position.
- Place function control lever to any ON position.
- Test for voltage between function control and blower motor switch.

Is voltage present?

Yes	No
Condition is intermittent. ATTEMPT to recreate condition by wiggling wires, connectors, crimps, etc. Also CYCLE function control lever. SERVICE system fault as necessary.	REPLACE function control switch. RETEST system.

PINPOINT TEST H: BLOWER MOTOR DOES NOT OPERATE

H1 CHECK BLOWER MOTOR OPERATION

- Turn ignition switch to ON, function selector switch to FLOOR and blower knob to HI.

Does blower motor operate?

Yes	No
GO to **H2** .	GO to **H4** .

H2 CHECK BLOWER LO SPEED

- Rotate blower knob to LO.

Does blower motor operate?

Yes	No
WIGGLE wires and CHECK for intermittent operation. REPAIR if necessary.	GO to **H3** .

H3 CHECK BLOWER MOTOR RESISTOR

- CHECK heater blower motor switch resistor for continuity of coils and thermal limiter.

Is resistor good?

Yes	No
CHECK Circuit 261 (O/BK) from blower motor to	

tomsn048@gmail.com

heater blower motor switch resistor and if Aerostar, check Circuit 57 (BK) from heater blower motor switch resistor to ground. If Ranger, check Circuit 260 (R/O) from heater blower motor switch resistor for open or short to ground. REPAIR as necessary.	REPLACE heater blower motor switch resistor and CHECK blower motor operation.

H4 CHECK BLOWER MOTOR

- Turn ignition switch off.
- Ground Circuit 261 (O/BK) at the blower motor.
- Position function selector knob at FLOOR and turn key to RUN long enough to check for blower motor operation.

Does blower motor operate?

Yes	No
CHECK CIrcuit 261 (O/BK) between blower motor and the splice to blower motor switch and heater blower motor switch resistor for an open. REPAIR as necessary.	If Ranger, GO to **H5** . If Aerostar, GO to **H6** .

H5 CHECK THE BLOWER MOTOR RELAY

- Disconnect the blower motor relay.
- Perform the Relay component test for the blower motor relay. Refer to component test in this section.

Is the relay OK?

Yes	No
GO to **H6** .	REPLACE the blower motor relay. RETEST system.

H6 CHECK FUSE

- Check blower motor fuse.

Is fuse OK?

Yes	No
GO to **H7** .	GO to **H10** .

H7 CHECK THE CIRCUITS FOR VOLTAGE

tomsn048@gmail.com

- If Aerostar, disconnect the A/C heater control assembly.
- If Ranger, check Circuit 364 (BK/LG) between the blower motor relay and known good ground for both (BK/LG) wires when in the RUN position.
- If Aerostar, check Circuit 181 (BR/O) between the A/C heater control assembly and known good ground when in the RUN position.
- Measure voltage.

Is or are the voltage(s) 10 volts or greater?

Yes	No
GO to **H8** .	REPAIR circuit(s) as necessary. RETEST system.

H8 CHECK CIRCUIT 371 (PK/W) OR 249 (DB/LG)

- Disconnect the blower motor.
- If Aerostar, check Circuit 249 (DB/LG) between A/C heater control assembly and the blower motor for an open.
- If Ranger, check Circuit 371 (PK/W) between blower motor relay and blower motor for an open.

Is there an open?

Yes	No
SERVICE as necessary. RETEST system.	GO to **H9** .

H9 CHECK THE BLOWER MOTOR

- Perform the Blower Motor Check in this section.

Is the blower motor OK?

Yes	No
If Aerostar, REPLACE the A/C heater control. If Ranger, SERVICE Circuit 260 (R/O). If OK, REPLACE the A/C heater control. RETEST system.	REPLACE the blower motor. RETEST system.

H10 CHECK CIRCUIT(S) 364 (BK/LG) OR 181 (BR/O)

- If Aerostar, disconnect the A/C heater control.
- If Ranger, disconnect the blower motor relay.
- If Aerostar, check Circuit 181 (BR/O) for a short.
- If Ranger, check Circuit 364 (BK/LG) for a short.

Is there a short?

tomsn048@gmail.com

Yes	No
SERVICE as necessary. RETEST system.	If Ranger, GO to **H11**. If Aerostar, GO to **H12**.

H11 CHECK THE BLOWER MOTOR RELAY FOR NORMAL OPERATION

- Perform the Blower Motor Relay Check as discussed in this section.

Is the relay OK?

Yes	No
GO to **H12**.	REPLACE the blower motor relay. RETEST system.

H12 CHECK CIRCUIT 371 (PK/W) OR 249 (DB/LG)

- Disconnect blower motor.
- If Ranger, check Circuit 371 (PK/W) for a short between the blower motor and ground.
- If Aerostar, check Circuit 249 (DB/LG) for a short between the blower motor and ground.

Is there a short?

Yes	No
SERVICE as necessary. RETEST system.	If Ranger, REPLACE blower motor. RETEST system. If Aerostar, GO to **H13**.

H13 CHECK THE BLOWER MOTOR FOR A SHORT

- Reconnect blower motor.
- Place a jumper wire between the A/C heater control Circuit 181 (BR/O) and Circuit 249 (DB/LG).
- Turn the ignition to the RUN position. Do this for 10 seconds and turn off.

Does fuse 9 (30A) fail?

Yes	No
REPLACE the blower motor. RETEST system.	REPLACE the A/C heater control. RETEST system.

PINPOINT TEST J: BLOWER MOTOR RUNS CONSTANTLY

tomsn048@gmail.com

J1 TEST OPERATION

- Turn ignition switch to RUN position.
- Place function control lever in the OFF position.

Does blower motor run?

Yes	No
GO to **J2** .	System OK. EXPLAIN proper operation to owner.

J2 TEST FUNCTION CONTROL

- Remove A/C control from instrument panel far enough to gain access to electrical connectors.
- Turnignition switch to ON position.
- Place function control lever in the OFF position.
- Test for voltage using Rotunda 73 Digital Multimeter 105-R0051 or equivalent. Check Circuit 371 (PK/W) for Ranger, Circuit 249 (DB/LG) for Aerostar.

Is voltage present?

Yes	No
REPLACE function selector switch for Aerostar. REPLACE blower motor relay for Ranger. RETEST system.	CHECK all adjacent wiring and connectors for exposed wires. SERVICE as necessary.

PINPOINT TEST K: NO OPERATION IN LOW BLOWER SETTING

K1 TEST SYSTEM OPERATION

- Place function control lever in any ON position.
- Turn blower motor switch to LO position.
- Turn ignition switch to RUN position and listen for blower motor operation.

Does blower motor operate in LO speed?

Yes	No
System OK.	GO to **K2** .

K2 TEST BLOWER MOTOR SWITCH

- Perform the Heater Blower Motor Switch Components Test in this section.

tomsn048@gmail.com

NOTE: Make certain ignition is in OFF position while performing this test.

Does switch test as continuous?

Yes	No
GO to K3 .	REPLACE blower motor switch. RETEST system.

K3 TEST BLOWER MOTOR RESISTOR

- Turn ignition switch to OFF position.
- Test heater blower motor switch resistor for continuity using Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Does resistor test as continuous?

Yes	No
If Aerostar, LOCATE and SERVICE open in Circuit 260 (R/O) or Circuit 57 (BK). If Ranger, LOCATE and SERVICE open in Circuit 754 (LG/W).	REPLACE heater blower motor switch resistor.

PINPOINT TEST L: NO OPERATION IN MEDIUM BLOWER SETTING

L1 TEST SYSTEM OPERATION

- Place function control lever in any ON position.
- Turn ignition switch to RUN position.
- Cycle blower motor switch between MED/LOW and MED/HI. Listen for blower motor operation.

Does blower motor operate in MEDIUM settings?

Yes	No
System OK.	GO to L2 .

L2 TEST BLOWER MOTOR SWITCH

CAUTION: The ignition switch must remain in the OFF position while performing this test.

- Remove A/C control from instrument panel far enough to gain access to electrical connectors.
- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent to Circuit 57 (BK) and Circuit 752 (Y/R) (Ranger) or 269 (LB/O) (Aerostar).

tomsn048@gmail.com

- Position blower motor switch in the MED/HI position and check for continuity.
- Repeat test steps on Circuit 57 (BK) and 754 (LG/W) or 260 (R/O) with blower motor switch in the MED/LO position.

Does switch test as continuous?

Yes	No
GO to **L3** .	REPLACE blower motor switch. RETEST system.

L3 TEST BLOWER MOTOR RESISTOR

- Test heater blower motor switch resistor for continuity using Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Does resistor test as continuous?

Yes	No
LOCATE and SERVICE open in Circuit 754 (LG/W), Circuit 752 (Y/R) Circuit 269 (LB/O) or Circuit 260 (R/O). RETEST system.	REPLACE heater blower motor switch resistor. RETEST system.

PINPOINT TEST M: NO OPERATION IN HIGH BLOWER SETTING

M1 CHECK BLOWER MOTOR OPERATION

- Turn ignition switch to RUN, function selector knob to FLOOR and blower knob to first position from HI.

Does blower motor operate?

Yes	No
GO to **M2** .	GO to **M4** .

M2 CHECK BLOWER SPEED

- Turn blower knob to HI.

Does blower motor operate on HI?

Yes	No
CYCLE blower switch from HI to LO several times. If blower motor operates each time, ADVISE owner of system operation. If blower motor does not operate in HI each time,	GO to **M3** .

tomsn048@gmail.com

REPLACE blower switch.	

M3 CHECK BLOWER SWITCH

- Check continuity of blower switch.
- Perform the Heater Blower Motor Switch Component Test in this section.

Is switch continuous in all positions?

Yes	No
SERVICE Circuit 261 (O/BK).	REPLACE blower motor switch.

M4 CHECK BLOWER SPEEDS (LO/HI)

- With ignition in RUN and function selector knob at FLOOR, rotate blower knob to LO and then one position toward HI.

Does blower motor operate in both positions?

Yes	No
INSPECT harness connector at blower switch. REPLACE harness connector if damaged. If OK, REPLACE blower switch.	GO to **M5** .

M5 CHECK BLOWER SPEEDS (LO)

- Reference blower motor speeds in Step M4 .

Does blower motor operate in LO?

Yes	No
GO to **M6** .	REPLACE heater blower motor switch resistor.

M6 CHECK BLOWER SWITCH CONNECTOR

- Check to ensure connector is correctly and securely connected to blower switch.

Is connector properly attached to blower switch?

Yes	No
REPLACE blower switch.	RECONNECT and CHECK blower motor operation.

tomsn048@gmail.com

PINPOINT TEST N: NOISE WHILE OPERATING CLIMATE CONTROL SYSTEM

N1 CHECK CONNECTORS

- Check in-line and control assembly multiple connectors for proper connection.

Does hiss stop?

Yes	No
RECHECK system for proper operation.	GO to **N2** .

N2 DETERMINE LEAKING VALVE

- Rotate function knob to determine what A/C damper door switch positions are leaking.

Do all positions leak?

Yes	No
GO to **N3** .	GO to **N5** .

N3 CHECK SOURCE TUBE

- Check A/C vacuum tank hose (black) from A/C vacuum reservoir tank and bracket to control assembly for cut or disconnection.

Does hiss stop?

Yes	No
SERVICE A/C vacuum tank hose. RECHECK system for proper operation.	GO to **N4** .

N4 PINCH OFF SOURCE TUBE

- Pinch off A/C vacuum tank hose (black) at control assembly.

Does hiss stop?

Yes	No
REPLACE A/C damper door switch valve. RECHECK system for proper operation.	RECHECK A/C vacuum tank hose (black), connections, A/C vacuum reservoir tank and bracket and A/C vacuum check valve. SERVICE or REPLACE as required.

tomsn048@gmail.com

N5 DETERMINE LEAKING HOSE(S)

- Determine what color hose(s) is used in leaking A/C damper door switch position(s).
- Pinch off suspect hose(s), one at a time, near each respective vacuum control motor.

Does hiss stop?

Yes	No
CHECK hose connection to vacuum control motor and SERVICE and/or RECONNECT if loose or split. RECHECK for hiss. If hiss still continues, REPLACE vacuum control motor. RECHECK system for proper operation. **CAUTION: Never manually operate any vacuum control motor or vacuum control motor door — this may cause internal damage to the vacuum control motor diaphragm.**	GO to **N6** .

N6 PINCH OFF SUSPECT HOSE(S)

- Pinch off suspect hose(s), one at a time, near control assembly and/or in-line connector.

Does hiss stop?

Yes	No
CHECK hose for cut or damage. SERVICE as required. RECHECK system for proper operation.	REPLACE A/C damper door switch.

PINPOINT TEST P: NOISE WHILE NOT OPERATING CLIMATE CONTROL SYSTEM

P1 CHECK FOR NOISE SOURCE

- Visually inspect all drive belts and component mounting brackets for proper installation and tightness.
- Start engine and turn A/C system to the OFF position.
- Listen for source of noise.

Is hiss noise in climate control system?

Yes	No
GO to **P2** .	System operation OK at this time.

tomsn048@gmail.com

P2 CHECK CLIMATE CONTROL OPERATION

- Operate A/C control in all positions.
- Note the pitch and approximate source of noise.

Is the noise still present?

Yes	No
SERVICE leaking vacuum hose as necessary and/or REPLACE function select or switch.	System operation OK at this time.

tomsn048@gmail.com

Component Tests

Heater Blower Motor Switch

To test the heater blower switch for continuity, connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent and proceed with the following steps.

RANGER/AEROSTAR

To Test	Connect to Terminal		Move Switch to Position	A Good Switch Will Indicate
	Aerostar	Ranger		
Low Speed	57 (BK) 260 (R/O) 269 (LB/O) 261 (O/BK)	260 (R/O) 754 (LG/W) 752 (Y/R) 261 (O/BK)	LO	Open Circuit Open Circuit Open Circuit Open Circuit
Med/Low Speed	57 (BK) 260 (R/O) 269 (LB/O) 261 (O/BK)	260 (R/O) 754 (LG/W) 752 (Y/R) 261 (O/BK)	Med/Low	Open Circuit Closed Circuit Open Circuit Open Circuit
Med/High Speed	57 (BK) 260 (R/O) 269 (LB/O) 261 (O/BK)	260 (R/O) 754 (LG/W) 752 (Y/R) 261 (O/BK)	Med/High	Open Circuit Open Circuit Closed Circuit Open Circuit

Heater Core

Plugged Heater Core

Check to make sure the engine coolant is at the proper level, then start the engine and let it run until it is warmed to operating temperature. Turn on the heater, feel the inlet and outlet heater water hose (18472) connected to the heater core. If the inlet heater water hose is hot and outlet heater water hose is cooler, the heater core may be plugged.

Leak Test, Aerostar

tomsn048@gmail.com

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Heater Hose Disconnect Tool	T85T-18539-AH

1. Inspect for visible evidence of coolant leakage at the heater water hose to heater core. A coolant leak at the heater water hose could follow the tube on the heater core and appear as a leak in the heater core.

2. For front heater core, remove the heater water hoses at the heater core using Heater Hose Disconnect Tool T85T-18539-AH.

3. Check for damaged or missing O-rings. Replace if necessary and install heater water hoses by pushing heater water hose on tube until connector snaps in place over white heater hose quick connect couplings (18D434). Check tubes for damage. If damaged, replace heater core. Refer to Section 12-03B . Install heater water hoses.

4. For auxiliary core, check the system for loose heater hose clamps. The clamps should be tightened to 2-3 Nm (18-27 lb-in). If clamps are tight and leakage is found, check the heater core tubes for distortion. Severe distortion of the tubes could cause leakage at the hose connection. Replace heater core if necessary. Refer to Section 12-03D . Install heater water hoses.

Leak Test, Ranger

1. Inspect for visible evidence of coolant leakage at the heater water hoses to heater core. A coolant leak at the heater water hose could follow the heater core tube in the heater core and appear as a leak in the heater core.

2. Check the system for loose heater hose clamps. The clamps should be tightened to 2-3 Nm (18-27 lb-in).

3. If leakage is found and the hose clamps are tight, check the heater core tubes for distortion. Severe distortion of the tubes could cause leakage at the hose connection.

tomsn048@gmail.com

tomsn048@gmail.com

Pressure Test

1. Drain the coolant from the cooling system.

2. Disconnect the heater water hoses (18472) from the heater core (18476).

3. Install a short piece of heater water hose (approximately 101.6mm [4 inches] long) on each 19.05mm (3/4-inch) heater core coupling. Connect couplings to heater core.

4. Fill the heater core and heater water hoses with water and install Plug BT-7422-B and Adapter BT-7422-A from Rotunda Radiator/Heater Core Pressure Tester or equivalent in the ends. Secure the heater water hoses, plug and adapter with hose clamps.

5. Attach the Rotunda Radiator/Heater Core Pressure Tester or equivalent to the adapter. Close the bleed valve at the base of the gauge and pump 206kPa (30 psi) of air pressure into the heater core.

6. Observe the pressure gauge for a minimum of three minutes. The pressure should not drop.

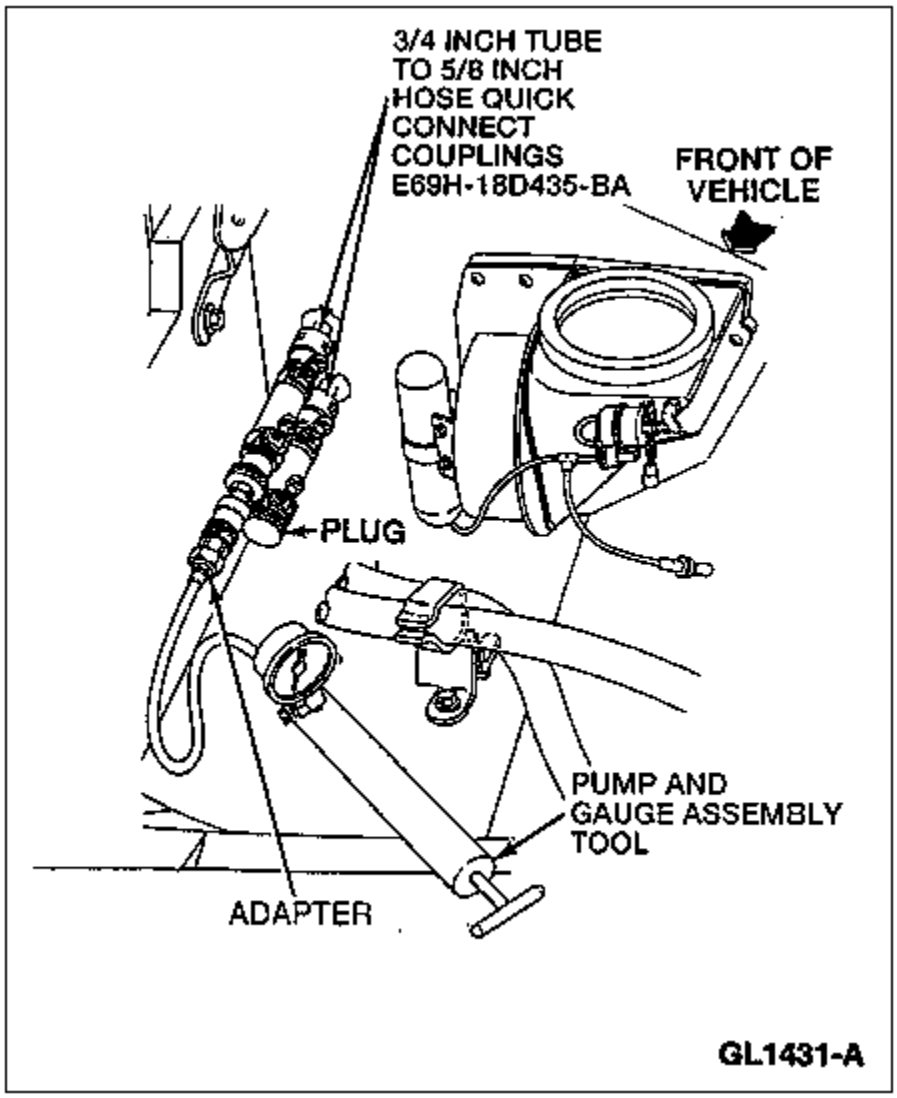
7. If the pressure does not drop, no leaks are indicated.

8. **NOTE: Severe distortion of the core tubes could cause leakage at the coupling connection; repair or replace as necessary.**

   If the pressure drops, check the coupling or hose connections to the core tubes for leaks. If the couplings or heater water hoses do not leak, remove the heater core from the vehicle and bench test the heater core.

Heater Core Leak Test (In-Vehicle)

tomsn048@gmail.com

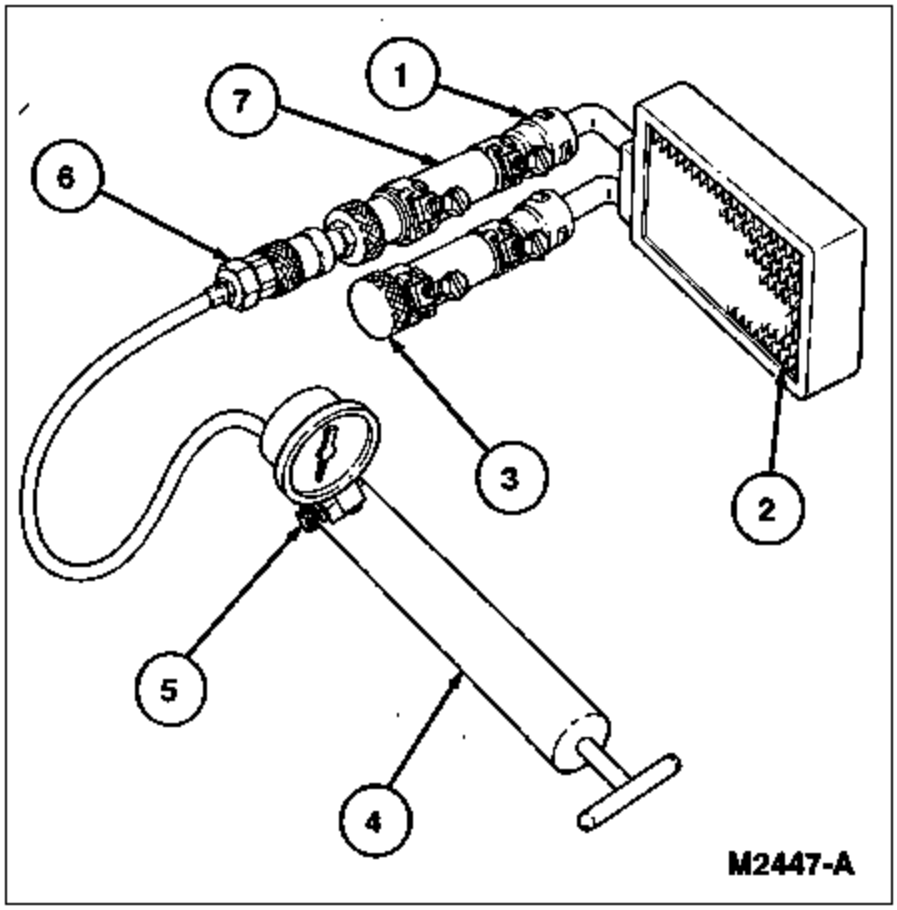


Bench Test

1. Drain all coolant from the heater core.
2. Connect the 101.6mm (4 in) test heater water hoses with plug and adapter to the core tubes. Then connect Rotunda Radiator/Heater Core Pressure Tester or equivalent to the adapter.
3. Apply 206 kPa (30 psi) of air pressure to the heater core with Rotunda Radiator/Heater Core Pressure Tester or equivalent and submerge the heater core in water.
4. If a leak is observed, repair or replace the heater core as necessary.

Heater Core Leak Test (On-Bench)

tomsn048@gmail.com



Item	Part Number	Description
1	18D435	3/4 Inch Tube to 5/8 Inch Hose Quick Connect Couplings
2	18476	Heater Core
3	7422	Plug
4	—	Radiator/Heater Core Pressure Tester
5	—	Bleed Valve
6	7422	Adapter
7	18472	Heater Water Hose

Leak Detector, Electronic

NOTE: Some vehicles may have signs of refrigerant oil at the spring lock couplers. This may be caused from the assembly process which applies oil to the fittings before installation to aid in assembly. When a spring lock coupler is suspected of leaking, always wipe the fitting clean and verify the leak with Rotunda R-134a Automatic Calibration Halogen Leak Detector 023-R1003 and Fluorescent Tracer Dye 164-R3704 and Tracer Dye Injector 164-R3711.

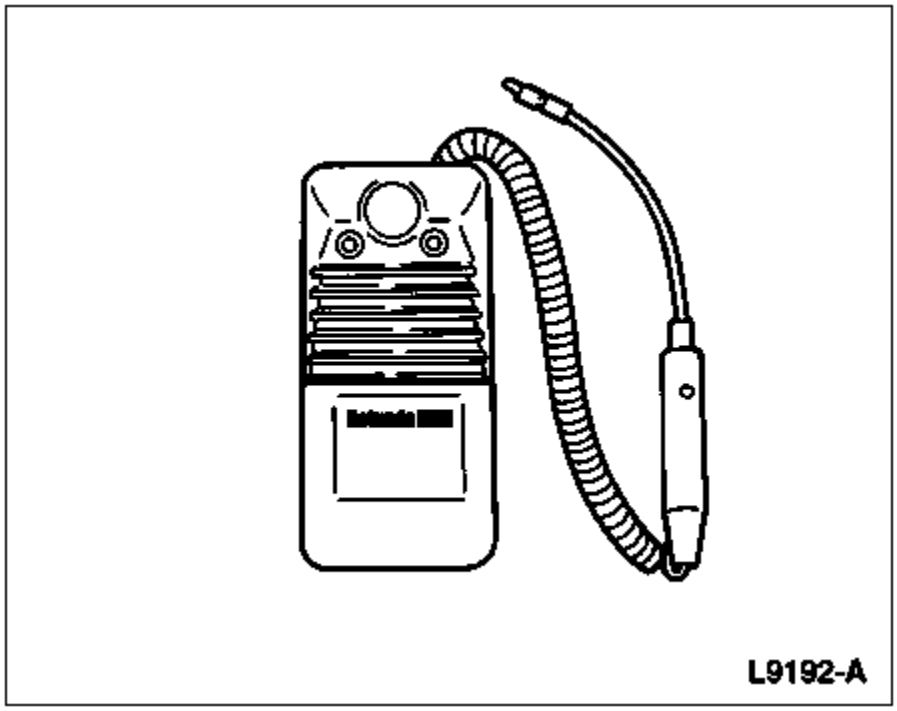
NOTE: All new systems contain detection dye. Leaks may be detected using ultra-violet light 164-

tomsn048@gmail.com

R0721.

Check all system connections, the compressor head gasket and shaft seal for leaks, using a good leak detector. Use Rotunda R-134a Automatic Calibration Halogen Leak Detector 023-R1003 or equivalent. Pass the leak detector along the underside of all points being checked. Refrigerant is heavier than air and will show most readily in those locations.

Operate leak detector according to manufacturer's directions.



Blower Motor

Current Draw Test

1. Disconnect the electrical wire harness from the blower motor (18527).

2. Connect ammeter such as Rotunda 73 Digital Multimeter 105-R0051 or equivalent, between the right (positive) terminal on the blower motor and the corresponding terminal of the wire harness connector. Connect a jumper wire between the left (ground) terminal on the blower motor and the corresponding terminal of the wire harness connector.

3. Place the system temperature control knob in the med-range position (halfway between COOL and WARM) and the function control knob in VENT position (air through registers).

4. With the battery fully charged, start the engine (6007) and operate the blower motor in all speeds. Record the current draw for each speed.

5. The current draw for each speed should be within the limits shown in Specifications at the end of this section.

tomsn048@gmail.com

6. Disconnect the ammeter and jumper wire, reconnect the harness connector to the blower motor.

7. Check the system for proper operation.

Open Circuit Test

Electrical circuits are used to control the blower motor.

The heater blower motor switch and heater blower motor switch resistor (18591) are connected between the blower motor and ground. Battery voltage is available at the blower motor whenever the ignition switch (11572) is ON.

On all electrical circuits, continuity must exist from the source of power (battery), to the unit where the power is used, and back up to the source of power (ground). A check at each connection in a circuit, starting at the battery, will locate an open circuit or will show that the circuit is complete. Refer to the electrical schematic in the applicable section.

An ohmmeter or self-powered test light connected at any two points of a circuit with the power removed from the circuit will show if the circuit between the two connections is open or continuous.

If the meter does not move, or has a slight movement, (high resistance), the circuit may have a poor connection or broken wire. If the bulb does not light, the circuit is open.

If the meter movement is great or full (low resistance), the circuit is complete. If the bulb lights, the circuit is continuous.

Blower Motor Resistor

The heater blower motor switch resistor contains a non-serviceable thermal limiter. If the heater blower motor switch resistor does not pass a continuity test, it must be replaced.

Relay Component Test

Testing of an ISO relay can be accomplished through the use of three No. 10 (or larger gauge) jumper wires and a Rotunda 73 Digital Multimeter 105-R0051 or equivalent. Remove (unplug) the relay to be tested from the power distribution box, fuse junction panel or individual connector.

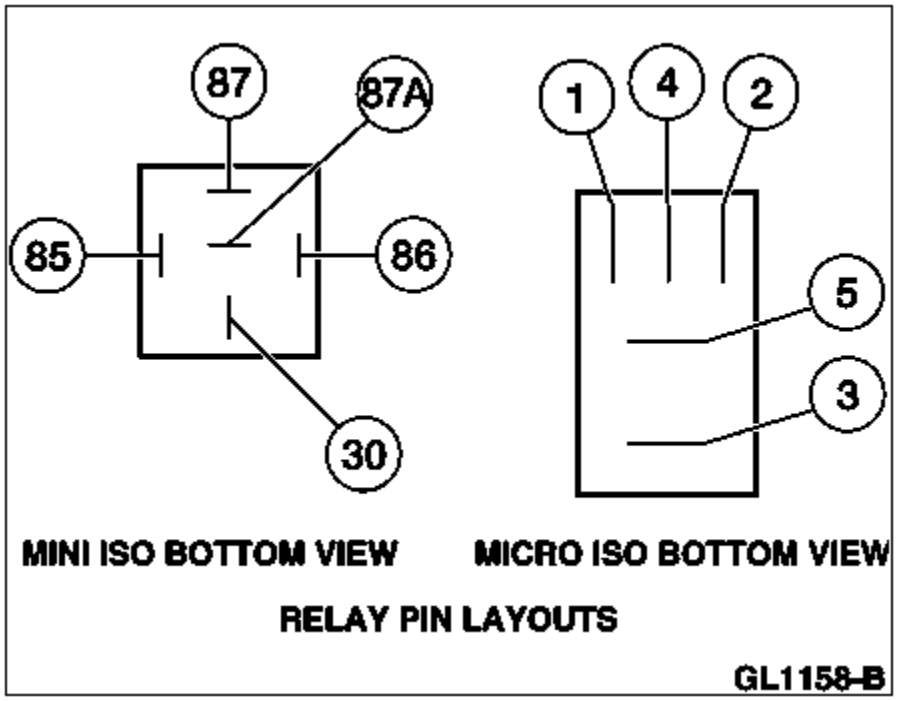
Mini ISO Relay

Using the multimeter, check for the continuity between terminal 85 and all other terminals. If resistance is 5 ohms or less between terminal 85 and any other terminal, replace the relay. If resistance is greater than 5 ohms, continue with the test. Using two jumper wires, connect relay terminals 86 and 30 directly to the positive battery terminal. Using the multimeter set in volts position, check for voltage at terminal 87A. If battery voltage is not indicated, replace the relay. If battery voltage is indicated, connect a third jumper wire to terminal 85 and ground the jumper wire to a known good ground. Check for voltage at terminal 87. If battery voltage is not indicated, replace the relay.

Micro ISO Relay

tomsn048@gmail.com

Using the multimeter, check for the continuity between terminal 2 and all other terminals. If resistance is 5 ohms or less between terminal 2 and any other terminal, replace the relay. If resistance is greater than 5 ohms, continue with the test. Using two jumper wires, connect relay terminals 1 and 3 directly to the positive battery terminal. Using the multimeter set in volts position, check for voltage at terminal 4. If battery voltage is not indicated, replace the relay. If battery voltage is indicated, connect a third jumper wire to terminal 2 and ground the jumper wire to a known good ground. Check for voltage at terminal 5. If battery voltage is not indicated, replace the relay.



tomsn048@gmail.com

A/C System Check — Retail Procedure

NOTE: This Retail Procedure is not eligible for claiming on Ford paid repairs (warranty and ESP).

WARNING: CARBON MONOXIDE IS COLORLESS, ODORLESS AND DANGEROUS. IF IT IS NECESSARY TO OPERATE THE ENGINE WITH THE VEHICLE IN A CLOSED AREA SUCH AS A GARAGE, ALWAYS USE AN EXHAUST COLLECTOR TO VENT THE EXHAUST GASES OUTSIDE THE CLOSED AREA.

WARNING: R-134A IS CLASSIFIED AS A SAFE REFRIGERANT, BUT MISUSE CAN MAKE IT DANGEROUS. THE FOLLOWING PRECAUTIONS MUST BE OBSERVED:

- **ALWAYS WEAR SAFETY GOGGLES WHEN REPAIRING AN AIR CONDITIONING SYSTEM.**
- **AVOID CONTACT WITH LIQUID R-134A. R-134A VAPORIZES AT APPROXIMATELY -25 DEGREES C (-13 DEGREES F) UNDER ATMOSPHERIC PRESSURE AND IT WILL FREEZE SKIN TISSUE.**
- **NEVER ALLOW REFRIGERANT R-134A GAS TO ESCAPE IN QUANTITY IN AN OCCUPIED SPACE. R-134A IS NON-TOXIC, BUT IT WILL DISPLACE THE OXYGEN NEEDED TO SUPPORT LIFE.**
- **NEVER USE A TORCH IN AN ATMOSPHERE CONTAINING R-134A GAS. R-134A IS NON-TOXIC AT ALL NORMAL CONDITIONS, BUT WHEN IT IS EXPOSED TO HIGH TEMPERATURES, SUCH AS A TORCH FLAME, IT DECOMPOSES. DURING DECOMPOSITION IT RELEASES IRRITATION AND TOXIC GASES (AS DESCRIBED IN THE MSDS SHEET FROM THE MANUFACTURER). DECOMPOSITION PRODUCTS ARE HYDROFLUORIC ACID, CARBON DIOXIDE, AND WATER.**
- **DO NOT ALLOW ANY PORTION OF THE CHARGED AIR CONDITIONING SYSTEM TO BECOME TOO HOT. THE PRESSURE IN AN AIR CONDITIONING SYSTEM RISES AS THE TEMPERATURE RISES AND TEMPERATURES OF APPROXIMATELY 85 DEGREES C (185 DEGREES F) CAN BE DANGEROUS.**
- **ALLOW THE ENGINE TO COOL SUFFICIENTLY PRIOR TO CARRYING OUT MAINTENANCE OR SERIOUS BURNS AND INJURY CAN OCCUR.**

WARNING: AVOID CONTACT OF LIQUID R-12 WITH SKIN AND EYES. AT NORMAL ATMOSPHERIC PRESSURES AND TEMPERATURES, R-12 EVAPORATES SO QUICKLY THAT IT HAS THE TENDENCY TO FREEZE ANYTHING IT CONTACTS. SHOULD LIQUID REFRIGERANT COME IN CONTACT WITH THE EYES, IMMEDIATELY WASH WITH A FEW DROPS OF MINERAL OIL FOLLOWED BY A WEAK BORIC ACID SOLUTION. CONTACT A PHYSICIAN IMMEDIATELY.

WARNING: ALWAYS WEAR SAFETY GOGGLES WHEN SERVICING ANY PART OF THE REFRIGERANT SYSTEM. R-12 IS ALWAYS UNDER PRESSURE. BECAUSE THE SYSTEM IS TIGHTLY SEALED, HEAT APPLIED TO ANY PART OF THE SYSTEM WILL CAUSE EXCESSIVE PRESSURE BUILDUP. TO AVOID A DANGEROUS EXPLOSION, NEVER WELD, USE A BLOW TORCH, SOLDER, STEAM CLEAN, BAKE BODY FINISHES OR USE AN EXCESSIVE AMOUNT OF HEAT ON OR IN THE IMMEDIATE AREA OF ANY PART OF THE AIR COOLING SYSTEM OR REFRIGERANT SUPPLY TANK, WHILE CLOSED TO ATMOSPHERE, WHETHER FILLED WITH REFRIGERANT OR NOT.

WARNING: LIQUID REFRIGERANT EVAPORATES RAPIDLY, DISPLACING AIR WHERE THE REFRIGERANT IS RELEASED. TO PREVENT POSSIBLE SUFFOCATION IN ENCLOSED AREAS, DISCHARGE THE REFRIGERANT FROM AN AIR COOLING SYSTEM INTO THE GARAGE EXHAUST

tomsn048@gmail.com

COLLECTOR. MAINTAIN GOOD VENTILATION SURROUNDING THE WORK AREA.

WARNING: ALTHOUGH R-12 GAS, UNDER NORMAL CONDITIONS, IS NON-POISONOUS, THE DISCHARGE OF REFRIGERANT GAS NEAR AN OPEN FLAME CAN PRODUCE A VERY POISONOUS GAS. IT IS GENERATED WHEN THE FLAME-TYPE LEAK DETECTOR IS USED. AVOID INHALING FUMES FROM THE LEAK DETECTOR. MAKE CERTAIN THAT R-12 IS STORED AND INSTALLED IN ACCORDANCE WITH ALL STATE AND LOCAL ORDINANCES.

CAUTION: To avoid damaging the vehicle or A/C components, the following precautions must be observed:

- **The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.**
- **Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These two types of refrigerant must never be mixed. Doing so can damage the A/C system.**
- **Charge the A/C system with the engine running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.**
- **R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.**
- **A number of manufacturers are producing alternative refrigerant products that are designed to be used instead of R-134a refrigerant. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.**

CAUTION: To avoid contamination of the A/C system, always observe the following:

- **Keep service tools and the work area clean.**
- **Never open or loosen a connection before discharging the system.**
- **When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.**
- **Evacuate a system that has been opened to install a new component or one that has been discharged through leakage before charging.**
- **Seal an open fitting with a cap or plug immediately after disconnecting a component from the system.**
- **Clean the outside of the fittings thoroughly before disconnecting a component from the system.**
- **Do not remove the sealing caps from a new component until ready to install.**
- **Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use, and install the cap immediately after using. Store the oil in a clean, moisture-free container.**
- **Install a new O-ring seal before connecting an open fitting. Coat the fitting and the O-ring seal with refrigerant oil before connecting.**
- **When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.**
- **Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.**

CAUTION: A number of manufacturers are producing refrigerant products which are described as being direct replacements for R-12. The use of any unauthorized substitute refrigerant may

tomsn048@gmail.com

severely damage the A/C components. If service is required, use only new or recycled R-12.

NOTE: The engine should be run at idle for 10 minutes with the air conditioning on and set to MAX A/C before carrying out this retail procedure.

1. Visual inspection

   Open the hood and visually inspect the heating and air conditioning systems for the following:

   - Coolant reservoir for correct coolant level.
   - Heater hoses for deterioration or loose connections.
   - Radiator and condenser for debris or damaged fins restricting airflow, loose mounting or connections.
   - Accessory drive belt(s) and cooling fan(s) for wear or physical damage.
   - Refrigerant lines and connections for physical damage or loose connections.
   - Compressor for physical damage or loose connections.
   - Suction accumulator/drier for physical damage or loose connections.
   - Wiring and connectors for excessive wear, loose or damaged connections, or incorrect routing.

2. A/C refrigerant analysis

   - Carry out air conditioning refrigerant analysis as outlined in TSB # 98-12-08.
   - If the refrigerant fails the analysis, discontinue diagnosis and make recommendations for repairs.
   - If the refrigerant passes the analysis, carry out the air conditioning system check.

3. Air conditioning system check

   - Connect manifold gauge set or charging station with gauges to refrigerant system.
   - With the vehicle in park, parking brake set, thermometer installed in center panel vent, and air conditioning system on and set to MAX A/C, start the engine.
   - Record air refrigerant system pressures while running the engine at 1500 RPM and allow engine to return to idle.
   - Operate the blower motor in all control positions and check for correct blower speed changes.
   - With the blower motor on HI, operate air discharge mode selector in all positions and check for correct airflow in each position.
   - Operate the temperature blend selector in all positions and check for correct change in discharge temperature. Check the air discharge temperature with the selector in the coolest position and the air conditioning on and set to MAX A/C to determine if the air discharge temperature is acceptable for the current ambient air temperature.
   - Carry out the EATC self-test (if applicable).

   If the refrigerant system pressures were low, carry out the refrigerant system leak test.

4. Refrigerant system leak test

   - Pre-1995 vehicles - Use an electronic leak detector to check for leaks at all refrigerant lines, connections, and components.
   - 1995 and newer vehicles - Use either an ultraviolet (UV) or an electronic leak detector to check for leaks at all refrigerant lines, connections, and components.

   After all tests have been completed, report all findings and recommended repairs to your service advisor before carrying out further diagnostic procedures.

tomsn048@gmail.com

tomsn048@gmail.com

A/C System Flushing

WARNING: USE EXTREME CARE AND OBSERVE ALL SAFETY AND SERVICE PRECAUTIONS RELATED TO THE USE OF REFRIGERANTS.

WARNING: DUE TO REFRIGERANT HAZARDS. ALWAYS WEAR SAFETY GOGGLES AND NON-PENETRABLE GLOVES WHEN WORKING ON OR FLUSHING A/C SYSTEMS.

CAUTION: A/C Refrigerant Analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that performed the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.

CAUTION: Suction accumulator/drier, muffler, hoses, thermal expansion valve, and fixed orifice tube should be removed when flushing the A/C system. Internal plumbing of these devices makes it impossible to properly remove any residual-flushing agent. Except for the hoses, these components are typically discarded after A/C system contamination. Hoses can normally be reused unless they are clogged with debris. The 3.78 liters (1 gal) of Ford A/C Flushing Solvent F4AZ-19579-A and FL1-A filter used in A/C Flusher, 219-00002 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.

1. **NOTE: Prior to using the A/C Flusher, 219-00002 for the first time, review the operating instructions.**

   NOTE: Only the A/C Flusher Kit,219-00002 which includes A/C Flusher, A/C Flusher Fitting Kit and the Ford Part number F4AZ-19579-A A/C system Flushing Solvent, is approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers. Use of any other Flusher or solvent may cause damage to the A/C system and the flushing unit.

   Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers, A/C evaporator core, A/C condenser core. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor and/or desiccant failure within the suction accumulator/drier and gummy residue that may form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a two step procedure that involves the use of an A/C Flusher, 219-00002 to:

   - Circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
   - Remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and/or evaporate any remaining flush solvent from the heat exchanger.

tomsn048@gmail.com

2. Discharge the A/C system. Observe all safety precautions. For additional information, refer to the procedure in this section.

3. Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

4. Connect the A/C Flusher, 219-00002 and A/C System Flusher Fitting Kit to the heat exchanger to be flushed. Do not flush through the A/C evaporator core orifice, mufflers or hoses. Internal plumbing and material make-up of these components make it impossible to properly remove debris and/or residual flushing solvent.

5. Use four liters (one gallon) of Ford A/C Flushing part number F4AZ-195790A to flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent is intended for one vehicle only. The filter is used on the flushing unit is also intended for use on one vehicle only.

6. Flush the component for a minimum of 15 minutes.

7. Apply 621-862 kPa (90-125psi) pressurized air to the component for a minimum of 30 minutes. The 30-minute purger time is required to force and/or evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal emissions.

8. **NOTE: A/C system filtering as described in this section is optional if system flushing is performed. However, the filter kit use is recommended after flushing if the A/C system contamination is extensive.**

   Replace the A/C evaporator core orifice in any vehicle being serviced for A/C compressor or desiccant failure.

9. Replace the refrigerant hoses if clogged with debris.

10. Reconnect the heat exchanger being serviced.

11. Add additional refrigerant oil as required. For additional information, refer to the procedure in this section.

12. Evacuate, leak test and charge the A/C system. For additional information, refer to the procedure in this section

13. Check the system for proper operation.

---

tomsn048@gmail.com

Refrigerant System Tests

The following test conditions must be established to obtain accurate pressure readings:

- Run engine (6007) at 1500 rpm for 10 minutes.
- Operate air conditioning system on MAX air conditioning (recirculating air).
- Run blower motor (18527) at HI speed.
- Stabilize vehicle interior temperature at 21°C to 2 7°C (70°F to 80°F).

Service Access Gauge Port Valves

When attaching Rotunda R-134a Manifold Gauge Set 176-R032A or equivalent with quick disconnects Rotunda 176-R0026 and 176-R0027 or equivalents to the system, the low pressure gauge hose must be connected to the service access gauge port valve on top of the suction accumulator/drier (19C836). The high pressure service access gauge port valve is located in the discharge line near the A/C condenser core (19712).

Diagnosis of the refrigerant system must be done by analyzing the high pressure readings in the charts shown to determine if the system pressures are normal. The conditional requirements for the refrigerant systems tests must be satisfied to obtain accurate pressure readings.

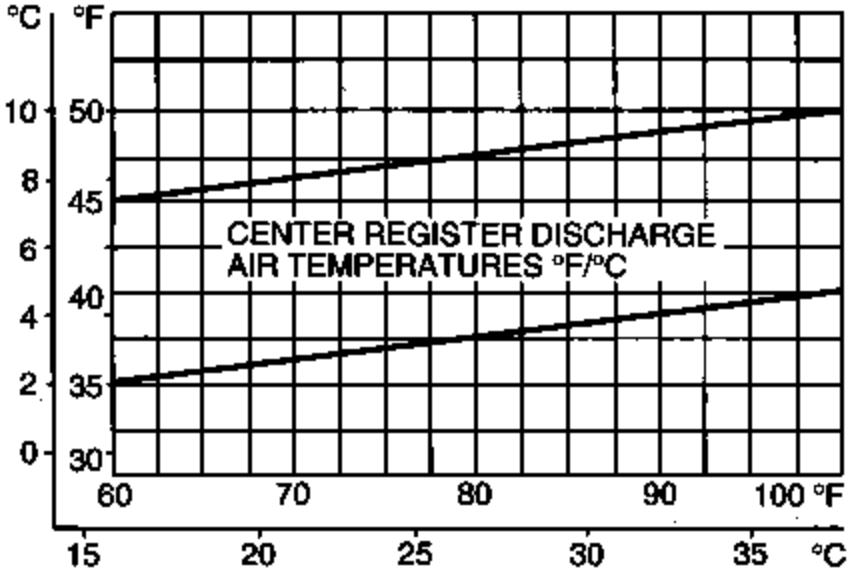
Normal Cycling, Refrigerant System Center Register Temperature Range

tomsn048@gmail.com

THESE CONDITIONAL REQUIREMENTS FOR THE CYCLING SYSTEM TESTS MUST BE SATISFIED TO OBTAIN ACCURATE PRESSURE READINGS.

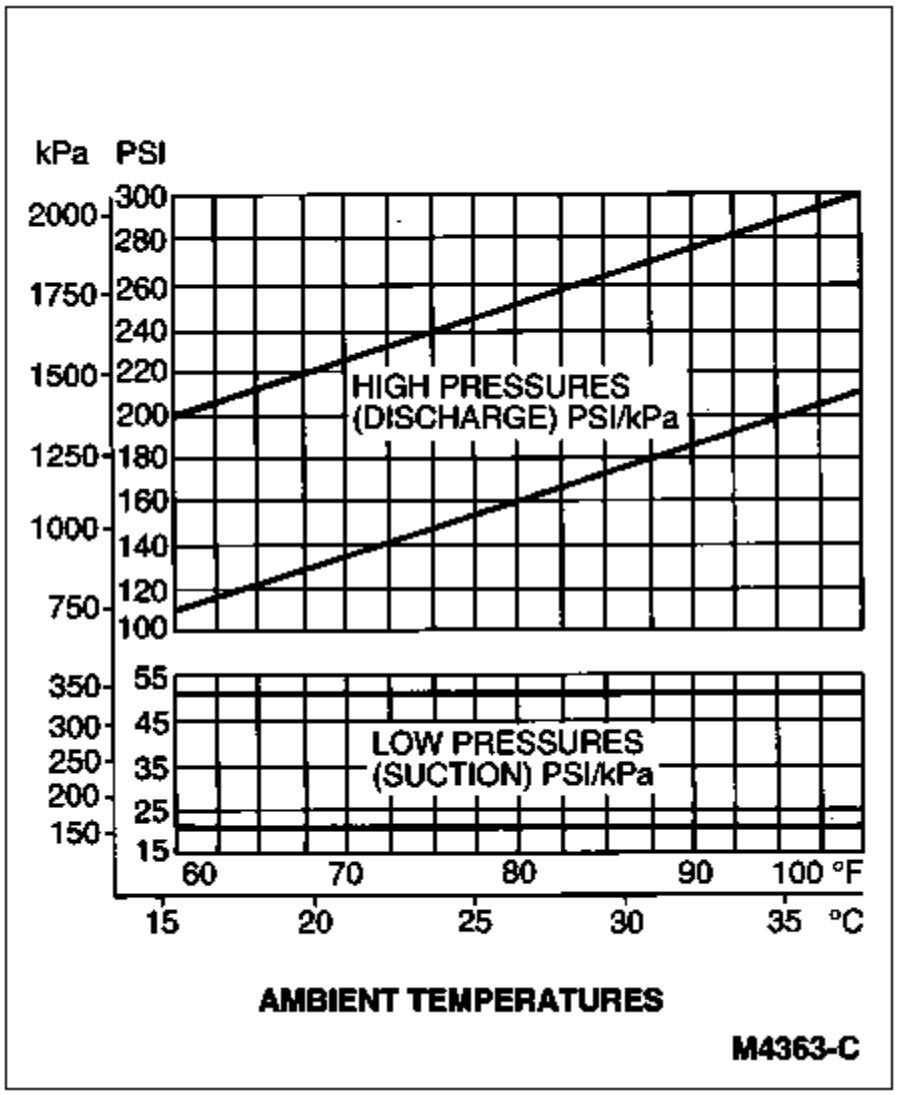
- STABILIZED PRESSURES
- STABILIZED IN VEHICLE TEMPERATURES @ 70° TO 80°F (21° TO 27°C)
- MAXIMUM AIR CONDITIONING (RECIRCULATING AIR)
- MAXIMUM SPEED OF HEATER BLOWER MOTOR
- 1500 ENGINE RPM

NORMAL CENTER REGISTER DISCHARGE TEMPERATURES



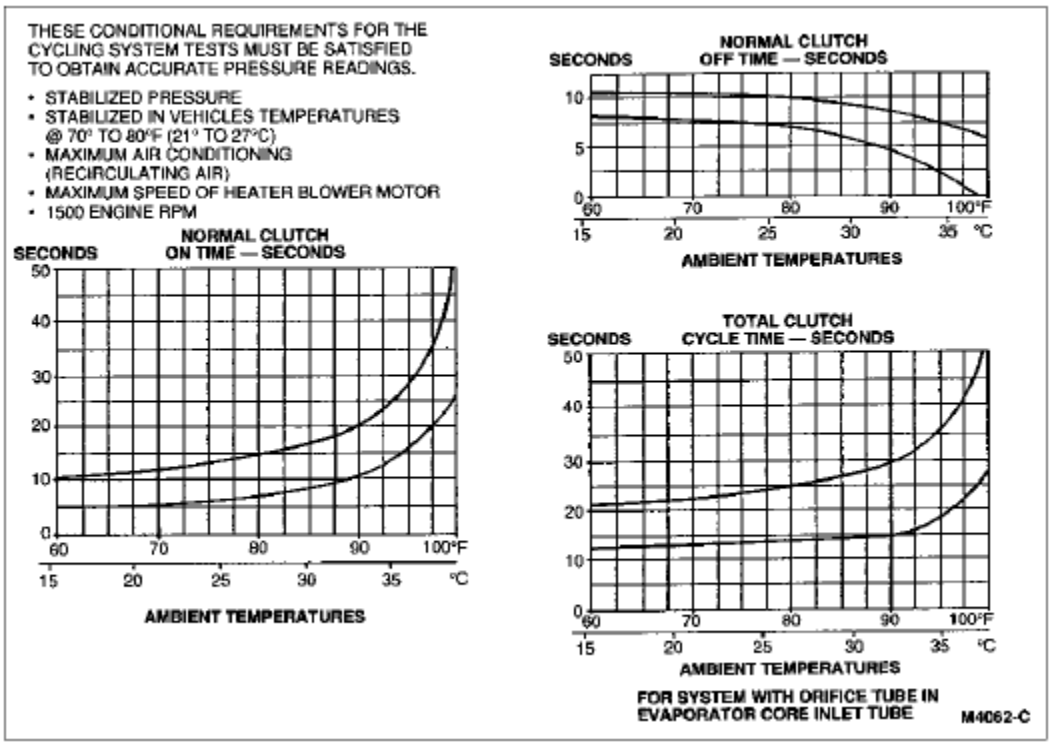
Normal Cycling, Refrigerant System Pressure Ranges

tomsn048@gmail.com



Normal On, Off and Total Cycling Time-Per-Second

tomsn048@gmail.com



Refrigerant System Pressure and Timing Evaluation Chart

tomsn048@gmail.com

NOTE: SYSTEM TEST REQUIREMENTS MUST BE MET TO OBTAIN ACCURATE TEST READINGS FOR EVALUATION. REFER TO THE NORMAL REFRIGERANT SYSTEM PRESSURE/TEMPERATURE AND THE NORMAL CLUTCH CYCLE RATE AND TIMES CHARTS.

HIGH (DISCHARGE) PRESSURE	LOW (SUCTION) PRESSURE	CLUTCH CYCLE TIME			COMPONENT – CAUSES
		RATE	ON	OFF	
HIGH	HIGH	CONTINUOUS RUN			CONDENSER – Inadequate Airflow
HIGH	NORMAL TO HIGH				ENGINE OVERHEATING
NORMAL TO HIGH	NORMAL				REFRIGERANT OVERCHARGE (a). AIR IN REFRIGERANT. HUMIDITY OR AMBIENT TEMP. VERY HIGH (b).
NORMAL	HIGH				FIXED ORIFICE TUBE – Missing O-Rings Leaking/Missing
NORMAL	NORMAL	SLOW OR NO CYCLE	LONG OR CONTINUOUS	NORMAL OR NO CYCLE	MOISTURE IN REFRIGERANT SYSTEM. EXCESSIVE REFRIGERANT OIL
NORMAL	LOW	SLOW	LONG	LONG	CLUTCH CYCLING SWITCH – Low Cut-Out
NORMAL TO LOW	HIGH	CONTINUOUS RUN			Compressor – Low Performance
NORMAL TO LOW	NORMAL TO HIGH				A/C SUCTION LINE – Partially Restricted or Plugged (c)
NORMAL TO LOW	NORMAL	FAST	SHORT	NORMAL	EVAPORATOR – Low or Restricted Airflow
			SHORT TO VERY SHORT	NORMAL TO LONG	CONDENSER, FIXED ORIFICE TUBE, OR A/C LIQUID LINE – Partially Restricted or Plugged
			SHORT TO VERY SHORT	SHORT TO VERY SHORT	LOW REFRIGERANT CHARGE
			SHORT TO VERY SHORT	LONG	EVAPORATOR CORE – Partially Restricted or Plugged
NORMAL TO LOW	LOW	CONTINUOUS RUN			A/C SUCTION LINE – Partially Restricted or Plugged (d). CLUTCH CYCLING SWITCH – Sticking Closed
ERRATIC OPERATION OR COMPRESSOR NOT RUNNING		–	–	–	CLUTCH CYCLING SWITCH – Dirty Contacts or Sticking Open. POOR CONNECTION AT A/C CLUTCH CONNECTOR OR CLUTCH CYCLING SWITCH CONNECTOR. A/C ELECTRICAL CIRCUIT ERRATIC – See A/C Electrical Circuit Wiring Diagram.

ADDITIONAL POSSIBLE CAUSE COMPONENTS ASSOCIATED WITH INADEQUATE COMPRESSOR OPERATION

- COMPRESSOR DRIVE BELT – Loose
- COMPRESSOR CLUTCH – Slipping
- CLUTCH COIL Open – Shorted, or Loose Mounting
- CONTROL ASSEMBLY SWITCH – Dirty Contacts or Sticking Open
- CLUTCH WIRING CIRCUIT – High Resistance, Open or Blown Fuse
- COMPRESSOR OPERATION INTERRUPTED BY ENGINE COMPUTER

ADDITIONAL POSSIBLE CAUSE COMPONENTS ASSOCIATED WITH A DAMAGED COMPRESSOR

- CLUTCH CYCLING SWITCH – Sticking Closed or Compressor Clutch Seized
- SUCTION ACCUMULATOR DRIER – Refrigerant Oil Bleed Hole Plugged
- REFRIGERANT LEAKS

(a) Compressor may make noise on initial run. This is slugging condition caused by excessive liquid refrigerant.
(b) Compressor clutch may not cycle in ambient temperatures above 80°F depending on humidity conditions.
(c) Low pressure reading will be normal to high if pressure is taken at accumulator and if restriction is downstream of service access valve.
(d) Low pressure reading will be low if pressure is taken near the compressor and restriction is upstream of service access valve.

M4063-A

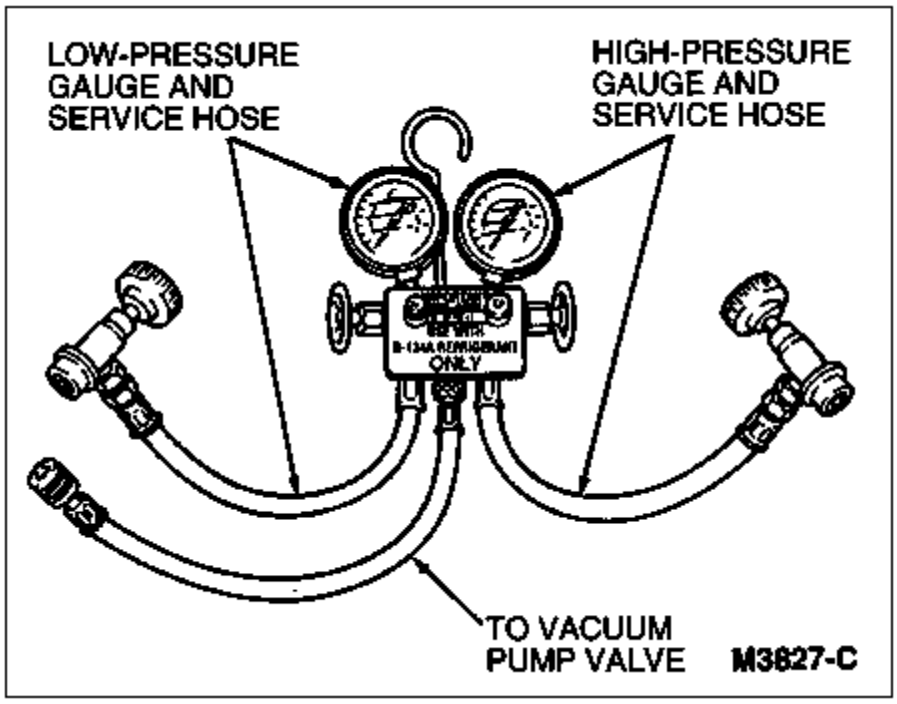
Checking for A/C Leaks

Avoid breathing A/C refrigerant and lubricant vapor or mist. If accidental system discharge occurs, ventilate the work area before resuming service.

WARNING: GOOD VENTILATION IS NECESSARY IN THE AREA WHERE A/C LEAK TESTING IS TO BE DONE. IF THE SURROUNDING AIR IS CONTAMINATED WITH REFRIGERANT GAS, THE LEAK DETECTOR WILL INDICATE THIS GAS ALL THE TIME. ODORS FROM OTHER CHEMICALS SUCH AS ANTIFREEZE, DIESEL FUEL, DISC BRAKE CLEANER OR OTHER CLEANING SOLVENTS CAN CAUSE THE SAME CONCERN. A FAN, EVEN IN A WELL-VENTILATED AREA, IS VERY HELPFUL IN REMOVING SMALL TRACES OF AIRBORNE CONTAMINATION THAT MIGHT AFFECT THE LEAK DETECTOR.

Attach the Rotunda R-134a Service Center 176-00001 or equivalent to the system. Leave both manifold gauge valves at the maximum open position. Both gauges should show approximately 413-551 kPa (60-80 psi) at 24°C (75°F) with engine not running.

tomsn048@gmail.com

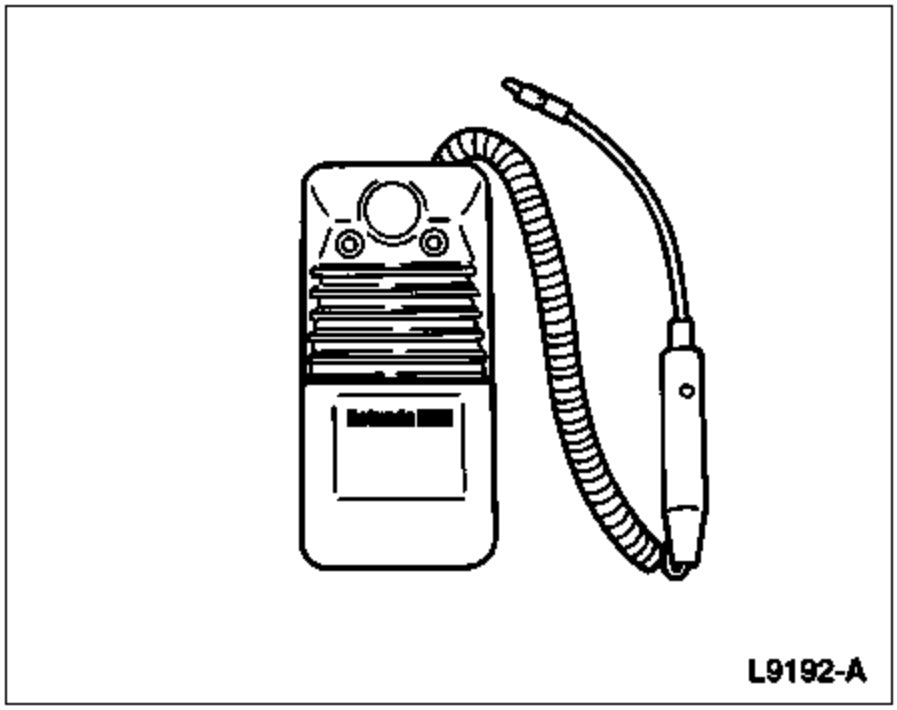


Leak Detector, Electronic

Check all system connections, the compressor head gasket and shaft seal for leaks, using a good leak detector. Use Rotunda R-134a Automatic Calibration Halogen Leak Detector or equivalent. Pass the leak detector along the underside of all points being checked. Refrigerant is heavier than air and will show most readily in those locations.

Operate leak detector according to manufacturer's directions.

tomsn048@gmail.com



tomsn048@gmail.com

A/C Evaporator Core and/or A/C Condenser Core

When performing leak tests of the A/C evaporator core (19860) with an electronic leak detector, test only at the evaporator core drain tube and the evaporator core refrigerant line connections. Do not attempt to leak test at the instrument panel A/C registers or inside the passenger compartment. Airflow from the blower motor (18527) and/or chemical odors inside the vehicle may cause false readings. This is especially important after the vehicle has sat in the sun and the interior temperature has risen above the ambient level.

If an A/C evaporator core leak is suspected, the leak test procedure should be performed before replacing the A/C evaporator core. Use of this leak test procedure will help to prevent unnecessary replacement of non-leaking A/C evaporator cores. If a leak is indicated at a refrigerant line connection to the A/C evaporator core, remove the refrigerant from the system and disassemble the fitting. Clean the fitting components and inspect for damage. Service as necessary.

NOTE: Use the previous procedure to also test the A/C condenser core (19712).

On-Vehicle Leak Test

Disconnect the liquid line and suction accumulator/drier (19C836) from the evaporator core tubes. **DO NOT** leak test an A/C evaporator core with the suction accumulator/drier attached to the A/C evaporator core. If the evaporator core tube fittings are the female spring lock design, check the inside of each fitting if possible for scratches and/or corrosion. If scratches or corrosion are found, the leak test results may not be accurate if a leak is indicated because of possible leaks at the fitting(s).

Connect the appropriate test fittings from Test Adapter Set D93L-19703-B or equivalent to the evaporator tube connections. Then, connect the gauge set RED and BLUE hoses to the test fittings. Connect the YELLOW gauge set hose to a known quality vacuum pump.

Before leak testing the A/C evaporator core, attach the high-side and low-side manifold gauge set hoses together and apply vacuum to verify the manifold gauge set and the hoses do not leak.

NOTE: The automatic shutoff valves on some gauge set hoses do not open when connected to the test fittings. Use hoses without shutoff valves if available. If hoses with shutoff valves are used, check to be sure the valve opens when attached to the test fittings before installing the fittings and proceeding with the leak test. The test is not valid if the shutoff valve does not open because only the hose will be tested.

Open both gauge set valves and start the vacuum pump. Turn the blower motor on low and allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low pressure gauge indicates 30 in-Hg. This evacuation is necessary to remove any refrigerant from oil left in the A/C evaporator core. If the refrigerant is not completely removed from the oil, gassing will occur and degrade the vacuum and appear as a refrigerant leak. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge. It should remain at the 30 mark.

NOTE: Use only a known quality vacuum pump. Make sure pump is maintained according to manufacturer's directions.

If the low-pressure gauge reading will not drop to 30 in-Hg when the valves are open and the vacuum pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before replacing the A/C evaporator core.

tomsn048@gmail.com

If the low pressure gauge reading rises 10 or more inches of vacuum from the 30 inch position in ten minutes, a leak is indicated. If a small leak is suspected, wait 30 minutes and observe the vacuum gauge. If a small amount of vacuum is lost, operate the vacuum pump with the gauge valves open for an additional 45 minutes with the system blower motor on low to remove any remaining refrigerant from the oil in the A/C evaporator core. Then, recheck for loss of vacuum. If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss. Always remember that a leaking fitting, gauge set or hose connection will appear as a leaking A/C evaporator core.

If a vehicle passes the vacuum leak test and is returned within 60 days for loss of cooling due to no refrigerant charge, look elsewhere in the system for refrigerant leaks such as the compressor shaft seal or refrigerant line connections.

---

tomsn048@gmail.com

A/C Compressor

A/C Manifold and Tube Leak Test

1. Tighten the manifold retaining bolt to 17-23 Nm (12-17 lb-ft).
2. Add refrigerant to the system if necessary.
3. Leak test the manifold O-ring seals using Rotunda R-134a Automatic Calibration Halogen Leak Detector or equivalent.
4. If no leaks are found, the manifold O-ring seals are good.
5. If a leak is found at the manifold and the manifold attaching bolt is tightened to 18-23 Nm (13-17 lb-ft), install new manifold O-ring seals. Then, repeat the leak test.

External Leak Test

1. If the A/C compressor (19703) is on the vehicle, discharge the system. Remove the A/C compressor from the vehicle. Observe all safety precautions.
2. Remove the manifold retaining bolt and remove the manifold from the rear head of the A/C compressor. Install pressure test adapter on the rear head of the A/C compressor using the existing manifold attaching bolt.
3. Connect the high and low pressure lines of Rotunda R-134a Manifold Gauge Set 176-R032A or equivalent to the corresponding fittings on the pressure test adapter.
4. Attach the center hose of the manifold gauge set to a refrigerant container standing in an upright position.
5. Using the clutch hub, hand-rotate the A/C compressor shaft ten revolutions to distribute the oil inside the A/C compressor.
6. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.
7. Using Rotunda R-134a Automatic Calibration Halogen Leak Detector or equivalent check for leaks at the compressor shaft seal and the compressor center seal.
8. If a shaft seal leak is found, install a new shaft seal. If an external leak is found at the center joint of the A/C compressor, install a new A/C compressor assembly.
9. When the leak test is completed, close the manifold gauge valves (both high and low) as well as the valve on the refrigerant container.
10. Slowly remove the gauge set hoses from the pressure test fitting tool. (Allow the refrigerant to escape from the compressor).
11. Install the A/C compressor on the vehicle.

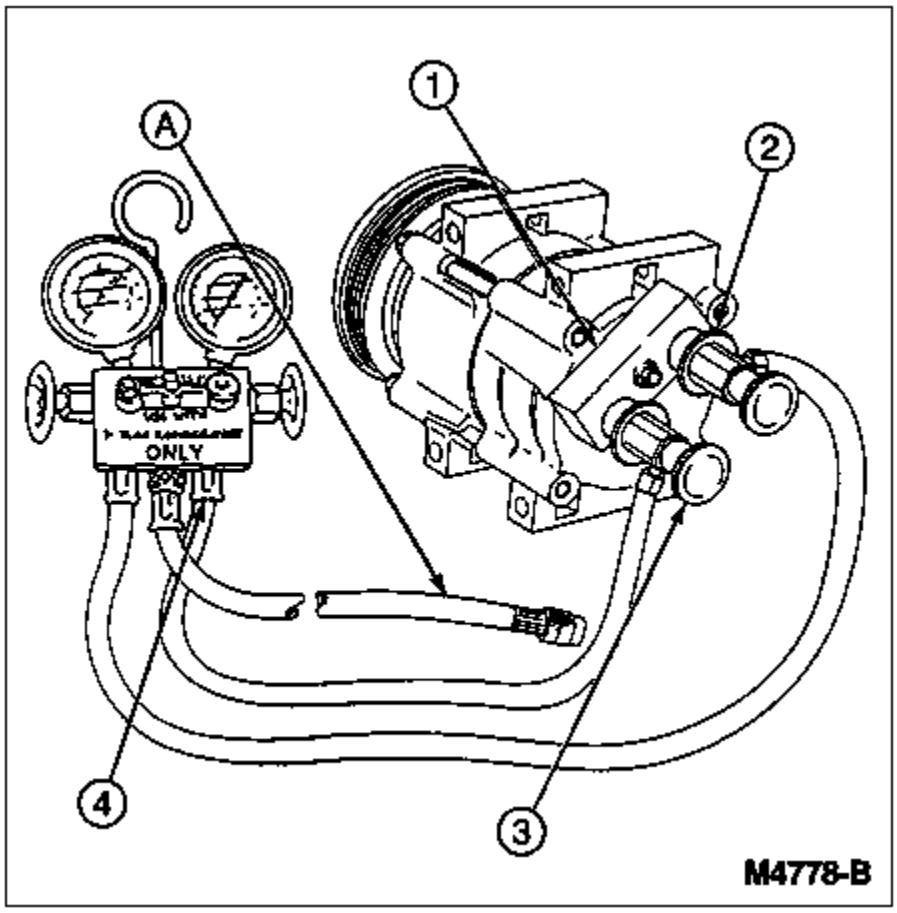
tomsn048@gmail.com

12. Leak test, evacuate and charge the system. Observe all safely precautions.

Rotating Torque Check

The rotational torque of a used A/C compressor should be checked as follows if excessive compressor drag is suspected.

1. Discharge refrigerant system. Observe all safety precautions.
2. Remove A/C manifold and tube (19D734) from A/C compressor. Use care not to allow dirt to enter A/C compressor.
3. Remove the A/C compressor from the vehicle. With the A/C clutch (2884) disengaged, rotate the compressor shaft one complete revolution and note the torque required to rotate the shaft another complete revolution.
4. If the rotational torque exceeds 13.015 Nm (9.6 lb-ft), replace the A/C compressor assembly.
5. If the rotational torque is less than specified, excessive drag does not exist in the A/C compressor. Install the A/C manifold and tube and leak test, evacuate and charge the system.
6. Check the system for proper operation.



tomsn048@gmail.com

Item	Part Number	Description
1	T94P-19623-E	Pressure Test Adapter R-134a

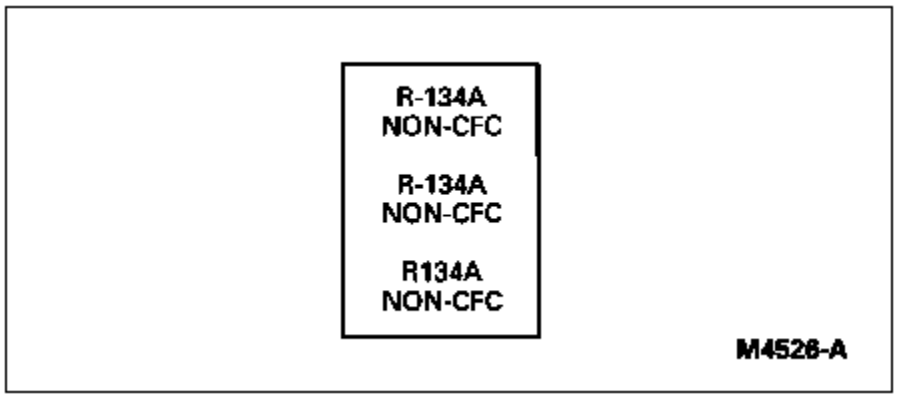
tomsn048@gmail.com

Refrigerant System

Refrigerant System Identification

Two refrigerants (R-12 and R-134a) are used in today's air conditioning systems. The refrigerants are not compatible and while system operations and procedures are the same for both, the equipment to service is unique and cannot be used interchangeably.

The label stating A/C refrigerant use in the vehicle is attached in the engine compartment so the proper service procedure and equipment can be referenced in the service manual. An R-134a refrigerant system will have gold R-134a non-CFC tags in addition to the refrigerant charge tag.



If a component has been used with R-12, it cannot be used again in an R-134a system. If used in an R-134a system, it cannot be put into a R-12 system. Contamination can occur and performance can be adversely affected because each system uses a different oil designed for that system.

Special Service Equipment

CAUTION: Do not use R-12 special tools and equipment when servicing a R-134a system. Doing so may cause damage to the R-134a A/C system.

The refrigerant system has a high-pressure (discharge) and a low-pressure (suction) gauge port valve. These are Schrader-type valves. They provide access to both sides (high-pressure and low-pressure) of the system for service hoses and a manifold gauge set so system pressures can be read.

R-134a systems require the use of special servicing equipment designed specifically for R-134a systems. R-12 servicing equipment cannot be used when servicing R-134a A/C systems. R-134a special service equipment includes R-134a recovery/recycling/recharging station, R-134a leak detector, R-134a vacuum pump and R-134a manifold gauge set.

For the R-134a A/C system, Ford Motor Company recommends the use of a recovery/recycling device such as Rotunda R-134a Service Center or equivalent during any air conditioning service repair or discharge/recharge procedure.

tomsn048@gmail.com

tomsn048@gmail.com

A/C-Heater System Deodorizing

The A/C System Deodorizer, product EP-1710-FF, is a full-strength deodorizer which requires no dilution or mixing. Each vehicle treated will require 10 fluid ounces to complete the procedure.

The A/C System Deodorizer can be applied using the A/C Disinfectant Sprayer Unit, a siphon type sprayer, or a refillable aluminum or stainless-steel aerosol paint sprayer (touch-up guns provide better access).

1. Set the A/C control (19980) to the **NORMAL A/C** position. On vehicles equipped with a manually operated fresh air/recirculate air door, set the door to the fresh air position.

2. With the blower motor (18527) operating at high speed, spray three ounces of the deodorizer product into the fresh air inlet.

3. Set the A/C control to the **MAX A/C** position. Move the temperature control lever to the full cold position. On vehicles equipped with a manually operated fresh air/recirculate air door, set the door to the recirculate (interior air) position.

4. With the blower motor operating at high speed, spray 1-1/2 ounces of the deodorizer product into the recirculate air opening (located in the passenger side foot area of the vehicle). Set the temperature control to provide full heat and spray an additional 1-1/2 ounces into the recirculate air opening.

5. Shut the blower motor off.

6. Spray equal amounts of the remaining four ounces of the deodorizer product into each of the air outlet openings (defroster, instrument panel registers, and floor ducts).

7. Allow the vehicle to sit for approximately 30 minutes before returning to the customer.

tomsn048@gmail.com

Refrigerant Recovery

Refrigerant Reclaiming/Recovery/Recycling Equipment

Ford Motor Company recommends the use of a recovery/recycling device such as Rotunda R-134a Service Center or equivalent during any air conditioning service repair or discharge/recharge procedure.

Refrigerant recovery systems and recycling stations are in use in a number of automotive air conditioning service facilities. The use of such equipment makes possible the recovery and use of air conditioning system refrigerant after contaminants and moisture have been removed.

If a refrigerant recovery or recycling station is used, the following general procedures should be observed, in addition to the operating instructions provided by the equipment manufacturer.

CAUTION: Use extreme care and observe all safely and service precautions related to the use of refrigerants.

NOTE: Hoses should have shutoff devices or check valves within 25.4cm (12 inches) of the hose end to minimize the introduction of non-condensable gases (air) into the recycling station and to minimize the amount of refrigerant released when the hose(s) is disconnected.

1. Connect refrigerant recycling station hose(s) to vehicle air conditioning service ports and recovery station inlet fitting.

2. Turn power to the recycling station on to start recovery process. Allow recycling station to pump refrigerant from the system until the station pressure goes into a vacuum. On some stations, the pump will be shut off automatically by a low pressure switch in the electrical system. On other units it may be necessary to manually turn off the pump.

3. Once recycling station has evaluated vehicle air conditioning system, close the station inlet valve (if so equipped). Then, switch off electrical power.

4. Allow vehicle air conditioning system to remain closed for about two minutes. Observe system vacuum level as shown on the gauge. If pressure does not rise, disconnect recycling station hose(s).

5. If system pressure rises, repeat the above 3 steps until the vacuum level remains stable for two minutes.

6. Perform required service operations, evacuate and recharge the air conditioning system.

tomsn048@gmail.com

tomsn048@gmail.com

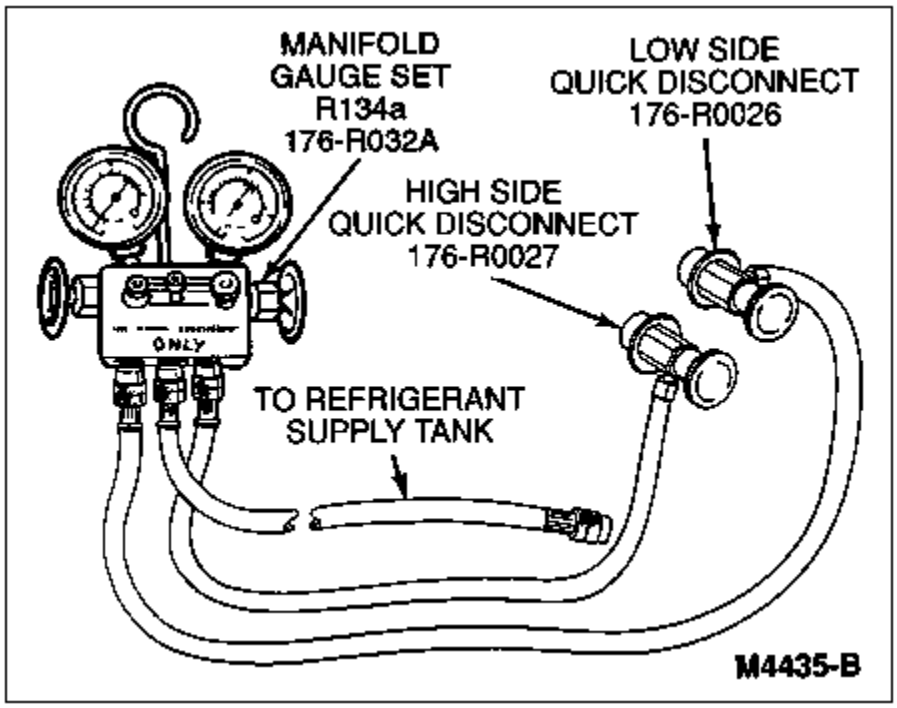
A/C Manifold Gauge Set Connection

When performing any of the various tests for the system's state-of-charge, or internal pressures, the appropriate test equipment must be connected to the refrigerant system. If a charging station is used, follow the instructions of the manufacturer.

To attach a manifold gauge set such as Rotunda R-134a Manifold Gauge Set 176-R032A or equivalent to the service port valves, proceed as follows:

1. Turn both manifold gauge set valves fully clockwise to close the high and low pressure hoses at the gauge set refrigerant center outlet hoses. Rotunda Quick Disconnect Adapters 176-R0027 and 176-R0026 or equivalents are required to connect the manifold gauge set or a charging station to the high and low pressure service gauge port valves.

Manifold Gauge Set



2. Remove the A/C charging valve caps (19D702) from the high and low pressure service gauge port valves.

3. If the manifold gauge set or charging station refrigerant hoses do not have the quick disconnect fittings on them, install Rotunda Quick Disconnect Fittings 176-R0027 and 176-R0026 or equivalents on the manifold gauge set low and high pressure hoses.

4. Connect the high and low pressure refrigerant hoses with adapters to the respective high and low pressure service gauge port valves.

tomsn048@gmail.com

5. Connect the hoses attached to the manifold center fitting to refrigerant supply tank and vacuum pump valves.

---

tomsn048@gmail.com

System Discharging

Discharge the refrigerant from the system into an approved recovery unit. With the exception of the A/C cycling switch (19E561), be sure to discharge the system before removing any other part.

1. Remove the A/C charging valve caps (19D702) from the high and low pressure service gauge ports.
2. Turn both gauge valves fully clockwise to close the high and low pressure hoses to the center hose.
3. Connect the gauge set high and low pressure hoses, with adapters, to the respective high and low pressure service gauge ports.
4. Slowly depressurize the refrigeration system by opening the low pressure valve of the gauge set a slight amount and allow the refrigerant to discharge slowly from the system.
5. After the system is nearly discharged, open the high pressure gauge valve very slowly to avoid losing any refrigerant oil while still allowing any refrigerant remaining in the compressor and high pressure line to discharge.

tomsn048@gmail.com

System Evacuating

1. Discharge the refrigerant system.

2. Be certain that the manifold gauge set is connected as follows:

    a. Low pressure hose connected to the low pressure service gauge port on the suction accumulator/drier (19C836).
    b. High pressure hose to the high pressure gauge port on the compressor discharge line at the A/C condenser core (19712).
    c. Connect the gauge set center hose to a vacuum pump.

3. Open the gauge set valves and start the vacuum pump.

4. Evacuate the system with the vacuum pump until the low pressure gauge reads at least 99.4 kPa (29.5 inches of mercury) (vacuum) and as close to 101 kPa (30 inches of mercury) as possible. Continue the vacuum pump operation for a minimum of 15 minutes. If a part of the system has been replaced or excessive moisture is suspected, continue the vacuum pump operation for at least 30 minutes.

5. When evacuation of the system is complete, close the gauge set valves and turn the vacuum pump off.

6. Observe the low side gauge to be sure the system holds vacuum for five minutes. If vacuum is held for five minutes, proceed to charging the system. If vacuum is not held for five minutes, leak test the system, repair leak(s) and again evacuate the system.

tomsn048@gmail.com

System Charging Set-Up

Follow manufacturer's guidelines for correct charging station set-up and operation.

tomsn048@gmail.com

System Charging

Charging with a Charging Cylinder

1. With the gauge set valve closed to the center hose, disconnect the vacuum pump from the gauge set.
2. Connect the center hose of the gauge set to a charging cylinder or refrigerant tank.
3. Loosen the center hose at the gauge set and open the charging cylinder or refrigerant drum valve. Allow refrigerant to escape to purge air and moisture from the center hose. Then, tighten the center hose connection at the gauge set.
4. Open the gauge set low side valve to allow refrigerant to enter the system.
5. When no more refrigerant is being drawn into the system, start the engine (6007) and move the function selector lever to the NORM/A/C position in Aerostar vehicles, and the VENT/HEAT/A/C position in Ranger vehicles. Move the heater blower motor switch (18578) to HI to draw the remaining refrigerant into the system.

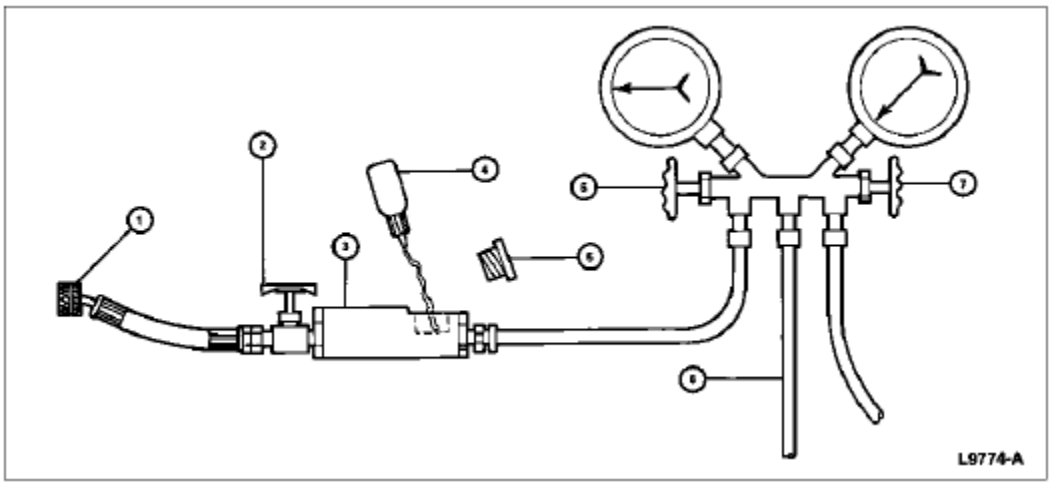
   Continue to add refrigerant to the system until the specified weight of R-134a is in the system. Then, close the gauge set low pressure valve and the refrigerant supply valve.
6. Operate the system until the pressures stabilize to verify normal operation and system pressures.
7. In high ambient temperatures, it may be necessary to operate a high volume fan positioned to blow air through the radiator and A/C condenser core (19712) to aid in cooling the engine and prevent excessive refrigerant system pressures.
8. When charging is completed and system operating pressures are normal, disconnect the gauge set from the vehicle. Install A/C charging valve caps (19D702) on the service gauge port valves.

tomsn048@gmail.com

tomsn048@gmail.com

Leak Tracer Dye

NOTE: R-134a fluorescent tracer dye is incorporated into the A/C system at assembly. If it is necessary to add dye, use Rotunda Dye Injector 164-R2610. A/C systems require 7.39ml (0.25 oz) of Rotunda Fluoro-Lite/P® Fluorescent Tracer Dye 164-R3712.



Item	Part Number	Description
1	—	To Low Pressure Service Port
2	—	Reservoir Valve (Part of 164-R2610)
3	—	Tracer Dye Reservoir 7.39ml (.25 oz) Capacity (Part of 164-R2610)
4	164-R3712	Fluoro-Lite/P® Fluorescent Tracer Dye
5	—	Reservoir Cap (Part of 164-R2610)
6	—	Low Pressure Valve (Part of 176-R032A)
7	—	High Pressure Valve (Part of 176-R032A)
8	—	To R-134a Cylinder

1. **NOTE: Periodically lubricate dye injector reservoir valve stem with refrigerant oil.**

   Close valve on dye injector.

2. Connect hose end of dye injector to system low pressure gauge port valve and tighten it securely.

3. **NOTE: If the system pressure is above 414 kPa (60 psi), there is no need to add refrigerant to the system for this operation.**

tomsn048@gmail.com

Close both valves on gauge manifold set and connect center hose to a charging cylinder. Leave center hose loose at the gauge manifold connection. Close valve on charging cylinder.

4. Connect gauge manifold low pressure hose to dye injector, leaving connection at the gauge manifold loose.

5. Open injector valve to allow A/C system pressure to purge air from the dye injector reservoir and the low pressure hose to the gauge manifold. Tighten hose connection at gauge manifold gauge set. Close valve on the dye injector.

6. Remove reservoir cap from the top of dye injector and fill reservoir with 7.39ml (0.25 oz) of Rotunda Fluoro-Lite/P® Fluorescent Tracer Dye 164-R3712.

7. Replace reservoir cap. Tighten securely.

8. Open valve on charging cylinder, then open the manifold gauge low pressure valve. Open valve on the dye injector for 5 to 10 seconds to allow the dye to be forced into A/C system. Close dye injector valve. Close manifold gauge low pressure valve and valve on the charging cylinder.

9. Start engine and operate the A/C system at MAX to stabilize system (approximately 10-15 minutes).

10. Engine OFF.

11. Disconnect all hoses slowly to dissipate any residual refrigerant pressure that may be present.

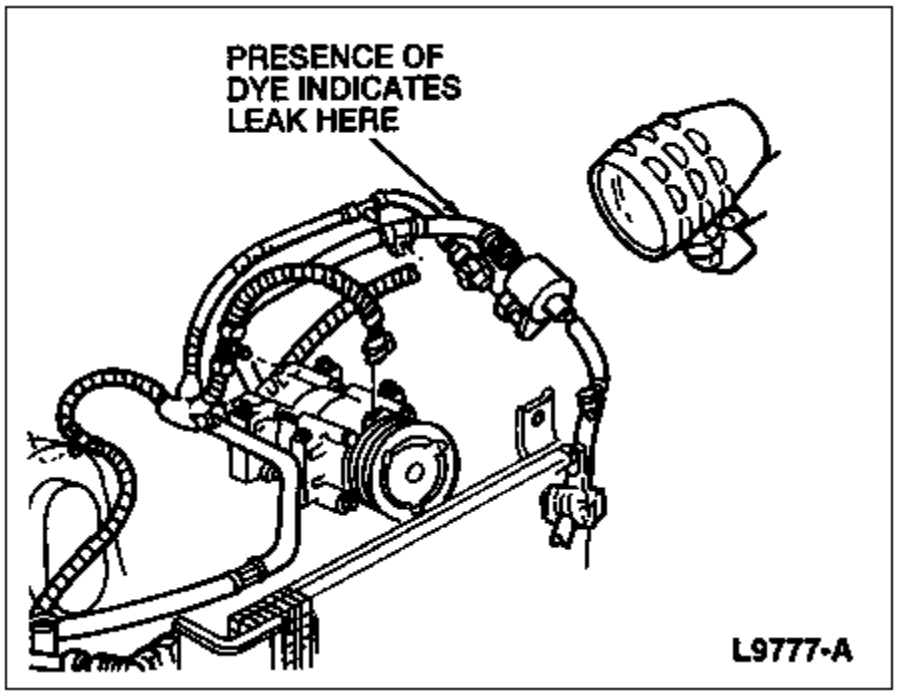
12. Start engine and operate the A/C system to thoroughly mix the tracer dye with the system's compressor oil.

13. Continue to operate the A/C system in order to allow the tracer dye to circulate through the system and penetrate the leak(s). The time needed for the leak to appear will depend on the type of system and size of the leak.

14. **NOTE: Fluoro-Lite/P® Fluorescent Tracer Dye 164-R3712 combines and circulates with both the compressor oil and the refrigerant. For the tracer dye to show leakage in an A/C system, the compressor oil must flow throughout the system you are checking. As the refrigerant escapes, it will leave a trace of compressor oil with the dye at the point of leakage.**

    Check for leak(s) with Rotunda UV Lamp 164-R0721 or equivalent. Scan all components, fittings and lines of the system. The exact location of the leak(s) can be pinpointed by the bright yellow-green glow of the tracer dye. Since more than one leak may exist in the system, always inspect each component.

tomsn048@gmail.com



15. **NOTE: The best leak detection results will be achieved in conditions of low ambient light. In areas that cannot be reached by the UV lamp, use a mechanic's mirror or use a non-fluorescent shop towel. Wipe the suspected leak area and then check the towel with the UV lamp for a trace of the fluorescent dye. If no leak is found, return the vehicle to the customer with instructions to bring it back at a later date to allow time for the fluorescent material to collect around the leak site.**

    After the leak is repaired, the traces of fluorescent dye can be removed from the previously leaking areas by using any general-purpose oil solvent.

16. Verify the repair to ensure that the leaks have been successfully repaired and all fittings are tight. Steps 12, 13 and 14 can be repeated without adding more tracer dye (unless the dye has been removed during the servicing). While Rotunda Fluoro-Lite/P® Fluorescent Tracer Dye 164-R3712 can safely remain in the A/C system indefinitely without harm to components, its fluorescent lifespan is roughly 500 hours of A/C system use, after which time another infusion of dye would be required.

17. Write the dye installation date on a label (labels are included with the dye) and apply it to the engine compartment in an area where it will be seen easily by a future technician. Labeling the vehicle will tell others that dye has already been installed.

---

tomsn048@gmail.com

tomsn048@gmail.com

Refrigerant Identifier

Prior to recovering or charging the refrigerant from any vehicle, you must use the Rotunda Refrigerant Identifier or equivalent. The Rotunda Refrigerant Identifier or equivalent is used to identify gas samples taken directly from the refrigeration system or storage containers. The identifier will display either R-12 or R-134a if the purity is better than 98% by weight. The unit will display FAIL if neither of the two gases have been identified or if they are not at least 98% pure. If the gas detected contains a hydrocarbon (flammable material), a horn will sound and the unit will display "HC." After analysis is made and displayed, the identifier purges the unit of the sampled refrigerant gas and is ready for the next sample.

If neither R-12 nor R-134a has been identified as 98% pure, do not service the A/C refrigeration system. Always refer to the refrigerant identifier manufacturer's instructions for proper tool usage.

tomsn048@gmail.com

System Flushing

WARNING: DUE TO REFRIGERANT HAZARDS, ALWAYS WEAR SAFETY GOGGLES AND NON-PENETRABLE GLOVES WHEN WORKING ON OR FLUSHING A/C SYSTEMS.

1. Perform all A/C system diagnostics per the Service Manual specified procedures.

2. Recover the refrigerant from the A/C system. Refer to the procedure using a U.L./E.P.A. approved recovery/recycling device. Follow the recovery procedure specified by the equipment manufacturer.

3. Disconnect the A/C hoses from the heat exchangers (A/C evaporator core (19860) and A/C condenser core (19712)) to be flushed.

4. **CAUTION: Suction accumulator/driers (19C836), receiver/driers, A/C evaporator core orifices (19D990), thermal expansion valves, hoses, and mufflers should be removed. Do not flush these components. Internal plumbing and material makeup of these components makes it impossible to properly remove debris and/or residual flushing solvent. Except for the hoses, these components are typically discarded after A/C system contamination. Hoses can typically be reused unless they are clogged with debris.**

   Remove A/C evaporator core orifices, thermal expansion valve, suction accumulator/drier, receiver/drier, and/or mufflers which may be attached to the heat exchangers (A/C evaporator core/A/C condenser core) being flushed.

5. Clean all dirt and debris from the fittings on the heat exchanger to be flushed.

6. Select the proper fittings, clean and lubricate connections, and securely attach to the heat exchanger. O-rings must be used with these fittings to ensure proper, leak free connections.

7. **NOTE: All flushing/purging will be performed in the direction opposite the normal flow of refrigerant in an operating A/C system.**

   If the A/C evaporator core is being flushed, connect the flusher outlet hose to the suction fitting on the A/C evaporator core. This fitting is normally connected to the suction accumulator/drier. Connect the return hose to the other fitting.

   If the A/C condenser core is being flushed, connect the flusher outlet hose to the liquid side fitting of the A/C condenser core. This fitting is normally connected by hose to the evaporator core. Connect the return hose to the other fitting.

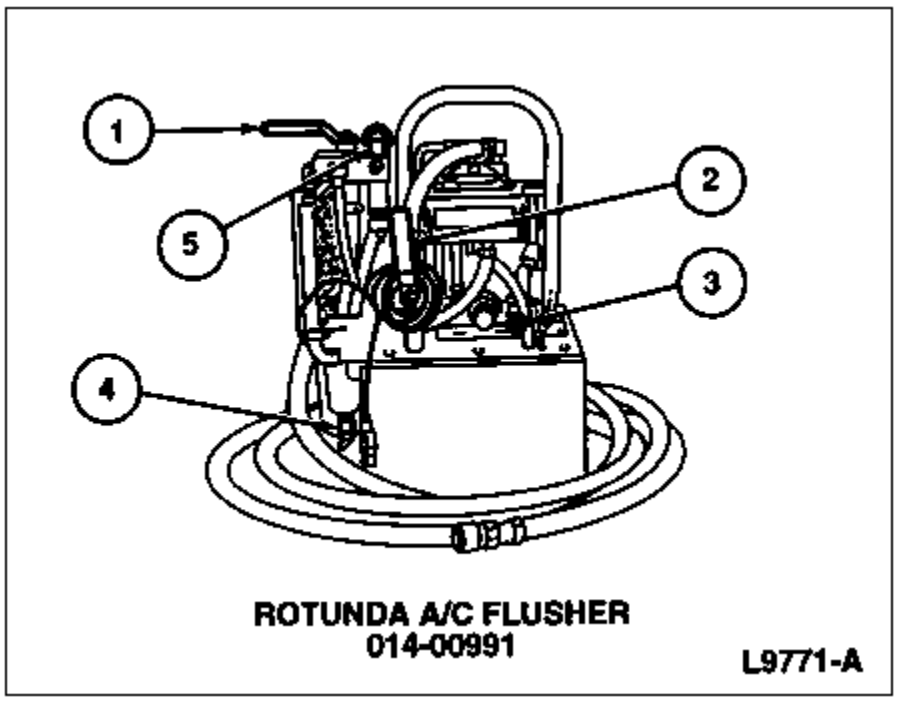
8. **CAUTION: This Rotunda A/C Tool Flusher 014-00991 is intended for use with only Ford A/C Flushing Solvent F4AZ-19579-A or equivalent. Use of any other flushing solvent or agent may cause damage to the flusher. Substitute solvents or agents may not be removed during the purging process and may leave residues which can damage A/C system components.**

   Fill the fluid reservoir with 3.8L (1.0 gallon) of Ford A/C System Flushing Solvent F4AZ-19579-A or equivalent.

9. Connect static ground strap to vehicle.

tomsn048@gmail.com

10. Make sure the purge air supply valve is released from its locked-on position. Place valve #1 in PURGE position. Attach the shop air supply to the flush quick coupler.



Item	Part Number	Description
1	—	Valve #1
2	—	Valve #2
3	—	Flush Quick Coupler
4	—	Moisture Trap
5	—	Air Purge Valve

11. Slowly turn valve #1 to FLUSH position.

12. Observe for flush solvent flow through the outlet hose.

13. **NOTE: If the pump stalls during operation, remove air hose immediately. Pump stalling may occur as a result of large particles of debris. To dislodge debris which impedes pump operation, connect air hose to purge quick coupler, gradually depress the purge air hose valve to force debris and flush solvent back into the reservoir. Reconnect air hose to flush quick coupler and observe for flow.**

    Operate the pump for a minimum of 15 minutes to flush all debris and dissolve any gummy oil residues which may be present in the component being flushed.

14. Return valve #1 to PURGE position for 1 minute.

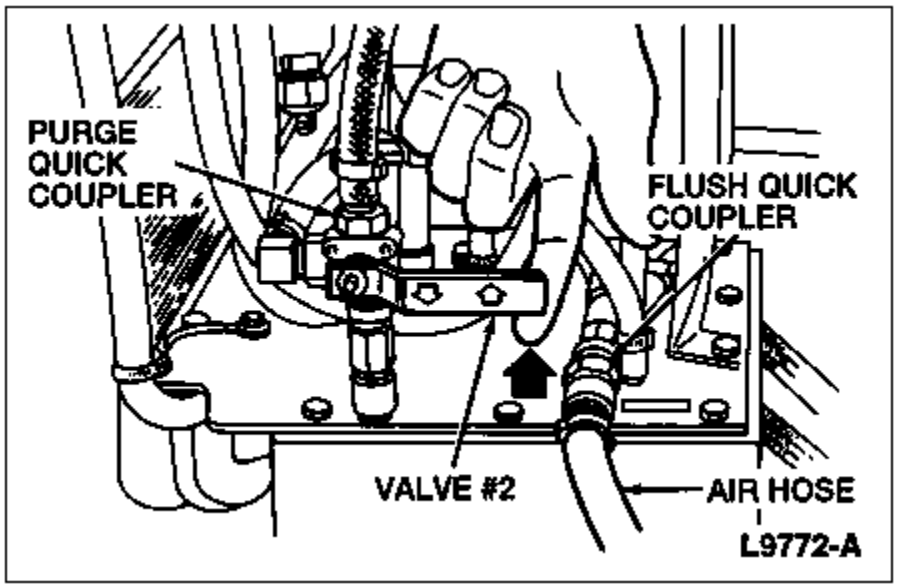
15. Disconnect air hose from flush quick coupler.

tomsn048@gmail.com

16. Attach air hose to purge quick coupler. Gradually engage the air purge valve to full flow for approximately one minute to remove the majority of the flushing agent from the heat exchanger being flushed.

17. Stop all purge air flow by releasing the air purge valve lever.

18. Place valve #2 in PURGE position.



19. Gradually engage the purge air supply valve and lock in the full flow position.

20. **CAUTION: Failure to continue air purge for the entire 30 minutes as specified may result in residual amounts of flush solvent contaminating the A/C system. Residual flush solvent in a functioning A/C system may lead to A/C system failure. The manufacturer of this flusher and the specified flushing solvent accept no responsibility for damages caused by misuse of, or failure to follow this procedure in its entirety as specified.**

    Allow the system air purge to continue for a minimum of 30 minutes.

21. Periodically, during the 30 minute air purge, check the moisture trap on the outlet side of the flusher and drain any water buildup using the petcock on the bottom of the moisture trap.

22. After completion of the 30 minute air purge, release the purge air supply valve to stop all air flow.

23. Disconnect the air hose from the flusher.

24. Disconnect the flusher hoses from the flushed heat exchanger.

25. Disconnect static ground strap. Move the flusher away from the vehicle.

26. Disconnect flusher fittings from the heat exchanger and retain for future use.

27. If the remaining A/C heat exchanger in the vehicle is to be flushed, repeat steps 1-28.

tomsn048@gmail.com

28. **CAUTION: The gallon of Ford A/C Flushing Solvent F4AZ-19579-A, and Filter FL-1A used in this flusher are intended for use on one vehicle only. They may be used to flush both heat exchangers on an individual vehicle, but under no circumstances should they be used on more than one vehicle. Residual contamination may contaminate other vehicles, causing possible damage to A/C system components.**

    Drain the flushing solvent from the flusher reservoir and replace filter. If filter becomes overtightened, use Oil Filter Wrench D79L-6731-B or equivalent to remove it.

29. Dispose of the drained flushing solvent and filter in accordance with federal, state, and local regulations.

---

tomsn048@gmail.com

Spring Lock Coupling

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spring Lock Coupling Disconnect Tools	T81P-19623-G1, T81P-19623-G2, T83P-19623-C, T85L-19623-A

Coupling — Disconnect

1. Discharge refrigerant from system with a refrigerant recycling machine. Fit Spring Lock Coupling Disconnect Tools T81P-19623-G1 (3/8-inch), T81P-19623-G2 (1/2-inch), T83P-19623-C (5/8-inch) or T85L-19623-A (3/4-inch) to the coupling.

2. **NOTE: The garter spring may not release if the tool is cocked while pushing it into the cage opening.**

   Close tool and push into open side of cage to expand garter spring and release female fitting.

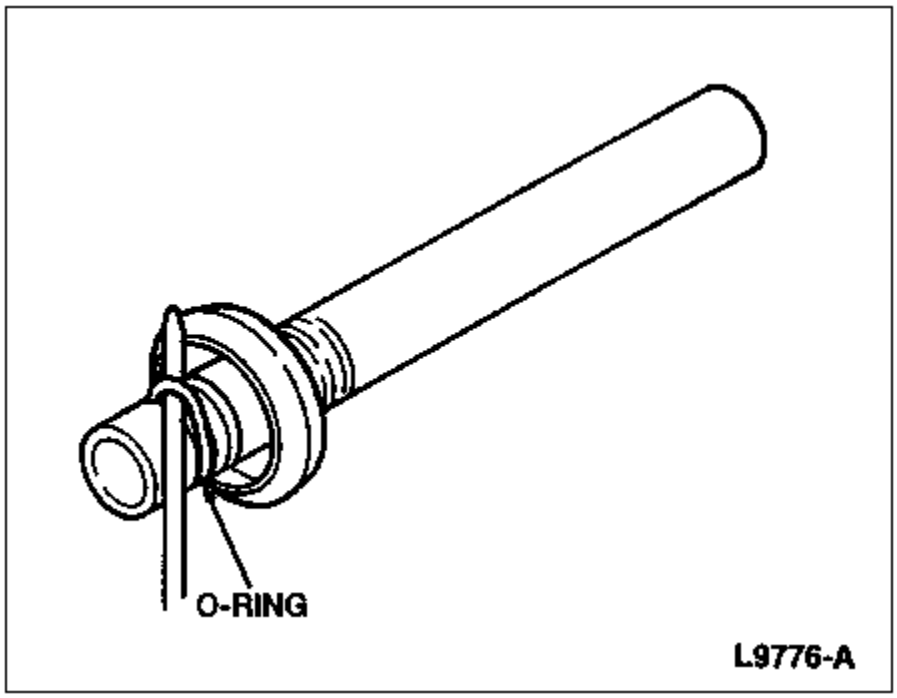
3. After garter spring is expanded, pull fitting apart.

4. Remove tool from disconnected coupling.

5. **CAUTION: Use of metal O-Ring Tool T71P-19703-C or a screwdriver to remove O-rings can cause scratches across the O-ring groove, leading to loss of refrigerant charge. Only plastic O-Ring Tool F5VH-17B017-AA or equivalent is approved for O-ring removal.**

   Remove O-ring seal from male fitting.

tomsn048@gmail.com



Coupling — Connect

1. Make sure garter spring is in cage of male fitting. If garter spring is missing, install a new spring by pushing it into cage opening. If garter spring is damaged, remove it from cage with a small wire hook (do not use a screwdriver) and install a new spring.

2. Clean all dirt or foreign material from both pieces of coupling.

3. Lubricate and install new green O-ring seals on male fitting.

   Use only the specified green O-ring seals as they are made of a special material. The use of any O-ring seal other than the specified green O-ring seal may allow the connection to leak intermittently during vehicle operation. Refer to service parts list.

4. Lubricate male fitting and O-rings and inside of female fitting with clean refrigerant oil.

5. Install plastic indicator ring into cage opening if indicator ring is to be used.

6. Fit female fitting to male fitting and push until garter spring snaps over flared end of female fitting.

   If plastic indicator ring is used, it will snap out of cage opening when coupling is connected to indicate engagement.

7. If indicator ring is not used, ensure coupling engagement by visually checking to verify garter spring is over flared end of female fitting.

Service Parts List

tomsn048@gmail.com

Part Number	Description
E35Y-19D690-D	O-Ring Seal Kit-A/C Spring Lock Coupling (Kit Contains 3/8, 1/2 and 5/8 Coupling O-Rings and 3/8, 1/2 and 5/8 Inch Coupling Garter Springs.)

tomsn048@gmail.com

A/C System Filtering

CAUTION: Follow all refrigerant system safety and service precautions in Section 12-00 .

A Filter Kit should be installed in the refrigerant system prior to the installation of the replacement A/C compressor (19703). The pancake filter, supplied with each kit, should be temporarily installed in the liquid line between the A/C condenser core (19712)the A/C evaporator core orifice (19D990). The suction filter, supplied with each kit, should be installed in the suction line between the suction accumulator/drier (19C836) and the A/C compressor. Install the replacement A/C compressor and the filters as outlined in the following procedure. Filter Kit for systems with nylon lined suction hose is Ford part number F2VY-19E773-C.

1. Before removing any refrigerant system components, discharge the system refrigerant following the approved recycling methods.

2. Remove the suction accumulator/drier and drain the oil into a calibrated container.

3. **NOTE: Due to the internal design of the suction accumulator/drier, it will be necessary to drill two 13mm (0.5 inch) holes in the suction accumulator/drier cylinder to drain the oil from the suction accumulator/drier.**

   Install a new suction accumulator/drier and add new Motorcraft YN-12b refrigerant oil or equivalent meeting Ford specification WSH-M1C231-B to replace the old oil. The quantity of new oil to be added is the amount to match that drained from the old accumulator plus 60 ml (2 oz.).

4. Install a new A/C evaporator core orifice. If the A/C evaporator core orifice is located in the condenser to evaporator tube (19835) between the A/C condenser core and the A/C evaporator core (19860), replace the condenser to evaporator tube assembly.

5. Temporarily install the pancake filter in the condenser to evaporator tube between the A/C condenser core and the A/C evaporator core orifice. Be sure the filter inlet is toward the A/C condenser core. Connections can be made using A/C Test Adapter Set, D93L-19703-B, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old A/C compressor and drain the oil into a calibrated container.

7. Drain the oil from the replacement A/C compressor into a clean calibrated container.

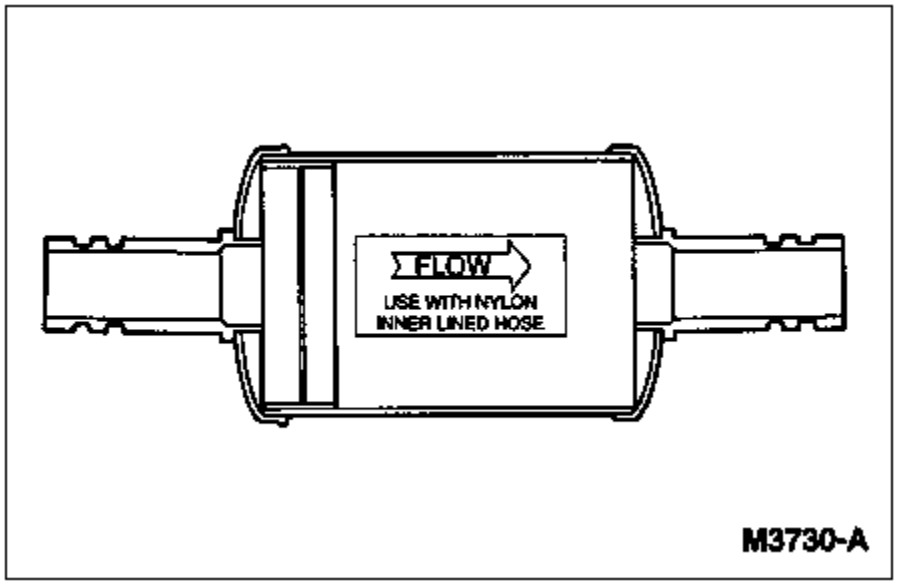
8. A new service replacement FS-10 A/C compressor may or may not contain 207ml (7 oz.) of refrigerant oil. If the amount of oil drained from the removed A/C compressor is between 90 and 148ml (3 to 5 oz.), pour the same amount of clean refrigerant oil into the new A/C compressor. If the amount of oil drained from the old A/C compressor is greater than 148ml (5 oz.), add an equivalent of clean refrigerant oil into the new A/C compressor. If the amount of refrigerant oil drained from the old A/C compressor is less than 90ml (3 oz.), pour 90ml (3 oz.) of clean refrigerant oil into the new A/C compressor. Use Motorcraft YN-12b Refrigerant Oil or equivalent meeting Ford specification WSH-M1C231-B.

9. **NOTE: It will be necessary to transfer the A/C clutch (2884) from the old A/C compressor to the replacement A/C compressor. Refer to Section 12-03C .**

   Install the new A/C compressor. Be sure all mounting bolts are tightened properly. Check the tension of the A/C compressor drive belt (8620).

tomsn048@gmail.com

10. Install the suction filter in the suction hose close to the A/C compressor. Suction filter is for nylon lined core hose. These filters have two grooves in the end tubes to accommodate O-ring seals.



11. Remove a length of suction hose (close to the A/C compressor end) to accommodate the suction filter and install the filter using A/C hose clamps. Be sure filter is correctly oriented for refrigerant system flow. Check the label on the filter. If using the filter for a nylon lined hose, install O-ring seals included in the Filter Kit, Ford part number F2VY-19E773-C (two on each filter tube).

12. Leak test, evacuate, and charge the system as outlined in Section 12-00 .

13. Check all refrigerant system hoses, lines and the positioning of the newly installed filters to be sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

14. Set the A/C control (19980) on MAX A/C, high blower motor (18527) and temperature control at full cold. Start engine and let it idle briefly. Make sure the A/C system is operating properly.

15. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system operating.

16. Stop the engine.

17. Remove the refrigerant from the system using a recovery machine. Refer to Section 12-00 .

18. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the condenser to evaporator tube.

19. Discard the pancake filter. It can be used one time only.

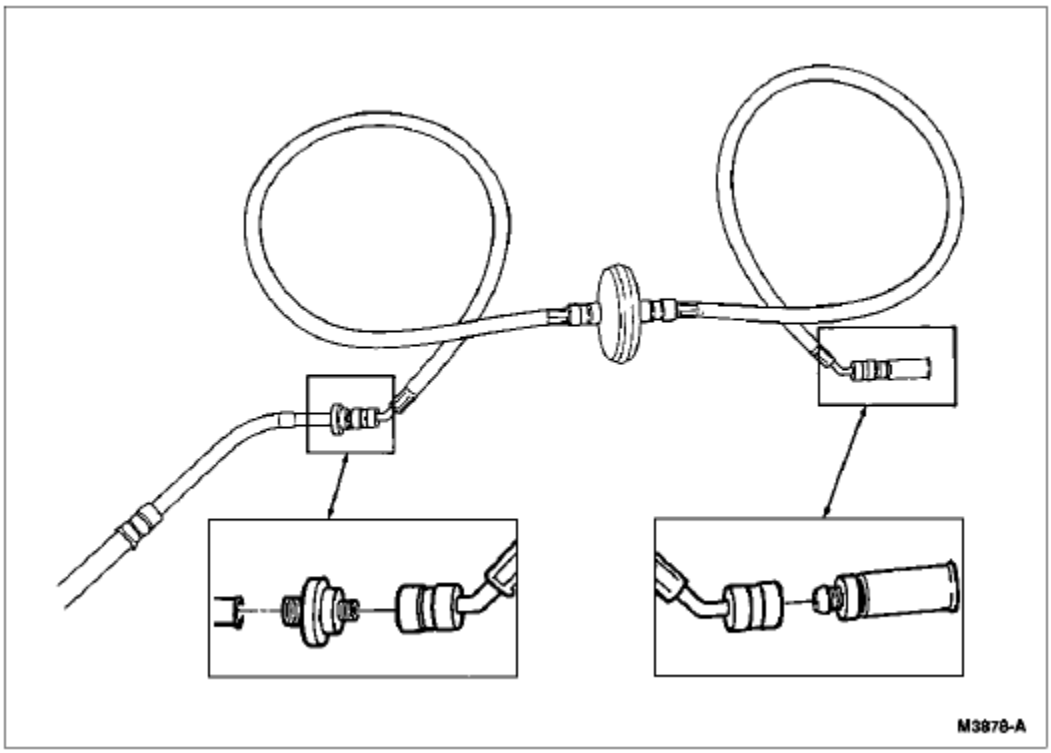
20. Reconnect the condenser to evaporator tube back into the system.

21. Evacuate, charge and leak test the system. Make any necessary adjustments.

tomsn048@gmail.com

22. Check the operation of the system in all control function selector lever positions.

A/C System Filtering

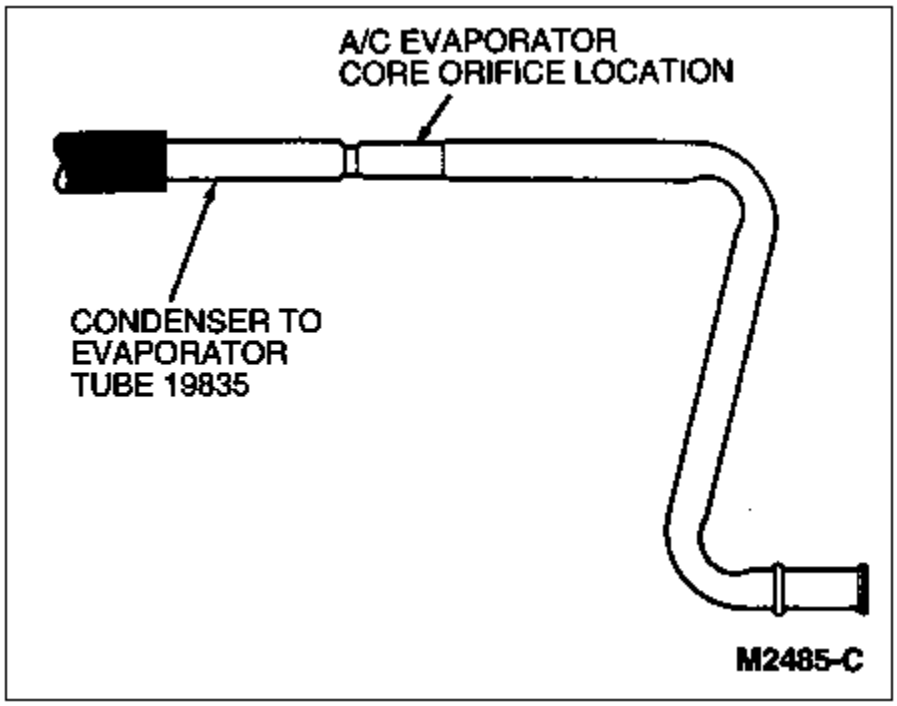


tomsn048@gmail.com

A/C Evaporator Core Orifice Replacement Kit

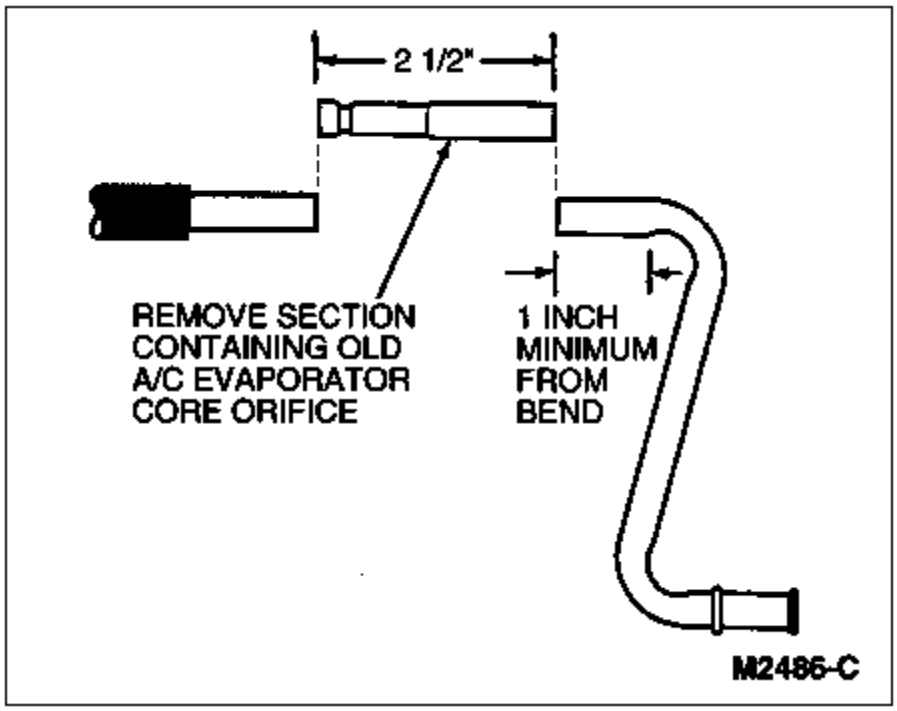
Installation

1. Discharge the A/C refrigerant system.
2. Remove the condenser to evaporator tube (19835) from the vehicle.
3. Locate the A/C evaporator core orifice (19D990) by the three indented notches or a circular depression in the metal portion of the liquid line.



4. Note the angular position of the ends of the condenser to evaporator tube so that it can be reassembled in correct position.
5. Cut a 63.5mm (2 1/2-inch) section from condenser to evaporator tube a t A/C evaporator core orifice location. Do not cut closer than 25.4mm (1 inch) from the start of a bend in tube.

tomsn048@gmail.com

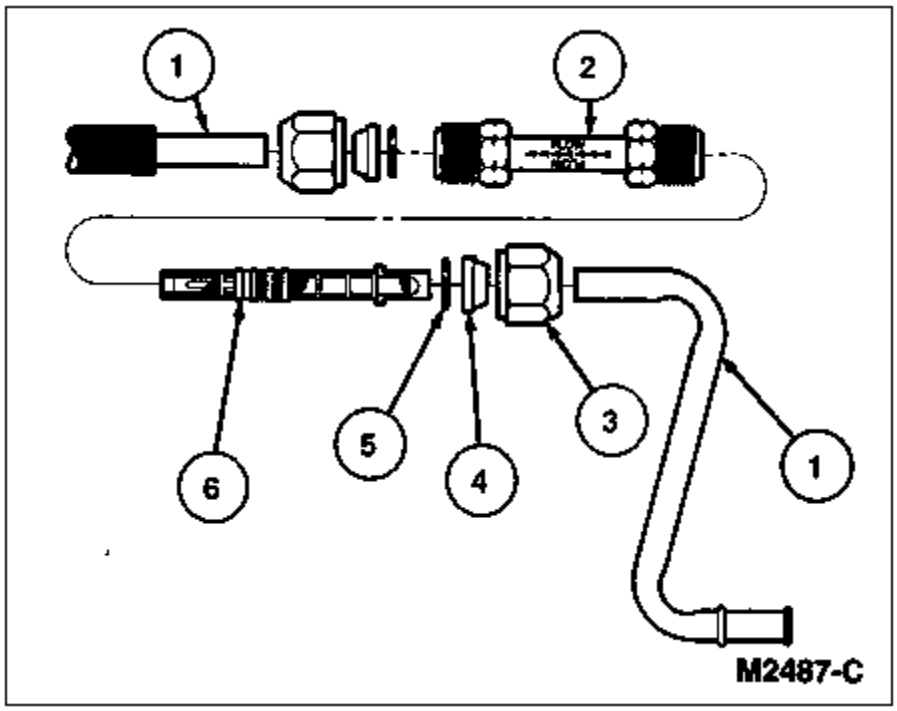


6. Flush the two pieces of condenser to evaporator tube to remove any contaminants.

7. Lubricate fitting O-ring seals with clean refrigerant oil and assemble orifice tube kit (with orifice tube installed) to condenser to evaporator tube as shown in the following illustration. Make sure flow direction arrow is pointing toward A/C evaporator core (19860) end of condenser to evaporator tube, and taper of each compression ring is pointing toward compression nut.

Orifice Tube Kit Disassembled

tomsn048@gmail.com



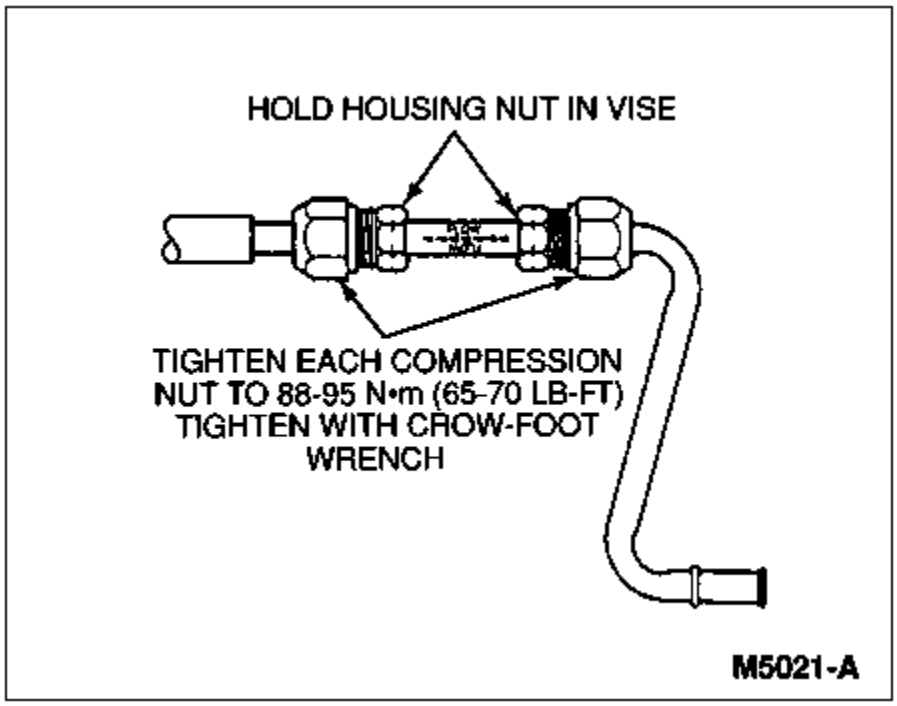
Item	Part Number	Description
1	19835	Condenser to Evaporator Tube
2	—	A/C Evaporator Core Orifice Housing (Part of 19D695)
3	—	Compressor Nut (Part of 19D695)
4	—	Brass Compression Ring (Part of 19D695)
5	—	O-Ring Seal (Part of 19D695)
6	19D990	A/C Evaporator Core Orifice

8. **NOTE: The inlet tube will be positioned against the A/C orifice tube (19D695) tabs when correctly assembled.**

   While holding hex of tube in a vise, tighten each compression nut to 88-95 Nm (65-70 lb-ft) with a crow-foot wrench.

Orifice Tube Kit Installed

tomsn048@gmail.com



9. Assemble condenser to evaporator tube to vehicle using new green O-rings lubricated with clean refrigerant oil. Use only specified green O-rings at spring lock coupling.

10. Leak-test, evacuate and charge system following approved procedures.

11. Check system for proper operation.

---

tomsn048@gmail.com

Suction Accumulator/Drier Replacement Guidelines

The suction accumulator/drier (19C808) should be replaced if one of the following conditions exist:

- The suction accumulator/drier is perforated.
- There is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator/drier.

NOTE: The compressor oil from vehicles equipped with an FS-10 A/C compressor (19D629) may have a dark color while maintaining a normal oil viscosity. This is normal for this A/C compressor because carbon from the piston rings will discolor the oil.

When replacing the suction accumulator/drier, the procedure given here must be followed to make sure that the total oil change in the system is correct after the new suction accumulator/drier is installed.

1. Drain the oil from the removed suction accumulator/drier into a suitable measuring container. Drill one or two 12.7mm (1/2-inch) holes in the bottom of the old suction accumulator/drier to ensure that all the oil has drained out.

2. Add the same amount of clean new refrigerant oil plus two fluid ounces to the new suction accumulator/drier. Use only the oil specified for the specific vehicle being serviced (Motorcraft YN-12b or an equivalent oil containing the same additives).

tomsn048@gmail.com

Refrigerant Oil Addition

It is important that only the specified type and quantity of refrigerant oil be used in the A/C compressor (19703). If there is surplus oil in the system, too much oil will circulate with the refrigerant, reducing the cooling capacity of the system. Too little oil will result in poor lubrication of the A/C compressor.

During A/C Compressor Replacement

The FS-10 A/C compressor used will require a special refrigerant oil with special additives. The A/C compressor used on R-134a systems requires YN-12b/F2AZ-19577-A oil, meeting Ford Specification WSH-M1C231-B.

R-134a Refrigerant Oil

The refrigerant oil required for R-134a A/C systems is a polyalkalylene glycol (PAG) oil, meeting Ford specification WSH-M1C231-B or equivalent. This type of refrigerant oil was made specifically for R-134a systems and is not suitable for use in R-12 systems. Never use an R-134a refrigerant oil in R-12 systems.

DURING COMPONENT REPLACEMENT

Refrigerant Oil Capacity (Main System Only):	267 ml (9 oz.)
Refrigerant Oil Capacity (Main and Auxiliary Systems):	385 ml (13 oz.)
Refrigerant Oil Replacement Capacities:	Evaporator Core = 118 ml (4 oz.)
	A/C condenser core = 40 ml (1.5 oz.)
	Suction accumulator/drier = 80 ml (3 oz.)
	Any 1 Refrigerant Line = 30 ml (1 oz.)
	A/C compressor — If the amount of oil drained from the removed A/C compressor is between 118 and 148 ml (4 and 5 oz.), pour the same amount of new refrigerant oil into the new A/C compressor.
	If the amount drained is greater than 148 ml (5 oz.), pour 148 ml (5 oz.) of new refrigerant oil into the new A/C compressor. If the amount drained is less than 118 ml (4 oz.), pour 118 ml (4 oz.) of new refrigerant oil into the new A/C compressor.

When it is necessary to replace a component of the refrigerant system, the correct procedures must be followed to make sure the total oil charge on the system is correct after the new component is installed. During normal A/C operation, some refrigerant oil is circulated through the system with the refrigerant and some is retained in the compressor. If certain components of the system are removed for replacement, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the replacement part.

tomsn048@gmail.com

Other Refrigerant System Components

Replacement of other refrigerant system components such as hoses, O-rings and pressure switches does not require the addition of refrigerant oil.

---

tomsn048@gmail.com

Heater-Ventilation System

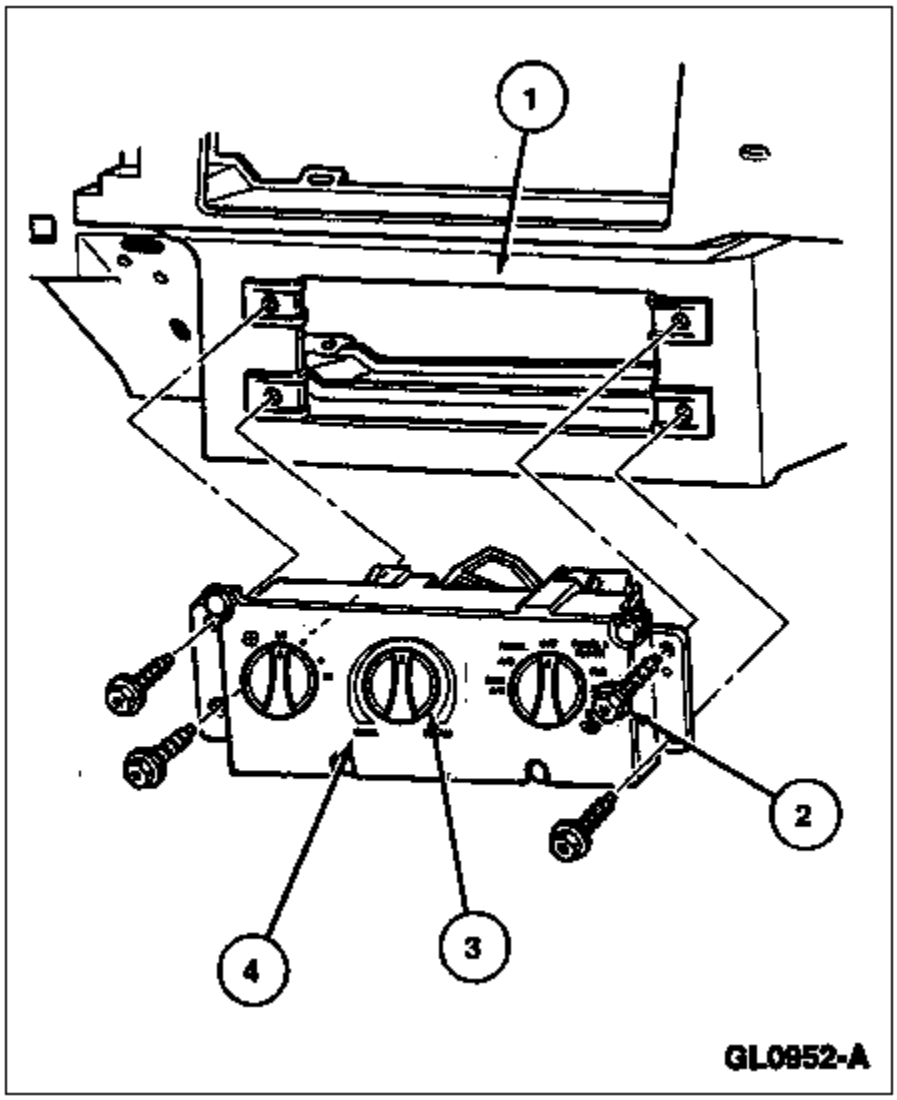
The heater-ventilation system used is a blend-air design which includes the following major components:

- The heater plenum chamber case (18A484) located on the engine compartment side of the dash panel. This assembly includes the following:
  - blower motor (18527)
  - blower motor wheel (18504)
  - heater blower motor switch resistor (18591)
  - heater plenum chamber case
- The heater air plenum chamber (18471) is located on the passenger compartment side of the dash panel. It includes the following:
  - outside/recirculating air inlet door
  - panel door
  - floor/defrost door
  - temperature blend door
  - heater core (18476)
- Other components which link and/or control the heating system include the following:
  - heater control (18549)
  - ducts and registers
  - windshield defroster hose nozzle (18490)
  - control cables
  - vacuum lines

tomsn048@gmail.com

Heater Control Assembly

The following illustration shows the heater control (18549).



Item	Part Number	Description
1	04320	Instrument Panel
2	N803876-S2	Screw (4 Req'd)
3	—	Temperature Control Knob
4	18549	Heater Control

The heater control is installed in a rectangular cutout in the lower center area of the instrument panel (04320). It contains three rotary switches. The extreme left switch is the heater blower motor switch (18578).

tomsn048@gmail.com

Airflow Control

The function selector knob is located on the extreme right of the heater control. The knob rotates to positions: PANEL, OFF, PNL/FLR, FLOOR, FLR/DEF and DEFROST. In the OFF position, the recirculation door is closed to stop outside air from passing through the climate control system and to keep the in-vehicle air circulating. To shut off the blower motor, the function selector knob must be turned to the OFF position.

Temperature Control

The temperature blend door, located in the heater air plenum chamber (18471), directs outside air to flow through the heater core (18476) for heating, or to bypass the heater core for ventilation. It is controlled by the temperature control knob of the heater control.

A heater temperature cable (18518) connects the temperature control knob to a cam which operates the temperature blend door. When the temperature control knob is at the COOL position, the temperature blend door directs outside air to bypass the heater core. When the temperature control knob is at WARM, the temperature blend door directs outside air through the heater core where the air is heated.

Positioning the temperature control knob in any position between COOL and WARM causes the temperature blend door to direct more or less outside air through or around the heater core for whatever proportion of heated or unheated outside air is desired.

The air blends together as it leaves the heater core into the heater air plenum chamber for distribution.

Blower Motor Control

The blower motor (18527) is controlled by a four-position heater blower motor switch located on the left side of the heater control. The four positions are LOW, MEDIUM LOW, MEDIUM HIGH and HIGH. The four operating speeds are obtained with a heater blower motor switch resistor (18591) connected in series with the heater blower motor switch operating on the ground side of the blower motor.

With the heater blower motor switch at LOW, current flow in the ground circuit is through three heater blower motor switch resistor coils to obtain the lowest operating speed.

With the heater blower motor switch at MEDIUM LOW, current flow in the ground circuit is through two heater blower motor switch resistor coils to obtain a medium low motor operating speed.

With the heater blower motor switch at MEDIUM HIGH, current flow in the ground circuit is through one heater blower motor switch resistor coil to obtain a medium high operating speed.

With the heater blower motor switch at HIGH, current flow in the ground circuit bypasses the heater blower motor switch resistor to obtain the maximum operating speed.

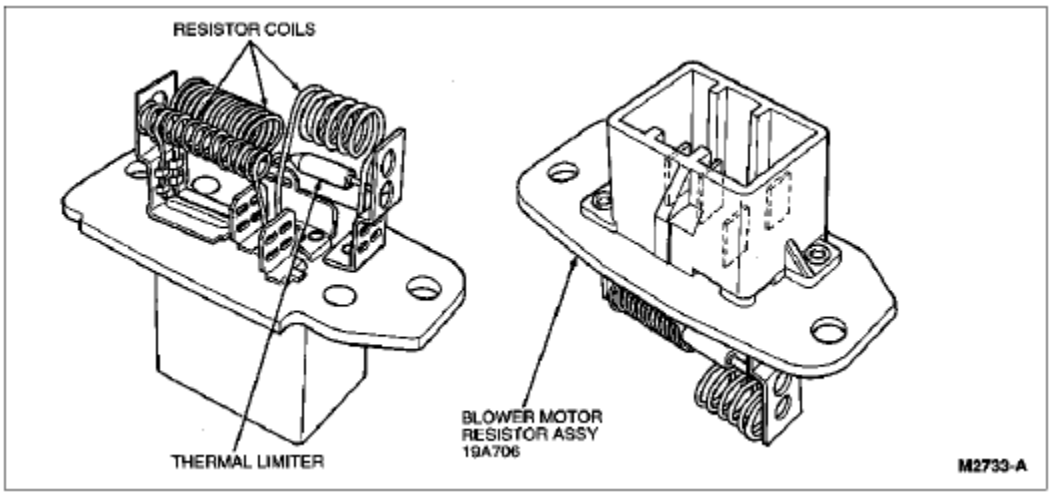
tomsn048@gmail.com

tomsn048@gmail.com

Heater Blower Motor Switch Resistor

The thermal limiter is mounted in theheater blower motor switch resistor (18591). Theheater blower motor switch resistor is used with the heater blower motor switch (18578) to obtain the desired fan speed. The heater blower motor switch resistor is shown disassembled from the heater plenum chamber case (18A484).

Heater Blower Motor Switch Resistor



tomsn048@gmail.com

Heater Blower Motor Thermal Limiter

The thermal limiter in the switch serves as a temperature sensitive fuse. When the thermal limiter is opened, the heater blower motor switch resistor (18591) must be replaced.

tomsn048@gmail.com

Instrument Panel Registers

The louvers in the registers can be adjusted to direct air as desired. The louvers can also be closed to block most of the airflow.

tomsn048@gmail.com

Heater Core

Outside air is heated as it passes through the fins of the heater core (18476). Hot engine coolant is used to heat the core.

tomsn048@gmail.com

C	—	Airflow (Fresh/Recirc.) (Part of 18471)

OFF

In the OFF position, vacuum is applied to the outside/recirc. door. In this position, outside airflow is shut off.

PANEL

Ventilation is delivered through the instrument panel registers when the function control knob in the control assembly is set in the PANEL position. In the PANEL position, no vacuum is applied to the door motor and the outside/recirc. door is open to the outside. The air coming in through the cowl is discharged through the

tomsn048@gmail.com

panel registers.

PNL/FLR

In the PNL/FLR position, no vacuum is applied to the door motor and the outside/recirc. door is open to the outside. Air is discharged through the floor outlets and the instrument panel registers.

FLOOR

In the FLOOR position, no vacuum is applied to the door motor and the outside/recirc. door is open to the outside. Air is discharged through the floor outlets only.

FLR/DEF

In the FLR/DEF position, outside air is discharged through the defroster nozzles and the floor outlets.

DEFROST

In the DEFROST position, outside air is discharged through the defrosters only.

tomsn048@gmail.com

Vacuum System

The outside/recirc. air inlet door is vacuum-operated. The vacuum system schematic diagram illustrates, in schematic form, how system components are involved.

The source of power for the vacuum control motor (18A318) which controls movement of the outside/recirc. air intake door is the engine intake manifold. This door has two operating positions, either of which is determined by the setting of the function selector lever in the heater control (18549).

When the vehicle is equipped with heater only and the function selector lever is in its OFF position, vacuum will be applied and the outside/recirc. door will move to shut off airflow from the outside. In all other positions of the selector lever (PANEL, PNL/FLR, FLOOR, FLR/DEF, or DEFROST) no vacuum is applied. Since the door is open to admit the input of outside air, it is closed to the admission of air from inside the vehicle.

Door position can be checked by lowering the glove compartment door on its hinges so that the recirculating air will be exposed.

If it should be necessary to service the vacuum control valve on the heater control, refer to the Removal and Installation procedures in this section.

Vacuum System Schematic

tomsn048@gmail.com

Safety Precautions

CAUTION: Whenever components in the engine compartment or instrument panel areas are being serviced, the battery ground cable must be disconnected to eliminate the possibility of electrical shorts, burned-up wiring and fires. Extreme care must be exercised when performing electrical tests where the battery must be connected to operate the system.

CAUTION: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with the vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside the closed area.

The various tests needed to check heater system operation are covered in Section 12-00 . In addition to these tests, visual inspection of all heater system components and connections should be made. Inspections should also be made especially in the dash panel area, to make sure that air leaks in the body are not having a significant effect on heating system performance.

tomsn048@gmail.com

Climate Control Assembly

Removal

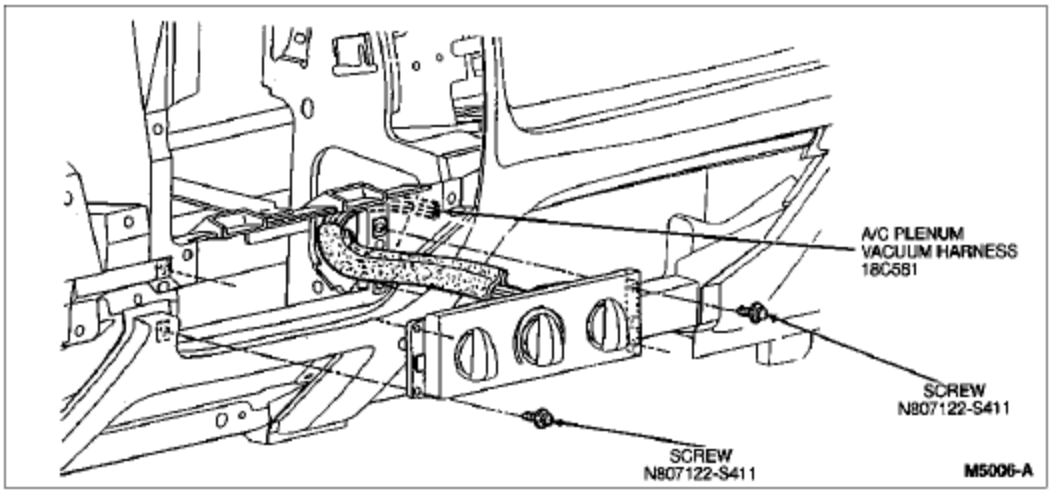
1. Disconnect battery ground cable.
2. Snap control opening finish panel away from instrument panel (04320). Refer to Section 01-12 .
3. Remove four screws attaching heater control (18549) assembly to instrument panel.
4. Pull heater control from instrument panel and disconnect electrical connectors from the heater control.
5. Disconnect A/C plenum vacuum harness (18C581).
6. Disconnect heater temperature cable (18518) from heater control.
7. The knobs (18519) can be removed by pulling.
8. Remove heater control.

Installation

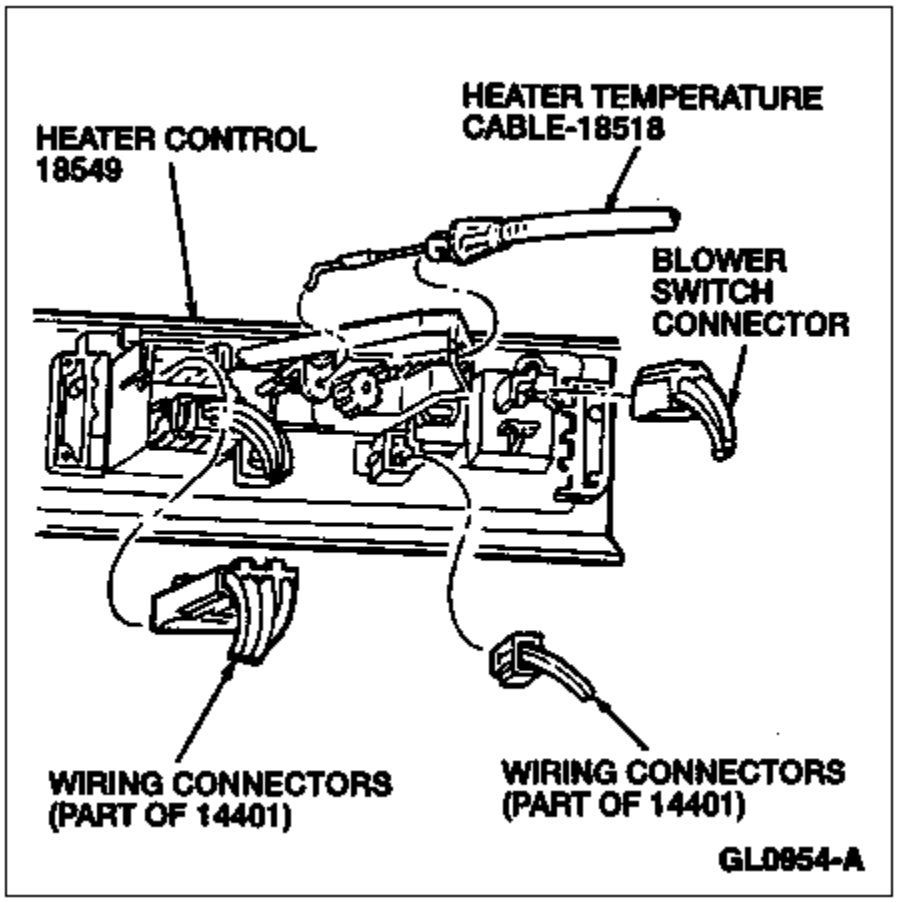
1. Push control knobs on appropriate shafts, if they were removed.
2. Connect heater temperature cable to heater control.
3. Connect electrical connector(s) and vacuum hose harness to heater control assembly.
4. Position heater control in instrument panel opening and install four retaining screws.
5. Install control opening finish panel by snapping it into place.
6. Connect battery ground cable.
7. Check system for proper operation.

Climate Control Assembly

tomsn048@gmail.com



Heater Control, Rear View



tomsn048@gmail.com

tomsn048@gmail.com

Climate Control Assembly Illumination Bulbs

Removal and Installation

1. Remove control assembly.
2. Rotate the miniature bulb assembly until the notch on the assembly is aligned with slot in the miniature bulb assembly access hole in the back of the control assembly.
3. Remove miniature bulb assembly.
4. Remove miniature bulb (13466).

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Climate Control Assembly Switch Knob(s)

Removal and Installation

Grasp knobs (18519) in fingers and carefully pull directly away from heater control (18549).

To install, align knob with appropriate heater control shaft and press into position. Make sure the flat points on both the shaft and knob are properly aligned.

tomsn048@gmail.com

Climate Control Assembly Switches

Heater Blower Motor Switch

Removal

1. Disconnect battery ground cable.
2. **NOTE: Do not detach the cables.**

   Remove the heater control (18549) from the instrument panel (04320) as described in this section.
3. Remove the wire harness hard shell connector from the connection by lifting the snap lock retainer with a screwdriver and pulling on the connector.
4. Remove the heater blower switch knob.
5. Remove the hex-head screw which attaches the heater blower motor switch (18578) to the heater control. Remove the switch by rotating and pulling it straight out from the rear of the control.

Installation

1. Position the heater blower motor switch against its mounting bracket in the heater control by inserting and rotating the switch to lock the tabs. Hold the heater blower motor switch tightly against the bracket, and install the hex-head screw.
2. Place the knob (18519) on its shaft and push in to secure attachment.
3. Connect the wire harness connector to the heater blower motor switch.
4. Position the heater control to the opening and install the four attaching screws.
5. Install the heater control as described in this section.
6. Connect the battery ground cable(s).
7. Check the heater blower motor switch for proper operation.

Vacuum Selector Switch

Removal

1. **NOTE: Do not detach the cables.**

   Remove the heater control as described in this section.
2. Move the function control knob to the OFF position. Remove the A/C plenum vacuum harness

tomsn048@gmail.com

(18C581) from the vacuum control valve by carefully opening the snap lock and pulling straight out on the vacuum harness connector.

3. Remove the hex head screw which attaches the vacuum selector valve switch. Rotate the switch and pull it straight out.

Installation

1. Position the vacuum control valve against its bracket in the heater control. Secure the valve with two hex-head screws.

2. Connect the A/C plenum vacuum harness to the vacuum valve assembly.

3. Install the heater control in its opening in the instrument panel as described in Removal and Installation, Climate Control Assembly in this section.

---

tomsn048@gmail.com

Climate Control Cable

Removal

1. Disconnect the battery ground cable.
2. Remove the heater control (18549) as described in this section.
3. Disengage the glove compartment door by squeezing the sides together, allowing the door to hang free, and remove the glove compartment assembly.
4. Working through the glove compartment and/or control opening, remove the temperature cable jacket from clips on top of the heater air plenum chamber (18471) by compressing the clip tabs and pulling the cables upward.
5. Reach through the glove compartment opening, and disconnect the heater temperature cable (18518) from its cam.
6. The cable is routed inside the instrument panel (04320) with two routing aids. Remove the cables from these devices. Reaching through the opening, pull the cable upward out of the wiring shield cut-out. Reaching through the glove box opening pull the cable out of the plastic clip up inside the instrument panel.
7. Pull the cable from the instrument panel through the opening for the heater control.

Installation

1. Working through the glove compartment opening and the opening in the instrument panel, feed the end of the cable to the cam assembly area. Feed the cable in from the glove compartment opening, ensuring that the round hole diecast end of the black heater temperature cable goes in first.
2. Attach the diecast end of the heater temperature cable to the temperature cam making sure that the cable is routed under the cable hold-down feature on the cam assembly.
3. Route the control end of the cable through the instrument panel until the ends stick out of the control opening. It is not necessary to insert the cable into any routing devices previously used. Those routing aids are only necessary when the entire instrument panel is removed and reinstalled.
4. Attach the heater temperature cable to the heater control. Install the heater control in the instrument panel as described in Removal and Installation, Climate Control Assembly in this section.
5. **NOTE: Make sure the radio antenna cable does not become disengaged from its mounting and fall into the plenum cam area where it could cause an increase in control assembly operating effort or a faulty selection of system functions.**

   Adjust the cable in its clips on top of the heater air plenum chamber by following the adjustment procedures described in Adjustments, Temperature Control Cable in this section.
6. Make a final check of the heater system for proper control cable operation.

tomsn048@gmail.com

tomsn048@gmail.com

Instrument Panel Registers

There are four instrument panel register assemblies, each of which can be adjusted horizontally and vertically to control directional airflow.

Register Louver Assembly (RH)

Removal and Installation

1. Carefully insert a small pry tool between the right-hand edge of the A/C register (19893) and the instrument panel pad. Use caution not to damage the pad finish.
2. Pry over and out to release the fixed snaps in line with center control knob. Three other flex tabs retain the assembly, one middle left side, one top left and one bottom left. These release the same as previously described.
3. Remove RH register from the face of the instrument panel (04320).

For installation, press the replacement RH register into its opening.

Instrument Panel Cluster, Center

The center register is actually two louver assemblies which can be adjusted and serviced independently of each other.

To remove the louver assemblies, proceed as follows:

1. Depress the center division bar to the side.
2. Pull the end of the louver assembly from the opening.
3. To install, snap each end of the louver assembly into position. Louvers will not assemble upside down, but will interchange with each other.
4. To service the entire register assembly, remove the center finish trim panel. Refer to Section 01-12 .
5. Release eight tabs from the backside and remove the assembly.

To install the register assembly, follow removal steps in reverse order.

Instrument Panel Cluster, Left Register

Removal and Installation

1. Remove the instrument panel applique as described in Section 01-12 .
2. From the back side of the applique, remove three screws from the left A/C register and push it out of the applique.
3. To install the register, set in position and install the screws.

tomsn048@gmail.com

4. Install the applique.

tomsn048@gmail.com

Heater Core

Removal and Installation

1. Allow the engine (6007) to cool. Following all safety precautions (refer to Section 03-03) and using a thick cloth, turn radiator cap slowly to the first stop. Step back while pressure is released. When the pressure has been released, tighten the radiator cap on the radiator.

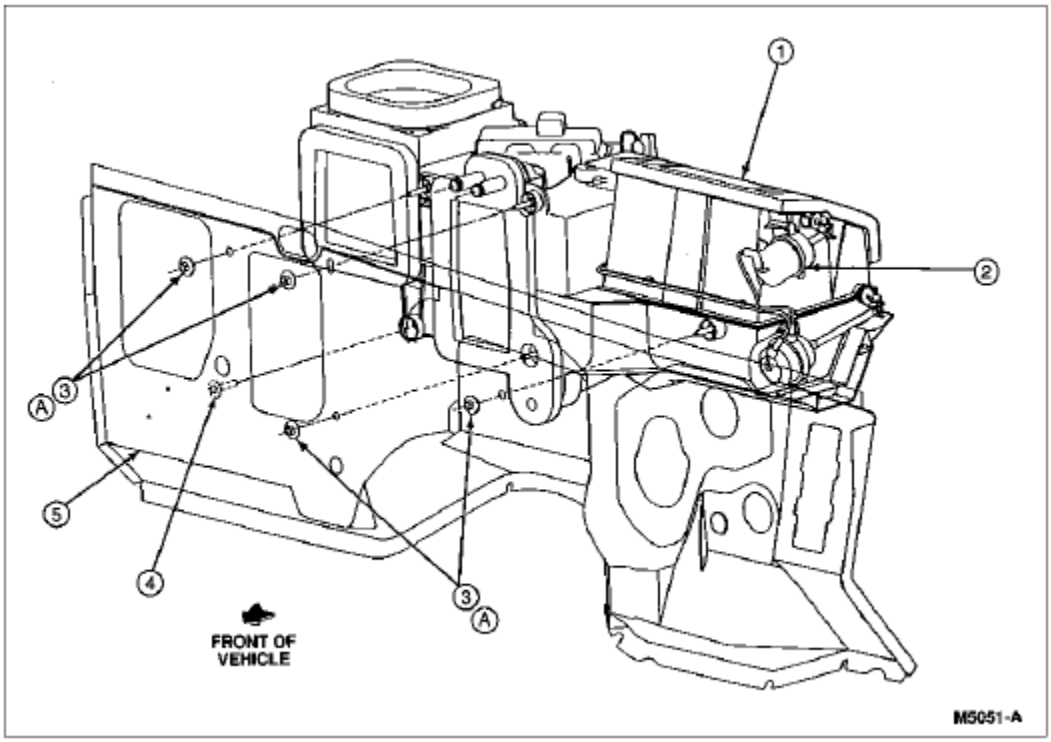
2. Disconnect the heater water hoses (18472) from the heater core (18476) and plug the heater water hoses.

3. In the passenger compartment, remove the instrument panel (04320). Refer to Section 01-12 .

4. Remove heater air plenum chamber (18471). Refer to Removal and Installation, Air Plenum Chamber and Duct in this section.

5. Remove heater core from heater air plenum chamber. For installation, follow removal procedures in reverse order.

Heater Air Plenum Chamber Installation



Item	Part Number	Description

tomsn048@gmail.com

1	18471	Heater Air Plenum Chamber
2	18A318	Vacuum Control Motor
3	N621907-S2	Nut (5 Req'd)
4	—	Stud (Part of 19850)
5	01610	Dash Panel
A	—	Tighten to 3-5 Nm (27-44 Lb-In)

tomsn048@gmail.com

Air Plenum Chamber and Duct

Removal

1. Disconnect the battery ground cable.
2. Remove heater water hoses (18472) fromheater core (18476) and plug heater water hoses as described in this section.
3. Remove the heater plenum chamber case (18A484).
4. Remove the remaining nuts which secure the heater air plenum chamber (18471) to the dash panel on the engine side of the panel.
5. In the passenger compartment, remove the instrument panel (04320), following procedures given in Section 01-12 .
6. Pull heater air plenum chamber from the dash panel and remove from the vehicle.

Installation

1. Position the heater air plenum chamber to the dash panel, aligning the studs with the holes in the panel.
2. Install the nuts on the studs at the dash panel in the engine compartment.
3. Install heater plenum chamber case.
4. Install the heater water hoses on the heater core.
5. Install the instrument panel, following procedures given in Section 01-12 .
6. Connect the battery ground cable. Check system for proper installation.

tomsn048@gmail.com

tomsn048@gmail.com

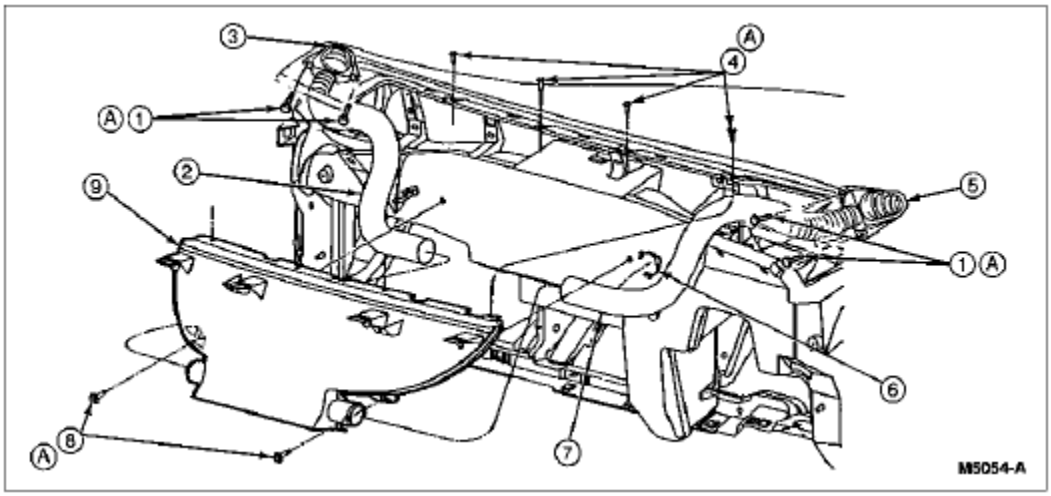
Defroster Ducts

Removal and Installation

1. Remove instrument panel (04320) and lay it back against front seat. Refer to Section 01-12 .
2. Remove four screws at the top of the defroster, front of the instrument panel pad.
3. Remove two screws attaching the defroster nozzle to the instrument panel duct beam.
4. Disconnect demister hoses from the defroster nozzle (pull off).
5. Remove defroster nozzle assembly.

To install, follow removal steps in reverse order.

Defroster Nozzle Installation



Item	Part Number	Description
1	N803875-S36	Screw (4 Req'd)
2	19E659	Side Window Demister Hose (RH)
3	19E656	Side Window Demister Nozzle (RH)
4	N804306-S36	Screw (4 Req'd)
5	19E657	Side Window Demister Nozzle (LH)
6	—	Clip (Part of 04320)
7	19E659	Side Window Demister Hose (LH)

tomsn048@gmail.com

8	N803875-S36	Screw (2 Req'd)
9	18490	Windshield Defroster Nozzle
A	—	Tighten to 2.1-2.9 Nm (18-27 Lb-In)

tomsn048@gmail.com

Outlet Floor Duct

Removal

1. Disconnect battery negative cable, then unplug connector assembly attached to front floor duct.
2. Using trim panel remover tool, remove connector assembly from front floor duct.
3. Remove the screw which attaches the rear of the front floor duct to the plenum.
4. Disengage the front floor duct from the tab on the left side of the plenum and remove the front floor duct.

Installation

1. Position the front floor duct so that the tab on the left side of the plenum protrudes through the oval hole in the duct. Install front floor duct attaching screw.
2. Install connector assembly to front floor duct.
3. Reconnect battery negative cable.

tomsn048@gmail.com

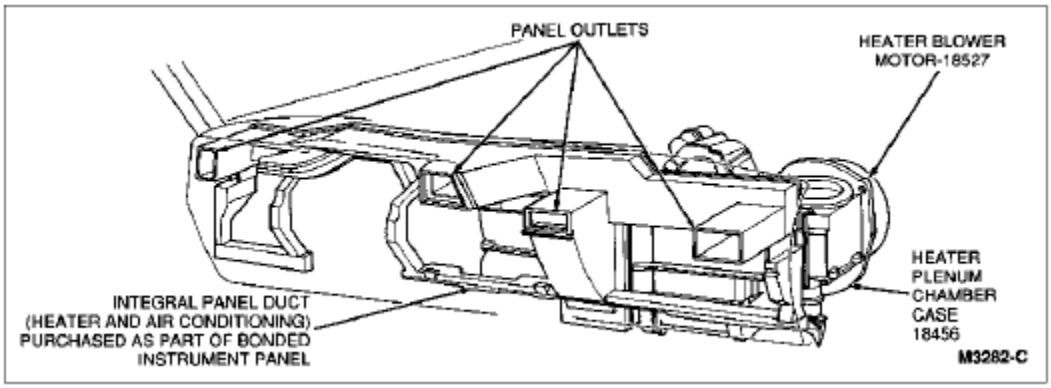
Ducts, Instrument Panel

The illustration shows the location of each of the four outlets in the instrument panel and duct assembly which direct air to the registers. The duct is a purchased-in-assembly component of the instrument panel (04320). It can be removed from the instrument panel assembly as follows.

Removal and Installation

1. Remove the instrument panel as described in Section 01-12 .
2. Remove the four screws which secure the instrument cluster. Remove the cluster.
3. Remove the windshield defroster hose nozzle (18490) as described in this section.
4. Remove the wiring channel cover (four screws).
5. Remove the wiring loom by disconnecting all connectors.
6. Remove all relays and modules.
7. Remove the glove compartment.

Instrument Panel Duct Assembly



8. Remove the radio and bracket.
9. Remove the climate control head assembly.
10. Remove eighteen screws which secure the duct. Remove the duct.

For installation, follow removal steps in reverse order.

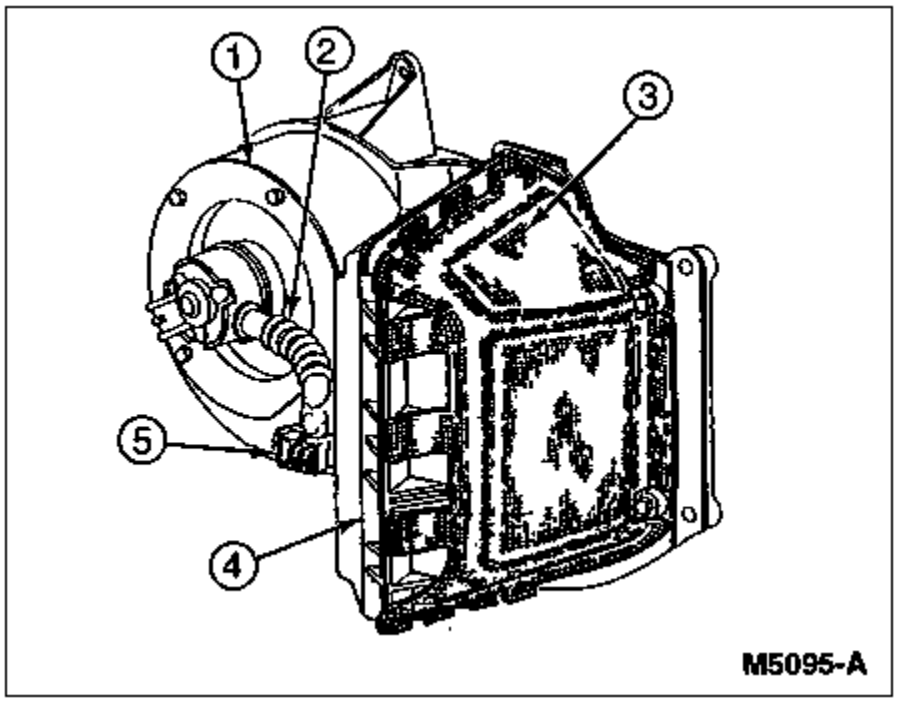
tomsn048@gmail.com

tomsn048@gmail.com

Blower Motor and Blower Motor Wheel Assembly

Removal and Installation

1. Disconnect the battery ground cable.
2. Remove the speed control module and windshield/washer bottle.
3. Disconnect the wire harness connector from blower motor (18527) by pushing down on the connector tabs and pulling the connector off the blower motor.



Item	Part Number	Description
1	18527	Blower Motor
2	19A786	Blower Motor Housing Tube
3	—	Heater Case Insulator (Part of 19850)
4	19930	Blower Housing
5	—	Electrical Connector (Part of 19805)

4. Disconnect the blower motor housing tube (19A786) at the blower motor.

tomsn048@gmail.com

5. Remove three screws attaching the blower motor to the A/C blower housing (19930).

6. Holding blower motor housing tube aside, pull the blower motor from the heater plenum chamber case (18A484) and remove it from the vehicle.

7. Remove the blower wheel hub pushnut and, if applicable, the clamp from the shaft. Then, pull the blower motor wheel (18504) from the shaft.

For installation, follow removal steps in reverse order. Check system for proper operation.

---

tomsn048@gmail.com

Blower Motor Switch Resistor Assembly

The heater blower motor switch resistor (18591) is located on the blower housing in the engine compartment.

Removal and Installation

1. Disconnect the wire connector from the heater blower motor switch resistor.

2. Remove the two attaching screws and lift the heater blower motor switch resistor from the opening in the blower housing.

For installation, follow removal steps in reverse order. Position resistor with notched edge toward blower motor. Check the blower for proper operation in all blower speeds.

tomsn048@gmail.com

Blower Case Assembly

Removal and Installation

1. Disconnect battery ground cable.
2. In the engine compartment, remove the electrical connector from the blower motor (18527) by pushing on the connector tab while pulling the connector off the blower motor. Remove the connector from the heater blower motor switch resistor (18591).
3. Disconnect the vacuum line from A/C vacuum reservoir tank and bracket (19A566).
4. Remove four nuts which attach the heater case to the dash panel.
5. Remove speed control module and windshield/washer bottle.
6. Pull heater case away from the dash panel and remove it from the vehicle.

For installation, follow removal steps in reverse order. Check system for proper operation.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

tomsn048@gmail.com

Vacuum Control Motors

Recirculation/Fresh Air Door

Removal and Installation

1. Open the glove compartment and remove contents. Push inward on the sides of the compartment and pull rearward until it disengages from its latched position and hangs down. The vacuum control motor (18A318) should be visible on the right side of the heater air plenum chamber (18471).

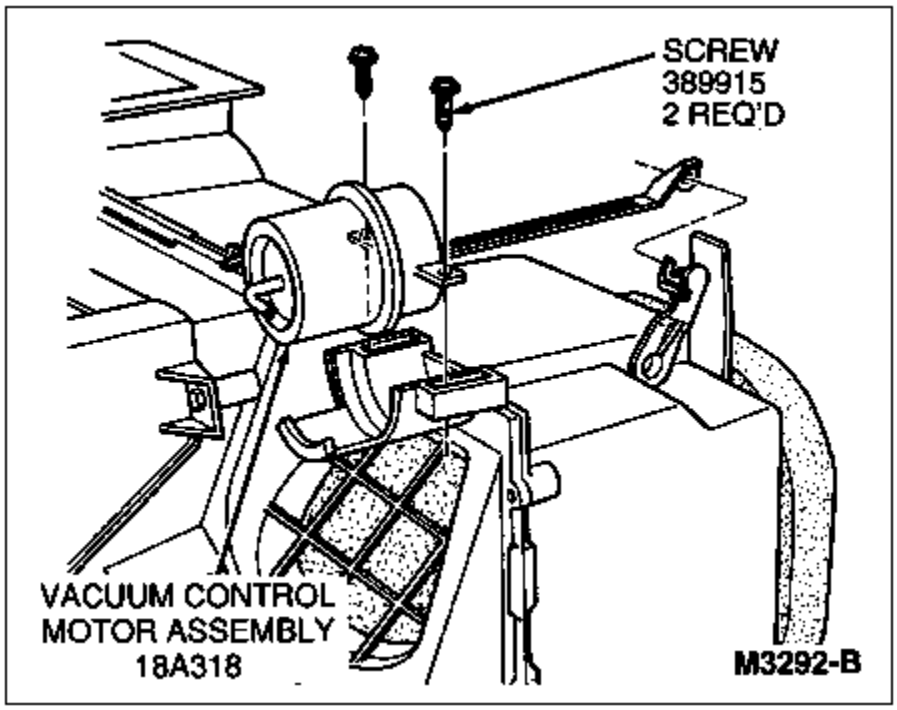
2. Disconnect the vacuum hose from the nipple.

3. Remove the two screws which attach the vacuum control motor to the heater air plenum chamber.

4. Swing the vacuum control motor rearward and disconnect its arm from the shaft on the heater air plenum chamber by sliding the arm to the left.

5. Start the engine and verify that the vacuum control motor responds properly to the function control knob (18519) when it is moved from its OFF position to one of the functional settings.

For installation, follow removal steps in reverse order.



tomsn048@gmail.com

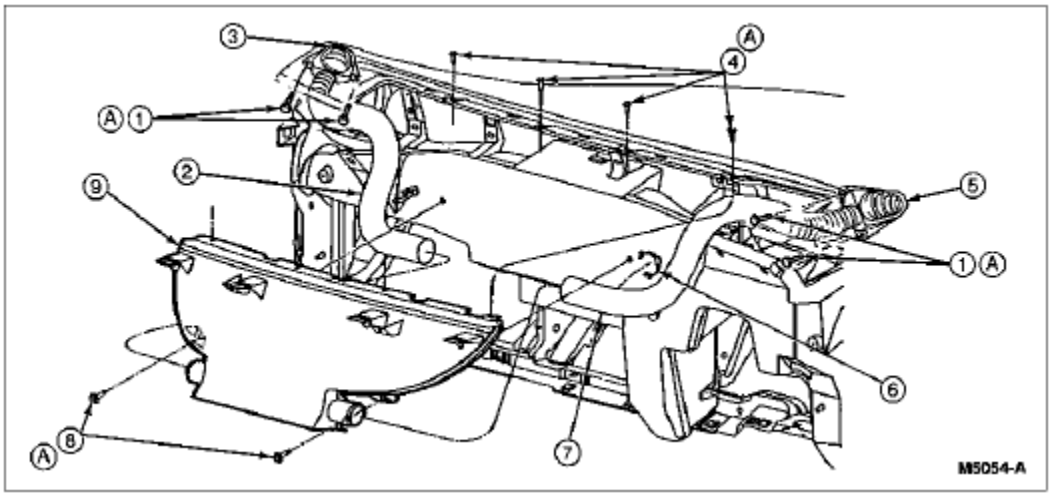
tomsn048@gmail.com

Windshield Defroster Nozzle

Removal and Installation

1. Remove instrument panel. Refer to Section 01-12 .
2. Remove four screws at the top of the defroster, on front of instrument panel pad.
3. Remove two screws attaching defroster to the instrument panel duct beam.
4. Disconnect demister hoses from defroster (pull off).
5. Remove nozzle assembly.
6. To install, follow installation procedures in reverse order.

Windshield Defroster Nozzle Installation



Item	Part Number	Description
1	N803875-S36	Screw (4 Req'd)
2	19E659	Side Window Demister Hose (RH)
3	19E656	Side Window Demister Nozzle (RH)
4	N804306-S36	Screw (4 Req'd)
5	19E657	Side Window Demister Nozzle (LH)
6	—	Clip (Part of 04320)
7	19E659	Side Window Demister Hose (LH)

tomsn048@gmail.com

8	N803875-S36	Screw (2 Req'd)
9	18490	Windshield Defroster Nozzle
A	—	Tighten to 2.1-2.9 Nm (18-27 Lb-In)

tomsn048@gmail.com

Side Window Demister and Hose

1. Remove instrument panel (04320). Refer to Section 01-12 .
2. Remove screws (two each side) which retain demister nozzles to the instrument panel.
3. Release RH A/C side window demister and hose (19E630) and the LH A/C side window demister and hose from the windshield defroster nozzle and the support clips and carefully remove hose assemblies from their locations.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Vacuum Hoses

Removal and Installation

1. Working in the engine compartment at the blower housing, disconnect the vacuum line (which is part of the A/C blower motor feed extension (19D605)).

2. Disconnect the vacuum line from the vacuum source on the engine intake manifold, and remove it from the routing channel.

3. Disconnect the vacuum line from the A/C vacuum reservoir tank and bracket (19A566), and remove the rosebud from the heater plenum chamber case (18A484).

For installation, follow removal steps in reverse order.

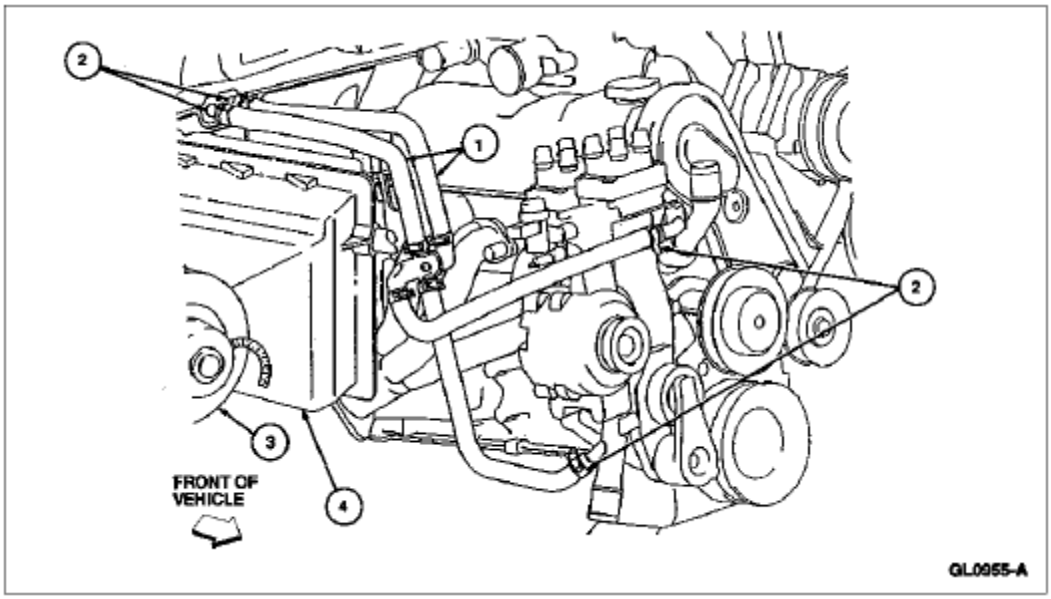
tomsn048@gmail.com

Heater Water Hoses

Removal and Installation

1. Drain the coolant from the cooling system. Observe the safety precautions covered in Section 03-03 .
2. Loosen the clamps and remove the heater water hose (18472) from the vehicle. Refer to the applicable engine illustration.

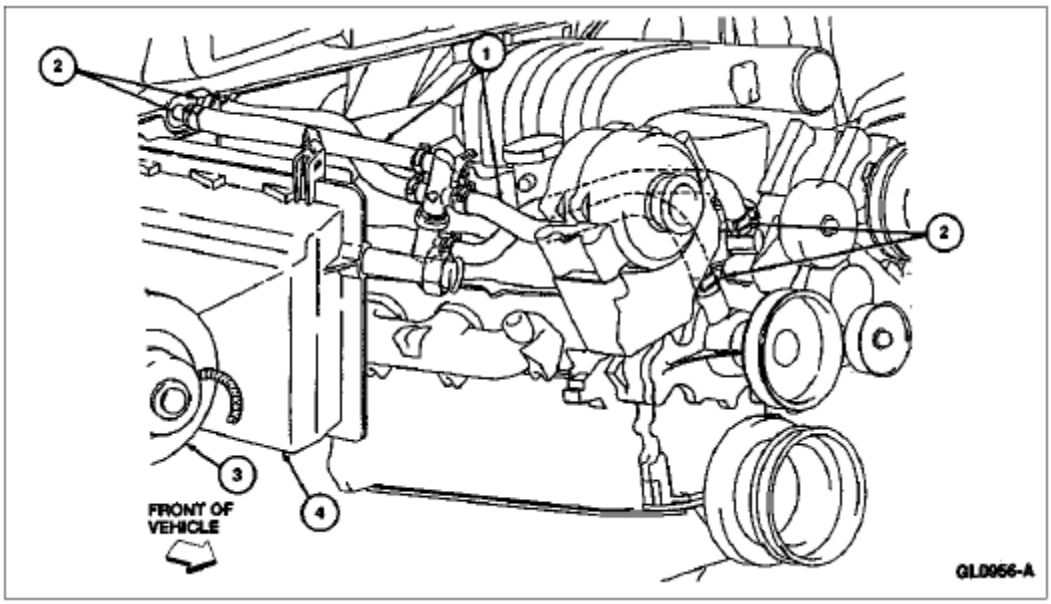
Heater Hose Installation, 2.3L Engine



Item	Part Number	Description
1	18472	Heater Water Hose
2	390761-S100	Clamp (4 Req'd)
3	19930	Blower Housing
4	19850	A/C Evaporator Housing

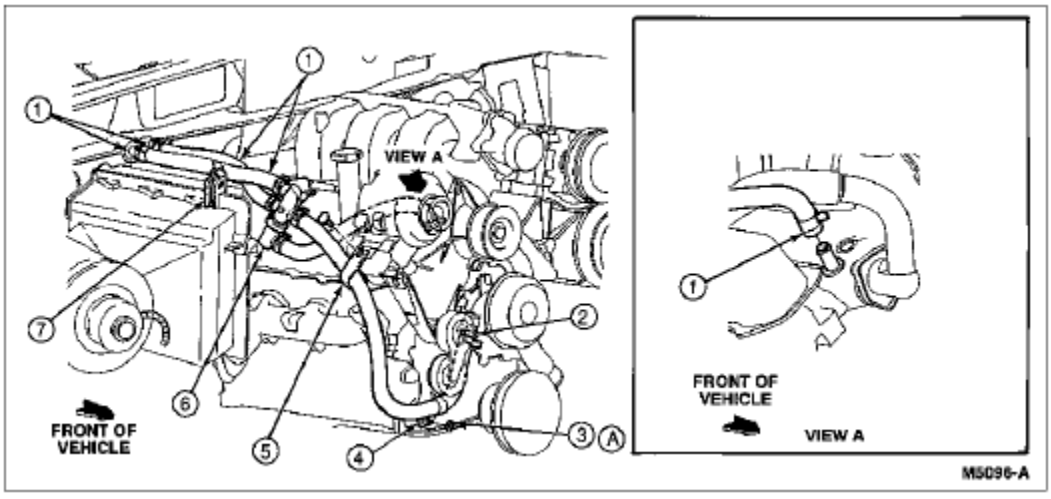
Heater Hose Installation, 3.0L Engine

tomsn048@gmail.com



Item	Part Number	Description
1	186266	Heater Hoses
2	8287	Clamp
3	19930	Blower Housing
4	19850	A/C Evaporator Housing

Heater Hose Installation, 4.0L Engine



Item	Part Number	Description
1	18472	Heater Water Hoses
2	8501	Water Pump
3	N621940-S54	Nut

tomsn048@gmail.com

4	N807327-S100	Clip
5	353859-S100	Clip
6	18495	Heater Water Control Valve
7	18D255	Heater Water Control Valve Bracket
A	—	Tighten to 10-14 Nm (7-10 Lb-Ft)

3. Route the heater water hose, as shown.
4. **NOTE: DO NOT overtighten the hose clamps.**

   Connect the heater water hose to the fittings and tighten the clamps to specification.
5. Fill and bleed the cooling system (refer to Section 03-03).
6. Check for coolant leaks and for proper operation of the system.

---

tomsn048@gmail.com

Temperature Control Cable

To check the adjustment of the heater temperature cable (18518), move the temperature control knob all the way to the left; then, move it all the way to the right. At the extreme ends of travel, the door should be heard to firmly seat allowing either maximum or no airflow through the heater core (18476). To check the adjustment of heater air cable (18552), establish that the function knob will reach the detents at the far left and right of its travel. In addition, determine that airflow is correct when the function knob is moved through each detent provided in the heater control (18549). If cable adjustment is needed, proceed as follows.

To adjust the cables:

1. Disengage the glove compartment door by squeezing the sides together, allow door to hang free and remove glove compartment assembly.

2. **NOTE: Cable end should remain attached to door cams.**

   Working through glove compartment opening, remove cable jacket from metal attaching clip on top of heater air plenum chamber (18471) by depressing clip tab and pulling cable out of the clip.

3. To adjust the heater temperature cable, set the temperature knob to COOL and hold. With the end attached to the temperature door cam, push gently on the jacket (black) to seat the blend door (push until you feel resistance). Reinstall heater temperature cable to clip by pushing jacket into clip from top until it snaps in place.

4. To adjust the heater air cable, set the function knob in the DEFROST detent and hold. With the end attached to the function cam, pull on the cam jacket (white) until cam travel stops. Reinstall heater air cable to clip by pushing cable jacket into clip from top until it snaps in place.

5. Run the blower motor (18527) on HIGH and actuate the knobs, checking for proper adjustment.

6. Install glove compartment.

7. **NOTE: If the heater temperature cable will move neither left nor right and appears to be locked in place, the adjustment pins may have been inadvertently left in the control cams during assembly. To remove these pins, refer to the following procedure.**

   Disengage the glove compartment door by squeezing its sides together. Allow the door to hang down and remove glove compartment assembly.

8. Working through the glove compartment opening, feel along the cable(s) until the cam(s) is reached. Then, feel the upper surface of the cam(s) to locate a small snap-in pin. (This pin should protrude approximately 9mm (3/8 inch) above the cam surface.

9. Remove and discard the pin.

10. Check for proper control cable operation.

11. Reinstall glove compartment assembly and door.

tomsn048@gmail.com

tomsn048@gmail.com

Mini-Tube Vacuum Hose

Mini-tube vacuum hoses are provided in the A/C plenum vacuum harness (18C581) assemblies. They provide greater flexibility with less tendency to collapse and are less susceptible to pinching. Service of damaged hoses are easily made using a short piece of standard 3mm (1/8 inch) ID vacuum hose and inserting the cut ends of the mini-tube into the ends of the standard 3mm (1/8 inch) ID vacuum hose. The following illustrates an in-line and tee connector installation.

1. Measure length of damaged area of the mini-tube vacuum hose.
2. Cut a piece of standard 3mm (1/8 inch) ID vacuum hose approximately 25mm (1 inch) longer than damaged area of the mini-tube vacuum hose.
3. Cut off the mini-tube vacuum hose on each side of damaged area.
4. Dip the mini-tube hose ends in Tetra Hydro Furan (THF) or Methyl Ethyl Ketone (MEK) to act as solvent and seal the repair joints.
5. Insert ends of the mini-tube vacuum hose approximately 9mm (0.375 inch) into ends of standard 3mm (0.125 inch) service vacuum hose section.
6. Shake service joint after assembly to ensure solvent is dispersed and vacuum line is not plugged.
7. Test system for a vacuum leak in service area using a Vacuum Tester.

Mini-Tube Vacuum Hose Service

R-134a Refrigerant System

CAUTION: Never mix the two refrigerants or the oils.

CAUTION: Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. Also, do not add R-134a refrigerant to an A/C system that requires the use of R-12 refrigerant. These two types of refrigerant should never be mixed. Doing so may cause damage to the A/C system.

NOTE: R-12 refrigerant and refrigerant oil is not compatible with R-134a refrigerant and R-134a refrigerant oil.

In an effort to avoid the use of CFC refrigerants that may harm the ozone layer of the atmosphere, Ford Motor Company has introduced a new refrigerant system on all Ford vehicles that requires the use of a non-CFC based refrigerant known as R-134a. This new type of refrigerant has many of the same properties as R-12 and is similar in form and function. However, R-134a is a hydrofluorocarbon (HFC)-based refrigerant while R-12 is a chlorofluorocarbon (CFC)-based refrigerant. Because of the absence of chlorine in its molecular structure, the use of R-134a refrigerant will not have any harmful effects on the ozone layer of the atmosphere.

tomsn048@gmail.com

A/C-Heater System, Manual

The manual air conditioning/heater system used in these vehicles is a split-case, blend air design. This design includes the following major components:

- An A/C evaporator housing (19850) which is attached to the engine compartment side of the dash panel (01610). This assembly includes: (1) the A/C evaporator core (19860), (2) the suction accumulator/drier (19C836), (3) the A/C cycling switch (19E561), (4) an internal A/C evaporator core orifice (19D990) located inside the inlet line to the A/C evaporator core, (5) a blower motor (18527), (6) a blower motor wheel (18504), (7) a heater blower motor switch resistor (18591), and (8) the A/C evaporator case (19897).
- A heater air plenum chamber (18471) which is attached to the passenger compartment side of the dash panel. This assembly includes: (1) the outside/recirculating air inlet door, (2) the panel door, (3) the floor defrost door, (4) the temperature blend door, and (5) the heater core (18476).
- Other components which link and/or control the heating and air conditioning systems include: (1) the A/C control (19980), (2) the ducts and registers, (3) the windshield defroster hose nozzle (18490), (4) the control cables, (5) the vacuum lines, (6) the refrigerant tubes and hoses, (7) the A/C compressor (19703), and (8) the A/C condenser core (19712).

tomsn048@gmail.com

Climate Control Assembly

The manual A/C-heater control includes the following features:

Airflow Control

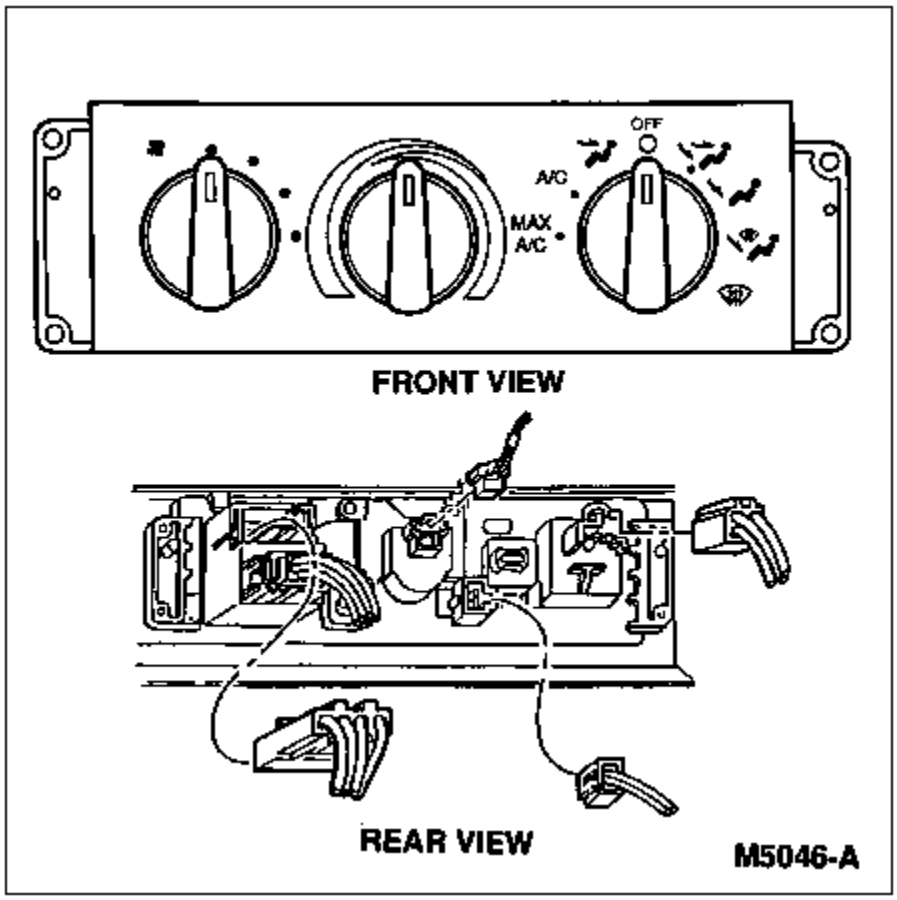
- A function selector knob which has positions: OFF, MAX-A/C, A/C, Panel, Panel/Floor, Floor, Floor/Defrost.
- The position of the knob determines the manner in which the system will operate.
  - A temperature control knob manually sets the desired comfort temperature.
  - Fan control knob controls the volume of air movement.
- Each position of the function selector knob and fan control knob is detented for positive engagement.
- The fan control knob provides four manually-selected A/C blower motor speeds and may be operated in any position of the function selector knob except OFF to select the desired amount of airflow.

The A/C control (19980) assembly consists of three main parts:

- The function selector knob, a vacuum selector valve combined with an internal electrical switch.
- Heater blower motor switch (18578), an electrical switch that provides four speeds of A/C blower motor operation.
- A temperature control knob, which controls the position of the temperature blend door mounted on the A/C evaporator housing (19850) assembly.

Front A/C and Heat

tomsn048@gmail.com



tomsn048@gmail.com

Airflow Control

The function selector actuates an eight-port air conditioner control that controls the vacuum control motor (18A318) at the floor/defrost, panel/defrost, and outside/recirc. air doors. The function selector also controls the OFF-ON operation of the heater blower motor switch (18578) and activates the circuit for the A/C clutch (2884) circuit in the A/C position.

In either A/C position and in FLOOR/DEFROST and DEFROST positions, compressor operation is dependent upon the A/C cycling switch (19E561).

The cutout pressure is approximately 161 kPa (23 psi). Cut-in pressure is approximately 321 kPa (46 psi).

The following chart relates function and temperature lever settings for direction of airflow into the passenger compartment.

FUNCTION AND TEMPERATURE LEVER SETTINGS AND RELATED AIRFLOW DIRECTIONS

Lever Position	Airflow Direction
Function Lever	
Panel	Instrument panel registers.
PNL/FLR	Split between instrument panel registers and floor outlets.
Floor	Floor outlets with bleed to defrosters.
FLR/DEF	Split between floor outlets and defrosters.
Defrost	Defroster with bleed to floor outlets.
Max A/C	Instrument panel registers.
Temperature Lever	
Cool (Full)	All air bypasses heater core.
Warm (Full)	All air flows through heater core.
Between Cool and Warm	Amount of air through heater core is proportionate to the amount that the blend air door is opened or closed to the extremes of cool or warm.

Temperature Control

The temperature selector actuates a variable resistance switch. This switch varies the voltage to an electric actuator used to position the temperature blend door.

Positioning the temperature control in any position between COOL and WARM causes the temperature blend door to direct more or less outside air through or around the heater core (18476) for whatever proportion of heated or unheated outside air is desired.

The air blends together as it leaves the heater core and enters the heater air plenum chamber (18471) for distribution.

tomsn048@gmail.com

tomsn048@gmail.com

Blower Motor Speed Control

The blower motor (18527) is controlled by a four-position heater blower motor switch (18578) located on the left side of the control assembly. The four positions are LOW, MEDIUM LOW, MEDIUM HIGH and HIGH. The four operating speeds are obtained with a heater blower motor switch resistor connected in series with the heater blower motor switch operating on the ground side of the blower motor.

With the function control knob in the OFF position, the blower motor will not operate.

With the heater blower motor switch at LOW, current flow in the ground circuit is through three resistors to obtain the lowest operating speed.

With the heater blower motor switch at MEDIUM LOW, current flow in the ground circuit is through two resistors to obtain a medium low operating speed.

With the heater blower motor switch at MEDIUM HIGH, current flow in the ground circuit is through one resistor to obtain a medium high operating speed.

With the heater blower motor switch at HIGH, current flow in the ground circuit by-passes the heater blower motor switch resistor (18591) to obtain the maximum operating speed.

tomsn048@gmail.com

Blower Motor Switch Resistor

A heater blower motor switch resistor (18591) with a thermal limiter is mounted in the A/C evaporator housing (19850). The heater blower motor switch resistor is used with the heater blower motor switch (18578) to obtain the desired fan speed.

tomsn048@gmail.com

Blower Motor Thermal Limiter

The thermal limiter in the heater blower motor switch (18578) serves as a temperature sensitive fuse. When the thermal limiter is opened, the heater blower motor switch resistor (18591) must be replaced.

tomsn048@gmail.com

Instrument Panel Registers

The louvers in the registers can be adjusted to direct air as desired. The louvers can also be closed to block most of the airflow.

tomsn048@gmail.com

A/C Evaporator Housing

The A/C evaporator housing (19850) is located on the engine compartment side of the dash panel (01610). It contains the A/C evaporator core (19860) and has the suction accumulator/drier (19C836) attached to the outside.

A/C Evaporator Housing

tomsn048@gmail.com

Blower Motor Assembly

The blower motor (18527) is housed in the A/C evaporator housing (19850) and is serviced from the engine compartment side of the vehicle dash panel (01610).

tomsn048@gmail.com

Defroster, Demister and Register Ducts

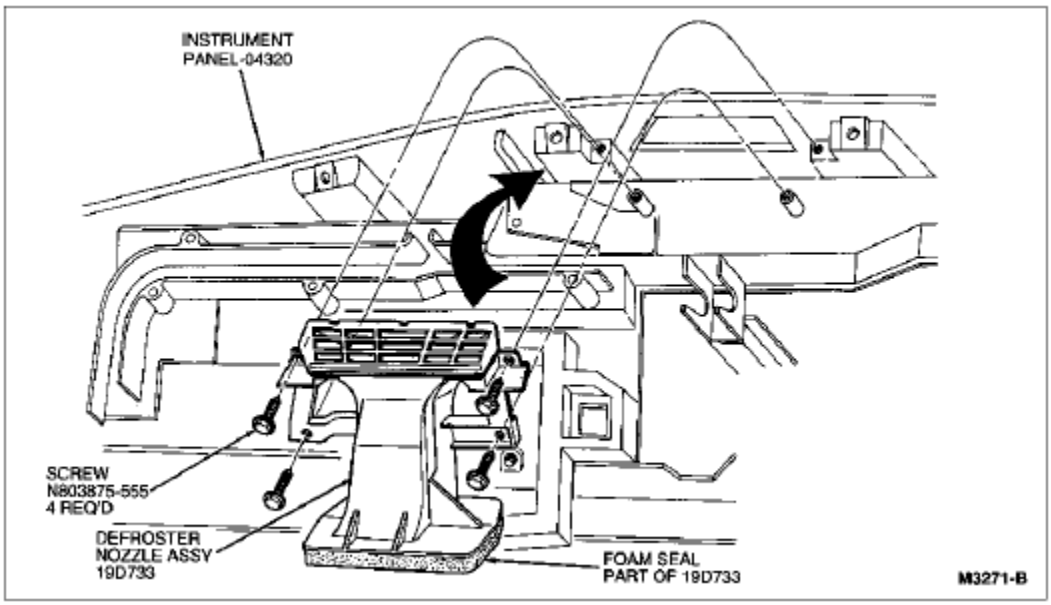
Register Duct

An air conditioner instrument panel duct and support assembly supplies air to the instrument panel registers as well as to the demisters. In addition, the assembly provides full support for the instrument panel (04320). It is attached to the instrument panel with 18 screws.

Windshield Defroster Hose Nozzle

The windshield defroster hose nozzle (18490) is attached with two screws to the under surface of the instrument panel as shown. It is also attached with two screws to the main air duct and support assembly, as shown.

Windshield Defroster Hose Nozzle



tomsn048@gmail.com

tomsn048@gmail.com

Vacuum Control Motor

The outside/recirculating inlet air door is vacuum-operated. The following illustrates, in schematic form, how system components are involved. The recirc. door is controlled by a vacuum control motor (18A318), which is powered by engine intake manifold vacuum. The function selector in the A/C control (19980) sets the door in either of its two operating positions: (1) closed to the vehicle interior (outside air position) when no vacuum is applied, or (2) open to the vehicle interior (recirculated air position) when vacuum is applied. In vehicles with A/C, vacuum is applied when the function selector is placed in the MAX A/C or OFF position only. This is to allow the driver of the vehicle the opportunity to improve the air conditioning performance in hot weather by cooling recirculated air or the opportunity to shutoff the flow of outside air. (In heater-equipped vehicles, vacuum is applied to shut off outside air in the OFF position.) In all other function selector lever positions (PANEL, PNL/FLOOR, FLOOR, FLR/DEF, or DEFROST), no vacuum is applied and the door remains closed to the vehicle interior. The inlet air door position can be observed through the recirculating inlet, located below the glove compartment.

tomsn048@gmail.com

Vacuum Hoses

Mini-tube vacuum hoses are used in the A/C plenum vacuum harness (18C581).

- They provide greater flexibility with less tendency to collapse and are less susceptible to pinching.
- Service is easily performed using a short piece of standard 3mm (1/8-inch) ID vacuum hose and inserting the cut ends of the mini-tube into the ends of the standard 3mm (1/8-inch) ID vacuum hose.

tomsn048@gmail.com

Electrical System

The components of the electrical system are the blower motor relay, blower motor (18527), a heater blower motor switch (18578), a heater blower motor switch resistor (18591) with thermal limiter, an A/C cycling switch (19E561), a high pressure cut-off switch, an A/C clutch (2884), and the fuse and wiring needed to protect and link the total circuit.

The blower motor is installed in the A/C evaporator core housing (19A559), which is part of the A/C evaporator case. The blower motor is connected to the electrical circuit with one hard shell connector located on the blower motor, which feeds back through the relay.

The mode function switch is installed on the A/C control (19980) and, with the heater blower motor switch resistor, provides four operating speeds.

The heater blower motor switch resistor is installed in the A/C evaporator case between the blower motor and the A/C evaporator core.

The heater blower motor switch is connected in series with the A/C cycling switch to control A/C compressor (19703) operation.

The A/C cycling switch is located on top of the suction accumulator/drier (19C836) assembly and controls cycling of the A/C clutch. When the pressure rises to 276-324 kPa (40-47 psi), the A/C cycling switch closes. When the pressure drops to approximately 152-179 kPa (22-26 psi), the A/C cycling switch opens to stop the A/C compressor operation. In ambient temperatures below approximately 10°C (50°F), the A/C cyclin g switch will not allow A/C compressor operation because low system pressures are not high enough to close the switch.

tomsn048@gmail.com

Relays

A/C Time Delay and WOT Cutout Relay

The air conditioning system is monitored and regulated by the closed loop engine control system. This system, working through the wide-open throttle (WOT) relay disengages the A/C clutch (2884) under the following conditions:

- Immediately after start-up.
- For a brief interval during wide open throttle performance to allow extra engine power for passing.
- When engine coolant temperature approaches an overheating condition.
- When engine idle rpm is approaching its stall speed.

In addition, the closed loop engine control system senses the output of the A/C cycling switch (19E561) and momentarily delays engaging the A/C clutch until engine idle rpm is boosted to an acceptable rate. Briefly, closed loop engine control provides smooth engine performance at slower speeds, as well as when the engine is operating in the idle range.

tomsn048@gmail.com

System Airflow Description

Air is drawn into the system by the blower motor (18527) through the outside-recirc. door opening. The air is blown through the A/C evaporator core (19860) and then the heater core (18476) (when the temperature control is moved toward the WARM position). When the temperature blend door is in the maximum cool position, the air bypasses the heater core. When the temperature control is moved to the right, away from the maximum cool position, air passes through the heater core where it is warmed, and then mixed with the cool air before it is discharged through the registers.

OFF

With the function selector in the OFF position, the outside-recirc. door is in the recirculated air position. It is closed to outside air and no air passes through the system. The blower motor is off.

MAX A/C

NOTE: No temperature modulation is possible in the MAX A/C position.

In the MAX A/C position, the outside-recirc. air door is in the recirculated air position. All of the air discharges through the panel registers except for a small amount of floor bleed. The A/C compressor (19703) operates in this function control setting.

PANEL/FLOOR

In the PANEL/FLOOR position, the outside/recirc. air door is open to outside air (no vacuum). Air is discharged through the heater outlet floor ducts (18C433) and panel registers. The A/C compressor will engage in this mode if outside air temperatures are above approximately 10°C (50°F).

NORM A/C

In the NORM A/C position the outside-recirc. air door is open to the outside (no vacuum) and outside air is discharged through the panel register with a small amount of floor bleed. The A/C compressor operates in this control setting.

PANEL

In the PANEL position the outside-recirc. air door is open to the outside (no vacuum), and outside air is discharged through the panel registers except for a small amount of floor bleed. The A/C compressor does not operate in this control setting.

FLOOR

In the FLOOR position, the outside-recirc. air door is open to outside air (no vacuum). Air is discharged through the heater outlet floor ducts plus a small amount of bleed is directed to the windshield.

DEF/FLR

In the DEF/FLR position air is discharged through both the windshield defroster hose nozzle (18490) and heater outlet floor ducts in approximate equal amounts. The A/C compressor operates in this control setting when the A/C cycling switch (19E561) is energized.

tomsn048@gmail.com

DEFROST

In the DEFROST position, the air is discharged through the windshield defroster hose nozzles. There is also a small amount of floor bleed. The A/C compressor operates in this control setting to help dehumidify the air.

tomsn048@gmail.com

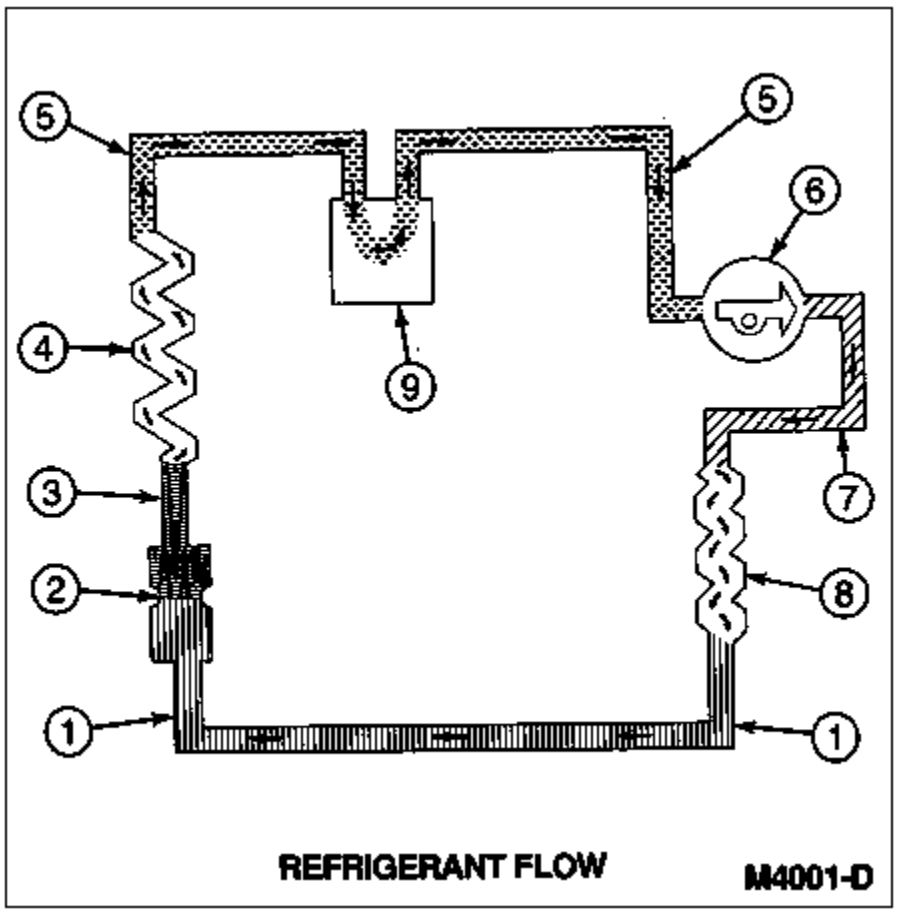
Refrigerant System

The air conditioning system uses a swash plate A/C compressor (19703), an A/C condenser core (19712) and inlet tube, a suction accumulator/drier (19C836), a A/C cycling switch (19E561), Schrader-type service access gauge port valves, and the necessary refrigerant lines. Subsequent text covering service procedures for the A/C evaporator core orifice (19D990) and refrigerant lines includes illustrations of the components involved.

Refrigerant Containment Switch — R-134a System

A refrigerant containment switch is used on all models with air conditioning to interrupt A/C compressor operation in the event of high system discharge pressures which could result in loss of refrigerant charge. The switch is located in the discharge line between the A/C compressor and the A/C condenser core. The switch is sensitive to the discharge pressure and functions to interrupt the A/C compressor operation if the discharge pressure exceeds a setting of 2751.1-3068.2 kPa (399-445 psi). The switch is a single function switch which only controls the circuit to the A/C cycling switch.

To introduce the subject of refrigerant flow, a simplified diagram follows which illustrates the pressure changes which take place in a typical refrigerant circuit. The diagram also calls out the physical state of the refrigerant as it passes through the circuit.



tomsn048@gmail.com

Item	Part Number	Description
1	—	High-Pressure Liquid
2	—	Restriction
3	—	Low-Pressure Liquid
4	19860	A/C Evaporator Core
5	—	Low-Pressure Vapor
6	19703	A/C Compressor
7	—	High-Pressure Vapor
8	19712	A/C Condenser Core
9	19C836	Suction Accumulator/Drier

When the A/C clutch field coil (2987) in the A/C clutch (2884) is energized and the A/C clutch engages and rotates the compressor drive shaft, the double-ended pistons move backward and forward in their respective cylinder bores pulling the low-pressure gas past the suction reed into the cylinder.

As each piston is forced into its respective cylinder bore, the refrigerant vapors from the suction side of the system are compressed into an increasingly smaller area, thus increasing the refrigerant vapor pressure and raising its temperature. The higher refrigerant vapor pressure now assists in seating the suction reed valve and the discharge (high pressure) reed valve as cylinder pressure exceeds the high pressure side of the system. When the compressed vapor is discharged into the high pressure side of the refrigerant system, the discharge reed valve spring pressure and the high side refrigerant pressure close and seal the reed valve, thus preventing the discharge pressure from re-entering the compressor cylinder. The A/C compressor refrigerant vapor compression cycle begins again as the pistons are pulled from their respective compressor cylinder bores by the rotating compressor shaft.

The high-pressure, high temperature compressor discharge refrigerant vapor is released into the top of the A/C condenser core, via the discharge hose. The A/C condenser core, being close to ambient temperature, causes the refrigeration vapor to condense into a liquid when heat is removed from the refrigerant vapor by ambient air passing over the fins and tubing.

Liquid refrigerant from the outlet enters the high-pressure liquid line which then flows to the inlet side of the A/C evaporator core orifice located in the inlet tube. The A/C evaporator core orifice is the refrigerant flow control device which controls refrigerant flow to the A/C evaporator core (19860) and separates the high- and low-pressure sides of the air conditioning system. The inlet filter screen of the A/C evaporator core orifice removes coarse contaminant particles, which may be present in the liquid refrigerant, before the liquid refrigerant enters the calibrated opening in the A/C evaporator core orifice. The outlet end of the A/C evaporator core orifice has a fine mesh filter with four open side slots. It is located in the body of the A/C evaporator core orifice, upstream from the filter. The side slots and filter act as a refrigerant flow noise suppressor.

The liquid refrigerant passes through the A/C evaporator core orifice tube and enters the A/C evaporator core as a cold low-pressure liquid. As airflow passes over the plate/fin sections of the A/C evaporator core, the refrigerant inside absorbs the heat and changes into a vapor.

A/C compressor suction draws the vaporized refrigerant and oil mixture into the suction accumulator/drier where the heavier oil laden vapors fall to the bottom and the lighter vapors and oil mixture continue their path to the A/C compressor via the top of the vapor return tube.

A desiccant bag, located inside the suction accumulator/drier, absorbs and retains moisture which may be circulating in the refrigeration system. The heavier oil laden refrigerant also returns to the A/C compressor through a small liquid bleed hole near the bottom of the vapor return tube. The liquid bleed hole provides a controlled second opportunity for the accumulated refrigerant and oil mixture to revaporize as it passes

tomsn048@gmail.com

though the opening to re-enter the main vapor flow path to the suction side of the A/C compressor and ensures adequate oil return to the A/C compressor.

Service Access Gauge Port Valves

Service gauge ports are located as follows:

NOTE: An adapter, Rotunda R-134a High Side Quick Disconnect 176-R0037 or equivalent is required to accommodate installation of service equipment.

- High-pressure port — In the compressor discharge line near the A/C condenser core.

  NOTE: An adapter, Rotunda R-134a Low Side Quick Disconnect 176-R0036 or equivalent is required to accommodate installation of service equipment.

- Low-pressure port — On top of the suction accumulator/drier near the A/C cycling switch.

A/C Evaporator Core

The A/C evaporator core is a "flooded type" (plate-fin) similar to those used in passenger cars. The condenser to evaporator tube (19835) connects to the bottom of the A/C evaporator core and suction accumulator/drier assembly connects to the top of the A/C evaporator core. The evaporator inlet tube is fitted with an A/C evaporator core orifice to control refrigerant flow. This A/C evaporator core orifice can be removed from the inlet tube for replacement if it becomes necessary. However, a special tool, Orifice Tube Remover and Installer D80L-19990-A or equivalent, is necessary to prevent breakage when removing the A/C evaporator core orifice.

A/C Evaporator Core Orifice

The A/C evaporator core orifice is a device which provides a restriction between the high- and low-pressure segments of the refrigerant circuit and meters the flow of liquid refrigerant into the A/C evaporator core. Temperature is controlled by sensing the pressure within the A/C evaporator core with a pressure operated electric switch. The pressure switch controls A/C compressor operation as necessary to maintain the pressure within specified limits.

The A/C evaporator core orifice is located in the inlet tube and has a filter screen on the inlet end of the body. The filter screen acts as a strainer for the liquid refrigerant flowing through the opening. O-rings, on the body, prevent the high-pressure liquid refrigerant from bypassing the A/C evaporator core orifice. Adjustment or repairs cannot be made to the A/C evaporator core orifice and it must be replaced as a unit. The replacement A/C evaporator core orifice must have a 0.067-inch orifice and be color-coded blue. Refer to Removal and Installation procedures in this section.

Item	Part Number	Description
1	19C836	Suction Accumulator/Drier
2	D80L-19990-A	Fixed Orifice Tube Tool
3	19D990	A/C Evaporator Core Orifice
4	—	Inlet Tube (Part of 19860)

Suction Accumulator/Drier

The suction accumulator/drier is mounted on the front of the A/C evaporator core and attaches directly to the outlet tube. A suction service access gauge port valve is mounted on top of the suction accumulator/drier. Its purpose is to provide service access to the suction side of the refrigeration system for pressure reading and system diagnosis.

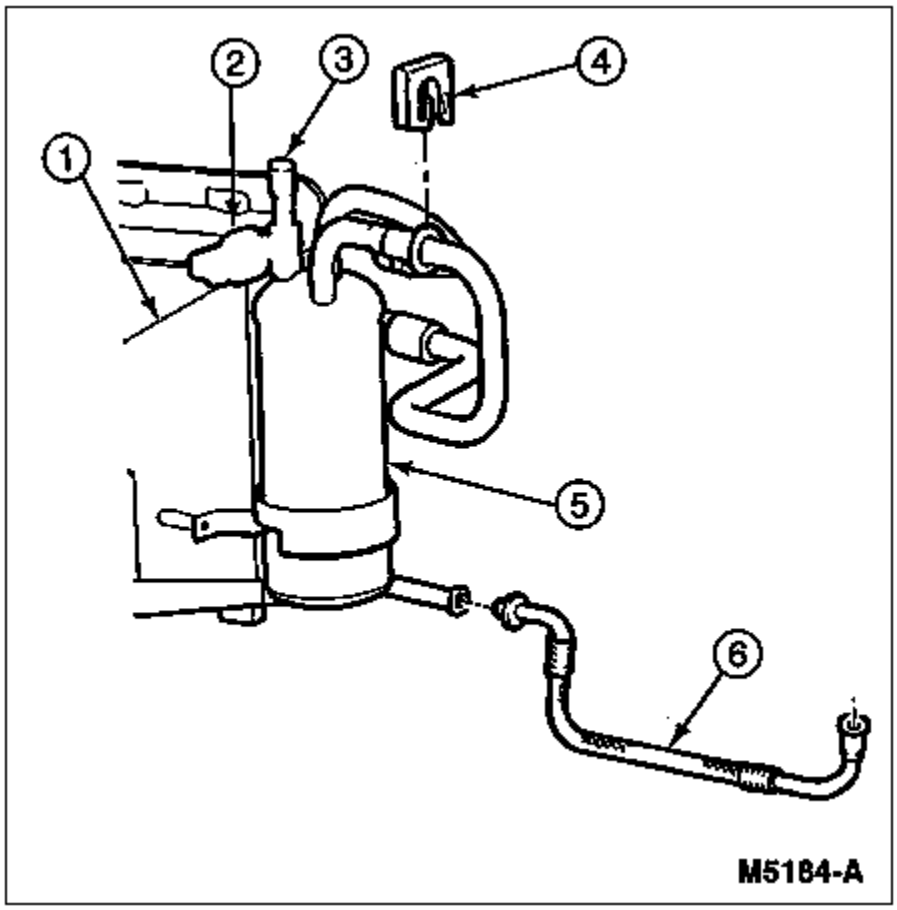
As refrigerant enters the suction accumulator/drier when charging or during air conditioning system operation, the liquid portion of the refrigerant and the system lubricating oil fall to the bottom of the accumulator can. A small diameter oil bleed hole, approximately 8mm (3/10 inch) above the bottom of the can in the J-shaped outlet tube, allows the accumulated heavier liquid refrigerant and oil mixture to re-enter the evaporator to compressor suction line at a controlled rate. As the heavier liquid refrigeration and oil mixture passes through the small diameter liquid bleed hole, it has a second opportunity to vaporize and recirculate through the A/C compressor without causing A/C compressor damage due to liquid slugging. The gaseous portion of the refrigerant is drawn out of the accumulator can at the upper end of the J-shaped tube by compressor suction.

A fine mesh screened filter fits tightly around the oil bleed tube to prevent contaminants from plugging the oil bleed hole.

A desiccant bag is mounted inside the suction accumulator/drier to absorb moisture which may be in the refrigerant system.

tomsn048@gmail.com

A fitting on the top of the suction accumulator/drier is used to mount the A/C cycling switch. It has a long travel Schrader-type valve stem core installed in the fitting opening to prevent refrigerant loss when the A/C cycling switch is removed. Use only the correct service replacement part which has a standard short travel valve. That will prevent the A/C cycling switch from seating when installed, causing refrigerant to leak from the system or causing damage to the A/C cycling switch.



Item	Part Number	Description
1	19850	A/C Evaporator Housing
2	19E561	A/C Cycling Switch
3	—	Low Pressure Access (Part of 19C808)
4	19E746	A/C Tube Lock Coupling Clip
5	19C836	Suction Accumulator/Drier
6	19835	Condenser to Evaporator Tube

The suction accumulator/drier should be replaced if one of the following exist:

1. The suction accumulator/drier is perforated.

2. There is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator/drier.

tomsn048@gmail.com

When replacing the suction accumulator/drier, the procedure given here must be followed to make sure that the total oil charge in the system is correct after the new suction accumulator/drier is installed.

- Drain the oil from the removed suction accumulator/drier into a suitable measuring container. It may be necessary to drill one or two 1/2-inch holes in the bottom of the old suction accumulator/drier to make sure that all the oil has drained out.
- Add the same amount of clean new refrigerant oil plus two fluid ounces to the new A/C compressor. Use only the oil specified.

All A/C compressors use oil that contains special additives not found in most other refrigerant oils. This refrigerant oil is Motorcraft Part No. YN-12b or an equivalent oil meeting Ford Specification WSH-M1C231-B. This oil is a mandatory requirement because of the aluminum swash plate used in Ford 10-cylinder compressors. The use of any oil other than one meeting Ford Specification WSH-M1C231-B could result in reduced suction accumulator/drier life.

A/C Cycling Switch

The A/C cycling switch is mounted on a Schrader-type valve fitting on the top of the suction accumulator/drier assembly. A valve depressor, located inside the threaded end of the A/C cycling switch, presses in on the Schrader valve stem as the A/C cycling switch is mounted and allows the suction pressure inside the accumulator/drier housing to activate the A/C cycling switch. The electrical contacts are normally open when the suction pressure is at or below 169 kPa (23 ± 1 psi); they will close, activating the A/C clutch, when the suction pressure rises to approximately 275-324 kPa (40-47 psi) or above. Lower ambient temperatures (below approximately 7℃ or 45℉), dur ing cold weather, will prevent the contacts from closing, due to the pressure/temperature relationship of the refrigerant in the system. The electrical contacts control the electrical circuit to the A/C clutch field coil. When the contacts are closed, the A/C clutch field coil is energized and the A/C clutch is engaged to drive the compressor. When the contacts are open, the A/C clutch field coil is de-energized, the A/C clutch is disengaged and the compressor does not operate. The A/C cycling switch, when functioning properly, will control the pressure at a point where the plate/fin surface temperature will be maintained slightly above freezing which prevents icing and the blockage or airflow.

tomsn048@gmail.com

Refrigerant System

A/C Pressure Cut-Off Switch

A refrigerant A/C pressure cut-off switch is used on all models with air conditioning to interrupt A/C compressor (19703) operation in the event of high system discharge pressures which could result in loss of refrigerant charge. The switch is located in the discharge line between the A/C compressor and the A/C condenser core (19712). The switch is sensitive to the discharge pressure and functions to interrupt the A/C compressor operation if the discharge pressure exceeds a setting of 2751-3068 kPa (399-445 psi). The switch is a single function switch which only controls the circuit to the A/C cycling switch (19E561).

A/C Condenser Core

The A/C condenser core is attached to the radiator support in front at the radiator with two mounting brackets at the top and bottom of the A/C condenser core. The top mounting brackets attach to the rear side of the radiator support and the lower bracket attaches to the front side of the radiator support.

A/C Compressor

The FS-10 A/C compressor is used on all Ranger vehicles.

Refer to Section 12-00 and Section 12-03D for service data, including specifications, for the FS-10 A/C compressor assembly.

Spring Lock Coupling

The A/C spring lock coupling is a refrigerant line coupling held together by a garter spring inside a circular cage. When the A/C spring lock coupling is connected together, the flared end of the female fitting slips behind the garter spring inside the male fitting cage. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage.

A/C Compressor Pressure Relief Valve

An A/C compressor pressure relief valve (19D644) is installed on the compressor discharge manifold to relieve excessively high-pressure buildups (3103 kPa or 450 psi and above) as well as prevent damage to the A/C compressor and other air conditioner components.

Inspection and Verification

Obstructed air passages, a broken drive belt (8620), disconnected or broken wires, damaged A/C clutch (2884), loose or broken mounting brackets and many refrigerant leaks may be determined by visual inspection of the parts.

A refrigerant leak will usually appear as an oily residue at the leakage point in the system. The oily residue soon picks up dust or dirt particles from the surrounding air and appears greasy. Through time, this will build up and appear to be heavy dirt impregnated grease.

Most common leaks are caused by damaged O-ring seals at the various hose and component connections. When these O-rings are replaced, the new O-rings should be lubricated with refrigerant oil and care should be taken to keep lint from the shop towels or rags from contaminating the internal surfaces of the connection.

Another type of leak may appear at the service ports. If leak appears at the service port(s), A/C system must be discharged before removal and replacement of the service port(s).

CAUTION: A/C charging valve caps (19D702) must be installed finger-tight. If tightened with pliers, the sealing surface of the service access gauge port valve may be damaged.

A missing A/C charging valve cap can also cause a refrigerant leak. If the A/C charging valve cap is missing, dirt will enter the area of the air conditioner charging valve core. When the service hose is attached, the valve depressor in the end of the service hose forces the dirt into the valve seat area and the dirt will destroy the sealing surface of the air conditioner charging valve core. When an A/C charging valve cap is missing, the protected area of the air conditioner charging valve core should be cleaned and a new A/C charging valve cap should be installed.

tomsn048@gmail.com

Symptom Chart — A/C, Heater System

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

A/C, HEATER SYSTEM

Condition	Possible Source	Action
• Manual A/C-Heater System Inoperative, Intermittent or Improper Operation	• Low refrigerant charge.	• REFER to Section 12-00 .
	• Damaged A/C clutch.	• REFER to Section 12-03D .
	• Loose drive belt.	• REFER to Section 03-05 .
	• Loose electrical connections.	• GO to Pinpoint Test Step **A1** .
• A/C Electronic Door Actuator Motor Inoperative, Intermittent or Improper Operation	• Loose electrical connections.	• CHECK for loose or corroded electrical connections.
	• Damaged A/C control.	• REPLACE A/C control. • GO to Pinpoint Test Step **B1** .

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A — MANUAL A/C-HEATER SYSTEM INOPERATIVE, INTERMITTENT OR IMPROPER OPERATION

A1 TEST BLOWER MOTOR OPERATION

- Turn ignition switch to RUN position.
- Place A/C control in any position except OFF.
- Cycle the heater blower motor switch through all speeds and listen for operation of the blower motor.

Does the blower motor operate?

Yes	No
GO to **A2** .	REFER to Section 12-00 .

A2 CHECK COMPRESSOR OPERATION

- Start vehicle engine.
- Place A/C control in any A/C position.
- Raise vehicle hood and observe A/C compressor operation.

Does A/C compressor operate normally?

Yes	No
GO to **A3** .	REFER to Section 12-00 .

A3 CHECK FUNCTION CONTROL OPERATION

- Start vehicle engine.
- Cycle A/C control through all detent positions and check for proper operation.

Does system operate correctly?

Yes	No
Complaint may be intermittent. Try to RECREATE condition by wiggling wiring harness and all connectors. SERVICE as necessary.	REFER to Section 12-00 .

tomsn048@gmail.com

PINPOINT TEST B — A/C ELECTRONIC DOOR ACTUATOR MOTOR INOPERATIVE, INTERMITTENT OR IMPROPER OPERATION

B1 CHECK TEMPERATURE CONTROL

- Start vehicle engine and bring up to normal operating temperature.
- Place A/C control in FLOOR position and temperature control in full warm position. Physically feel discharge air temperature at the heater outlet floor duct.
- Rotate temperature control to full cool and again check discharge air temperature at the heater outlet floor duct.

Does discharge air temperature vary?

Yes	No
Condition may be intermittent. Attempt to RECREATE condition by wiggling all connectors, splices, crimps, etc. SERVICE as necessary.	GO to **B2** .

B2 TEST FUSE

- Turn ignition switch to OFF position.
- Remove 7.5 amp fuse from fuse cavity 10 and test for continuity.

Does fuse test OK?

Yes	No
REINSTALL fuse. GO to **B3** .	REPLACE fuse. VERIFY system operation.

B3 TEST FEED CIRCUIT

- Measure voltage of Circuit 1003 (GY/Y) at the blend door actuator Pin 7.
- Turn ignition switch to run position and A/C control to FLOOR position. Read display on meter.

Is voltage present?

Yes	No
GO to **B4** .	SERVICE open in Circuit 1003 (GY/Y). VERIFY system operation.

B4 TEST BLEND DOOR POTENTIOMETER

tomsn048@gmail.com

- Turn ignition switch to OFF position.
- Remove A/C control from instrument panel far enough to gain access to electrical connectors.
- Rotate temperature control knob from full warm to full cool when performing the following 2 steps.
- Measure resistance between Pin 1, Circuit 359 (GY/R) and Pin 2, Circuit 773 (DG/0) of the blend door potentiometer.
- Measure resistance between Pin 2, Circuit 773 (DG/O) and Pin 3, Circuit 660 (Y/LG) of the blend door potentiometer.

Does the resistance vary for both measurements?

Yes	No
GO to **B5** .	REPLACE blend door potentiometer.

B5 CHECK RESISTANCE

- Key OFF.
- Measure resistance of Circuit 359 (GY/R), Circuit 773 (DG/O) and Circuit 660 (Y/LG) between the blend door potentiometer and A/C electronic door actuator motor.

Does each circuit test as continuous?

Yes	No
GO to **B6** .	REPAIR circuit in question.

B6 CHECK FOR SHORT

- Key OFF.
- Disconnect A/C electronic door actuator motor connector.
- Disconnect blend door potentiometer connector.
- Measure resistance to ground of circuit 359 (GY/R), Circuit 773 (DG/O) and Circuit 660 (Y/LG).

Is there greater than 10,000 ohms for each circuit?

Yes	No
GO to **B7** .	SERVICE short to ground circuit in question.

B7 TEST BLEND DOOR ACTUATOR

- Measure voltage between Pin 7, Circuit 1003 (GY/Y) and Pin 8, Circuit 57 (BK) of the A/C electronic door actuator motor.
- Turn ignition switch to RUN position and A/C control to FLOOR position. Read display on meter.

Is voltage present?

Yes	No
	Condition may be intermittent. Try to

tomsn048@gmail.com

REPLACE blend door actuator.	RECREATE condition by wiggling all wires, connectors, crimps, etc. CHECK for sticking or stuck blend door. SERVICE as necessary.

tomsn048@gmail.com

Refrigerant Oil Addition

During A/C Compressor Replacement

CAUTION: The R-134a A/C system FS-10 A/C compressor (19703) uses a unique high-quality refrigerant oil F2AZ-19577-AC, Motorcraft Part Number YN-12b or equivalent refrigerant oil meeting Ford specification WSH-M1C231-B. An oil charge of 207 ml (7 oz) is used in a new system. It is extremely important that only the specified type and quantity of refrigerant oil be used in the FS-10 A/C compressor. If there is a surplus of oil in the system, it will circulate with the refrigerant, reducing the cooling capacity of the system. Using too little oil or oil not meeting the Ford specification will result in poor lubrication of the A/C compressor.

When replacing a component of the refrigerant system, the procedures in this section must be followed to make sure that the total oil charge in the system is correct after the new part is installed.

During Component Replacement

When replacing other components of the air conditioning system, measured quantities of the specified refrigerant oil should be added to the component to make sure that the total oil charge in the system is correct before the system is operated.

Clean refrigerant oil should be poured directly into the replacement components as follows:

NOTE: Add an additional 60ml (2 oz) when repairing a leak.

- A/C evaporator core: add 90ml (3 oz).
- A/C condenser core (19712): add 30ml (1 oz).
- Suction accumulator/drier (19C836): drain oil from removed suction accumulator/drier. Add same amount plus 60ml (2 oz) of clean refrigerant oil to new suction accumulator/drier.

If any other component such as an orifice tube or a hose is replaced, no additional refrigerant oil is necessary unless a hose bursts with a fully charged system. Then, additional refrigerant oil may be necessary with the amount to be determined by the technician. The suction accumulator/drier should also be replaced under this circumstance.

tomsn048@gmail.com

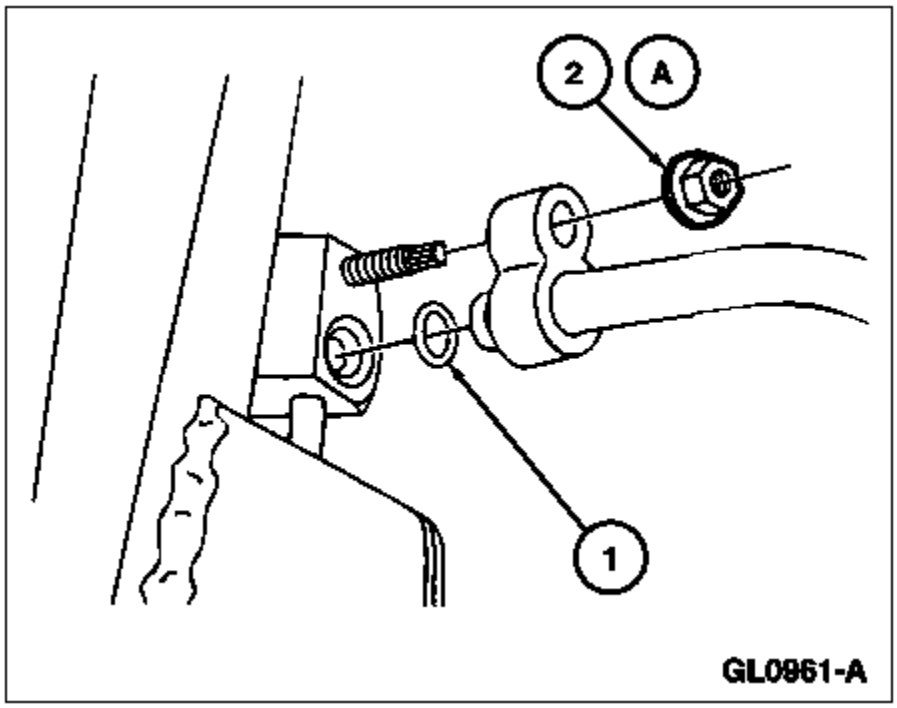
tomsn048@gmail.com

Spring Lock Coupling

The spring lock coupling is a refrigerant line coupling held together by a garter spring inside a circular cage. When the spring lock coupling is connected together, the flared end of the female fitting slips behind the garter spring inside the male fitting cage. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage. The following illustrations explain the removal and installation procedures for the spring lock couplings.

Peanut Fitting

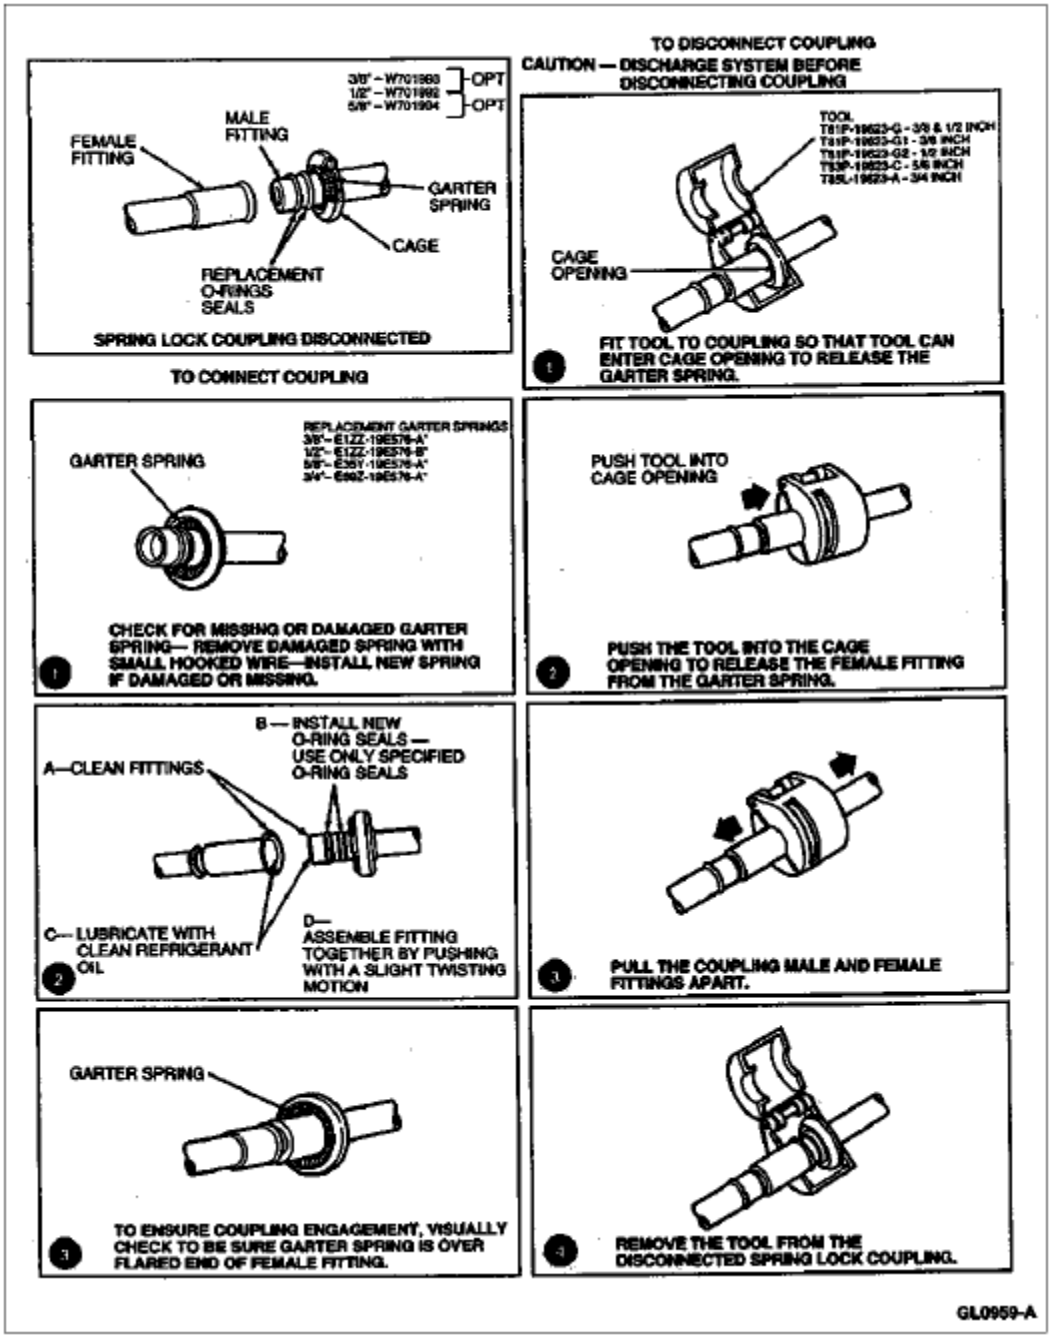
The peanut fitting is used for refrigerant line coupling. A replaceable O-ring is housed inside. The fitting is retained by a nut and a replaceable stud.



Item	Part Number	Description
1	—	Replaceable O-Ring Seal
2	—	Peanut Fitting Nut
A	—	6.8-9.2 Nm (61-82 lb-in)

Spring Lock Couplings

tomsn048@gmail.com



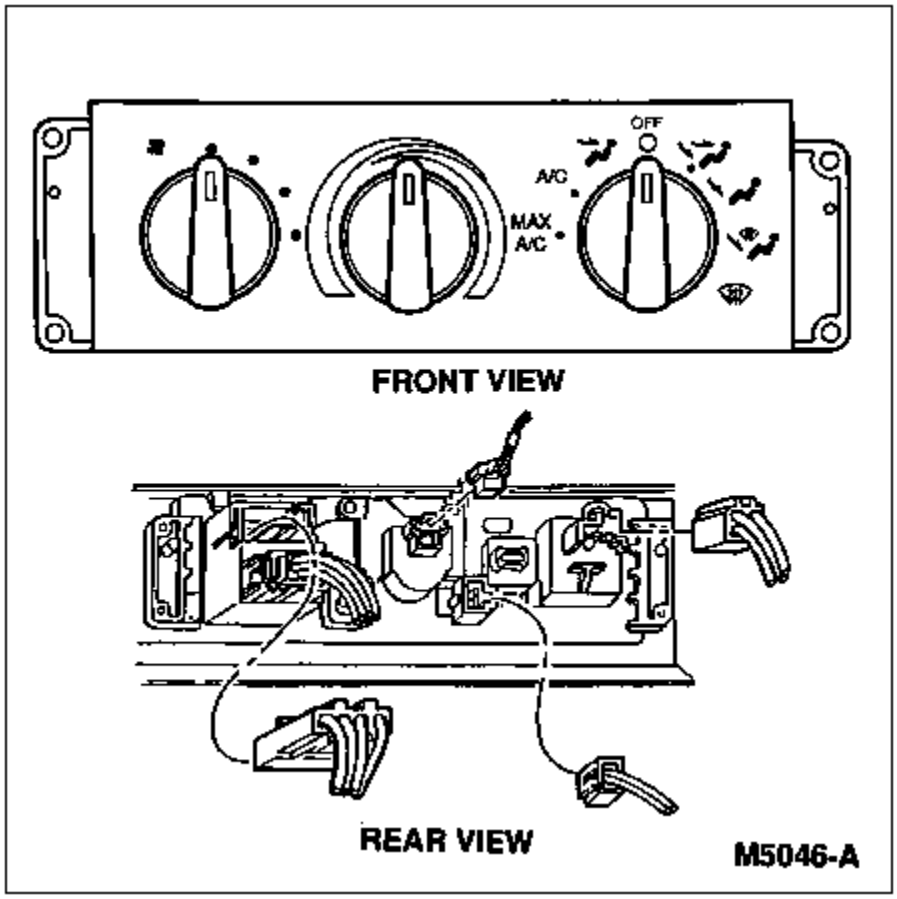
tomsn048@gmail.com

tomsn048@gmail.com

Climate Control Assembly

Removal

1. Disconnect battery ground cable.
2. Remove radio, refer to Section 15-01 .
3. Gently pull the finish panel away from the instrument panel (04320), and cluster. The finish panel pops straight back for approximately one inch, then "up" to remove. Take care so as not to wrap the finish panel around the steering column. If the vehicle is equipped with the electronic 4x4 electronic shift control, disconnect the wire from the rear of the 4x4 electronic shift control switch before trying to remove the finish panel from the instrument panel.
4. Remove the four screws attaching the A/C control (19980) to the instrument panel.



5. Pull the A/C control through the opening far enough to allow removal of electrical connections from heater blower motor switch (18578) and control lamp socket and wire (18541). Working with a small screwdriver, remove the A/C plenum vacuum harness (18C581) from the vacuum switch which is part of the A/C control.

tomsn048@gmail.com

6. Remove the A/C control from the instrument panel.

7. For installation, follow removal procedures in reverse order.

Illumination Bulbs

Removal and Installation

1. Remove control assembly as described under Climate Control, Removal and Installation in this section.

2. Rotate the miniature bulb assembly until the notch on the assembly is aligned with slot in the miniature bulb assembly access hole in the back of the control assembly.

3. Remove miniature bulb assembly.

4. Remove miniature bulb.

5. For installation, follow removal procedures in reverse order.

A/C Switch

Removal and Installation

1. Remove A/C control as described in Removal and Installation in this section.

2. Remove one screw retaining the function control switch to the back of the A/C control.

3. Grasp function control knob in fingers and pull away from the face of the A/C control.

4. Working from the back of the A/C control rotate function control switch counterclockwise until the retaining tabs are free from the A/C control and remove the function control switch from the A/C control.

5. For installation, follow removal procedures in reverse order.

Switch Knobs

Removal

1. Grasp knobs in fingers and pull directly away from A/C control.

Installation

1. Align knob with appropriate shaft. Make sure flat (keyed) area of knob matches with flat (keyed) portion of appropriate switch shaft.

2. Gently push knob onto shaft until fully seated.

Heater Blower Motor Switch

Removal and Installation

1. Disconnect battery ground cable.

tomsn048@gmail.com

2. Remove A/C control from the instrument panel as outlined under Removal and Installation in this section.

3. Remove the wire harness hard shell connector from the heater blower motor switch by gently prying with a screwdriver and pulling on the connector.

4. Remove switch knob as outlined under Removal and Installation in this section.

5. Remove the hex-head screw which attaches the heater blower motor switch to the bracket. Remove the heater blower motor switch by rotating it counterclockwise until it is free from the retaining tabs on the A/C control and pulling it straight out the rear of the A/C control panel (19808).

6. For installation, follow removal procedures in reverse order.

Temperature Control Module

Removal and Installation

1. Remove A/C control as outlined under Removal and Installation in this section.

2. Remove the temperature control knob as outlined under Removal and Installation in this section.

3. Remove the hex-head screw retaining the temperature control module to the A/C control.

4. Rotate the temperature control module clockwise until it is free from the retaining tabs on the A/C control and remove from the A/C control.

5. For installation, follow removal procedures in reverse order.

---

tomsn048@gmail.com

Relays

Blower Motor Relay

Removal and Installation

1. Raise vehicle hood and locate relay module one on the vehicle right fender apron.
2. Remove blower motor relay by unplugging it from relay module number one.
3. For installation, follow removal procedures in reverse order.

WOT Relay

Removal and Installation

1. Raise the vehicle hood and locate the power distribution box situated on the vehicle left fender apron.
2. Remove the power distribution box cover and locate the WOT relay.
3. Remove relay by pulling directly away from the power distribution box.
4. For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

A/C Electronic Door Actuator Motor

Removal

1. Disconnect battery ground cable.
2. **NOTE: Refer to Section 01-12 for instrument panel removal and installation procedure.**

   Loosen instrument panel (04320) and pull back from cowl.
3. Remove A/C electronic door actuator motor electrical connector from bracket on A/C evaporator housing.
4. Remove three A/C electronic door actuator motor retaining screws.
5. **NOTE: The mounting bracket remains in place on the A/C evaporator housing.**

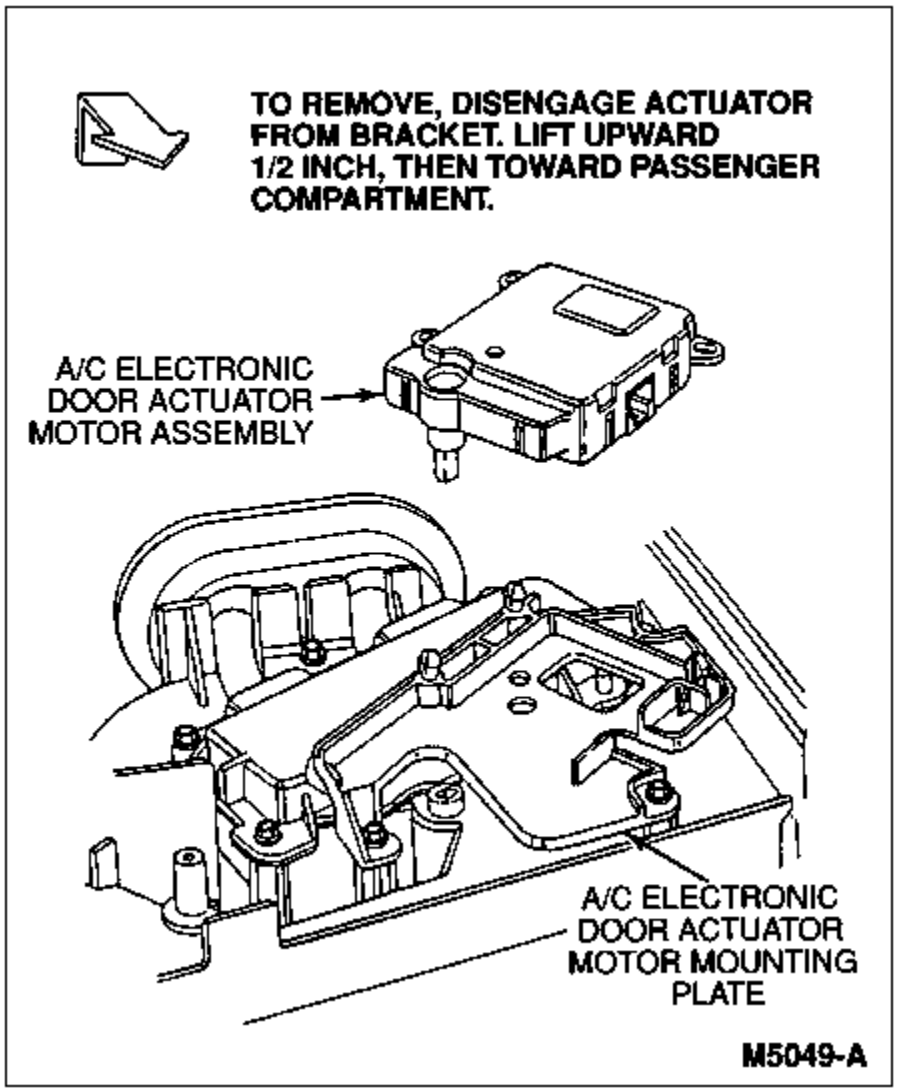
   Lift A/C electronic door actuator motor vertically approximately 12mm (1/2 inch) to disengage it from bracket and actuator shaft, then pull A/C electronic door actuator motor back toward passenger compartment.

Installation

1. Insert A/C electronic door actuator motor horizontally over actuator bracket on A/C evaporator housing.
2. Insert actuator shaft into A/C air temperature control door. (Manually moving A/C air temperature control door will help engage shaft.)
3. Attach actuator bracket with three retaining screws.
4. Attach actuator electrical connector to bracket on A/C evaporator housing.
5. Install instrument panel.
6. Connect battery ground cable.

Electronic Blend Door Actuator

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

A/C Evaporator Core Housing

Removal

1. Disconnect the ground cable.
2. Discharge the refrigerant system. Refer to Section 12-00 . Observe all safety precautions.
3. Disconnect the electrical hardshell connectors from the blower motor (18527), the heater blower motor switch resistor (18591) and the A/C cycling switch (19E561).
4. Disconnect the vacuum line (part of A/C blower motor feed extension (19D605)) from the A/C vacuum check valve (19A563).
5. Disconnect the vacuum line (part of the vacuum assembly) from the vacuum source on the engine intake manifold; then, remove the line from the routing channel.
6. Disconnect the condenser to evaporator tube (19835) from the inlet tube and cap the openings to prevent the entry of dirt and moisture.
7. Disconnect the A/C manifold and tube (19D734) from the suction accumulator/drier (19C836).
8. Remove speed control module from fender.
9. Remove the coolant recovery reservoir.
10. Remove the solenoid box cover, if so equipped, by removing the three bolts fastened through the fender liner. Remove the air cleaner and A/C vacuum reservoir tank and bracket (19A566), if so equipped.
11. Remove three nuts from the engine compartment side of the A/C evaporator housing (19850) and one nut from the passenger compartment side of the A/C evaporator housing.
12. Remove the A/C evaporator housing from the vehicle.

Installation

1. Position the A/C evaporator housing to the dash panel and install the three retaining nuts in the A/C evaporator housing and one nut in the passenger compartment.
2. Install the air cleaner, speed control module and coolant recovery reservoir.
3. Using a new O-ring lubricated with clean refrigerant oil, connect the condenser to evaporator tube to the inlet tube.
4. Connect the A/C manifold and tube to the suction accumulator/drier outlet tube after checking for a missing or damaged garter spring and/or repairing or replacing the spring. Install two new specified (special material) O-rings, lubricated with clean refrigerant oil onto the coupling male fitting.
5. Connect the vacuum line to the A/C vacuum check valve.

tomsn048@gmail.com

6. Connect the vacuum line (part of A/C vacuum reservoir tank and bracket) to the source on the engine intake manifold and route it as illustrated.

7. Connect the electrical hardshell connectors to the heater blower motor switch (18578), the A/C cycling switch, and the blower motor.

8. Leak test, evacuate and charge the system. Refer to Section 12-00 . Observe all safety precautions.

9. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable.

10. Check the air conditioning/heater system for proper operation.

---

tomsn048@gmail.com

A/C Evaporator Core

NOTE: Replacement of the suction accumulator/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator/drier.

NOTE: Before replacing the A/C evaporator core it is mandatory that an On-Vehicle Leak Test be performed. Refer to Section 12-00 .

Removal

1. Disconnect the cable from the battery negative (ground) terminal.
2. Discharge the refrigerant from the A/C system.Refer to Section 12-00 . Observe all safety precautions.
3. Disconnect the electrical connector from the A/C cycling switch (19E561) located on top of the suction accumulator/drier.
4. Remove the A/C cycling switch from the suction accumulator/drier.
5. Disconnect the suction hose from the suction accumulator/drier and cap openings to prevent dirt and/or moisture from entering.
6. Disconnect the condenser to evaporator tube (19835) from the inlet tube using the appropriate spring lock coupling disconnect tool. Cap the openings to prevent dirt and/or moisture from entering.
7. Remove the screws holding the service cover to the A/C evaporator housing (19850).
8. Remove the service cover from the A/C evaporator housing.
9. Remove the A/C evaporator core from the vehicle.

Installation

1. Position the A/C evaporator core in the A/C evaporator housing.
2. Position the service cover into place on the A/C evaporator housing.
3. Install the two dash panel mounting nuts.
4. Install the screws holding the service case half to the A/C evaporator housing.
5. Install the suction accumulator/drier into the bracket (3 screws), then install inlet clamp (1 screw).
6. Connect the condenser to evaporator tube to the A/C evaporator housing inlet tube.
7. Connect the A/C manifold and tube (19D734) to the outlet side of the suction accumulator/drier. Install two new specified (special material) O-rings, lubricated with clean refrigerant oil, onto the male fitting.

tomsn048@gmail.com

8. **CAUTION: DO NOT use a wrench to tighten the A/C cycling switch.**

   Install (screw) the A/C cycling switch to the suction accumulator/drier and tighten finger-tight.

9. Connect the electrical connector to the A/C cycling switch.

10. Charge the air conditioning system. Refer to Section 12-00 . Observe all safety precautions.

11. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect the cable to the battery negative (ground) terminal.

12. Check the air conditioning system for refrigerant leaks and proper operation.

---

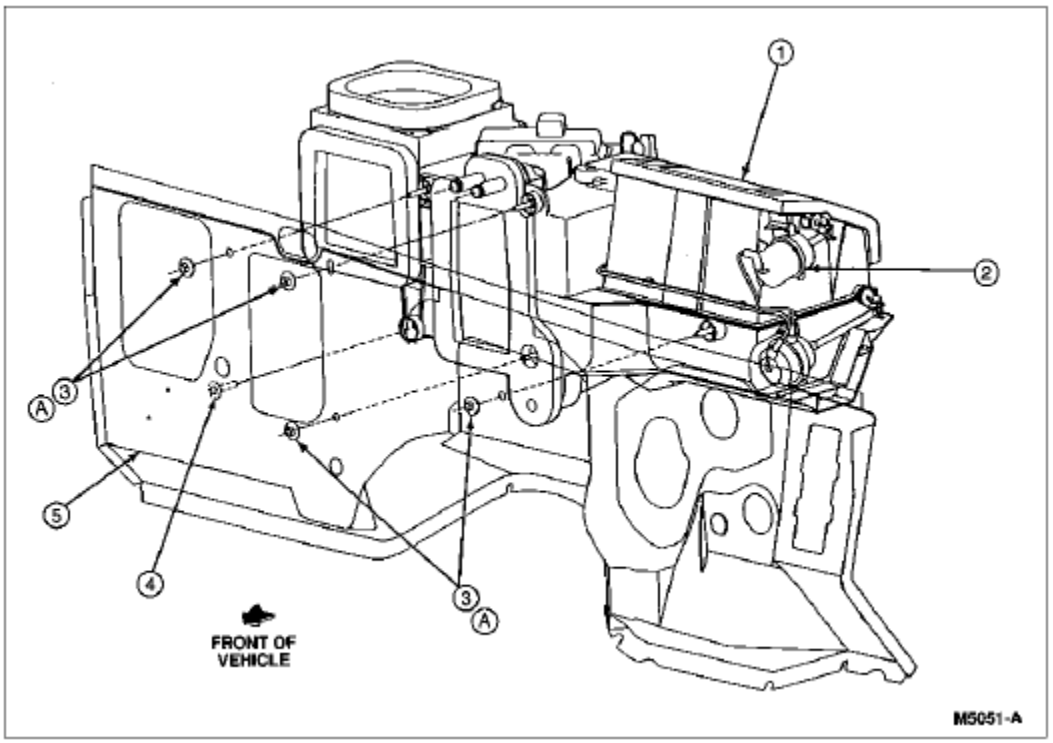
tomsn048@gmail.com

Heater Case

Removal and Installation

Refer to Heater Air Plenum Chamber under Removal and Installation in this section.

Air Conditioning/Heater Plenum Chamber Case



Item	Part Number	Description
1	18471	Heater Air Plenum Chamber
2	18A318	Vacuum Control Motor
3	N621907-S2	Nut (5 Req'd)
4	—	Stud (Part of 19850)
5	01610	Dash Panel
A	—	Tighten to 3-5 Nm (27-44 Lb-In)

tomsn048@gmail.com

tomsn048@gmail.com

Heater Core

Removal and Installation

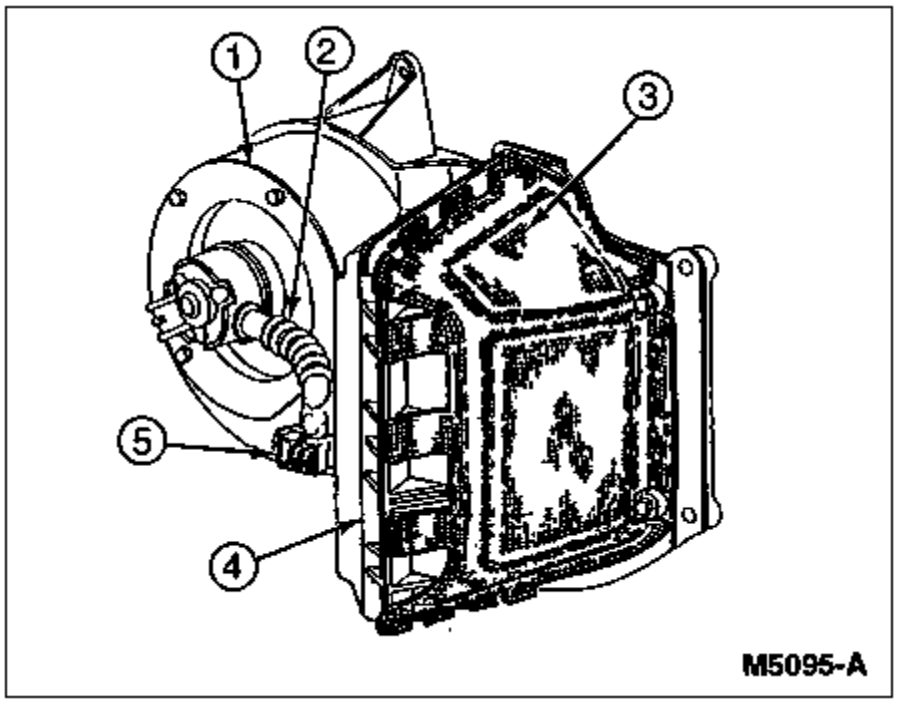
1. Allow the engine to cool. Observe the safety precautions outlined in Section 03-03 . Using a thick cloth, turn the radiator cap slowly to its first stop. Step back while the pressure is being released; then, when no more pressure is escaping, place a drain pan beneath the radiator. Open drain valve and allow engine and radiator to fully drain.
2. Disconnect the heater water hose (18472) from the heater core (18476), then, plug the heater water hose.
3. Working inside the passenger compartment, remove the instrument panel. Refer to Section 01-12 .
4. Remove Heater Air Plenum Chamber (18471). Refer to Removal and Installation in this section.
5. Remove heater core from heater air plenum chamber.
6. For installation, follow removal procedures in reverse order.

Blower Motor and Blower Motor Wheel Assembly

Removal

1. Disconnect the battery ground cable (14301).
2. Remove the air cleaner in front of the blower motor (18527).
3. Disconnect the wire harness connector from the blower motor by pushing down on the connector tabs and pulling the connector off the blower motor.

tomsn048@gmail.com



Item	Part Number	Description
1	18527	Blower Motor
2	19A786	Blower Motor Housing Tube
3	—	Heater Case Insulator (Part of 19850)
4	19930	Blower Housing
5	—	Electrical Connector (Part of 19805)

4. Disconnect the blower motor housing tube at the blower motor.
5. Remove four screws attaching the blower motor to the A/C blower housing.
6. Holding blower motor housing tube (19A786) aside, pull the blower motor from the heater plenum chamber case and remove it from the vehicle.
7. Remove the blower wheel hub pushnut and, if applicable, the clamp from the shaft. Then, pull the blower motor wheel from the shaft.

Installation

To install, reverse the removal procedure. Check system for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

Heater Blower Motor Wheel

Removal

1. Remove blower motor (18527). Refer to Heater Blower Motor and Blower Motor Wheel Assembly under Removal and Installation in this section.
2. Place blower motor assembly on bench with blower motor wheel (18504) facing up.
3. Remove pushnut, then gently remove the blower motor wheel from the blower motor shaft.

Installation

1. Install blower motor wheel onto blower motor shaft until it bottoms on the hub and secure with a new pushnut.
2. Install blower motor and blower motor wheel assembly by following removal procedures in reverse order.

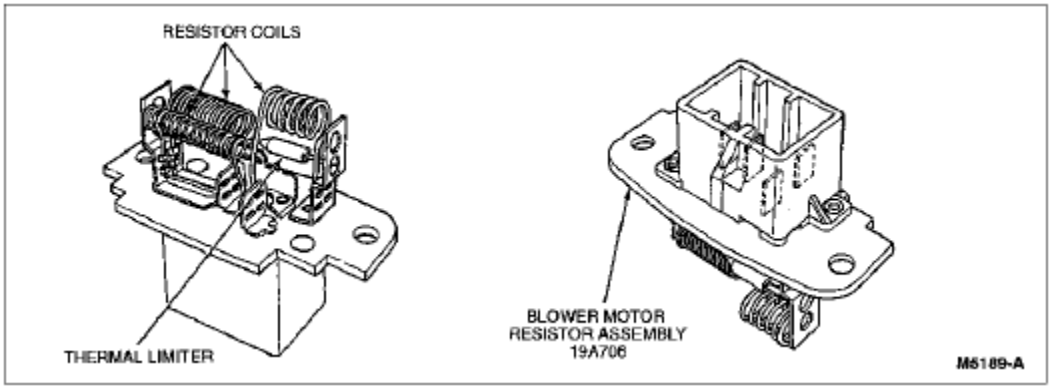
tomsn048@gmail.com

Blower Motor Switch Resistor

Removal and Installation

1. Disconnect battery ground cable.
2. Disconnect the wire connector from the heater blower motor switch resistor (18591), located on the A/C evaporator housing (19850).
3. Remove two screws attaching the heater blower motor switch resistor to the A/C evaporator housing then remove the heater blower motor switch resistor.
4. For installation, follow removal procedures in reverse order. Check system for proper operation.

Heater Blower Motor Switch Resistor with Thermal Limiter



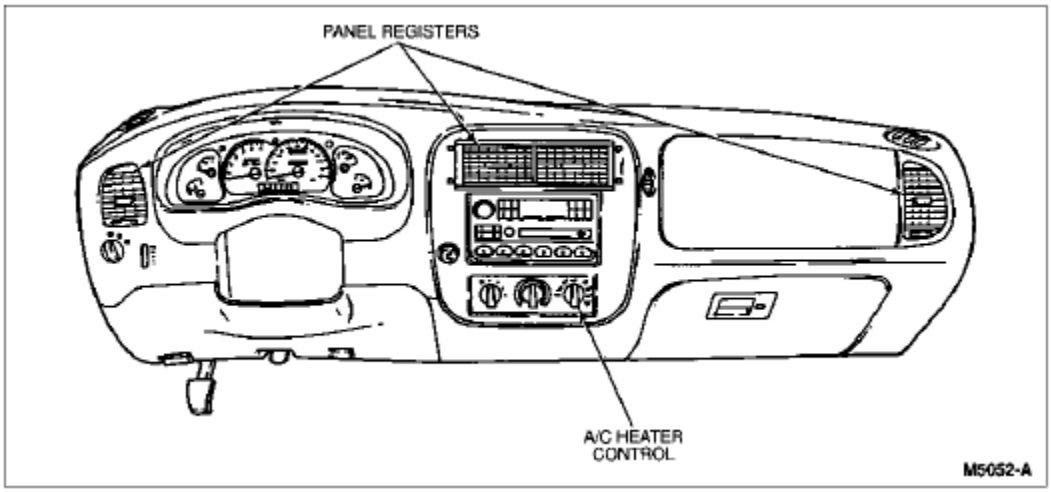
tomsn048@gmail.com

tomsn048@gmail.com

Instrument Panel Register Assemblies

There are four instrument panel register assemblies each of which can be adjusted horizontally and vertically to control airflow. Shutoffs are independent of air directional controls.

A/C Register Locations



RH

The right-hand A/C register (19893) is above the glove compartment door. It is supplied to production as a "purchased-in-assembly" component of the instrument panel (04320); but it is available for service replacement.

Removal and Installation

1. Carefully insert a small pry tool between the right-hand edge of the A/C register and the instrument panel pad. Use caution not to damage the pad finish.

2. Pry over and out to release fixed snaps in line with center control knob. Three other flex tabs retain assembly, one middle left side, one top left and one bottom left. These release the same as described.

3. Remove RH A/C register from face of the instrument panel.

4. Move the RH A/C register rearward far enough to prevent the tab from re-engaging.

5. For installation, press the replacement RH A/C register into its opening.

Center

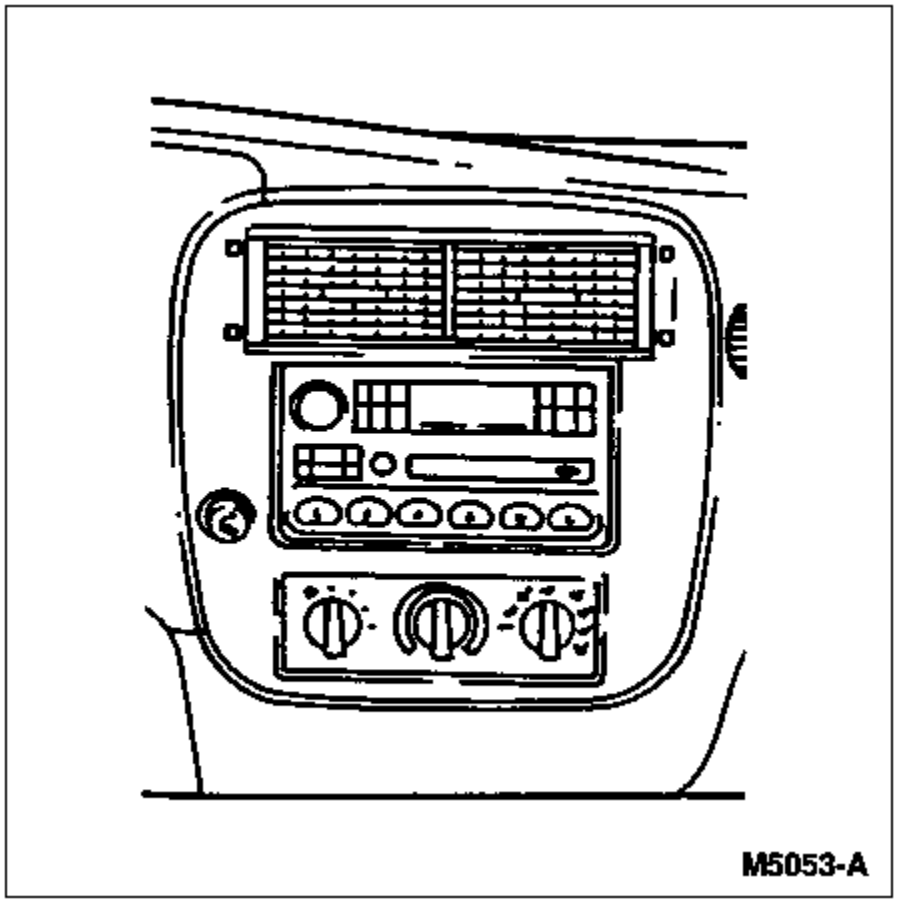
tomsn048@gmail.com

Removal and Installation

The center A/C register is actually two louver assemblies which can be adjusted and serviced independent of each other.

To remove the louver assembly, proceed as follows:

1. Depress the center division bar to the side.
2. Pull the end of the louver assembly from opening.
3. To install, snap each end of louver assembly into position. Louvers will not assemble upside down but will interchange with each other.
4. To service the entire register assembly, remove the center finish panel. Refer to Section 01-12 .
5. Release eight tabs from the backside and remove assembly.
6. To install, follow removal steps in reverse order.



LH

tomsn048@gmail.com

Removal and Installation

1. Remove the instrument panel applique. Refer to Section 01-12 .
2. From the backside of the applique, remove three screws from the left-hand A/C register and push it out of the applique.
3. To install the A/C register, set in position and install the screws.
4. Install the applique.

Rear

Removal and Installation

NOTE: The rear registers are part of the console rear panel assembly but can be serviced.

1. Access and remove the three screws in the top of the console rear panel assembly. Refer to Section 01-12 .
2. Lower the convenience tray in the console rear panel assembly.
3. Remove the four remaining screws retaining the console rear panel assembly.
4. Remove the console rear panel assembly.
5. When the panel assembly is free, the louver assembly can be rotated to a position to allow removal in a downward direction from the front side.
6. To install, push rear register assembly(s) into rear panel assembly until retaining tabs engage. Reassemble following removal procedures in reverse order.

---

tomsn048@gmail.com

tomsn048@gmail.com

Heater Air Plenum Chamber

Removal

1. Disconnect battery ground cable.
2. Remove the heater water hose (18472) from the heater core (18476) and plug the heater water hose as outlined.
3. Remove the A/C evaporator housing (19850) as outlined.
4. Remove five nuts from studs located in the engine compartment at the dash panel.
5. Working in the passenger compartment, remove the instrument panel (04320). Refer to Section 01-12 .
6. Pull the heater air plenum chamber (18471) rearward from the dash panel, and remove it from the vehicle.

Installation

1. Position heater air plenum chamber to dash panel, aligning studs to holes in panel.
2. Install new nuts on studs at dash panel in engine compartment.
3. Install A/C evaporator housing as outlined.
4. Install heater water hose on heater core.
5. Install instrument panel. Refer to Section 01-12 .
6. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable. Check system for proper installation.

tomsn048@gmail.com

tomsn048@gmail.com

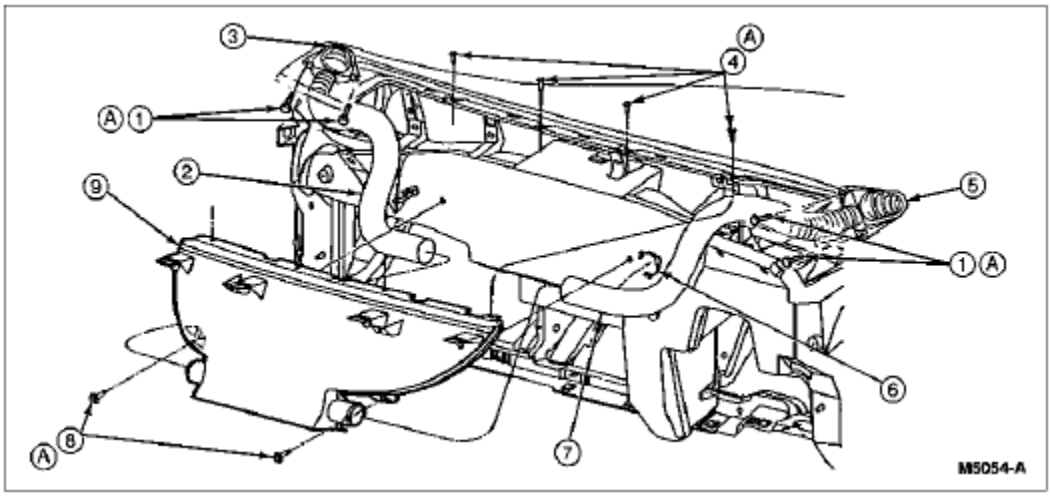
Ducts

Windshield Defroster Nozzle

Removal and Installation

1. Remove instrument panel (04320). Refer to Section 01-12 .
2. Remove four screws at the top of the defroster, front of instrument panel pad.
3. Remove two screws attaching defroster to the instrument panel duct beam.
4. Disconnect demister hoses from defroster (pull off).
5. Remove nozzle assembly.
6. To install, follow installation steps in reverse order.

Defroster Nozzle Installation



Item	Part Number	Description
1	N803875-S36	Screw (4 Req'd)
2	19E659	A/C Side Window Demister Hose (RH)
3	19E656	A/C Side Window Demister Nozzle (RH)
4	N804306-S36	Screw (4 Req'd)
5	19E657	A/C Side WIndow Demister Nozzle (LH)
6	—	Clip (Part of 04320)

tomsn048@gmail.com

7	19E659	A/C Side Window Demister Hose (LH)
8	N803875-S36	Screw (2 Req'd)
9	18490	Windshield Defroster Nozzle
A	—	Tighten to 2.1-2.9 Nm (18-27 Lb-In)

A/C Side Window Demister and Hose

Removal and Installation

1. Remove instrument panel. Refer to Section 01-12 .
2. Remove the screws (two each side) which retain the demister nozzles to the instrument panel.
3. Release RH A/C side window demister and hose (19E630) and the LH A/C side window demister and hose from the windshield defroster nozzle and the support clips and carefully remove hose assemblies from their locations.
4. For installation, follow removal procedures in reverse order.

Register Distribution Ducts

The ducts are a "purchased-in-assembly" component of the instrument panel. They can be removed from the panel as follows:

Removal and Installation

LH Duct

1. Remove cluster trim cover. Refer to Section 01-12 .
2. Remove two screws retaining duct.
3. Remove duct.
4. For installation, follow removal steps in reverse order.

Center Duct

1. Remove center trim panel. Refer to Section 01-12 .
2. Remove two screws retaining duct.
3. Remove duct.
4. For installation, follow removal steps in reverse order.

RH Duct

1. Remove RH air register.

tomsn048@gmail.com

2. Remove passenger side air bag module or simulator. Refer to Section 01-20B .
3. Remove two screws retaining duct.
4. Remove duct.
5. For installation, follow removal steps in reverse order.

Heater Outlet, Floor

Removal

1. Disconnect battery negative cable, then unplug connector assembly attached to front floor duct.
2. Using trim panel remover tool, remove connector assembly from front floor duct.
3. Remove the screw which attaches the rear of the front floor duct to the plenum.
4. Disengage the front floor duct from the tab on the left side of the plenum and remove the front floor duct.

Installation

1. Position the front floor duct so that the tab on the left side of the plenum protrudes through the oval hole in the duct. Install front floor duct attaching screw.
2. Install electrical connector to front floor duct and plug in.
3. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Reconnect battery negative cable.

---

tomsn048@gmail.com

tomsn048@gmail.com

Vacuum Control Motors

Heater and A/C Air Inlet Duct Door

Removal and Installation

1. Open glove compartment, and remove contents. Press in sides of glove compartment and pull back so it hangs down. The vacuum control motor (18A318) should be visible on the right side of heater air plenum chamber (18471).
2. Disconnect vacuum hose from nipple.
3. Remove two screws attaching the vacuum control motor to the heater air plenum chamber.
4. Release vacuum control motor arm from shaft on heater air plenum chamber and remove.
5. For installation, follow removal procedures in reverse order. Check system for proper operation.

tomsn048@gmail.com

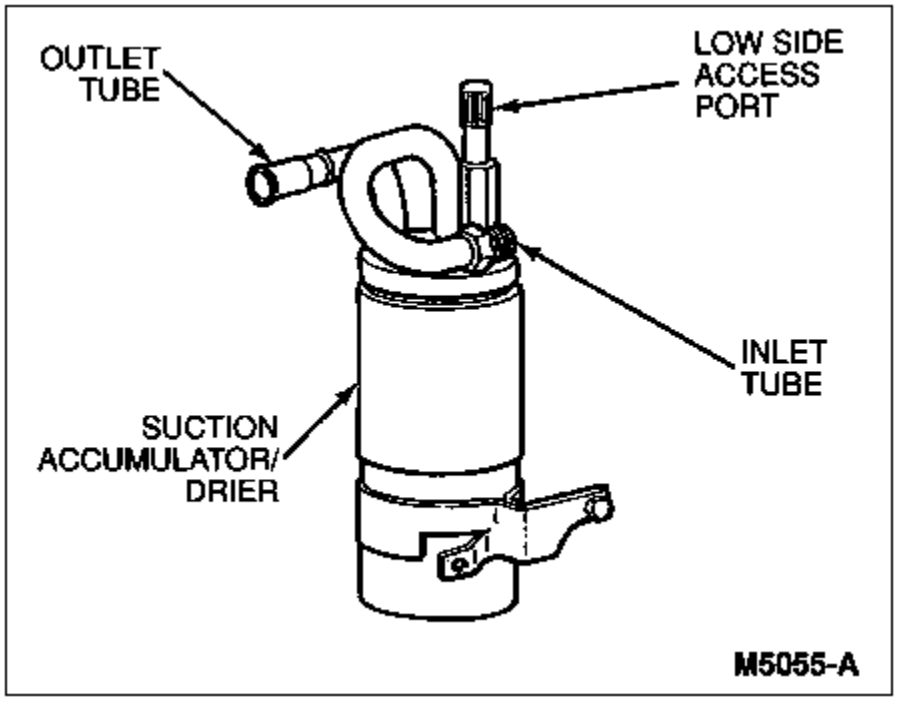
Suction Accumulator/Drier

NOTE: Replacement of the suction accumulator/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator/drier.

Removal

1. Discharge the refrigerant from the A/C system. Refer to Section 12-00 . Observe all safety precautions.
2. Disconnect the electrical connector from the A/C cycling switch (19E561).

Suction Accumulator/Drier



3. Remove the A/C cycling switch by unscrewing it from the suction accumulator/drier.
4. Disconnect the suction accumulator/drier, using Spring Lock Coupling Disconnect Tool, and cap the openings to prevent the entry of dirt and moisture.
5. Loosen the fitting connecting the suction accumulator/drier to the A/C evaporator core (19860). Use a backup wrench to prevent component damage.
6. Remove the suction/accumulator drier bracket pinch screw.

tomsn048@gmail.com

7. Disconnect the suction accumulator/drier from the A/C evaporator core and remove the suction accumulator/drier from the bracket.

Installation

1. Position the new suction accumulator/drier into the bracket.

2. Using a new O-ring lubricated with clean refrigerant oil, connect the suction accumulator/drier to the tube while aligning the bracket to the evaporator housing.

3. Tighten the suction accumulator/drier to fitting to 35-42 Nm (26-31 lb-ft) using a backup wrench. Install the bracket to the evaporator housing. Tighten the accumulator bracket pinch screw.

4. Connect the suction hose to suction accumulator/drier after checking for a missing or a damaged garter spring and replacing the spring. Install two new specified (special material) O-rings, lubricated with clean refrigerant oil, onto the male fitting.

5. Use a new O-ring lubricated with clean refrigerant oil on the nipple of the suction accumulator/drier. Then, install the A/C cycling switch and tighten the A/C cycling switch to 7-13 Nm (62-115 lb-in) if A/C cycling switch has metal base and hand-tighten only if A/C cycling switch has plastic base.

6. Connect the electrical connector to the A/C cycling switch.

7. Leak test, evacuate and charge the system. Refer to Section 12-00 . Observe all safety precautions.

8. Check the system for proper operation.

---

tomsn048@gmail.com

A/C Cycling Switch

NOTE: Do not vent the refrigerant charge.

Removal

1. Disconnect battery ground cable.
2. Disconnect the wire connector from the A/C cycling switch (19E561).
3. Unscrew the A/C cycling switch from the suction accumulator/drier (19C836).

Installation

1. Install a new O-ring lubricated with clean refrigerant oil on the accumulator fitting.
2. Screw the A/C cycling switch on the accumulator fitting. Tighten the A/C cycling switch to 7-13 Nm (62-115 lb-in) if A/C cycling switch has metal base and hand-tighten only if A/C cycling switch has plastic base.
3. Connect the wire connector to the A/C cycling switch.
4. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable.
5. Check the system for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

A/C Evaporator Core Orifice

The A/C evaporator core orifice (19D990) is constructed with a plastic body, two screens and a small brass tube down the center of the body. Two O-rings are around the body to seal against leakage.

CAUTION: Do not attempt to remove the A/C evaporator core orifice with pliers or by twisting. To do so will break the body in the tube. Use only the recommended tool and follow the recommended service procedures.

Removal

1. Discharge the refrigerant from the air conditioning system. Refer to Section 12-00 . Observe all safety precautions.

2. Disconnect the condenser to evaporator tube (19835) from the A/C evaporator core (19860). Cap the condenser to evaporator tube to prevent the entry of dirt and excessive moisture.

3. Squirt a small amount of clean refrigerant oil into the inlet tube to lubricate the A/C evaporator core orifice and O-rings during removal of the A/C evaporator core orifice or the tube.

4. **CAUTION: Do not twist or rotate the A/C evaporator core orifice in the tube as it may break off in the tube.**

   Engage the Rotunda Orifice Tube Tool D80L-19990-A or equivalent with the two tangs on the A/C evaporator core orifice.

5. Hold the T-handle of the Orifice Tube Tool to keep it from turning and run the nut on the tool down against the tube until the A/C evaporator core orifice is pulled from the tube.

6. If the A/C evaporator core orifice breaks in the tube, it must be removed from the tube with Rotunda Broken Orifice Tube Extractor D80L-19990-B or equivalent.

7. To remove a broken A/C evaporator core orifice, insert the screw end of the Broken Orifice Tube Extractor D80L-19990-B or equivalent into the tube and thread the screw end of the tool into the brass tube in the center of the A/C evaporator core orifice. Then, pull the A/C evaporator core orifice from the tube.

8. If only the brass center tube is removed during Step 7, insert the screw end of Broken Orifice Tube Extractor D80L-19990-B into the tube and screw the end of the tool into the A/C evaporator core orifice. Then, pull the A/C evaporator core orifice from the tube.

Installation

1. Liberally lubricate the O-rings on the A/C evaporator core orifice with clean refrigerant oil.

2. Place the A/C evaporator core orifice in the remover, Rotunda Orifice Tube Tool D80L-19990-A or equivalent, and insert the A/C evaporator core orifice into the tube until the A/C evaporator core orifice is seated at the stop.

tomsn048@gmail.com

3. Remove the tool from the A/C evaporator core orifice.
4. Using a new O-ring lubricated with clean refrigerant oil, connect the condenser to evaporator tube to the tube. Tighten the fitting to 21-27 Nm (15-20 lb-ft) using a backup wrench.
5. Leak test, evacuate and charge the system. Refer to Section 12-00 . Observe all safety precautions.
6. Check the system for proper operation.

---

tomsn048@gmail.com

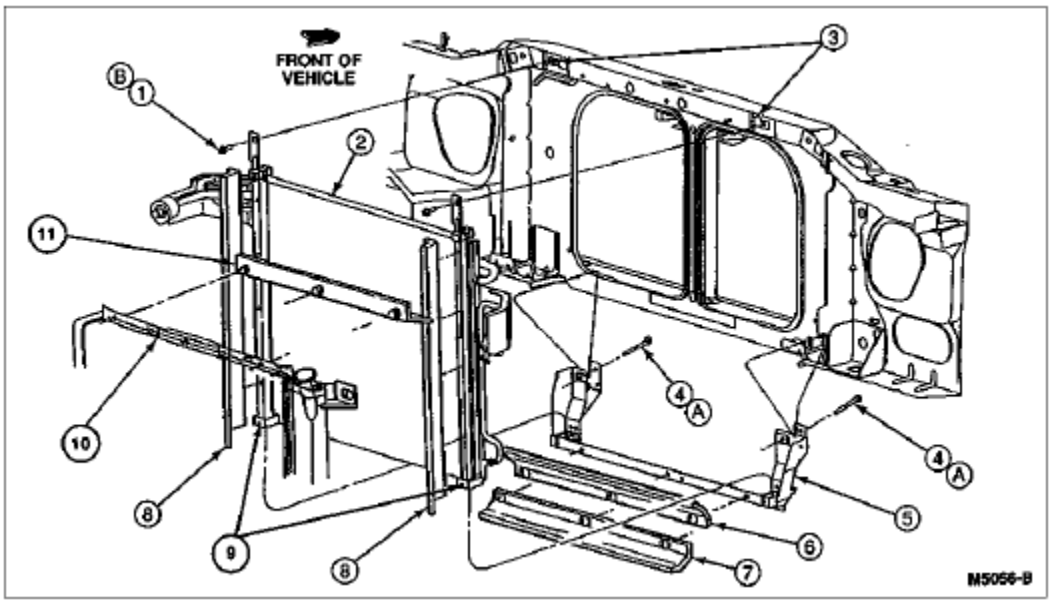
A/C Condenser Core — Ranger

NOTE: The illustrations included in this procedure detail the location of the various A/C condenser seals.

Removal

1. Discharge the refrigerant from the air conditioning system. Refer to Section 12-00 . Observe all safety precautions.
2. Disconnect the compressor discharge line from the A/C condenser core (19712) at the spring lock coupling using Spring Lock Coupling Disconnect Tool and cap the openings to prevent the entry of dirt and moisture.
3. Disconnect the condenser to evaporator tube (19835) from the A/C condenser core at the spring lock coupling using Spring Lock Coupling Disconnect Tool. Cap the openings to prevent the entry of dirt and moisture.
4. Tilt the top of the radiator rearward, after removing the upper radiator bracket bolts, being careful not to damage the cooling fan or radiator. Refer to Section 03-03 . Remove two bolts attaching the two upper mounting brackets of the A/C condenser core to the rear side of the radiator support.
5. Lift the A/C condenser core from the vehicle.

A/C Condenser Core Installation



tomsn048@gmail.com

Item	Part Number	Description
1	N605894-S57	Bolt (2 Req'd)
2	19712	A/C Condenser Core
3	N623342-S426	U-Nut (2 Req'd)
4	N606525-S57	Bolt (2 Req'd)
5	19702	A/C Condenser Mounting Bracket
6	19T555	Lower Seal (2.3/3.0L Engines)
7	19T555	Lower Seal (4.0L Engine)
8	19E572	A/C Condenser Seal
9	—	Rubber Mounting Bracket Inserts
10	8005	Radiator
11	19T554	Top Seal
A	—	Tighten to 6-8 Nm (53-71 Lb-In)
B	—	Tighten to 10-14 Nm (7-10 Lb-Ft)

Installation

1. Place the A/C condenser core in position aligning the bottom ends of the condenser side supports with the A/C condenser rubber mounting bracket inserts.
2. Position the A/C condenser core to the vehicle with the lower mounts and upper brackets on the rear face of the radiator support.
3. Install the two bolts attaching the two upper mounting brackets to the rear side of the radiator support.
4. Move the radiator into the correct installed position and install the two upper retaining brackets (two screws each). Refer to Section 03-03 .
5. Install hoses to the spring lock coupling after checking for a missing or damaged garter spring and repairing or replacing the spring. Install two new specified (special material) O-rings lubricated with clean refrigerant oil into the male fittings.
6. Leak test, evacuate and charge the system. Refer to Section 12-00 . Observe all safety precautions.
7. Check the air conditioning system for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

Refrigerant Lines

NOTE: The suction accumulator/drier (19C836) should be replaced if a refrigerant hose is replaced due to the possibility of dirt or moisture entering the system.

Removal

1. Discharge the refrigerant from the system. Refer to Section 12-00 . Observe all safety precautions.
2. Disconnect and remove the refrigerant line(s) using a wrench on each side of the fitting, or proper Spring Lock Coupling Disconnect Tool.

Installation

1. Route the new refrigerant line(s) (with protective caps installed). Refer to the appropriate illustration which follows.

Air Conditioner Hose Installation, 2.3L Engine

5	19835	Condenser to Evaporator Tube

2. Connect the refrigerant line into the system using new O-rings lubricated with clean refrigerant oil or new specified O-rings if coupled. Use two wrenches to tighten the threaded fittings to the torque specified or connect the spring lock coupling in accordance with the proper procedure.

3. Leak test, evacuate and charge the refrigerant system. Refer to Section 12-00 . **Observe all safety precautions.**

4. Check the air conditioning system for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

Heater Water Hoses

1. Drain the coolant from the cooling system.
2. Loosen the clamps and remove the heater water hoses (18472) from the vehicle. Refer to Section 03-03 .
3. Cut a new length of heater water hose to the dimension of the removed heater water hoses.
4. Route the new heater water hoses in the same manner as those removed.
5. Connect the heater water hose to the fittings and install the clamps.
6. Fill the cooling system. Refer to Section 03-03 .
7. Check for coolant leaks and for proper operation of the system.

tomsn048@gmail.com

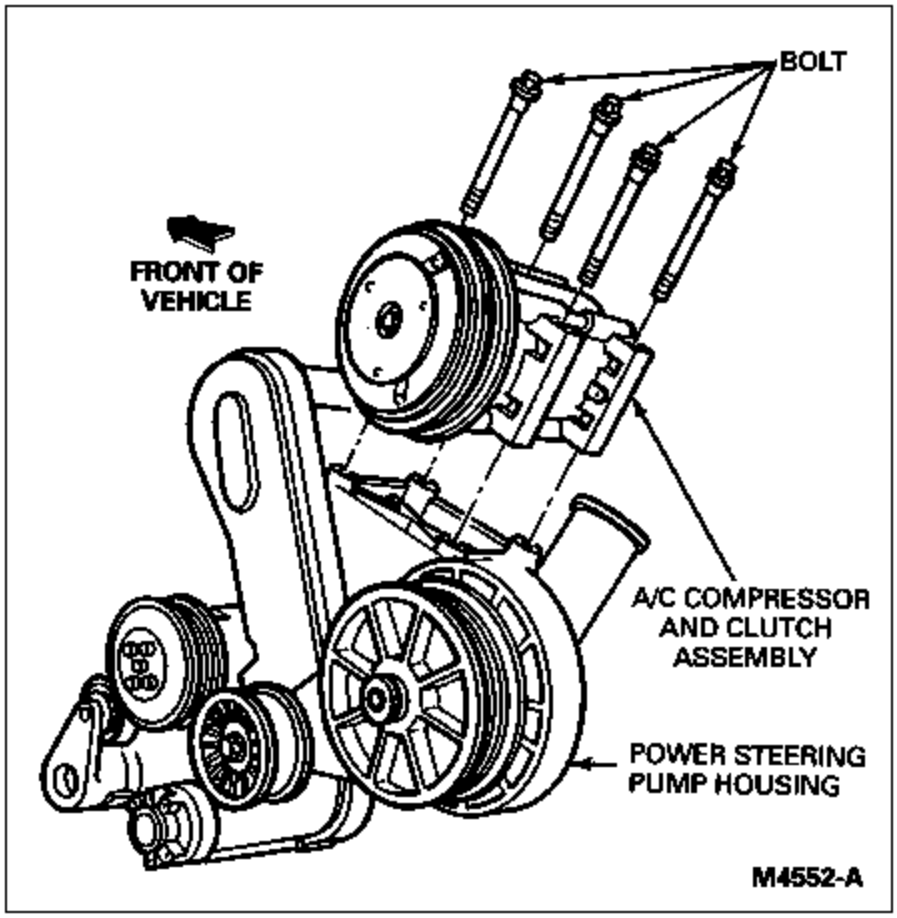
Refer to the following illustrations for compressor removal and installation.

Compressor Mounts, 2.3L Engine

tomsn048@gmail.com



Removal

1. **NOTE: Vehicles that have an inoperative A/C compressor due to internal causes, must have the A/C system flushed to prevent damage to the replacement A/C compressor (19703). If the flushing procedure is not performed, the system will need to be filtered. For additional information, refer to Section 12-00.**

   NOTE: Replacement of the suction accumulator/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator/drier.

   NOTE: The A/C evaporator core orifice (19D990) should be replaced whenever the A/C compressor is replaced for lack of performance or when there is debris in the system.

   Discharge the A/C system. For additional information, refer to Section 12-00.

2. Remove manifold attaching bolt.
3. Remove the A/C manifold and tube.
4. Remove drive belt (8620). For additional information, refer to Section 03-05 .
5. Disconnect electrical connector from A/C compressor clutch.

tomsn048@gmail.com

6. Remove the A/C compressor bolts.

7. Remove the A/C compressor from the power steering pump and A/C compressor bracket.

Installation

1. Transfer the old A/C compressor clutch to the new A/C compressor.

2. **NOTE: If installing a new A/C compressor, lubricate with 30 ml (one fluid ounce) of clean compressor oil, and fill to system capacity. If installing a compressor after repairing for leaks, add the same amount of oil that was removed from the old compressor. If that amount is 90 ml (three ounces) or less, add an additional two ounces.**

   Lubricate new O-ring seals with clean refrigerant oil. Use only the O-ring seals specified for the type of manifold being used.

3. Apply Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specifications WSK-M2G350-A2 and ESR-M18P7-A to threads of manifold retaining bolt.

4. **NOTE: When replacing an A/C compressor (19703), use original manifold bolt from removed A/C compressor to attach A/C manifold and tube to new A/C compressor. DO NOT USE THE SHIPPING CAP BOLTS.**

   Position A/C compressor in the power steering pump and A/C compressor bracket.

5. Install the A/C compressor bolts. Tighten the A/C compressor bolts to 21.2-28.8 Nm (15.6-21 lb-ft).

6. Install electrical connector to A/C clutch (2884).

7. Install drive belt.

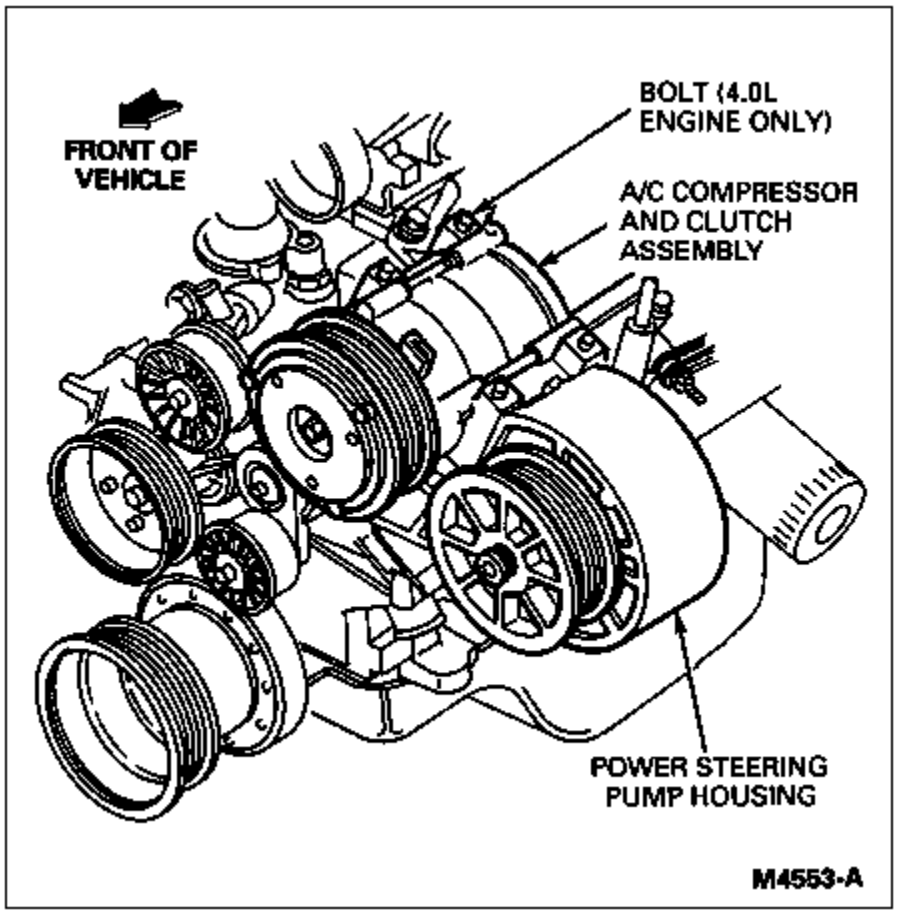
8. Position the A/C manifold and tube.

9. Charge the A/C system. For additional information, refer to Section 12-00.

10. Operate A/C system to determine if A/C system is operating properly.

Compressor Mounts, 3.0L and 4.0L Engines

tomsn048@gmail.com



Removal

1. **NOTE: Vehicles that have an inoperative A/C compressor due to internal causes, must have the A/C system flushed to prevent damage to the replacement A/C compressor (19703). If the flushing procedure is not performed, the system will need to be filtered. For additional information, refer to Section 12-00.**

   NOTE: Replacement of the suction accumulator/drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator/drier.

   NOTE: The A/C evaporator core orifice (19D990) should be replaced whenever the A/C compressor is replaced for lack of performance or when there is debris in the system.

   Discharge the A/C system. For additional information, refer to Section 12-00.

2. Remove A/C manifold and tube. For additional information, refer to the procedure in this section.

3. Remove drive belt (8620). For additional information, refer to Section 03-05 .

4. Disconnect electrical connector from A/C compressor clutch.

5. Remove the power steering hose bracket nut from the A/C compressor stud and remove power

tomsn048@gmail.com

steering hose bracket.

6. Remove the A/C compressor bolts and stud from the power steering pump and A/C compressor bracket.

7. Remove the A/C compressor from the power steering pump and A/C compressor bracket.

Installation

NOTE: The FS-10 A/C compressor used will require a special refrigerant oil with special additives. The A/C compressor used on R-134a systems requires YN-12c/F2AZ-19577-A oil, meeting Ford Specification WSH-M1C231-B.

NOTE: If installing a new A/C compressor, lubricate with 30 ml (one fluid ounce) of clean compressor oil, and fill to system capacity. If installing a compressor after repairing for leaks, add the same amount of oil that was removed from the old compressor. If that amount is 90 ml (three ounces) or less, add an additional two ounces.

1. Position A/C compressor in the power steering pump and A/C compressor bracket.

2. Install the A/C compressor bolts and stud. Tighten the A/C compressor bolts and stud to 21.2-28.8 Nm (15.6-21 lb-ft).

3. Install power steering hose bracket on A/C compressor stud. Tighten power steering hose bracket nut to 7.6-10.4 Nm (67-92 lb-in).

4. Install electrical connector to A/C clutch (2884).

5. Install drive belt.

6. Install A/C manifold and tube. Refer to the procedure in this section.

7. Charge the A/C system. For additional information, refer to Section 12-00.

8. Operate A/C system to determine if A/C system is operating properly.

---

tomsn048@gmail.com

tomsn048@gmail.com

A/C System Filtering

CAUTION: Follow all refrigerant system safety and service precautions in Section 12-00 .

A Filter Kit should be installed in the refrigerant system prior to the installation of the replacement A/C compressor (19703). The pancake filter, supplied with each kit, should be temporarily installed in the liquid line between the A/C condenser core (19712) and the A/C evaporator core orifice (19D990). The suction filter, supplied with each kit, should be installed in the suction line between the suction accumulator/drier (19C836) and the A/C compressor. Install the replacement A/C compressor and the filters as outlined in the following procedure. Filter Kit for systems with nylon lined suction hose is Ford part number F2VY-19E773-C.

1. Before removing any refrigerant system components, discharge the system refrigerant following the approved recycling methods.

2. Remove the suction accumulator/drier and drain the oil into a calibrated container.

3. **NOTE: Due to the internal design of the suction accumulator/drier, it will be necessary to drill two 13mm (1/2-inch) holes in the suction accumulator/drier cylinder to drain the oil from the suction accumulator/drier.**

   Install a new suction accumulator/drier and add new YN-12b refrigerant oil to replace the old oil. The quantity of new oil to be added is the amount to match that drained from the old accumulator plus 60 ml (2 oz.).

4. Install a new A/C evaporator core orifice. If the A/C evaporator core orifice is located in the liquid line between the A/C condenser core and the A/C evaporator core (19860), replace the liquid line assembly.

5. Temporarily install the pancake filter in the liquid line between the A/C condenser core and the A/C evaporator core orifice. Be sure the filter inlet is toward the A/C condenser core. Connections can be made using A/C Test Fitting Set, D93L-19703-B, and flexible refrigerant hose of 2500 psi burst rating. Individual fittings are also available.

6. Remove the old A/C compressor and drain the oil into a calibrated container.

7. Drain the oil from the replacement A/C compressor into a clean calibrated container.

8. A new service replacement FS-10 A/C compressor may or may not contain 207ml (7 oz.) of refrigerant oil. If the amount of oil drained from the removed A/C compressor is between 90 and 148ml (3 to 5 oz.), pour the same amount of clean refrigerant oil into the new A/C compressor. If the amount of oil drained from the old A/C compressor is greater than 148ml (5 oz.), add an equivalent of clean refrigerant oil into the new A/C compressor. If the amount of refrigerant oil drained from the old A/C compressor is less than 90ml (3 oz.), pour 90ml (3 oz.) of clean refrigerant oil into the new A/C compressor. Use Motorcraft YN-12b Refrigerant Oil.

9. **NOTE: It will be necessary to transfer the A/C clutch (2884) from the old A/C compressor to the replacement A/C compressor. Refer to Section 12-03C for FS-10 A/C compressor.**

   Install the new A/C compressor. Be sure all mounting bolts are tightened properly. Check the tension of the A/C compressor drive belt (8620). Adjust if necessary.

tomsn048@gmail.com

10. Install the suction filter in the suction hose close to the A/C compressor. The suction filter shown in the following illustration is for nylon lined core hose. These filters have two grooves in the end tubes to accommodate O-ring seals.

11. Remove a length of suction hose (close to the A/C compressor end) to accommodate the suction filter and install the filter using A/C hose clamps. Be sure the filter is correctly oriented for refrigerant system flow. Check the label on the filter. If using the filter for a nylon lined hose, install O-ring seals included in the kit (two on each filter tube).

12. Leak test, evacuate, and charge the system as outlined in Section 12-00 .

13. Check all refrigerant system hoses, lines and the positioning of the newly installed filters to be sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

14. Set the A/C control (19980) on MAX A/C, high blower motor (18527) and temperature control at full cold. Start engine and let it idle briefly. Make sure the A/C system is operating properly.

15. Gradually bring the engine up to 1200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1000 rpm). Set the engine at 1200 rpm and run it for an hour with the A/C system operating.

16. Stop the engine.

17. Remove the refrigerant from the system using a recovery machine. Refer to Section 12-00 .

18. Allow the engine to cool sufficiently to remove the fittings, flexible hoses and pancake filter from the liquid line.

19. Discard the pancake filter. It can be used one time only.

20. Reconnect the liquid line back into the system.

21. Evacuate, charge and leak test the system. Make any necessary adjustments.

22. Check the operation of the system in all control function selector lever positions.

A/C Manifold and Tube

NOTE: Two different O-ring seals are used on the A/C manifold and tube (19D734) and they are not interchangeable. One is black and is used with aluminum manifolds. The other O-ring seal is red and is used with brazed steel manifolds. Either O-ring seal must be replaced with one of the same color.

Removal

1. Discharge refrigerant from system. Observe all safety precautions. Refer to Section 12-00 .
2. Remove manifold attaching bolt.
3. Disconnect pressure cutoff switch connector.
4. Remove A/C tube lock coupling clips (19E746) at the condenser tube and at the suction accumulator/drier (19C836). Disconnect spring lock coupling at these two locations.
5. Remove the A/C manifold and tube.

Installation

1. Position the A/C manifold and tube.
2. Connect the spring lock couplings.
3. Connect the pressure cutoff switch connector.
4. Lubricate new O-ring seals with clean refrigerant oil and position them in O-ring seal grooves of manifold. Use only the O-ring seals specified for the type of manifold being used.
5. Apply Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specifications WSK-M2G350-A2 and ESR-M18P7-A to threads of manifold retaining bolt.
6. **NOTE: When replacing an A/C compressor (19703), use original manifold bolt from removed A/C compressor to attach A/C manifold and tube to new A/C compressor. DO NOT USE THE SHIPPING CAP BOLTS.**

   Position manifold with O-ring seals to A/C compressor. Install retaining bolt and tighten to 17-23 Nm (12.5-17.0 lb-ft).
7. Leaktest, evacuate and charge system following recommended procedures. Observe all safety precautions.

tomsn048@gmail.com

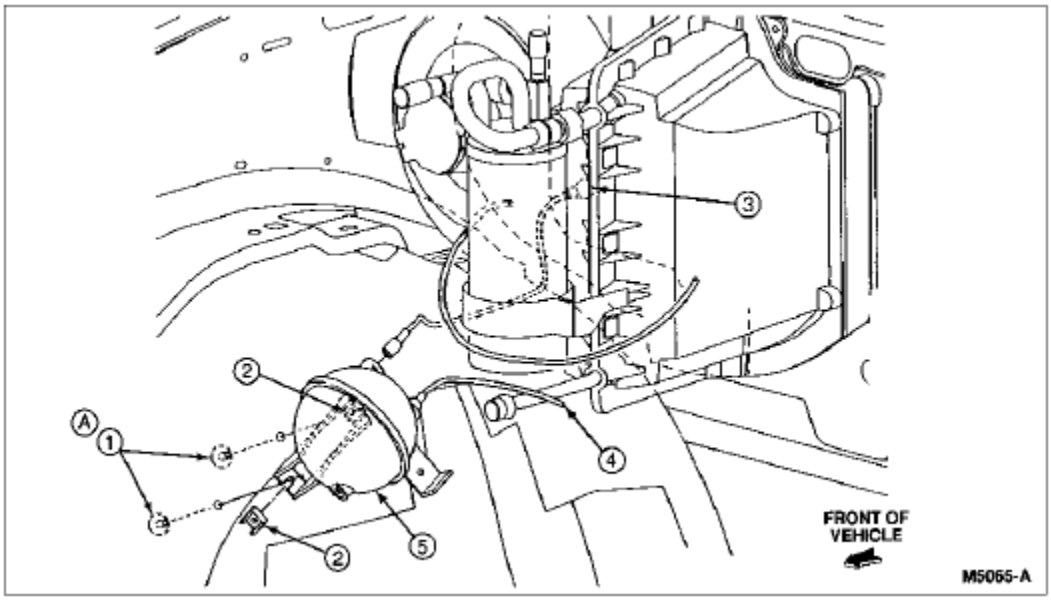
A/C Vacuum Reservoir Tank and Bracket

Removal and Installation

1. Disconnect the vacuum lines from the A/C vacuum reservoir tank and bracket (19A566).
2. Remove the two screws from the mounts and remove the A/C vacuum reservoir tank and bracket.
3. For installation, follow removal procedures in reverse order. Check system for proper operation.

Vacuum Reservoir Installation



Item	Part Number	Description
1	N611080-S2	Screw (2 Req'd)
2	45258-S2	J-Nut (2 Req'd)
3	19850	A/C Evaporator Housing
4	—	To Vacuum Source (Part of 19D848)
5	19A566	A/C Vacuum Reservoir Tank and Bracket
A	—	Tighten to 7-9 Nm (62-80 Lb-In)

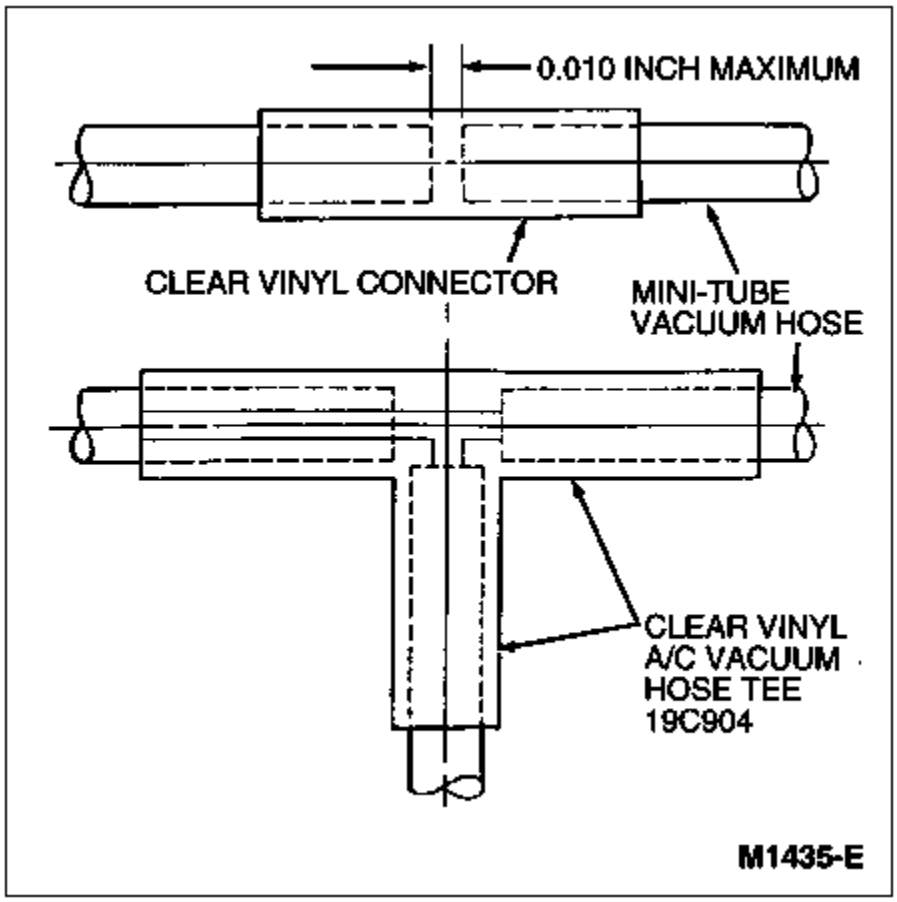
tomsn048@gmail.com

tomsn048@gmail.com

Mini-Tube Vacuum Hoses

Mini-tube vacuum hoses are used in the vacuum harness assemblies. They provide greater flexibility with less tendency to collapse and are less susceptible to pinching. Service is easily made using a short piece of standard 3mm (1/8 inch) ID vacuum hose.

1. Measure length of damaged area of mini-tube vacuum hose.
2. Cut a piece of standard 3mm (1/8 inch) ID vacuum hose approximately 25mm (1 inch) longer than the damaged area of mini-tube vacuum hose.
3. Cut off mini-tube vacuum hose on each side of damaged area.
4. Dip mini-tube hose ends in methyl ethyl ketone (MEK). Some paint thinners contain MEK. Check with your paint shop. This solvent will seal mini-tube to vacuum hose.
5. Insert ends of mini-tube vacuum hose approximately 9mm (3/8 inch) into ends of standard 3mm (1/8 inch) service vacuum hose section.



6. Shake repair joint after assembly to ensure solvent is dispersed and vacuum line is not plugged.

tomsn048@gmail.com

7. Use Rotunda Vacuum Leak Tester 014-R1054 or equivalent to test system for a vacuum leak.

---

tomsn048@gmail.com

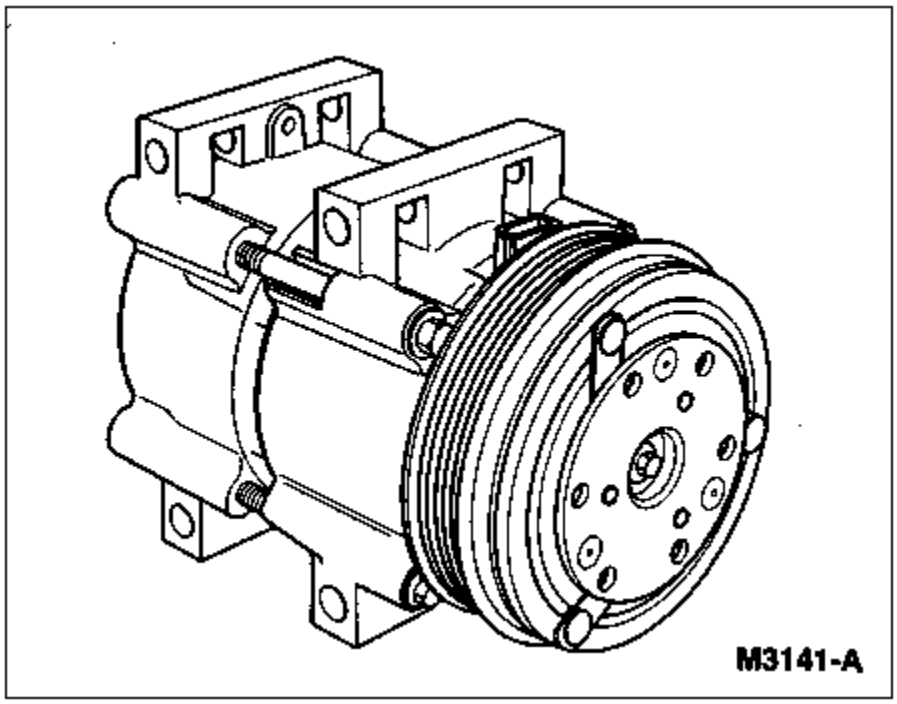
A/C Compressor

The FS-10 is a swashplate design ten-cylinder aluminum A/C compressor (19703) utilizing the tangential-design mount. The compressor mainshaft is driven by a belt from the engine crankshaft pulley. A one-piece lip-type seal (replaceable from the front of the compressor) is used to seal it at the shaft opening in the assembly. Five double-acting pistons, positioned axially around the compressor shaft, operate within the cylinder assembly. The pistons are actuated by a swashplate that is pressed on the compressor shaft. The swashplate changes the rotating action of the shaft to provide a reciprocating driving force to each of the five pistons. This driving force is applied, through shoes, to the midpoint of each of the double end pistons.

Reed-type discharge valves are assembled on the valve plate which is located with the suction reed valve between the cylinder assembly and the head at each end of the A/C compressor. The heads are connected to each other by gas-tight passageways through the cylinder assembly which direct the refrigerant gas to the suction and discharge ports located in the rear head.

A magnetic A/C clutch (2884) is used to drive the compressor shaft. When voltage is applied to the A/C clutch field coil (2987) the clutch plate and hub assembly (which is solidly coupled to the compressor shaft) is drawn rearward by magnetic force toward the A/C clutch pulley (2E884) which rotates freely on the A/C compressor front head housing. The magnetic force locks the clutch plate and hub assembly and the pulley together as one unit. The compressor shaft then turns with the pulley. When voltage is removed from the clutch field coil, springs in the clutch plate and hub assembly move the clutch plate away from the pulley. The clutch plate hub assembly and compressor shaft cease to rotate.



A/C Clutch

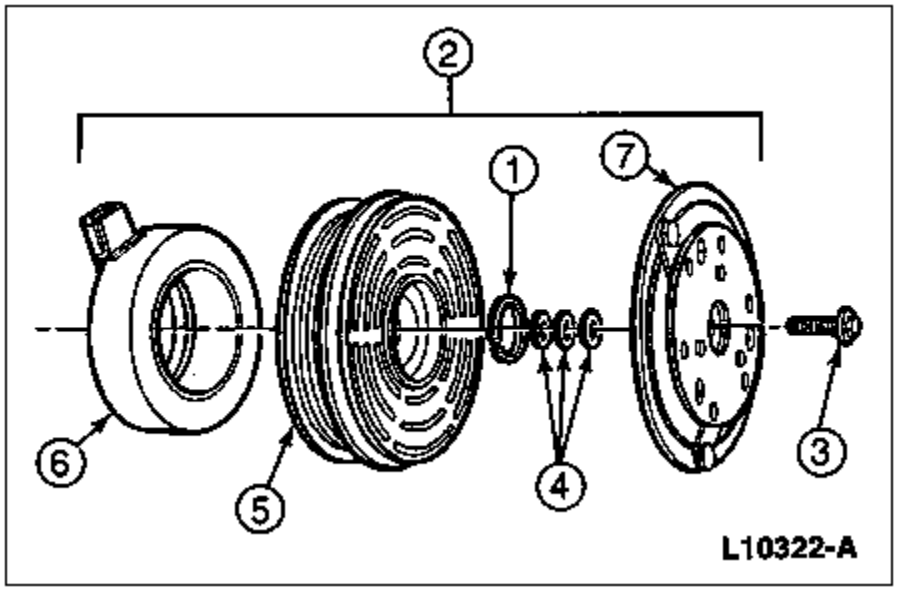
A/C Clutch and A/C Clutch Pulley

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spanner Wrench	T70P-4067-A
Compressor Clutch Holding Tool (4.0L)	T94P-19703-AH

A disassembled view of the A/C clutch (2884) and related parts is shown in the illustration.

A/C Clutch and Pulley



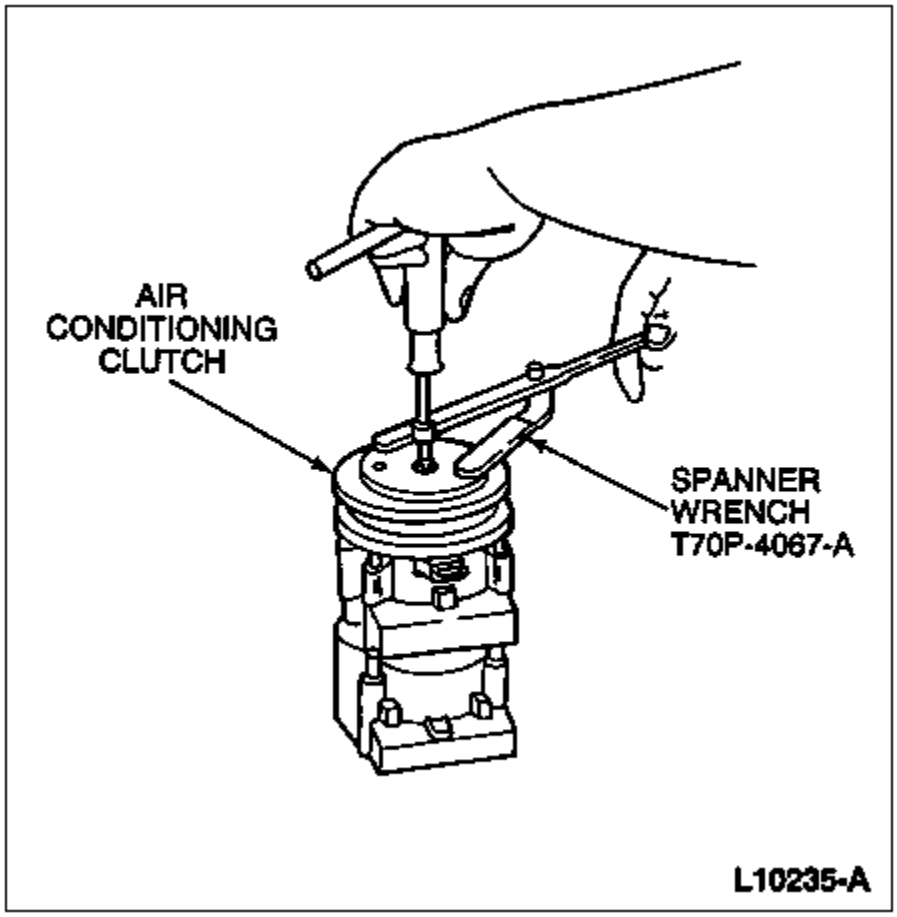
Item	Part Number	Description
1	N800620-S2	Pulley Snap Ring
2	2884	A/C Clutch
3	—	Bolt (8mm) (Part of 2884)
4	—	Shims (Part of 2884)
5	19D784	
6	2987	A/C Clutch Field Coil
7	19D786	A/C Clutch Hub

Removal

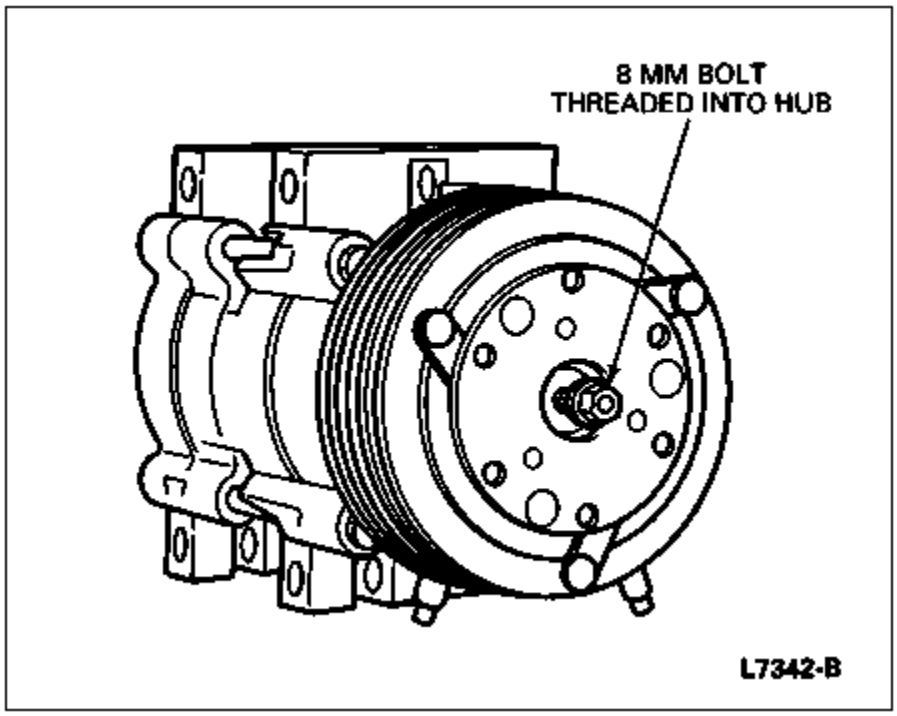
NOTE: Before disassembling the A/C compressor/clutch assembly for repair, it is important to check the A/C clutch air gap. This will help determine if the clutch is not engaging or if the A/C compressor is failing internally. For additional information, refer to Adjustments in this section.

1. Remove the clutch hub retaining bolt. Use Spanner Wrench T70P-4067-A (Compressor Clutch Holding Tool T94P-19703-AH for 4.0L.) Note position of the coil electrical connector.

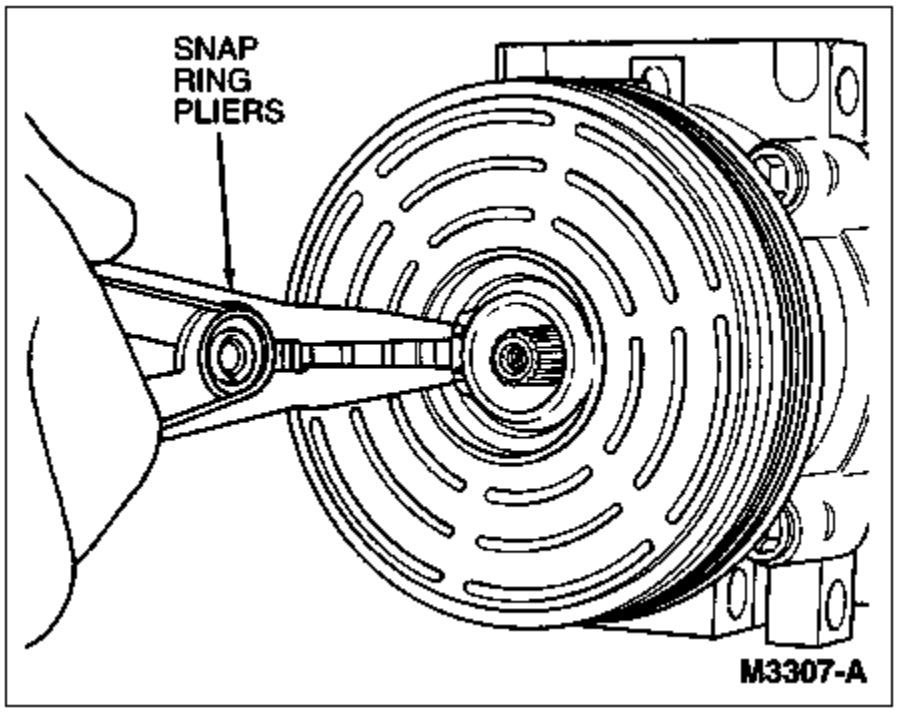
2.3L and 3.0L Shown; 4.0L Typical



2. Pull clutch hub and shims from compressor shaft. If hub cannot be pulled from compressor shaft, screw an 8mm bolt into the shaft hole of the clutch hub to force the hub from the shaft.

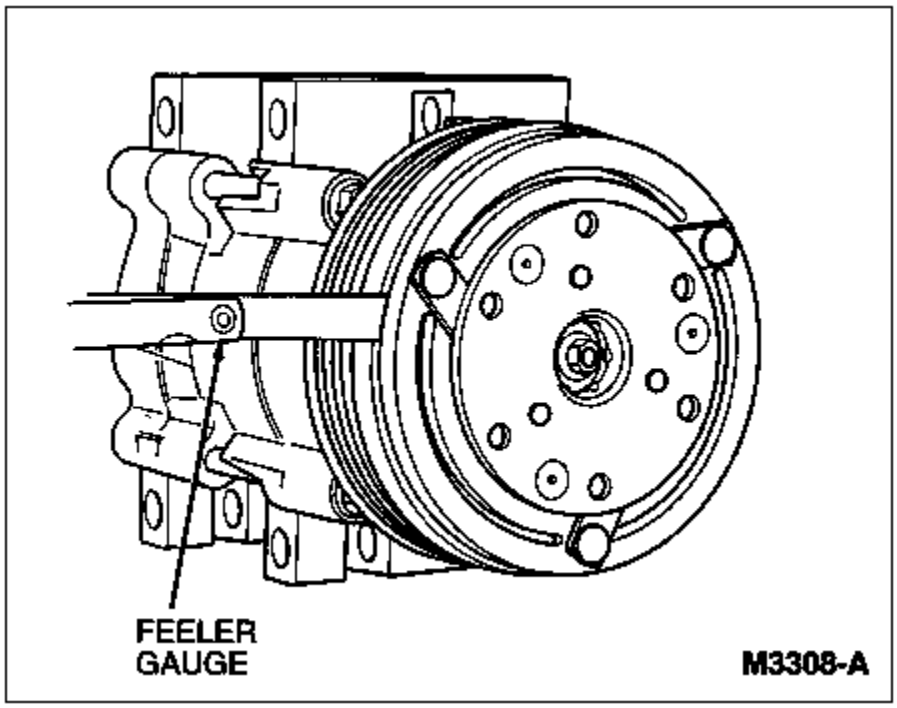


3. Remove pulley retaining snap ring.
4. Pull the pulley and A/C clutch pulley (2E884) assembly from compressor.



Installation

1. Clean pulley bearing surface of A/C compressor (19703) head to remove any dirt or corrosion.
2. Install pulley and A/C compressor pulley bearing (2990) on A/C compressor. The bearing is a slip-fit on the A/C compressor head and, if properly aligned, it should slip on easily.
3. Install pulley retaining snap ring with bevel side of snap ring out.
4. Place one nominal thickness spacer shim on the end of the splined shaft and slide the hub on the end of the compressor shaft.
5. Thread a new 8mm hub retaining bolt into end of compressor shaft. Tighten hub retaining bolt to 11-14 Nm (8-10 lb-ft). DO NOT USE AIR TOOLS.
6. Check clutch air gap between clutch disc and pulley mating surfaces with a feeler gauge. The air gap should be between 0.35 and 0.85mm (0.014 and 0.033 inch). Check at three locations equally spaced around the A/C clutch pulley.



7. If clutch air gap is not within 0.35 to 0.85mm (0.014 to 0.033 inch), repeat Steps 4 through 6 with various thickness shims until air gap is within specified limits.
8. Leak test, evacuate and charge the A/C system. For additional information, refer to Section 12-00 .
9. When installing a new A/C clutch, cycle it ten times at idle to burnish the A/C clutch and prevent slippage.

A/C Clutch Field Coil

NOTE: The A/C clutch field coil (2987) is pressed on the front head of the compressor. Special

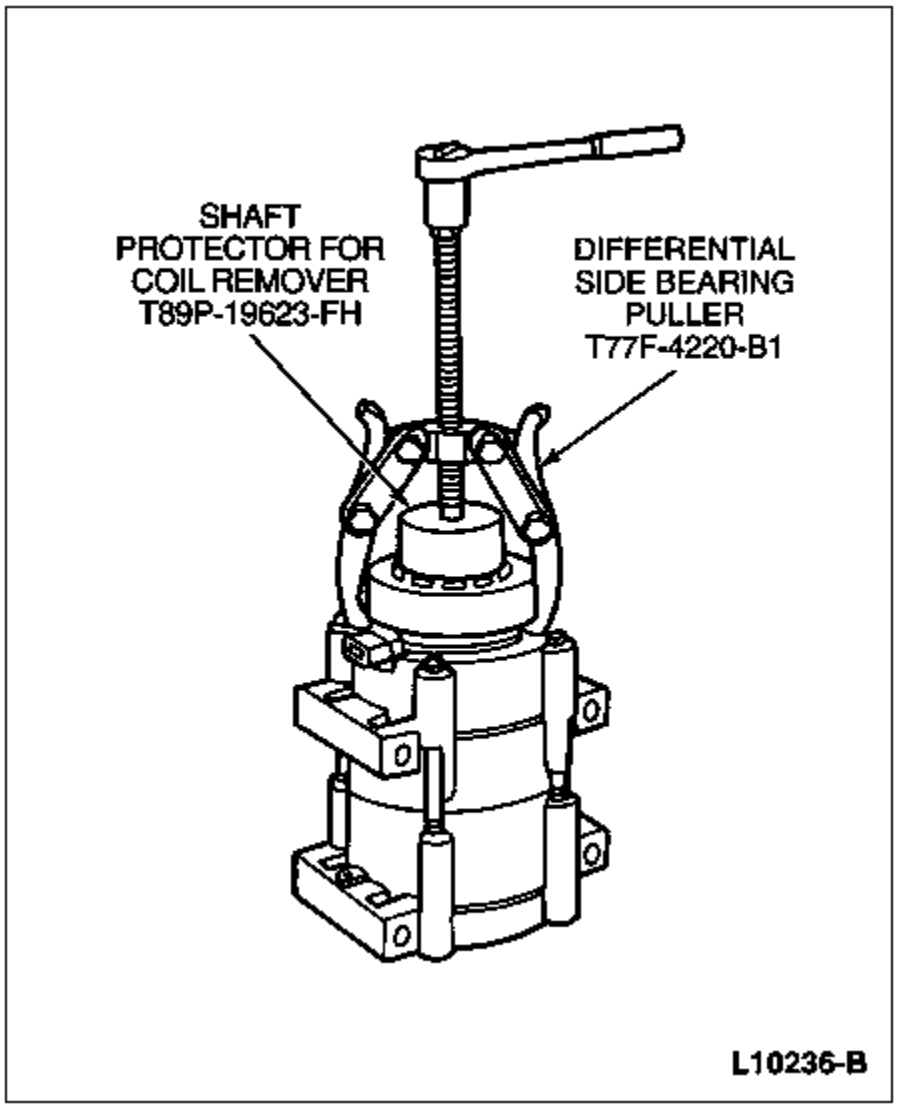
service tools are required to remove and install the A/C clutch field coil.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Shaft Protector for Coil Remover	T89P-19623-FH
Shaft Seal Protector	T89P-19623-CH
Differential Side Bearing Puller	T77F-4220-B1
Coil Pressing Installer Tool	T89P-19623-EH
Field Coil Replacer	T91L-19623-CH

Removal

1. Remove the A/C compressor from the vehicle following the recommended service procedure.
2. Remove the clutch hub and pulley as described in this section. Note the location of coil electrical connection for proper orientation during compressor clutch coil installation.
3. Install Shaft Protector for Coil Remover T89P-19623-FH on the nose opening of the A/C compressor.
4. Install a Differential Side Bearing Puller T77F-4220-B1 or equivalent on the compressor. Place the tip of the puller forcing screw in the center pilot of the shaft protector and the jaws of the puller around the back edge of the A/C clutch field coil.
5. Tighten the puller forcing screw to pull the A/C clutch field coil from the compressor head. DO NOT USE AIR TOOLS.



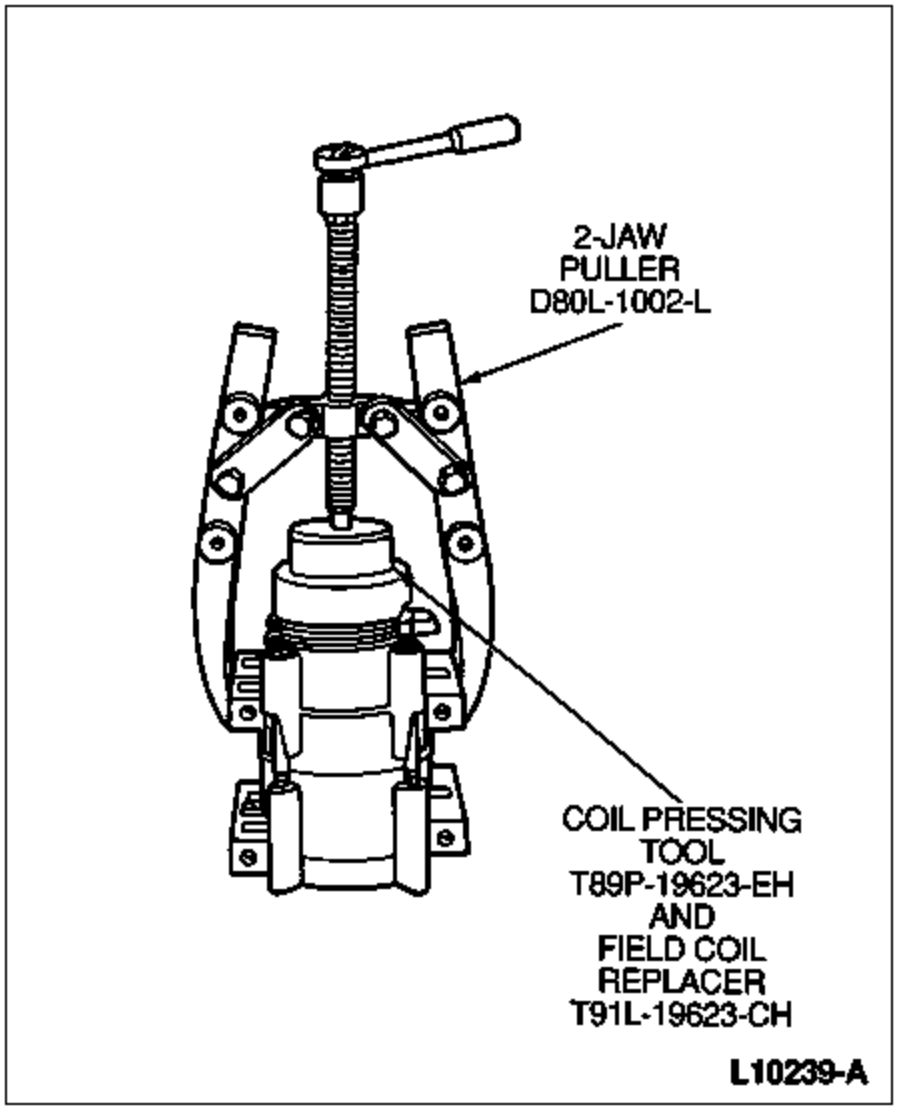
Installation

1. Clean the mounting surface on the front head to remove any dirt or corrosion.

2. With the A/C compressor in a vertical position (nose up), place the A/C clutch field coil in position on the compressor front head. Make sure the electrical connector is positioned correctly.

3. Place the Coil Pressing Tool T89P-19623-EH and Field Coil Replacer T91L-19623-CH in position over the compressor nose and to the inner radius of the A/C clutch field coil.

4. Position 2-Jaw Puller Tool D80L-1002-L or equivalent on the compressor and the Coil pressing tool. The jaws of the puller should be firmly engaged with the rear side of the compressor front mounts. The forcing screw must be piloted on the center mark of the pressing tool.



5. Tighten the forcing screw with a hand wrench until the A/C clutch field coil is pressed on the compressor front head. DO NOT USE AIR TOOLS. Check to make sure that the A/C clutch field coil bottoms against the head at all points around the outer diameter.

6. Install the clutch pulley and hub on the A/C compressor as outlined. Adjust the air gap, as necessary.

7. Install the compressor on the vehicle following the recommended procedure.

Shaft Seal

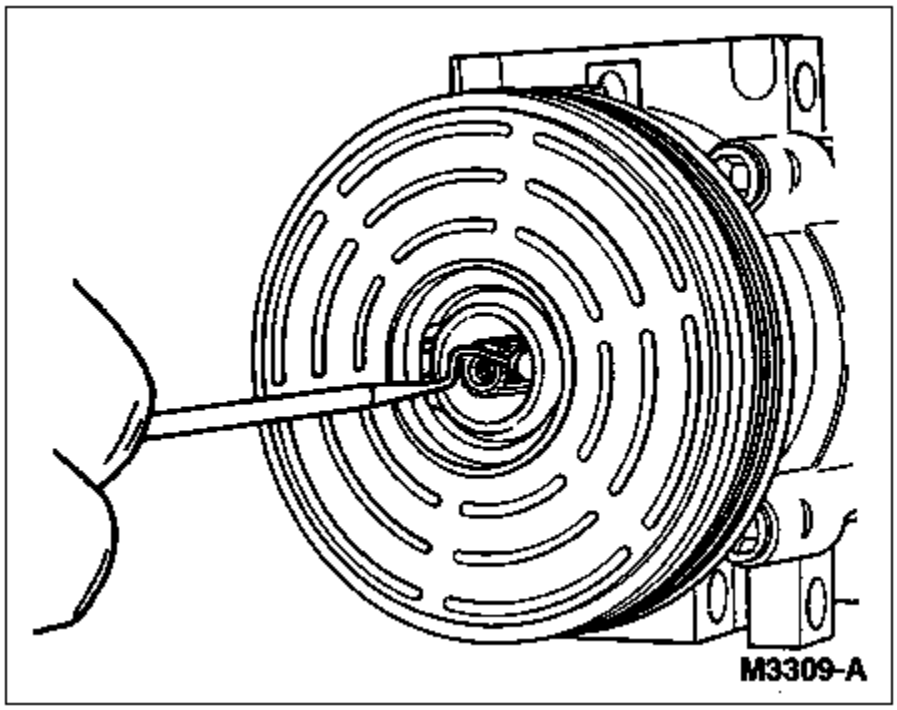
The refrigerant system must be discharged and the compressor must be removed from the vehicle prior to replacing the compressor shaft seal. Refer to Section 12-00 for discharging procedures and to Section 12-03A for Compressor Removal.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Snap Ring Remover	T89P-19623-DH
Shaft Seal Remover	T89P-19623-BH
Shaft Seal Replacer	T89P-19623-AH
Shaft Seal Protector	T89P-19623-CH

Removal

1. Remove clutch hub from compressor as outlined.
2. Remove shaft seal felt from nose of compressor.



3. Blow any debris from inside the compressor nose with **low pressure** compressed air. Then clean the

inside and outside nose area of the compressor with a lint free cloth to remove any oil and dirt.

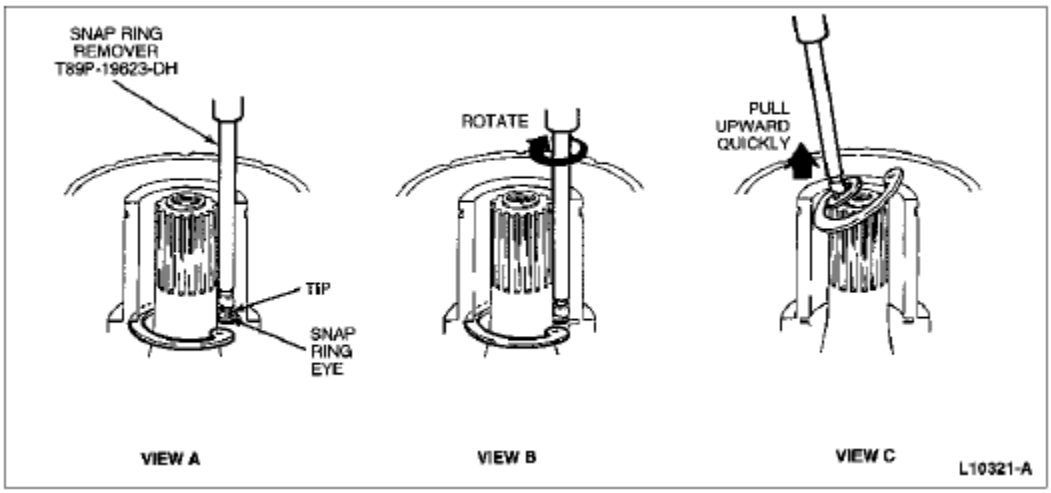
4. Remove shaft seal retaining snap ring from inside compressor nose with Snap Ring Remover T89P-19623-DH as described in the following steps. Refer to the illustrations.

5. Insert the tip of the Snap Ring Remover T89P-19623-DH into one of the snap ring eyes (View A).

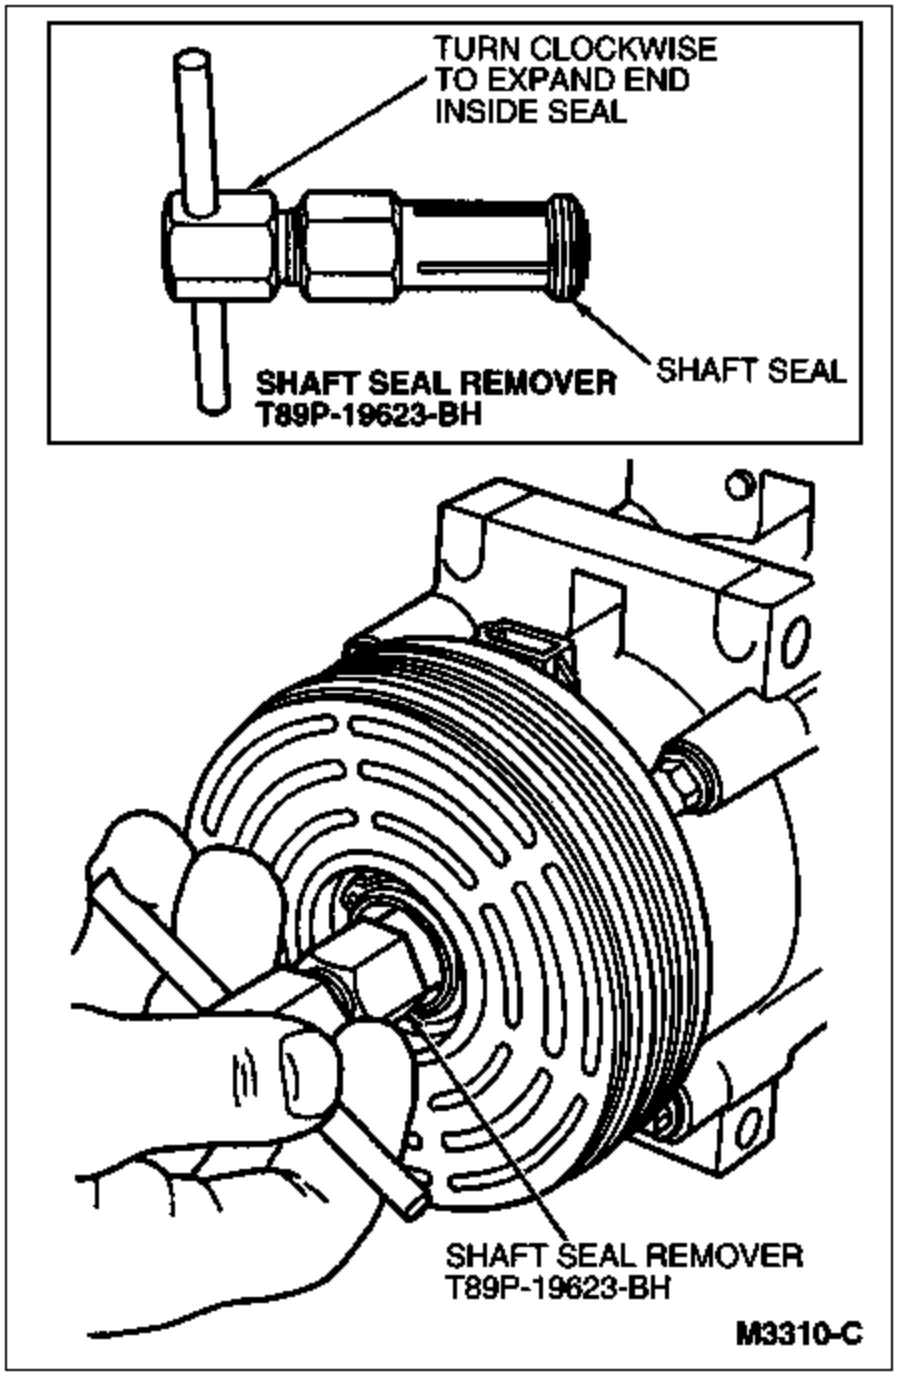
6. Rotate the snap ring remover to position the tool tip and the snap ring eye closest to the compressor shaft (View B).

7. Pull the snap ring remover up quickly while keeping the tool shaft against the side of the nose opening and remove the snap ring (View C).

Snap Ring Removal



8. Position Shaft Seal Remover T89P-19623-BH over compressor shaft and push tool into nose of compressor and down against shaft seal. Engage end of tool with internal diameter of shaft seal. While holding the hex part of the tool, turn tool handle clockwise to expand tool tip inside seal inner radius. Then, pull shaft seal from the A/C compressor (19703) with the tool.



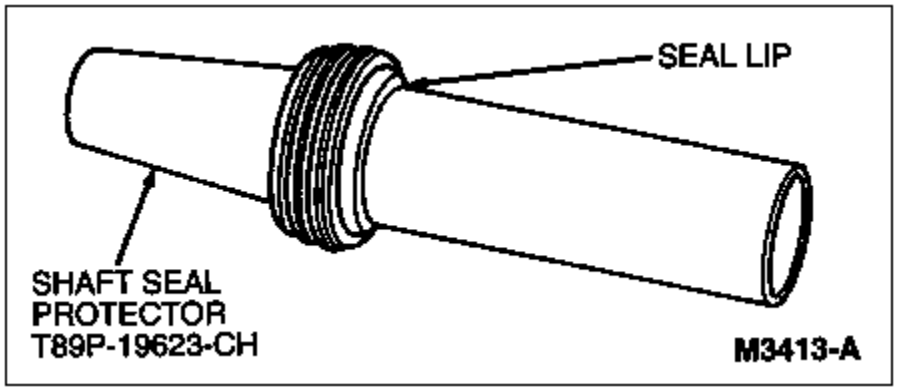
Installation

1. Obtain a new Shaft Seal Kit (Basic Part No. 19D665). Carefully remove the contents of the kit from the package. A plastic shaft seal protector is included with each kit. Inspect the protector for any burrs or other damage. Do not use the protector if it is damaged. Obtain another shaft seal kit, if necessary, and use the protector from it.

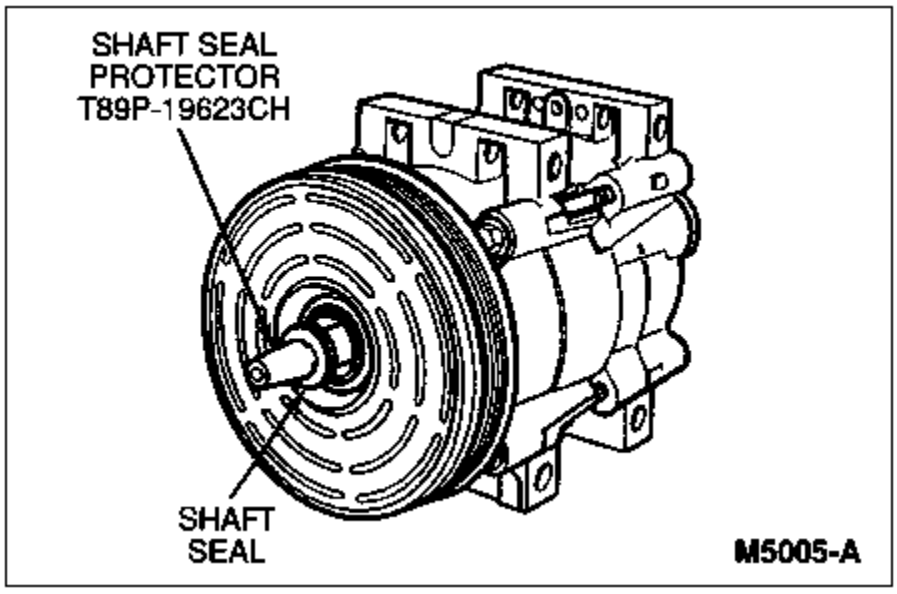
2. **CAUTION: Do not allow any dirt or foreign materials to enter the compressor.**

Using a clean lint free cloth, clean the compressor shaft and the seal pocket inside the compressor nose.

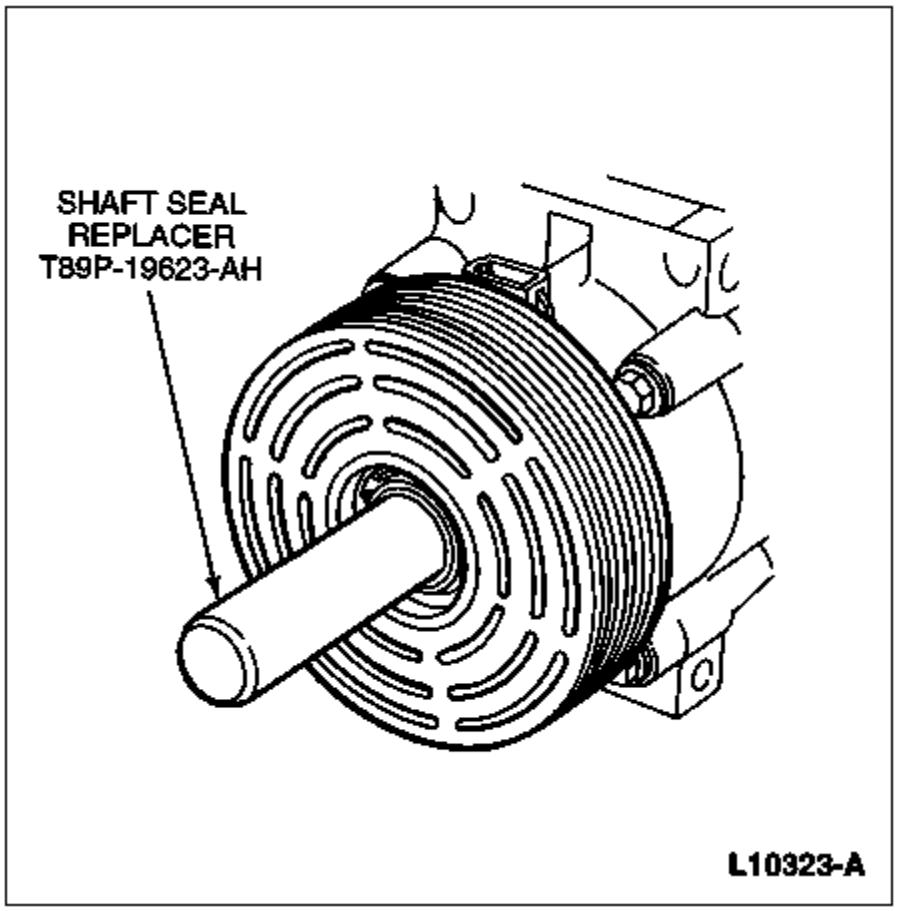
3. Dip the shaft seal protector T89P-19623-CH and shaft seal in clean Refrigerant Oil E73Z-19577-A or equivalent. Position the shaft seal on the protector with the lip of the seal pointing toward the large end of the protector as shown.



4. Place the shaft seal protector with shaft seal over the end of the compressor shaft.



5. Using Shaft Seal Replacer T89P-19623-AH, carefully push seal down shaft protector onto compressor shaft until seated.



6. Remove installer tool and shaft protector from compressor shaft.
7. Place a new shaft seal retaining snap ring into the compressor nose opening and seat the snap ring into the groove.
8. Leak test the shaft seal installation after rotating the compressor shaft about ten revolutions with the clutch hub. Refer to Section 12-00 .
9. Install a new shaft seal felt in nose of compressor.
10. Install clutch hub on compressor as outlined.
11. Check and adjust the air gap as necessary.

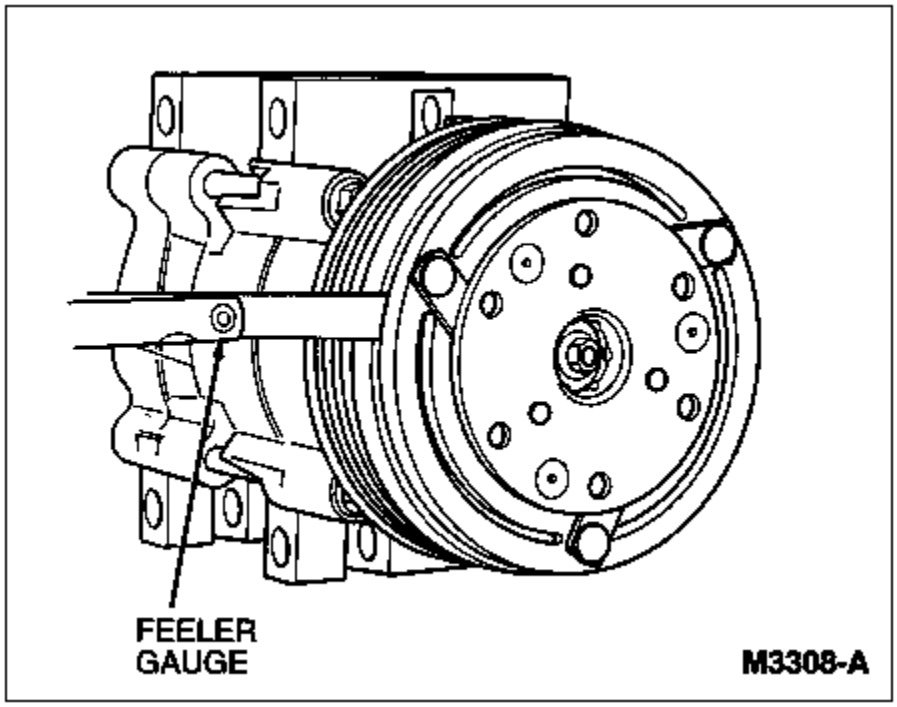
A/C Clutch Air Gap

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spanner Wrench	T70P-4067-A
Compressor Clutch Holding Tool (4.0L)	T94P-19703-AH

Before disassembling A/C compressor (19703) for repair, it is important to check the A/C clutch air gap. This will help determine if the clutch is not engaging, or if the A/C compressor is failing internally.

1. Check A/C clutch air gap between clutch hub and pulley mating surfaces with a feeler gauge. The air gap should be between 0.35 and 0.85mm (0.014 and 0.033 inch). Check at three locations equally spaced around the pulley.

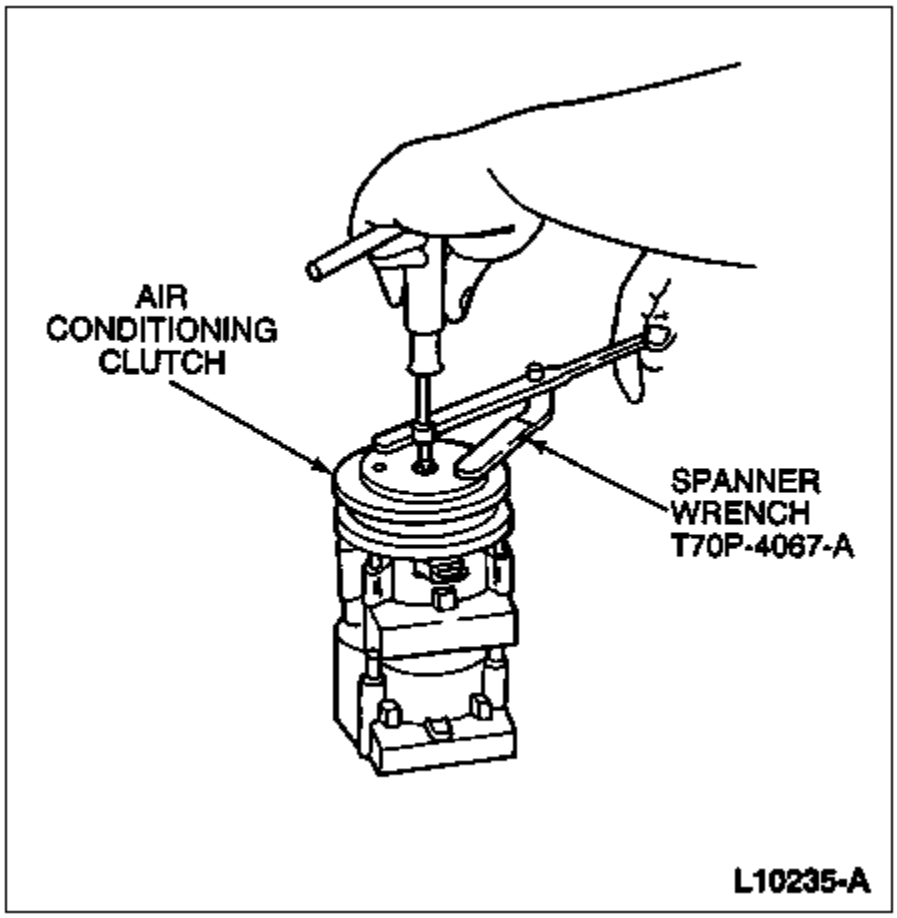


2. **NOTE: If desired gap is not attainable with the available shims, clutch disc and pulley should be inspected for wear or damage. Replace as required.**

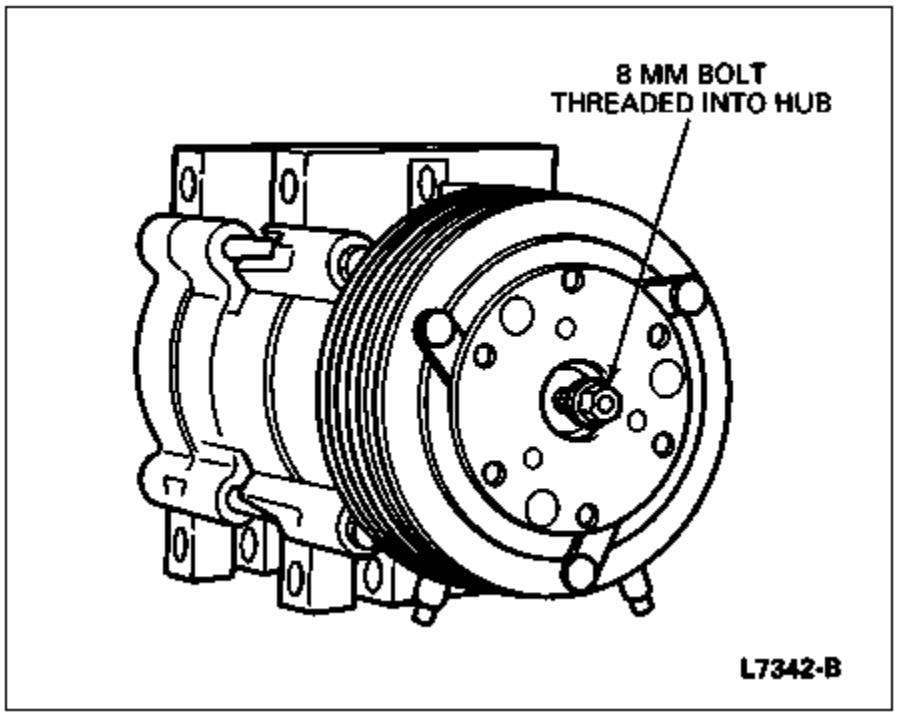
   If A/C clutch air gap is not within specification, use the following steps to adjust air gap.

3. Use Spanner Wrench T70P-4067-A to (or Compressor Clutch Holding Tool T94P-19703-AH for 4.0l.) hold the A/C clutch disc and hub assembly in position while removing the clutch bolt.

2.3l and 3.0l Shown; 4.0l Similar



4. Pull the A/C clutch (2884) and shims from the A/C compressor shaft. If the A/C compressor clutch disc and hub assembly cannot be removed, screw an 8mm bolt into the clutch pulley hub to force the A/C compressor clutch from the shaft.

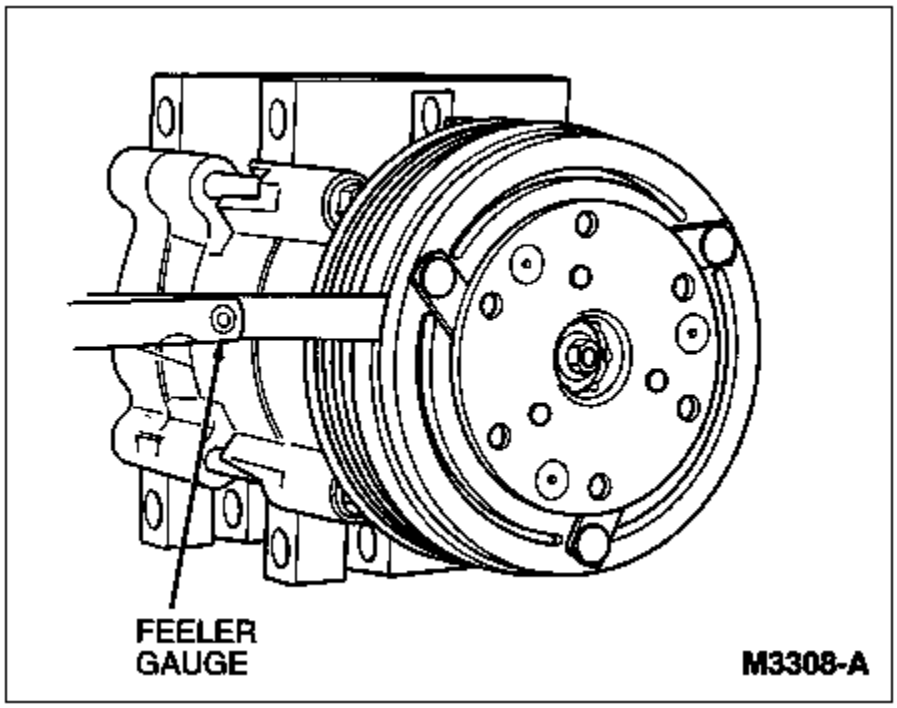


5. Start by placing the nominal thickness shim on the end of the splined shaft and slide the A/C compressor clutch disc and hub assembly onto the end of the A/C compressor shaft.

6. **CAUTION: Do not use air tools to tighten the bolt.**

   Install the clutch bolt into the end of the compressor shaft. Use Spanner Wrench T70P-4067-A (or Compressor Clutch Holding Tool T94P-19703-AA for 4.0l.) to hold the A/C clutch disc and hub assembly in position while tightening the clutch bolt. Tighten the A/C clutch bolt to 11-14 Nm (8-10 lb-ft).

7. Recheck A/C clutch air gap between clutch disc and pulley mating surfaces with a feeler gauge. The air gap should be between 0.35 and 0.85mm (0.014 and 0.033 inch). Check at three locations equally spaced around the pulley.



8. If A/C clutch air gap is not within specification, repeat Steps 3 through 7. Install the correct shim to achieve the desired air gap.

Instrument Cluster and Panel Lighting

Ranger

The instrument cluster (10849) and panel lighting are powered through the headlamp switch (11654) and pulse width module. The instrument cluster illumination is controlled by the output of the pulse width module.

Theinstrument clusterand panel lighting circuit provides illumination to:

- Heater control (18549)
- Instrument cluster
- Instrument panel ash receptacle (04810)
- Radio chassis.

Aerostar

Intensity of illumination is controlled by rotating the headlamp switch knob and shaft (11661) which controls the output of the pulse width module.

Electrical Schematics

Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical Pinpoint Tests. Refer to Diagnosis and Testing in this section.

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the headlamp switch (11654) in the PARK position with the headlamp switch knob and shaft (11661) rotated fully counterclockwise without turning on courtesy lamps to duplicate the condition.

2. Inspect to determine if any of the following electrical concerns apply:

    - Fuse
    - Circuit wiring
    - Headlamp switch

3. If the concern(s) remain after the inspection, determine the symptoms and proceed to the following Symptom Chart.

Symptom Chart — Instrument Cluster And Panel Lighting

INSTRUMENT CLUSTER AND PANEL LIGHTING

Condition	Possible Source	Action
• Control Illumination Inoperative	• Fuse. • Headlamp switch. • Circuit wiring.	• GO to Pinpoint Test A .
• Instrument Panel Illumination Does Not Dim	• Headlamp switch.	• GO to Pinpoint Test B .
• Instrument Cluster Illumination Inoperative	• Circuit wiring. • Illumination bulbs. • Instrument cluster printed circuit.	• GO to Pinpoint Test C .
• Climate Control Illumination Inoperative	• Circuit wiring. • Illumination bulbs.	• GO to Pinpoint Test D .
• Audio System Illumination Inoperative	• Circuit wiring. • Illumination bulbs.	• GO to Pinpoint Test E .
• Single Illumination Source Inoperative	• Circuit wiring. • Illumination bulbs.	• GO to Pinpoint Test F .

Pinpoint Tests

PINPOINT TEST A: CONTROL ILLUMINATION INOPERATIVE

A1 CHECK FUSE

- Check fuse 7 (10A) (Ranger) or 13 (5A) (Aerostar) located in the I/P fuse panel.

Is the fuse OK?

Yes	No
GO to **A4** .	GO to **A2** .

A2 CHECK SYSTEM

- Key OFF.
- Replace fuse 7 (10A) (Ranger) or 13 (5A) (Aerostar).

Does the fuse fail again?

Yes	No
GO to **A3** .	GO to **A4** .

A3 CHECK FOR SHORT TO GROUND

- Key OFF.
- Remove fuse 7 (Ranger) or 13 (Aerostar).
- Measure the resistance of the "T/O" (Ranger) or "LB/R" (Aerostar) wire between the RH terminal of fuse 7 or 13 and ground.

Is the resistance less than 5 ohms?

Yes	No
SERVICE the "T/O" wire.	REPLACE fuse 7 or 13. GO to **A4** .

A4 CHECK POWER SUPPLY TO HEADLAMP SWITCH

- Key OFF.
- Reconnect fuse 7 or 13.
- Disconnect the headlamp switch connector located on the instrument cluster.
- Measure the voltage on the "T/W" wire at the headlamp switch connector.

Is the voltage greater than 10 volts?

Yes	No
GO to **A5** .	SERVICE the "T/W" wire.

A5 CHECK HEADLAMP SWITCH

- Key OFF.
- Disconnect the headlamp switch connector.
- Headlamp switch OFF.
- Measure the resistance between the "T/W" wire terminal and the "BR" (Ranger) or "LB/R" (Aerostar) wire terminal on the headlamp switch.
- Headlamp switch in the parking lamp position.
- Measure the resistance between the "T/W" wire terminal and the "BR" (Ranger) or "LB/R" (Aerostar) wire terminal on the headlamp switch. Rotate the panel dimmer switch while performing this test (Aerostar Only).

Is the resistance less than 5 ohms with the headlamp switch in the parking lamp position, (Ranger), vary with the dimmer control being rotated, (Aerostar), and greater than 10,000 ohms with the headlamp switch in the OFF position?

Yes	No
Aerostar, REPAIR the "LB/R" wire; Ranger, GO to **A6** .	REPLACE the headlamp switch.

A6 CHECK POWER SUPPLY TO PULSE WIDTH MODULE

- Key OFF.
- Reconnect the headlamp switch connector.
- Disconnect the pulse width module connector.
- Headlamp switch in the parking lamp position.
- Measure the voltage on the "T/O" wire at the pulse width module connector.

Is the voltage greater than 10 volts?

Yes	No
GO to **A7** .	SERVICE the "T/O" wire.

A7 CHECK PULSE WIDTH MODULE

- Key OFF.

- Reconnect the pulse width module connector.
- Headlamp switch in PARK or HEAD.
- Probe "LB/R" wire.

Is the voltage greater than 10 volts?

Yes	No
System OK.	REPLACE the pulse width module.

PINPOINT TEST B: INSTRUMENT PANEL ILLUMINATION DOES NOT DIM

B1 TEST SYSTEM

- Headlamp switch to PARK position.
- Rotate dimmer control from fully clockwise to fully counterclockwise.

Does instrument panel illumination dim?

Yes	No
System OK.	GO to **B2** .

B2 TEST PULSE WIDTH MODULE

- Headlamp switch in PARK or HEAD.
- Turn the pulse width module dial to the bright position.
- Probe voltage between Circuit 19 (LB/R) and a known good ground.
- Slowly turn the dial toward the dim position while watching the voltage indicated.

Does the voltage drop from the bright position to the dim position?

Yes	No
System OK.	REPLACE pulse width module.

PINPOINT TEST C: INSTRUMENT CLUSTER ILLUMINATION INOPERATIVE

C1 CHECK CIRCUIT 19 (LB/R) FOR BATTERY VOLTAGE

- Gain access to cluster connectors as outlined in Section 13-01 .
- Actuate headlamp switch to park lamp position.
- Rotate dimmer module control to bright position.
- Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent connected to a known good ground to

check Circuit 19 (LB/R) for voltage.

Is battery voltage present?

Yes	No
GO to **C2** .	SERVICE Circuit 19 (LB/R) for open. RETEST system.

C2 CHECK GROUND CIRCUIT

- Key OFF.
- Disconnect the instrument cluster.
- Check Circuit 57 (BK) for continuity to ground.

Is continuity present?

Yes	No
SERVICE wiring or REPAIR the instrument cluster. RETEST the system.	SERVICE Circuit 57 (BK). RETEST the system.

PINPOINT TEST D: CLIMATE CONTROL ILLUMINATION INOPERATIVE

D1 CHECK POWER SUPPLY TO CLIMATE CONTROL ASSEMBLY

- Key OFF.
- Headlamp switch in the parking lamp position or the headlamp position.
- Rotate dimmer module control to bright position.
- Check Circuit 19 (LB/R) for voltage.

Is the voltage greater than 10 volts?

Yes	No
GO to **D2** .	SERVICE Circuit 19 (LB/R).

D2 CHECK CLIMATE CONTROL ASSEMBLY MINIATURE BULB(S)

- Key OFF.
- Remove the climate control assembly miniature bulb.
- Check the continuity between the terminals of the front climate control assembly miniature bulbs.

Does continuity exist?

Yes	No
	REPLACE the front climate control assembly

GO to **D3** .	miniature bulb(s).

D3 CHECK CLIMATE CONTROL ASSEMBLY GROUND CIRCUIT

- Key OFF.
- Disconnect the climate control assembly connector.
- Check the continuity between Circuit 57 (BK) and ground.

Does continuity exist?

Yes	No
REPLACE the climate control assembly.	SERVICE Circuit 57 (BK).

PINPOINT TEST E: AUDIO SYSTEM ILLUMINATION INOPERATIVE (FRONT AND REAR)

E1 CHECK POWER SUPPLY TO RADIO AND COMPACT DISC PLAYER (IF EQUIPPED)

- Key OFF.
- Disconnect the radio connector.
- Headlamp switch in the parking lamp position or headlamp position.
- Rotate dimmer module control to bright position.
- Measure the voltage on Circuit 19 (LB/R) at the radio connector and/or compact disc player connector.

Is the voltage greater than 10 volts?

Yes	No
GO to **E2** .	SERVICE Circuit 19 (LB/R).

E2 CHECK ILLUMINATION CONTROL CIRCUIT

- Key OFF.
- Disconnect the radio connector.
- Check continuity between Circuit 57 (BK) and ground.

Does continuity exist?

Yes	No
SERVICE the radio at an authorized Ford Audio Service Center.	SERVICE Circuit 57 (BK).

PINPOINT TEST F: SINGLE ILLUMINATION SOURCE INOPERATIVE

F1 DETERMINE SERVICEABILITY OF BULB

- Check continuity of bulb.

Is illumination bulb serviceable?

Yes	No
REPLACE illumination bulb. RESTORE system. RETEST system.	REPLACE component. RESTORE system. RETEST system.

Instrument Cluster (IC), Aerostar

The cluster warning lamps are located in two vertical columns, one on each side of the instrument cluster (10849) and also along the bottom of the instrument cluster. The following indicator lamps are found on the instrument cluster:

Left side, top-to-bottom

- DOOR AJAR
- BRAKE warning
- rear anti-lock brake (REAR ABS)

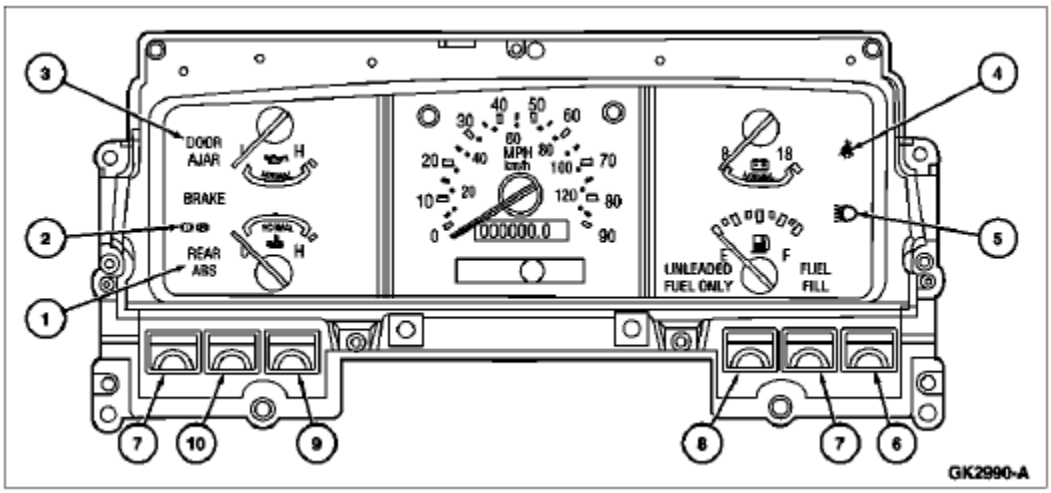
Right side, top-to-bottom

- fasten belts
- high beam

Bottom, left to right

- turn signal
- check engine
- charging system
- electronic 4-wheel drive (only on E-4WD)
- air bag
- turn signal

Instrument Cluster, Aerostar



tomsn048@gmail.com

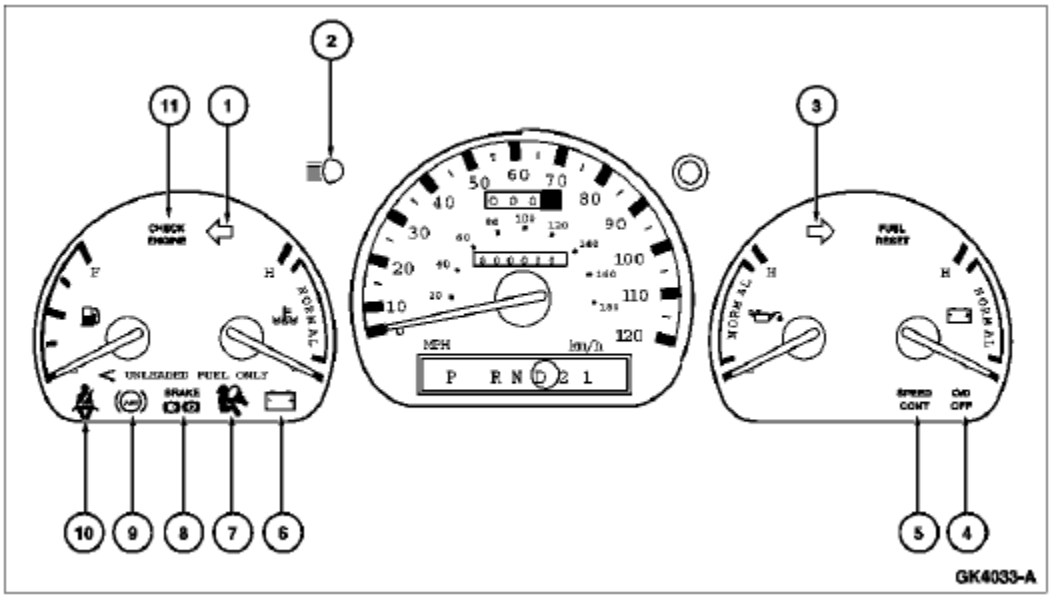
Instrument Cluster (IC), Ranger

The instrument cluster (10849) is available in two versions, standard and tachometer (17360) cluster. Both versions include a voltage indicator gauge (10A835), engine coolant temperature gauge (10883), fuel gauge (9280), and oil pressure gauge (9273) with an odometer (17A265) and tripometer as standard. The standard and tachometer clusters are available for the Ranger with the tachometer cluster. Warning indicators are provided as follows:

- Safety belt
- Air bag
- CHECK ENGINE
- O/D off
- Anti-theft (Tach only)
- Brake
- Anti-lock
- High beam
- Left turn signal
- Right turn signal
- FUEL RESET (Tach only)
- 4WD low range (Tach only)
- 4x4/AWD (Tach only)
- Door ajar (Tach only)
- Check gauge (Tach only)
- Speed control (Tach only)

Instrument Cluster (Base), Ranger



tomsn048@gmail.com

Instrument Cluster Display Prove Out

The instrument cluster (IC) performs a display prove out to verify that all warning/indicator bulbs and monitored systems are functioning properly. When the ignition switch (11572) is in the ON position with the engine (6007) off, the following indicators will illuminate:

- CHECK ENGINE/Malfunction Indicator Lamp (MIL)
- BRAKE Warning Indicator
- FUEL RESET Indicator
- Anti-Lock Brake Warning Indicator (ABS)
- Safety Belt Warning Indicator (60 second prove out)
- Air Bag Warning Indicator

Printed Circuit

The instrument cluster printed circuit (10K843) which supplies current to the instrument panel indicators, gauges, and some clocks, is made of copper foil which is bonded to a polyester base film (usually referred to as Mylar).

The instrument cluster printed circuit is mounted to the cluster housing and, due to its location, cannot be easily inspected or tested in the vehicle. This makes the instrument cluster printed circuit vulnerable to damage when a probe is used for in-vehicle testing as the probe can pierce the instrument cluster printed

tomsn048@gmail.com

circuit or, in some cases, burn the copper conductor.

Since there is no approved procedure for in-vehicle testing of the instrument cluster printed circuit, it must be removed for visual inspection. If no visual damage is evident, each circuit should be tested with an ohmmeter. If an open circuit or short is detected, the instrument cluster printed circuit must be replaced.

---

tomsn048@gmail.com

Fuel Level Indication System

The fuel level indication system is a magnetic gauge system. It consists of a magnetic fuel gauge (9280) mounted in the instrument cluster (10849) and a sending unit located in the fuel tank (9002) with an instrument cluster gauge amplifier (10E849) in series between the two. No instrument voltage regulator is used with this system.

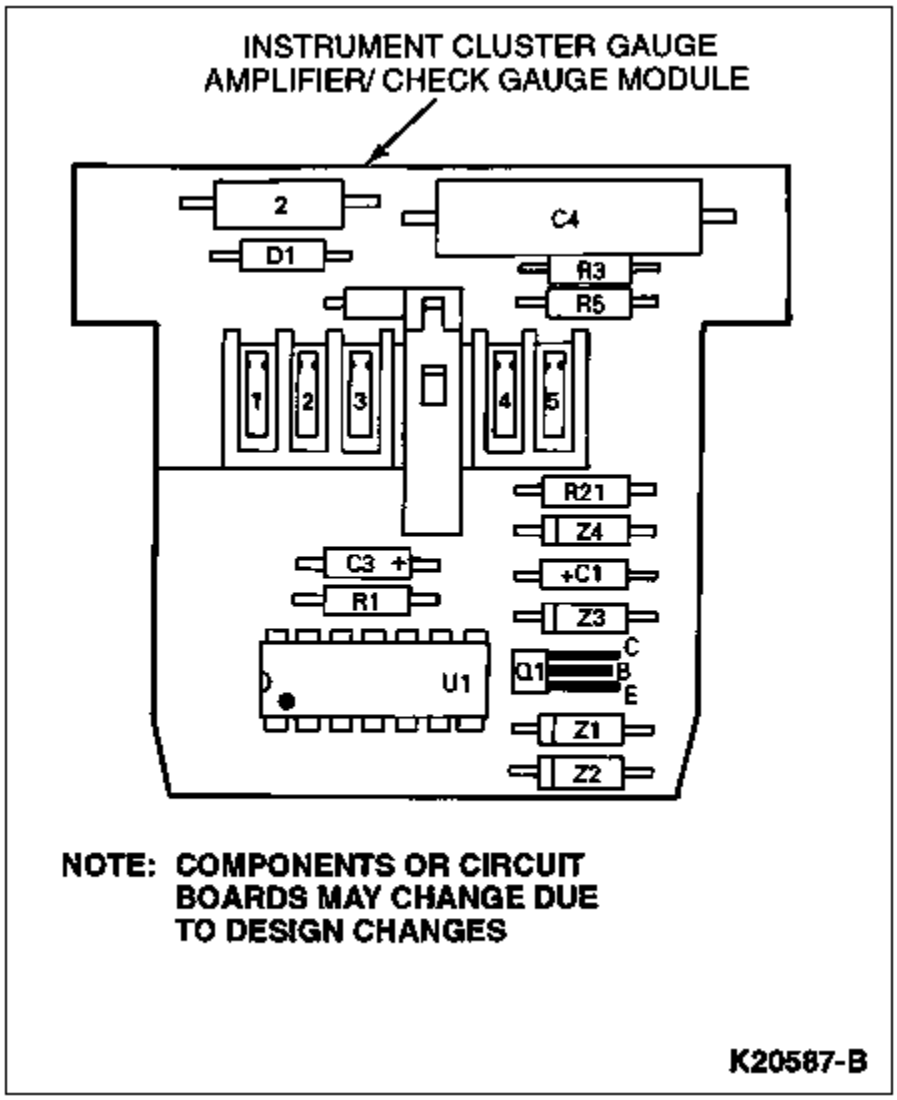
Fuel Gauge

The magnetic gauge movement consists of three primary coils, one of which is wound at a 90-degree angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the sender unit which is connected between two of them. A primary magnet, to which a shaft and pointer are attached, rotates to align to this primary field, resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which has two holes for dial mounting. There is no adjustment, calibration or maintenance required for these gauges. The instrument cluster amplifier is calibrated to the fuel gauge. The instrument cluster amplifier and fuel gauge must be replaced as a system.

Instrument Cluster Gauge Amplifier/Check Gauge Module

The instrument cluster gauge amplifier electrically averages fuel sender readings so the fuel gauge displays actual fuel level and not fluctuations due to sloshing in fuel tank. The instrument cluster gauge amplifier is a small printed circuit board which latches into a pocket on the back of the instrument cluster. The electrical connections for ignition, ground, input from fuel sender and output to fuel gauge are made through a spring-type connector on the instrument cluster gauge amplifier to the instrument cluster printed circuit (10K843) on the instrument cluster. There are no provisions for calibration or adjustment of the instrument cluster gauge amplifier.

tomsn048@gmail.com



Fuel Sending Unit

The fuel sending unit consists of a variable screened resistor made up of a ceramic substrate. It is controlled by the action of an attached float in the fuel tank. When the fuel level is low, resistance in the sending unit is low. When the fuel level is high, the resistance in the sending unit is high. As the float moves from empty to full, the resistance will gradually and continuously increase.

tomsn048@gmail.com

tomsn048@gmail.com

Coolant Temperature Indication System

The water temperature indication system is a magnetic gauge system. It consists of a magnetic water temperature gauge mounted in the instrument cluster and a water temperature indicator sender unit (10884).

Coolant Temperature Gauge

The engine coolant temperature gauge (10883) is a magnetic gauge movement consisting of three primary coils, one of which is wound at a 90-degree angle to the other two. The coils form a magnetic field which varies in direction according to the variable resistance of the water temperature indicator sender unit.

A primary magnet, to which a shaft and pointer are attached, rotates to align to this primary field, resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which has two holes for dial mounting. There is no adjustment calibration or maintenance required for this gauge.

Coolant Temperature Indicator Sender Unit (CTS)

When the engine coolant temperature is low, the resistance of the water temperature indicator sender unit is high, thus restricting the flow of current through the gauge, and moving the pointer only a short distance. As the coolant temperature increases, the resistance of the water temperature indicator sender unit decreases, causing a proportionately increased flow of current through the water temperature indicator sender unit and a corresponding movement of the pointer.

Oil Pressure Gauge

The oil pressure gauge (9273) movement consists of three primary coils, one of which is wound at a 90-degree angle to the other two. A primary magnet, to which a shaft and pointer are attached, rotates to align to this primary field, resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which has two holes for dial mounting. There is no adjustment calibration or maintenance required for this gauge.

Oil Pressure Switch

The oil pressure sensor (9278) is installed in the engine block and consists of a diaphragm and contact. The diaphragm reacts to the pressure, transferring its reaction to a contact which opens and closes when the oil pressure changes.

tomsn048@gmail.com

tomsn048@gmail.com

Charge Indication System

Battery Voltage Gauge Design One

The battery voltage indicator gauge (10A835) is a gauge which measures the voltage potential at the battery to indicate the battery state of charge. The battery voltage indicator gauge is not adjustable and should be replaced if inoperative. The battery voltage indicator gauge is a magnetic gauge which consists of two primary coils and a return-to-zero magnet, one of the coils which is wound at a 90-degree angle to the other coil. The coils form a magnetic field which varies in direction according to the vehicle's voltage.

tomsn048@gmail.com

Battery Voltage Gauge Design Two

The battery voltage indicator gauge (10A835) is a gauge which measure the voltage potential at the battery to indicate state of charge. The battery voltage indicator gauge is not adjustable and should be replaced if inoperative. The battery voltage indicator gauge is a magnetic gauge which consists of a calibration resistor (190 ohms) found on the instrument cluster printed circuit, one primary coil and a return-to-zero magnet. The return to zero magnet forms a magnetic field with the coils. The coil magnetic field varies in direction according to voltage.

A primary magnet, to which a shaft and pointer are attached, rotates to align to this primary field, resulting in pointer position. The bobbin/coil assembly is pressed into a metal housing which has two holes for dial mounting. There is no maintenance required for this gauge.

Charging System Warning Indicator

A red alternator charge indicator is located in the instrument cluster. This indicator glows when there is no generator (GEN) (10346) output.

When the ignition switch contacts are closed (switch turned on), battery current flows through the charge indicator and the parallel resistor (500 ohm), to the voltage regulator and the indicator comes on.

When the generator builds up enough voltage to energize a circuit in the voltage regulator, the charge indicator goes out.

tomsn048@gmail.com

Speedometer, Ranger

The electronic speedometer operates in the following manner.

- Receives a speed/distance signal from the cableless transmission-mounted vehicle speed sensor (VSS) (9E731).

All vehicles have a vehicle speed sensor attached to the transmission. This is used to sense vehicle speed required for the engine management system and to regulate the speed control system for vehicles so equipped.

tomsn048@gmail.com

Odometer Ranger

A million-mile tamper-resistant odometer (17A265) is standard on all vehicles. Also, all service speedometers (17255) have a non-resettable million-mile odometer.

Odometer Replacement

NOTE: Federal law requires that the odometer in any replacement speedometer must register the same mileage as that registered on the removed speedometer. Service replacement speedometers and odometer modules with the mileage preset to actual vehicle mileage are available through Ford Electronic Service Centers. In nearly all instances, the mileage continues to accumulate in the odometer memory even if the odometer does not display mileage. This mileage can usually be verified by the electronic service centers. Contact the service center for instructions to receive a replacement speedometer or odometer module with the mileage preset to actual mileage.

If the actual vehicle mileage cannot be verified, the service center will supply a speedometer or odometer module with the odometer display preset to zero ("0") miles. An odometer mileage sticker is supplied with the replacement odometer. This sticker must display the estimated vehicle mileage and is to be affixed to the driver's door.

tomsn048@gmail.com

Programmable Speedometer/Odometer Module, Aerostar

The programmable electric analog speedometer receives its input from the anti-lock brake sensor. The liquid crystal display (LCD) odometer is a combination trip odometer and total odometer. The total odometer is normally displayed.

- To see the trip odometer, press and release the SELECT button on the upper right side of the speedometer (17255).
- To zero out the trip odometer, press and release the RESET button on the upper left side of the speedometer while the trip odometer is displayed.
- If the trip odometer is displayed, press and release the SELECT button to return the display to the total odometer value.

The speedometer, containing the trip odometer and total mileage odometer, is serviceable only as an instrument cluster assembly.

The speedometer is also used to provide a speed signal for correct operation of the vehicle's powertrain control module (PCM) (12A650), electronic transmission and speed control (if so equipped). Because of this, it is VERY IMPORTANT to change the internal conversion constant of the speedometer if the size of tires, or the rear axle and ring gear on the vehicle are changed. Changing the conversion constant to the proper value when the tires, or the rear axle and ring gear are changed will also make sure that the speedometer retains the original factory-set accuracy. The conversion constant can only be changed six times once the vehicle leaves the factory.

tomsn048@gmail.com

Trip Odometer

The trip odometer (17A265) indicates how many kilometers (miles) the vehicle has been driven since the last reset.

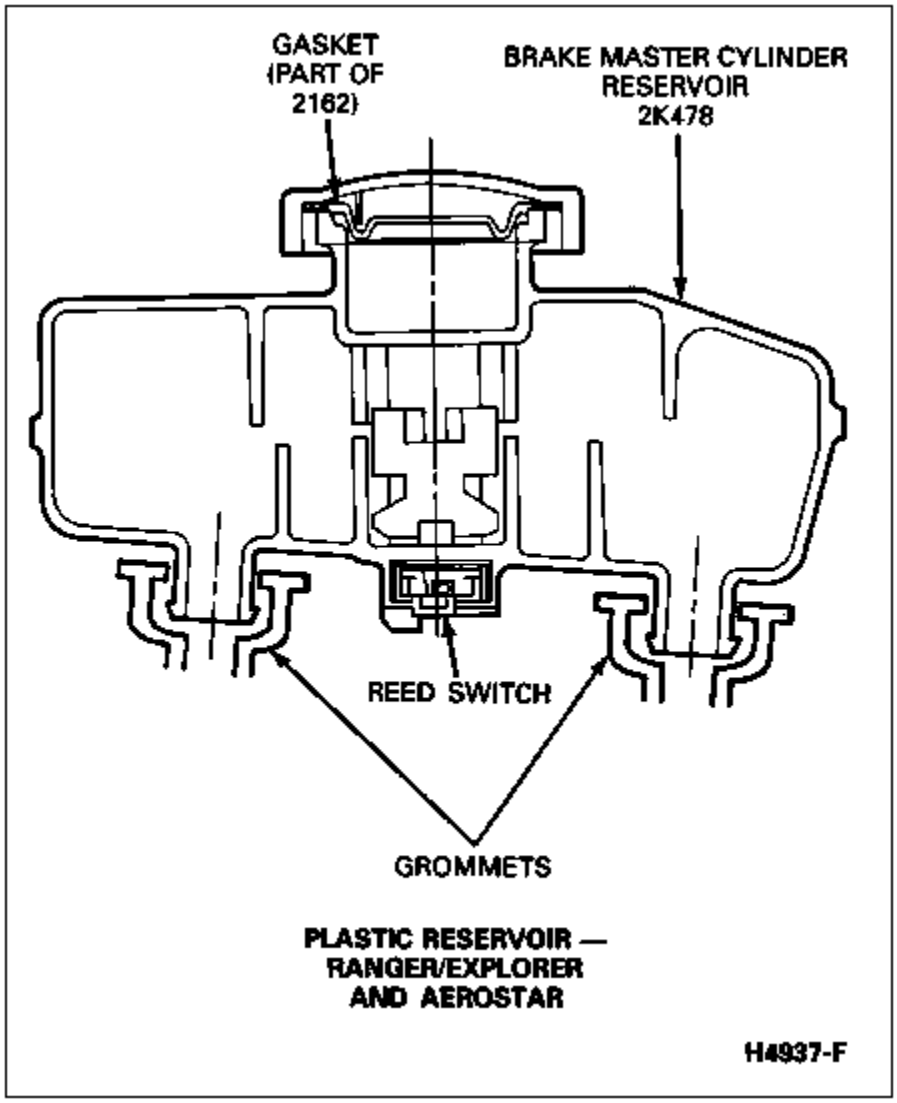
tomsn048@gmail.com

Warning Indicators

Brake System

All vehicles use a brake warning light in the instrument panel to warn of system malfunctions. The red brake warning light is used to indicate a low fluid condition, or a parking brake not fully released condition.

The low fluid level sensor is located in the master cylinder reservoir and is an integral part of the reservoir. It consists of a float and magnet assembly and a reed switch. When the fluid in the reservoir gets to a predetermined level, the magnet, which is attached to the float, actuates the reed switch, causing the warning lamp to light. Loss of fluid from either the primary or the secondary system will cause this system to actuate.



tomsn048@gmail.com

Rear Anti-Lock Brakes, Aerostar and Ranger

Aerostar and Ranger vehicles are equipped with a rear anti-lock braking system and have an ANTI-LOCK BRAKE system light in addition to the BRAKE light. The yellow ABS warning light is used to indicate a malfunction and a deactivation of the rear anti-lock brake system. The ABS warning light will light for approximately 2 seconds when the ignition switch lock cylinder (11582) is initially moved to ON or START for circuit prove out.

Check Engine (MIL)

Check engine lights if a diagnostic trouble code (DTC) is sensed in the closed loop by the powertrain control module (PCM) (12A650).

Charging System

The charge indicator lights if the voltage in the integral generator-regulator drops below a preset level while the ignition switch lock cylinder is in RUN.

Air Bag

If an air bag system diagnostic trouble code (DTC) is present, the air bag diagnostic module grounds pin 54. Current flows through the air bag indicator and the air bag diagnostic module to ground, causing the indicator to illuminate. Refer to the Electrical and Vacuum Troubleshooting Manual (EVTM) for the applicable circuit diagram.

The air bag lamp is designed to illuminate for 6 (± 2) seconds when the ignition switch lock cylinder is turned to the ON position. This initial 6 seconds of air bag lamp illumination (continuous lamp) is considered normal operation and is called prove out of the air bag lamp.

Safety Belt

When the ignition switch lock cylinder is turned to START or RUN, the warning buzzer/chime module applies voltage to the FASTEN BELTS indicator in the instrument cluster to turn it on.

If the safety belt has not been buckled when the ignition switch lock cylinder is turned to the RUN position, the safety belt warning will sound for a duration of 4 to 8 seconds.

The warning chime and warning indicator will then shut off whether the safety belt has been buckled or not.

Low Fuel — Aerostar Only

The CHECK GAUGE indicator will illuminate when a low fuel situation is encountered.

Check Gauge

The CHECK GAUGE indicator will illuminate when any one of the following conditions arise: low fuel, engine overtemp, or low oil pressure.

tomsn048@gmail.com

Door Ajar

The DOOR AJAR indicator will illuminate when any one of the vehicle doors are open.

High Beam

The high beam indicator comes on when the headlamps are turned on high beam or when the headlamps are flashed.

LH/RH Turn Signals

The LH/RH turn signal indicators are located in the instrument cluster. If the turn signal indicator light in the instrument cluster does not illuminate or remains on (doesn't flash) when a turn is signaled, the turn signaling system is malfunctioning.

Overdrive/Overdrive Off

The O/D OFF indicator will illuminate indicating that the transmission is locked out of the overdrive gear (4th gear).

This dual-function lamp will also blink on and off in the event of a transmission fault.

Heated Back Window Light — Aerostar

The heated back light indicator (Aerostar only) will illuminate when the back light is on.

Electronic 4-Wheel Drive — Aerostar

The electronic 4-wheel drive warning light, located on the instrument cluster (10849), turns on when the electronic 4-wheel drive system is working improperly. The light comes on briefly when the ignition switch lock cylinder is turned on, but should turn off when the engine starts.

The electronic 4-wheel drive light will go off after a few seconds and stay off if all systems are operating correctly.

The light comes on steady if a problem occurs. The technician can retrieve a diagnostic trouble code (DTC). If a problem is detected by the control unit, a DTC will be selected and sent to the electronic 4-wheel drive warning light. The vehicle operator and/or service technician needs to count the flashes that occur between the pauses and reference the diagnostic code chart. Refer to Group 07 in the Powertrain, Drivetrain Manual for the on-board diagnostic trouble code chart.

4x4/Low Range Indicators with Lever-Operated Transfer Case, Ranger

The 4x4/low range indicator lamp circuit consists of two lamps located on the instrument cluster and a switch located in the transfer case. One lamp indicates when the vehicle is in the 4-wheel drive position (4H) and one lamp indicates when the vehicle is in the 4-wheel drive low range position (4L).

When the 4-wheel drive is engaged, the switch closes a first contact and the 4x4 lamp illuminates. When the low range is engaged, the switch closes a second contact and the low range bulb illuminates at the same

tomsn048@gmail.com

time as the 4x4 lamp illuminates.

4x4/Low Range Indicators with Electronic Shift Transfer Case, Ranger

The electronic shift control, located on instrument panel (04320), consists of a rotary type switch. The 4x4 switch selects either the 2-wheel drive or the 4-wheel drive position. The instrument cluster indicator will illuminate when the 4-wheel drive position is engaged. The low range position is used to select and indicate 4x4 low range. The light will illuminate when a signal is received from the generic electronic module indicating low range is engaged.

The generic electronic module controls the operation of the transfer case in response to inputs to the rotary switch controlled by the vehicle operator.

Speed Control

The SPEED CONTROL indicator lamp will illuminate when the speed control has been engaged.

Fuel Reset

The FUEL RESET lamp is grounded through the inertia switch whenever the vehicle is subjected to a high force situation. The inertia switch cuts off the fuel pump motor causing a loss of fuel to the cylinders.

The fuel cutoff system is a safety feature in the event of an accident. The fuel reset lamp will illuminate indicating that the fuel reset switch must be switched back to the ON state before the vehicle can be started.

tomsn048@gmail.com

Inspection and Verification

Visually inspect the components. Check for damaged components, blown fuses, loose or corroded connections. Check the wiring harness for obvious signs of shorts, opens, bad connections or damage. Verify circuit operation. Verify speedometer and odometer operation by road testing the vehicle.

If fuel indicating system components are functioning properly and inaccurate indications continue, check the fuel tank (9002) for damage which may have changed the fuel sending unit mounting angle and/or damaged the fuel sending unit.

Verify the engine coolant level is full. Verify the water thermostat (8575) is operating and that drive belt tension is within specification.

tomsn048@gmail.com

Symptom Chart — Conventional Instrument Cluster

CONVENTIONAL INSTRUMENT CLUSTER

CONDITION	ACTION
Fuel Level Reads Inaccurately	· GO to Pinpoint Test A.
Coolant Temperature Reads Inaccurately, Aerostar	· GO to Pinpoint Test B.
Coolant Temperature Reads Inaccurately, Ranger	· GO to Pinpoint Test C.
Oil Pressure Reads Inaccurately	· GO to Pinpoint Test D.
Charge Indicator Reads Inaccurately	· GO to Pinpoint Test E.
Speedometer/Odometer Reads Inaccurately, Aerostar	· GO to Pinpoint Test F.
Speedometer/Odometer Reads Inaccurately, Ranger	· GO to Pinpoint Test G.

Pinpoint Tests

PINPOINT TEST A: FUEL LEVEL READS INACCURATELY

A1 VERIFY POWER AT FUSE 11 — LOAD SIDE

- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at the load side of fuse 11.

Is the voltage greater than 10 volts?

Yes	No
GO to **A3** .	GO to **A2** .

A2 VERIFY POWER AT FUSE 11 — FEED SIDE

- Key ON.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at the feed side of the fuse 11.

Is the voltage greater than 10 volts?

Yes	No
REPLACE the fuse. RETEST system.	REPAIR the wiring to the fuse panel. RETEST system.

A3 VERIFY POWER AT CLUSTER CIRCUIT 640 (R/Y)

- Have cluster connector(s) remain intact.
- Partially remove the instrument cluster from the instrument panel.
- Key ON.
- Measure the voltage on Circuit 640 (R/Y) at the instrument cluster connector to ground.

Is the voltage greater than 10 volts?

Yes	No
GO to **A4** .	REPAIR Circuit 640 (R/Y). RETEST system.

tomsn048@gmail.com

A4 VERIFY GROUND CIRCUIT 570 (BK/W)

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Use an ohmmeter to check the continuity of the ground wire at the instrument cluster connector to ground.

Is the resistance less than 1 ohm?

Yes	No
GO to **A5** .	REPAIR Circuit 570 (BK/W). RETEST system.

A5 CHECK FUEL GAUGE (EMPTY)

- Key OFF.
- Disconnect the fuel gauge sending unit.
- Connect one lead of the Rotunda Instrument Gauge System Tester 014-R1063 or equivalent to the fuel sending unit input wire Circuit 29 (Y/W) at the fuel gauge sending unit connector. Connect the other lead to ground.
- Set the tester to 22 ohms.
- Key ON.
- Wait one minute.
- Read the fuel gauge.

Does the fuel gauge read E (empty)?

Yes	No
GO to **A8** .	GO to **A6** .

A6 RECHECK FUEL GAUGE (EMPTY)

- Place the key in the OFF position. Then to the ON position. Tap on the instrument panel.
- Wait one minute.
- Read the fuel gauge.

Does the fuel gauge read E (empty)?

Yes	No
GO to **A8** .	GO to **A7** .

A7 CHECK PRINTED CIRCUIT

tomsn048@gmail.com

- Key OFF.
- Disconnect the instrument cluster and instrument cluster gauge amplifier.
- Measure the resistance of the circuit between the "SIG" terminal of the fuel gauge and the instrument cluster gauge amplifier.

Is the resistance less than 1 ohm?

Yes	No
REPLACE the instrument cluster gauge amplifier and fuel gauge. RETURN to **A5** .	Ranger: REPLACE instrument cluster printed circuit as described in Removal and Installation, instrument cluster in this section. Aerostar: REPLACE instrument cluster as described in Removal and Installation, Instrument Cluster in this section.

A8 CHECK FUEL GAUGE SENDING UNIT WIRE

- Key OFF.
- Disconnect the instrument cluster and the fuel gauge sending unit.
- Measure the resistance of Circuit 29 (Y/W) between the instrument cluster and the fuel gauge sending unit.

Is the resistance less than 1 ohm?

Yes	No
GO to **A9** .	SERVICE Circuit 29 (Y/W) between the instrument cluster and the fuel gauge sending unit. RETEST system.

A9 CHECK FUEL SENDING UNIT GROUND

- Key OFF.
- Measure the resistance of Circuit 651 (BK/Y) (Ranger) or "BK/W" (Aerostar) wire at the fuel gauge sending unit connector to ground at battery.

Is the resistance less than 1 ohm?

Yes	No
GO to **A10** .	SERVICE Circuit 651 (BK/Y) (Ranger) or "BK/W" (Aerostar) wire from the fuel gauge sending unit to ground.

A10 CHECK FUEL GAUGE (FULL)

- Key OFF.
- Disconnect the fuel gauge sending unit.
- Connect one lead of the Rotunda Instrument Gauge System Tester 014-R1063 or equivalent to

tomsn048@gmail.com

Circuit 29 (Y/W) at the fuel gauge sending unit connector and the other lead to ground.
- Set the tester to 145 ohms.
- Key ON.
- Wait one minute.
- Read the fuel gauge.

Does the fuel gauge read F (full)?

Yes	No
GO to **A11** .	REPLACE the instrument cluster gauge amplifier and fuel gauge. RETURN to **A5** .

A11 FUEL TANK INSPECTION

- Inspect fuel tank for distortion or damage.

Is fuel tank damaged?

Yes	No
REPLACE fuel tank. REFER to Section 10-01 .	GO to **A12** .

A12 TEST BOX CHECK — EMPTY STOP

- Connect one lead of a Rotunda 73 Digital Multimeter 105-R0051 or equivalent, to the fuel sender signal lead Circuit 29 (Y/W) and the other lead to sender ground Circuit 651 (BK/Y).
- Position the float rod against the empty stop (closest to fuel filter).

Does DVOM read 14-18 ohms?

Yes	No
GO to **A13** .	REPLACE fuel sender.

A13 TEST BOX CHECK — FULL STOP

- Connect one lead of a Rotunda 73 Digital Multimeter 105-R0051 or equivalent, to the fuel sender signal lead Circuit 29 (Y/W) and the other lead to sender ground Circuit 651 (BK/Y).
- Position the float rod against the full stop.

Does DVOM read 154-162 ohms?

Yes	No
GO to **A14** .	REPLACE fuel sender.

A14 TEST BOX CHECK — FLOAT ROD TRAVEL

tomsn048@gmail.com

- Connect one lead of a Rotunda 73 Digital Multimeter 105-R0051 or equivalent, to the fuel sender signal lead Circuit 29 (Y/W) and the other lead to sender ground Circuit 651 (BK/Y).
- Move float rod slowly from FULL to EMPTY stop position.

Does ohmmeter reading decrease slowly?

Yes	No
GO to **A15** .	REPLACE fuel sender. REFER to Section 10-01 .

A15 HARNESS CONNECTOR CHECK — EMPTY STOP

- Reattach all fuel indication connectors.
- Move float rod to empty stop position.
- Place key in the ON position.
- Wait 60 seconds.
- Read fuel gauge.

Does fuel gauge read empty?

Yes	No
GO to **A16** .	GO to **A7** .

A16 HARNESS CONNECTOR CHECK — FULL STOP

- Reattach all fuel indication connectors.
- Move float rod to full-stop position.
- Place key in the ON position.
- Wait 60 seconds.
- Read fuel gauge.

Does fuel gauge read full?

Yes	No
GO to **A17** .	GO to **A7** .

A17 INSPECT FUEL SENDER

- Inspect float and float rod.

Is float or float rod distorted, hitting filter, filled with fuel or loose?

Yes	No
REPLACE fuel sender. REFER to Section 10-01 .	REPLACE fuel sending unit. REFER to Section 10-01 in the Powertrain, Drivetrain Manual.

tomsn048@gmail.com

PINPOINT TEST B: COOLANT TEMPERATURE READS INACCURATELY, AEROSTAR

B1 VERIFY POWER AT FUSE PANEL — LOAD SIDE

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent verify system voltage at load side of warning indicator fuse 11.

Is system voltage present at load side of fuse?

Yes	No
GO to **B3** .	GO to **B2** .

B2 VERIFY POWER AT FUSE PANEL — FEED SIDE

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent verify system voltage at feed side of warning indicator fuse 11.

Is system voltage present at feed side of fuse?

Yes	No
REPLACE fuse. RETEST system.	SERVICE wiring to fuse panel. RETEST system.

B3 VERIFY POWER AT INSTRUMENT CLUSTER

- Partially remove cluster from instrument panel. Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent verify system voltage at instrument cluster connector Circuit 640 (R/Y).
- Inspect instrument cluster connector for damage.

Is voltage present at instrument cluster connector?

Yes	No
GO to **B4** .	SERVICE Circuit 640 (R/Y). RETEST system.

B4 VERIFY GROUND CIRCUITRY AT CLUSTER

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity of cluster and gauge ground Circuit 570 (BK/W).

tomsn048@gmail.com

Is the resistance less than 1 ohm?

Yes	No
GO to **B5** .	SERVICE Circuit 570 (BK/W). RETEST system.

B5 COMPONENT TEST

- Perform Coolant Temperature Gauge Component Test in this section.

Does gauge operate properly?

Yes	No
REPLACE coolant temperature sender. REFER to Section 03-03 in the Powertrain, Drivetrain Manual .	GO to **B6** .

B6 CHECK SENDING UNIT CIRCUIT WIRING

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment and to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Ignition OFF.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check sending unit circuit wiring and instrument cluster printed circuit for shorts or opens by physically flexing the wiring and observing continuity. The continuity reading should not fluctuate.

Are wiring and flex circuit OK?

Yes	No
REPLACE gauge as described in Removal and Installation in this section.	SERVICE wiring or REPLACE the instrument cluster as described in Removal and Installation in this section.

PINPOINT TEST C: COOLANT TEMPERATURE READS INACCURATELY, RANGER

C1 CHECK INSTRUMENT CLUSTER TEMPERATURE GAUGE

- Perform the Coolant Temperature Gauge Component Test in this section.

Is the instrument cluster temperature gauge OK?

Yes	No

tomsn048@gmail.com

REPLACE the water temperature indicator sender unit.	GO to **C2** .

C2 CHECK WIRE BETWEEN INSTRUMENT CLUSTER AND WATER TEMPERATURE INDICATOR SENDER UNIT

- Key OFF.
- Disconnect the instrument cluster connector C2.
- Measure the resistance of the "R/W" wire between the instrument cluster connector C2 pin 3 and the water temperature indicator sender unit connector; and between the instrument cluster connector C2 pin 3 and ground.

Is the resistance less than 5 ohms between the instrument cluster connector C2 and the water temperature indicator sender unit; and greater that 10,000 ohms between the instrument cluster C2 connector and ground?

Yes	No
GO to **C3** .	SERVICE the "R/W" wire.

C3 CHECK POWER TO INSTRUMENT CLUSTER

- Disconnect the instrument cluster connector C1.
- Key ON.
- Measure the voltage between the instrument cluster connector C1 pin 13, Circuit 640 (R/Y), and ground.

Is the voltage greater than 10 volts?

Yes	No
GO to **C4** .	SERVICE the "R/Y" wire.

C4 CHECK INSTRUMENT CLUSTER GROUND

- Key OFF.
- Measure the resistance between instrument cluster C2 pin 2, Circuit 570 (BK/W), and ground.

Is the resistance less than 5 ohms?

Yes	No
GO to **C5** .	SERVICE the "BK/W" wire.

C5 CHECK INSTRUMENT CLUSTER TEMPERATURE GAUGE

- Measure the resistance between the instrument cluster temperature gauge clip "B" and the instrument

tomsn048@gmail.com

cluster temperature gauge clip "S".
- Measure the resistance between the instrument cluster temperature gauge clip "S" and the instrument cluster temperature gauge clip "G".

Is the resistance 235 +/- 21 ohms between the "B" clip and "S" clip; and 100 +/- 10 ohms between the "S" clip and "G" clip?

Yes	No
REPLACE the instrument cluster printed circuit.	REPLACE the engine coolant temperature gauge.

PINPOINT TEST D: OIL PRESSURE READS INACCURATELY

D1 VERIFY POWER AT FUSE PANEL — LOAD SIDE

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at load side of warning indicator fuse.

Is system voltage present at load side of fuse?

Yes	No
GO to **D3** .	GO to **D2** .

D2 VERIFY POWER AT FUSE PANEL — FEED SIDE

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at feed side of warning indicator fuse.

Is system voltage present at feed side of fuse?

Yes	No
REPLACE fuse. RETEST system.	SERVICE wiring to fuse panel. RETEST system.

D3 VERIFY POWER AT CLUSTER

- Partially remove cluster. Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at cluster connector CIrcuit 640 (R/Y) and/or gauge terminal.
- Inspect cluster connector for damage.

Is voltage present at cluster connector and gauge terminal?

Yes	No
GO to **D4** .	SERVICE Circuit 640 (R/Y). RETEST system.

tomsn048@gmail.com

D4 VERIFY GROUND CIRCUITRY AT CLUSTER

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity of instrument cluster Circuit 570 (BK/W) and gauge ground circuitry.

Is ground circuitry good?

Yes	No
GO to **D5** .	SERVICE as required.

D5 TEST SENDER CIRCUIT AT LOW

- Place key in the ON position with engine off. Observe gauge performance.

Does the gauge read L or below?

Yes	No
GO to **D6** .	GO to **D7** .

D6 CHECK GAUGE RESPONSE

- Disconnect oil pressure switch and short the lead to engine ground.

Does the gauge indicate approximately mid-scale or slightly above mid-scale (around the MAL in normal)?

Yes	No
REPLACE oil pressure switch. GO to **D7** .	

D7 CHECK SENDING UNIT/SWITCH WIRING

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check sending unit/switch wiring and instrument cluster printed circuit for shorts or opens by physically flexing the wiring and observing continuity. The continuity reading should not fluctuate.

tomsn048@gmail.com

- Measure the resistance on the circuits from the instrument cluster input connector to the gauge clips. Resistance should be less that 1.1 ohm, unless circuit has a 20 ohm resistance in line with circuit, in which case resistance should be less than 21 ohms.

Is wiring and instrument cluster printed circuit OK?

Yes	No
REPLACE gauge as described in Removal and Installation in this section.	Aerostar: SERVICE wiring or REPAIR or REPLACE the instrument cluster. Ranger: SERVICE wiring or REPLACE instrument cluster printed circuit as described in Removal and Installation in this section.

PINPOINT TEST E: CHARGE INDICATOR READS INACCURATELY

E1 VERIFY VOLTAGE GAUGE OPERATION

- Key ON (with engine stopped).
- Headlamps ON.
- Heater blower/fan on HIGH.

Does gauge pointer move toward the lower portion of the NORMAL BAND (white marked area)?

Yes	No
GO to **E2** .	CHECK fuse and the battery-to-circuit breaker and Circuit 640 (R/Y). GO to **E6** .

E2 VERIFY POWER AT FUSE PANEL — LOAD SIDE

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at load side of warning indicator fuse.

Is system voltage present at load side of fuse?

Yes	No
GO to **E4** .	GO to **E3** .

E3 VERIFY POWER AT FUSE PANEL — FEED SIDE

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at feed side of warning indicator fuse.

Is system voltage present at feed side of fuse?

Yes	No

tomsn048@gmail.com

REPLACE fuse. RETEST system.	SERVICE wiring to fuse panel. RETEST system.

E4 VERIFY POWER AT INSTRUMENT CLUSTER

- Partially remove instrument cluster from instrument panel. Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify system voltage at cluster connector Circuit 640 (R/Y) or gauge terminal.

Is voltage present at instrument cluster connector and gauge terminal?

Yes	No
GO to **E5** .	SERVICE Circuit 640 (R/Y).

E5 VERIFY GROUND CIRCUITRY AT INSTRUMENT CLUSTER

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity of instrument cluster Circuit 570 (BK/W) and gauge ground circuitry.

Is ground circuitry OK?

Yes	No
GO to **E6** .	SERVICE Circuit 570 (BK/W).

E6 CHECK INSTRUMENT CLUSTER PRINTED CIRCUIT CONTINUITY

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Check for instrument cluster printed circuit continuity and confirm flex circuit-to-clip and clip-to-gauge contact by physically flexing the wiring and observing continuity. Continuity reading should not fluctuate.

Are wiring and instrument cluster printed circuit OK?

Yes	No
NOTE: Two volt gauges. Determine if resistor and diode are soldered to leads of the terminals (Design One). No electronic component, on gauge terminals (Design Two).	Aerostar: SERVICE wiring or REPLACE the instrument cluster as described in Removal and Installation in this section. Ranger: SERVICE wiring or REPLACE instrument cluster printed circuit as described in Removal and Installation

tomsn048@gmail.com

REPLACE gauge as described in Removal and Installation in this section.	in this section.

PINPOINT TEST F: SPEEDOMETER/ODOMETER READS INACCURATELY, AEROSTAR

F1 CHECK INITIAL STATUS

- Refer to speedometer calibration tolerance specifications table in F7 . Be sure to check the odometer calibration. If both the odometer and speedometer are incorrect in the same direction, it is usually a sign that the conversion constant, tire size, or speed sensor ring are different than programmed. A speedometer inaccurate with an accurate odometer is usually a problem with the speedometer module itself.

Are speedometer and odometer calibration within specified limits?

Yes	No
Speedometer normal.	GO to F2 .

F2 CHECK FOR "NOT PROGRAMMED" MESSAGE

Does "ERROR 3" message alternate with normal odometer display?

Yes	No
GO to F7 . RESET conversion constant. REFER to Reset Conversion Constant in F7 .	GO to F3 .

F3 CHECK TIRES/AXLE CAPACITY

Are tires the same size on opposite ends of a common axle and properly inflated?

Yes	No
DETERMINE conversion constant. GO to F5 .	CORRECT condition or ADVISE customer. GO to F1 .

F4 VERIFY CONVERSION CONSTANT AND DISPLAY MODE

- Check whether the conversion constant in the speedometer is correct with the following procedure:
  - Press and hold the RESET button on the front of the speedometer while turning the key to RUN.
  - Release the RESET button. The pointer will prove out and some codes will appear on the odometer display. If an "E" is on the left side of the display, the module is programmed for English display mode and should have English (MPH) graphics. A lower case "o" signifies an

tomsn048@gmail.com

overseas (KMH) graphics. Verify the graphics and display modes agree. (The number appearing after the type is the microprocessor revision level and is not used in this test.)
- Press and release the RESET button again. The conversion constant and the word CAL will be shown on the odometer display.
- Verify the programmed conversion constant is the same as that displayed on the chart or the constant calculated in **F6** . Refer to Conversion Constants Chart under Specifications in this section.
- Turn off the key to exit this test.

Is the programmed conversion constant the same as that displayed on the chart or the constant calculated in F6?

Yes	No
REPLACE instrument cluster as described in this section. VERIFY proper operation.	GO to **F7** .

F5 DETERMINE CONVERSION CONSTANT

- Check tire size and type on vehicle rear axle or SAE average revs/mile.
  - Refer to tire/axle capacity chart and note conversion constant.

Can the conversion constant be determined?

Yes	No
VERIFY conversion constant. GO to **F4** .	GO to **F6** .

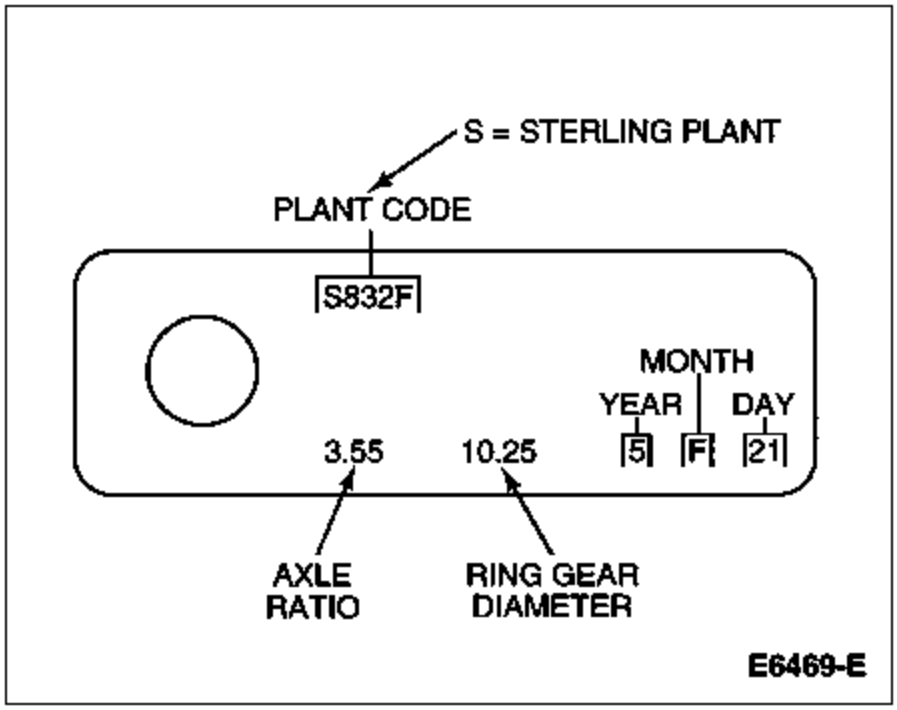
F6 MEASURE TIRE DIAMETER

- To determine the conversion constant perform the following procedure:
  - Hoist vehicle.
  - Measure tire outside diameter (TOD).
  - Note number of rear axle speed sensor teeth, speed sensor ring diameter, or axle capacity/tape group.
  - Verify speed sensor ring diameter with identification tag attached to rear axle cover retaining bolts. If tag is missing manually count teeth.

    NOTE: 7.5-inch rear axles have 102 teeth and 8.8-inch rear axles have 108 teeth.

Is outside diameter greater than 25.2 inches?

tomsn048@gmail.com



Yes	No
USE formula revs/mile = 1528 - (28x TOD) to calculate SAE average revs/mile. GO to F4 .	Revs/mile = 20,850/TOD. GO to F4 .

F7 RESET CONVERSION CONSTANT

- Reprogram speed conversion constant using the following procedure:
  - Locate the dealer mode programming enable connection. It is located behind the cowl side trim panel.
  - Insert metal clip in service wire panel connector. Clip other end to vehicle ground while the key is in the OFF position.
  - Turn key to RUN (not crank) position while holding down the trip odometer RESET button on speedometer. Release RESET button.
  - Speedometer will prove out (sweep across dial and back). The English/Metric and revision levels will be displayed.
  - The last number on the right side of display is the reprogramming lockout count. This count shows the number of allowable conversion constants remaining. When the count is zero, no additional changes can be made to this instrument cluster. If a conversion constant change is necessary, a service instrument cluster must be ordered.
  - Press and release RESET button again and PSOM conversion constant (without the decimal point) followed by the word CAL.
  - Press and release the odometer SELECT button as many times as necessary to change conversion constant to the correct value.

    NOTE: Pressing and releasing the RESET button to lock in the new conversion constant removes the number of times the PSOM can be reprogrammed by one count. The module can only be reprogrammed six times. If it is determined the original conversion constant is satisfactory, turn the key to OFF BEFORE the new constant is locked in.

tomsn048@gmail.com

- When the correct new value is displayed in odometer window, press and release the RESET button to lock in the new conversion constant.
- Turn the key off and remove the ground wire. Verify proper operation of the speedometer.

Is conversion constant set to desired value?

Actual Speedometer or Odometer Value Indicated	48 km/h (30 mph) Actual Speed	97 km/h (60 mph) Actual Speed	Odometer Measure Over Actual 16.1 km Distance (10 Miles)
Allowable Range	45-55 km/h (28-34 mph)	93-108 km/h (58-67 mph)	15.4-16.6 km (9.6-10.3 miles)

Yes	No
Procedure complete.	GO to F5 .

PINPOINT TEST G: SPEEDOMETER/ODOMETER READS INACCURATELY, RANGER

G1 CHECK CONNECTIONS

- Verify connector is properly attached at speed sensor.

Are all connections good?

Yes	No
GO to G2 .	REPAIR or REPLACE as necessary. RETEST system.

G2 CHECK ODOMETER

- Check accuracy of odometer.
- If odometer is accurate, calibration of speedometer may be off. Changing the speedometer may correct, but going on to change either gear will make speedometer reading more accurate, but now odometer will not be accurate.

Is odometer accurate?

Yes	No
REPLACE speedometer as described in Removal and Installation in this section. CHECK for speedometer accuracy.	GO to G3 .

G3 CHECK DRIVEN GEAR

tomsn048@gmail.com

- Check for proper driven gear. Refer to the Ford Speedometer Gear Supplement Charts for speedometer gear applications.
- If odometer is accurate, calibration of speedometer may be off. Changing the speedometer may correct but going on to change either gear will make speedometer reading more accurate, but now odometer will not be accurate.

Is the correct driven gear installed?

Yes	No
GO to **G4** .	REPLACE gear with correct gear. CHECK for accuracy.

G4 CHECK DRIVE GEAR AXLE, TIRES AND RATIO ADAPTOR

- Check for proper driven gear, axle, tires and ratio adaptor.

Is driven gear, axle, tire and ratio adapter correct?

Yes	No
REPLACE speedometer as described in Removal and Installation in this section. CHECK for accuracy.	REPLACE incorrect component or driven gear. CHECK for accuracy.

PINPOINT TEST H: SPEEDOMETER/ODOMETER INOPERATIVE (PSOM), AEROSTAR

H1 CHECK REAR ANTI-LOCK LAMP ILLUMINATION

- Key to RUN.

Does anti-lock lamp go out after self-test?

Yes	No
GO to **H2** .	REFER to Section 06-09A for diagnosis of anti-lock speed sensor, and speed sensor gear.

H2 CHECK ODOMETER DISPLAY

Is odometer display on, and do digits appear normal?

Yes	No
GO to **H3** .	GO to **H6** .

H3 CHECK FOR PRESENCE OF ERROR MESSAGE

tomsn048@gmail.com

NOTE: "ERROR 3" indicates the conversion constant must be programmed. See Pinpoint Test F.

Does the word "ERROR" appear on the odometer display?

Yes	No
REPLACE instrument cluster as described in Removal and Installation in this section. VERIFY proper operation.	GO to **H4** .

H4 CHECK ODOMETER OPERATION

Odometer display increments mileage with vehicle motion or rear wheels turning?

Yes	No
GO to **H9** .	GO to **H5** .

H5 CHECK SPEEDOMETER

Does speedometer indication increase with increasing vehicle speed?

Yes	No
REPLACE instrument cluster as described in Removal and Installation in this section. VERIFY proper operation.	GO to **H8** .

H6 CHECK SPEEDOMETER POWER FUSES

- Remove, check, and reinstall battery power fuse No. 8 if intact.
- Remove, check, and reinstall battery power fuse No. 17 if intact.

NOTE: If fuses are blown, replace with a new, intact fuse. If new fuse blows, determine cause and service as necessary.

With fuses intact, do the speedometer and odometer operate properly?

Yes	No
REPLACE instrument cluster as described in Removal and Installation in this section. VERIFY proper operation.	Go to **H7** .

H7 CHECK SPEEDOMETER CONNECTOR VOLTAGES

- Verify battery, ground and ignition available on Pins 1, 2 and 3 respectively with key in RUN.

tomsn048@gmail.com

NOTE: Only the wiring harness end of the connector should be probed.

Is resistance to ground less than 1 ohm with terminals in wiring harness connector completely seated in connector and locking tabs?

Yes	No
REPLACE instrument cluster as described in Removal and Installation in this section.	SERVICE wiring harness and fuses as required. VERIFY proper operation.

H8 CHECK SPEED INPUT SIGNAL

- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent to Pin 4 (speed in +) and Pin 5 (speed in -).

  NOTE: Only the wiring harness end of the connector should be probed.

- **Does the voltage increase smoothly and continuously from 0 to approximately 3.5 volts as vehicle speed increases from 0 to 30 mph?**
- OR,
- If available, a frequency counter may be connected to Pin 4 (speed in +) and Pin 5 (speed in -).
- **Does the displayed frequency of the signal increase smoothly and continuously from 0 to approximately 667 Hz at approximately 30 mph?**
- OR,
- If neither a voltmeter nor frequency counter is available, vehicle speed control may be used as a good indicator. If it works normally, then the speedometer module is at least receiving a speed input signal and the wiring and sensor can be assumed to be good.

Does the speed control work normally?

Yes	No
REPLACE instrument cluster as described in Removal and Installation in this section.	SERVICE wiring. CHECK for open or shorted wiring. If no problems are found, REFER to Section 06-09A .

H9 CHECK SPEEDOMETER OPERATION

Does speedometer indication increase with increasing vehicle speed?

Yes	No
Normal operation. ADVISE customer.	REPLACE instrument cluster as described in Removal and Installation in this section.

PINPOINT TEST J: SPEEDOMETER/ODOMETER INOPERATIVE, RANGER

J1 CHECK CONNECTIONS

tomsn048@gmail.com

- Verify connector is properly attached at speed sensor.

Are connections OK and is drive tip seated properly?

Yes	No
GO to J2 .	SERVICE or REPLACE as necessary, RETEST system.

J2 CHECK ODOMETER

- Check operation of odometer.

Does the odometer operate?

Yes	No
GO to J3 .	Go to J4 .

J3 CHECK SPEEDOMETER POINTER

- Check operation of speedometer pointer.

Does the speedometer/pointer operate?

Yes	No
System is OK.	REPLACE speedometer as described in Removal and Installation in this section. RECHECK speedometer for operation.

J4 CHECK VEHICLE SPEED SENSOR

- Disconnect speedometer connector from vehicle speed sensor and remove vehicle speed sensor and check that shaft in vehicle speed sensor turns freely.

Does shaft turn freely?

Yes	No
GO to J5 .	REPLACE vehicle speed sensor as described in Removal and Installation in this section. CHECK speedometer for operation.

J5 CHECK GEARS

- Check drive/driven gears for damage or wear.

tomsn048@gmail.com

Is drive/driven gears damaged?

Yes	No
REPLACE damaged or worn gear(s). CHECK speedometer for proper operation.	Go to **J6** .

J6 CHECK WIRING AND CONNECTIONS

- Verify the presence of signals at the printed circuit clips on the speedometer at the instrument cluster:
  - Circuit 640 R/Y: 10-14 volts DC with ignition switch in RUN or START position.
  - Circuit 1001 W/Y: 10-14 volts DC AT ALL TIMES.
  - Circuit 570 BK/W: 0 volts DC. Check continuity to ground (sheet metal).
  - Circuit 679 GY/BK: Speed signal. 1-5 volts AC with drive wheels turning (voltage rises with speed).

Are the above signals present?

Yes	No
REPLACE speedometer.	CHECK wiring and printed circuit on the instrument cluster for opens/shorts and REPAIR/REPLACE. RECHECK system.

PINPOINT TEST K: SPEED CONTROL, PCM, AEROSTAR EIC, OR ELECTRONIC TRANSMISSION INOPERATIVE OR ERRATIC NOTE: Follow this procedure only after being referred here by the Speed Control, PCM, AEROSTAR EIC, or electronic transmission shop manual diagnostics.

K1 CHECK REAR ANTI-LOCK LAMP ILLUMINATION

- Key ON.

Does anti-lock lamp go out after self-test?

Yes	No
GO to **K2** .	REFER to Section 06-09A .

K2 CHECK SPEEDOMETER SPEED OUTPUT SIGNAL

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment user's manual for additional information.

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for shorts in the wiring between Pin 7 (speed out) and battery/ignition or ground. **Is circuit shorted?**

tomsn048@gmail.com

- Use an ohmmeter to check for opens in the wiring between Pin 7 (speed out) and the affected module. Verify that terminals in PSOM wiring connector are completely seated in the connector. **Is the circuit open?**
- Connect an AC voltmeter to Pin 7 (speed out) and Pin 2 (module ground). **Does the voltage increase smoothly and continuously from 0 to approximately 4.5 volts as vehicle speed increases from 0 to approximately 30 mph?**
- OR,
- If available, a frequency counter may be connected to Pin 7 (speed out) and Pin 2 (module ground). **Does the displayed frequency of the signal increase smoothly and continuously from 0 to approximately 67 hz at approximately 35 mph?**
- OR,

If neither a voltmeter nor frequency counter is available, vehicle speed control may be used as a good indicator. If it works normally above 30 mph, this means that the speedometer module is at least receiving a speed input signal and the wiring and sensor can be assumed to be good. Does speed control work?

Yes	No
SERVICE wiring between speedometer and affected module as required. VERIFY proper operation.	GO to **K3** .

K3 CHECK SPEED INPUT SIGNAL

CAUTION: Make sure multimeter is in the voltage function and not in the resistance function to avoid damage to multimeter.

- Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent to Pin 4 (speed/in +) and Pin 5 (speed/in -). **Does the voltage increase smoothly and continuously from 0 to approximately 3.5 volts as vehicle speed increases from 0 to approximately 30 mph?**

  NOTE: Only the wiring harness end of the connector should be probed.

- OR,

If available, a frequency counter may be connected to Pin 4 (speed in +) and Pin 5 (speed in -). Does the displayed frequency of the signal increase smoothly and continuously from 0 to approximately 667 hz at approximately 30 mph?

NOTE: Only the wiring harness end of the connector should be probed.

Yes	No
REPLACE instrument cluster as described in Removal and Installation in this section.	SERVICE wiring. CHECK for opens or shorted wiring. If no problems are found, REFER to Section 06-09A or Section 06-09B .

PINPOINT TEST L: TACHOMETER INOPERATIVE — RANGER

tomsn048@gmail.com

L1 CHECK FUSE

- Check Fuse.

Is fuse OK?

Yes	No
GO to L2 .	REPLACE fuse. If fuse blows again, CHECK for short in circuit.

L2 CHECK WIRING

- Check for loose wiring connections in engine compartment or at instrument cluster.

Is wiring OK?

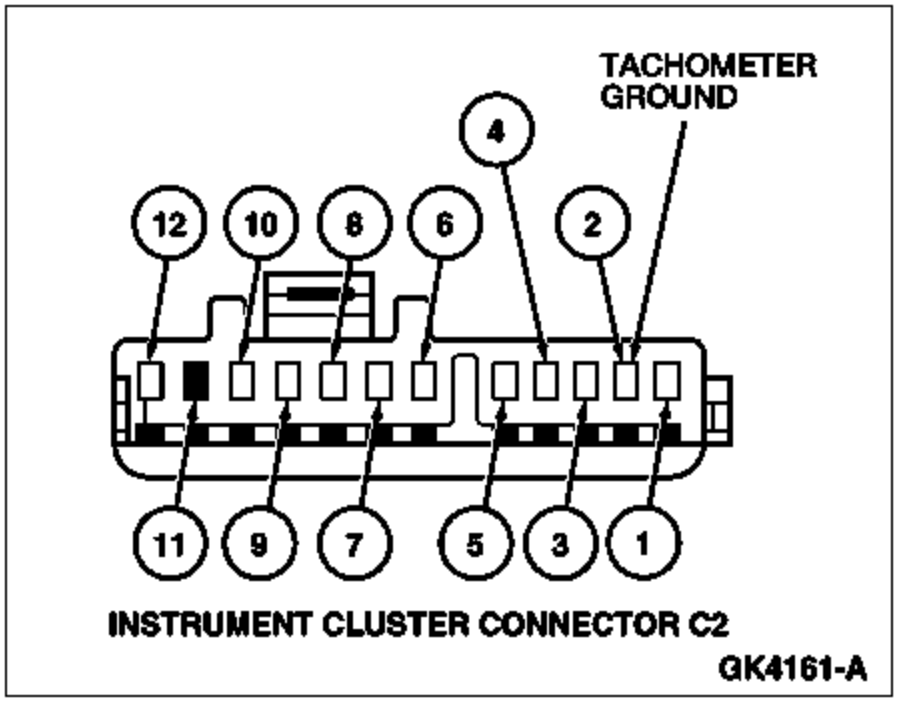
Yes	No
GO to L3 .	SECURE loose connections.

L3 MAKE RESISTANCE CHECKS

CAUTION: Before checking the continuity of any circuit, make sure there is no voltage present in the circuit prior to switching the test equipment to the resistance function to avoid damage to equipment. Refer to the test equipment manual for additional information.

- Disconnect battery ground cable. Remove instrument cluster. Check resistance and voltage using Rotunda 73 Digital Multimeter 105-R0051 as follows:

tomsn048@gmail.com



- Check pin 2 (Connector C2) resistance to chassis ground. Resistance should be 1 ohm or less.

  NOTE: Perform this check using EEC-V 104-pin Breakout Box 014-00950.

- Check pin 15 (Connector C1) to pin 48 of the PCM connector. Resistance should be 1 ohm or less.

  CAUTION: Make sure multimeter is in the voltage function and not in the resistance function to avoid damage to multimeter.

- Connect battery. Turn key ON. Check for 12 volts at pin 13 (Connector C1). Turn key off. Disconnect battery.

Is resistance within specifications?

Yes	No
REMOVE instrument cluster. REFER to the procedure in this section. REPLACE tachometer. REFER to the procedure in this section.	Condition is not in tachometer. SERVICE wiring.

PINPOINT TEST M: TACHOMETER NOT REFLECTING CORRECT ENGINE SPEED

M1 CHECK POWER SUPPLY TO GAUGE

tomsn048@gmail.com

- Key OFF.
- Partially remove instrument cluster panel to gain access to the cluster connectors.
- Turn ignition switch to the RUN position.
- Check voltage at Circuit 640 (R/Y) at connector.

Is battery voltage present?

Yes	No
GO to **M2** .	SERVICE Circuit 640 (R/Y) for open. RESTORE vehicle. RETEST system.

M2 CHECK GAUGE GROUND

- Measure resistance between a known good ground and Circuit 398 (BK/Y) for 3.0L and 4.0L engines.

Are resistances 5 ohms or less?

Yes	No
GO to **M3** .	SERVICE Circuit 398 (BK/Y) for open. RESTORE vehicle. RETEST system.

M3 CHECK TACHOMETER INPUT CIRCUIT

- Key OFF.
- Disconnect instrument cluster connector C1.
- Disconnect ignition coil, or DIS.
- Install Rotunda EEC-V 104 Pin Breakout Box 014-00950.
- Measure resistance of Circuit 11 (T/Y) from Breakout Box Pin 30 to instrument cluster connector C1.

Is resistance 1.8 ohms or less?

Yes	No
GO to **M4** .	SERVICE Circuit 11 (T/Y) for open. RESTORE vehicle. RETEST system.

M4 CHECK CLUSTER CLIP TO CLUSTER CIRCUIT CONNECTION

- Reconnect instrument cluster connector C1.
- Check for continuity from the tachometer connector clips to instrument cluster printed circuit.

Is there continuity?

Yes	No
GO to **M5** .	REPLACE connector clips. RESTORE vehicle. RETEST system.

tomsn048@gmail.com

M5 CHECK PRINTED CIRCUIT

- Check each circuit listed below for continuity from tachometer connector clips to cluster connector.

Connector	Pin	Circuit	Function
C3	8	398 (BK/Y), 3.0L and 4.0L	Ground Through 4.32 k Ohms Flex Circuit Resistor
C1	13	640 (R/Y)	Battery Power (Hot in Start or Run)
C1	15	11 (T/Y)	Tachometer Input

Is there correct resistance at all circuits?

Yes	No
REPLACE speedometer/tachometer assembly. RESTORE vehicle. RETEST system.	REPLACE instrument cluster printed circuit. RESTORE vehicle. RETEST system.

PINPOINT TEST N: ALL WARNING INDICATORS INOPERATIVE

N1 CHECK FUSE

- Check fuse.

Is fuse OK?

Yes	No
GO to N2 .	REPLACE fuse. If fuse blows again, CHECK for short in circuit.

N2 CHECK WIRING

- Check for loose wiring connections in engine compartment or at instrument cluster.

Is wiring OK?

Yes	No
GO to N3 .	SECURE loose connections.

N3 CHECK CLUSTER GROUND

- Key OFF.
- Partially remove instrument cluster as outlined.
- Measure resistance between a known good ground and Circuit 57 (BK) at instrument connector C1,

tomsn048@gmail.com

Pin 7.

Is resistance 5 ohms or less?

Yes	No
GO to **N4** .	SERVICE Circuit 57 (BK) for open. RESTORE vehicle. RETEST system.

N4 CHECK SUPPLY AT CLUSTER

- Turn ignition switch to RUN position.
- Using a test lamp check CIrcuit 640 (R/Y) at connector C1.

Did test lamp illuminate?

Yes	No
REPLACE instrument cluster printed circuit. RESTORE vehicle. RETEST system.	SERVICE Circuit 640 (R/Y) for open. RESTORE vehicle. RETEST system.

tomsn048@gmail.com

Component Tests

The Rotunda Instrument Gauge System Tester 014-R1063 or equivalent is used to diagnose concerns with the instrument cluster magnetic gauges.

Oil Pressure Gauge/Oil Pressure Sender

1. Disconnect connector from the oil pressure sender.
2. Turn the vehicle ignition switch lock cylinder (11582) to ON position.
    a. Short the connector directly to engine ground. The centerline of the pointer should fall slightly above the oil pressure gauge mid-scale.
3. With connector attached to the oil pressure sender and ignition switch lock cylinder on, the center line of the pointer should fall on or below the "L" mark.

- If the oil pressure gauge (9273) tests within calibration, replace oil pressure sender.
- If the oil pressure gauge still tests out of calibration, replace the gauge.

Fuel Gauge

With the sending unit float arm in the empty stop position, resistance should be 15 ohms (below E). With the sending unit float arm in the full-stop position, resistance should be 160 ohms (above F). The fuel gauge (9280) should read empty at 22.5 ohms and full at 145 ohms.

Fuel Tank Sending Unit

With ohmmeter positive lead on the signal wire lead and the negative lead on ground, check the resistance values of the fuel sending unit at various positions of the float arm. An open circuit will indicate infinity on the ohmmeter and a short will indicate zero ohms.

Coolant Temperature Gauge — Aerostar

1. Disconnect the water temperature indicator sender unit (10884).
2. Connect one lead of Rotunda Instrument Gauge System Tester 014-R1063 or equivalent to water temperature indicator sender unit Circuit 39 (R/W) and the other lead to ground.
3. Turn the ignition switch lock cylinder to the ON position.
4. Set the tester to 74 ohms.

tomsn048@gmail.com

5. Wait one minute. The center line of the pointer should fall within the band around the "C" mark.
6. Set the tester to 9.7 ohms.
7. Wait one minute. The center line of the pointer should fall within the band around the "H" mark.
8. Return to the Pinpoint Test.

Coolant Temperature Gauge — Ranger

1. Disconnect the water temperature indicator sender unit.
2. Connect one lead of Rotunda Instrument Gauge System Tester 014-R1063 or equivalent to water temperature indicator sender unit Circuit 39 (R/W) and the other lead to ground.
3. Set the tester to 300 ohms.
4. Turn the ignition switch lock cylinder to the ON position.
5. Wait one minute. The gauge should read "C" (cold).
6. Set the tester to 45 ohms.
7. Wait one minute. The gauge should read one quarter range to mid-range.
8. Set the tester to 18 ohms.
9. Wait one minute. The gauge should read "H" (hot).
10. Return to the Pinpoint Test.

Charge Indicator Lamp

The integral alternator regulator (IAR) has a circuit in the voltage regulator that will indicate a high battery (10655) voltage condition. With the IAR system, two conditions can cause the charge indicator lamp to come on during vehicle operation:

1. No generator (GEN) (10346) output — damaged generator, voltage regulator or wiring.
2. Overvoltage correlation — shorted generator rotor, regulator or wiring.

   If the system is working normally, the following conditions will be present:

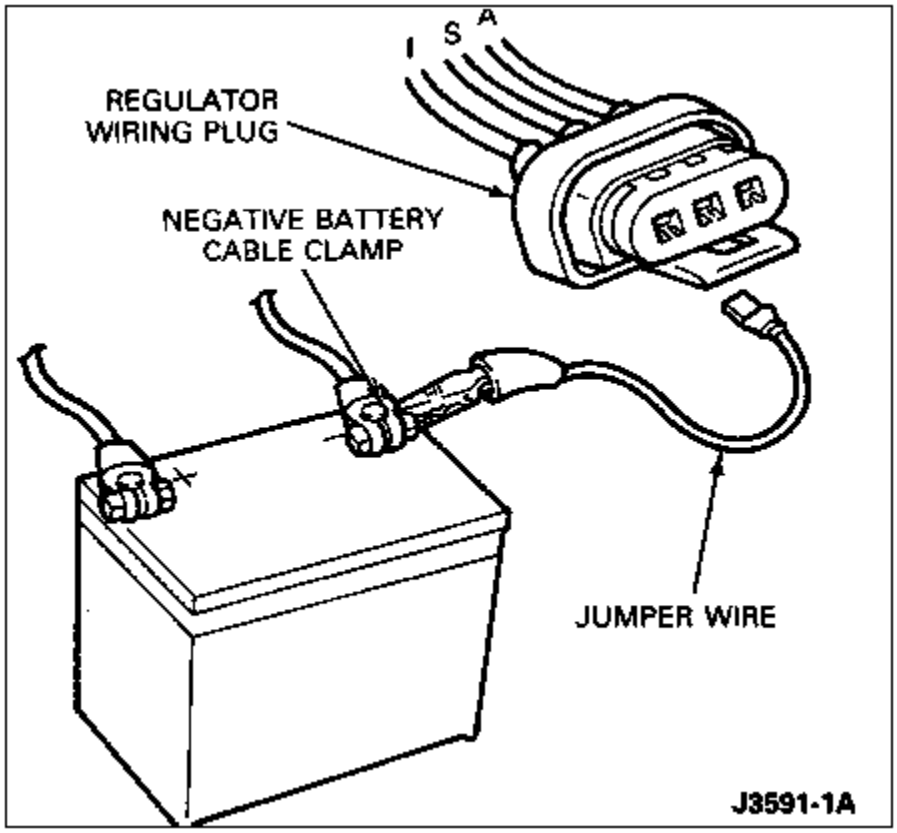
   - With ignition switch lock cylinder in OFF position, charge indicator (battery symbol) lamp is off.
   - With ignition switch lock cylinder in RUN (engine not running), charge indicator (battery symbol) lamp is on.
   - With ignition switch lock cylinder in RUN (engine running), charge indicator (battery symbol) lamp is off. Except as noted above.

tomsn048@gmail.com

If the charge indicator lamp does not come on with the ignition switch lock cylinder in the RUN position (engine not running), check the "I" circuit (ignition switch lock cylinder to regulator "I" terminal) for an open circuit or burned out charge indicator lamp. Replace the lamp, if necessary.

3. If the charge indicator lamp does not come on, disconnect the wiring connector from the voltage regulator.

4. Connect a jumper wire from the wiring connector "I" terminal to the battery negative post cable clamp.



5. Turn the ignition switch lock cylinder to RUN (engine not running). If the indicator lamp does not light, check the indicator bulb for continuity and replace the bulb if it is burned out. If the bulb is still good, perform the voltage regulator "I" circuit tests.

Odometer Accuracy Test

To test the odometer (17A265) accuracy, drive the vehicle over a measured distance of at least 10 consecutive miles (or 16 kilometers). Check measured distance against odometer measured distance. Acceptable odometer measured distance is 15.5-16.7 km (9.6-10.4 miles).

tomsn048@gmail.com

tomsn048@gmail.com

Instrument Cluster, Aerostar

CAUTION: The instrument cluster (10849) requires SPECIAL HANDLING to avoid damaging internal components. The instrument cluster MUST be kept FACE UP or in the in-vehicle position. Leaving the instrument cluster face down may result in a loss of dampening fluid used in the gauges. The lost fluid could stain the cluster face or result in excessive pointer waiver.

NOTE: Federal law requires that the odometer (17A265) must register the same mileage as that registered in the removed instrument cluster.

Aerostar instrument components that are serviceable at the dealership level are:

- instrument panel lamp socket and bulbs (13B765)
- engine coolant temperature gauge (10883) and oil pressure gauge (9273)
- fuel gauge (9280) and voltage indicator gauge (10A835)
- instrument cluster gauge amplifier (10E849)
- instrument cluster main lens (10887)
- instrument cluster mask (10890)
- lens attaching screws

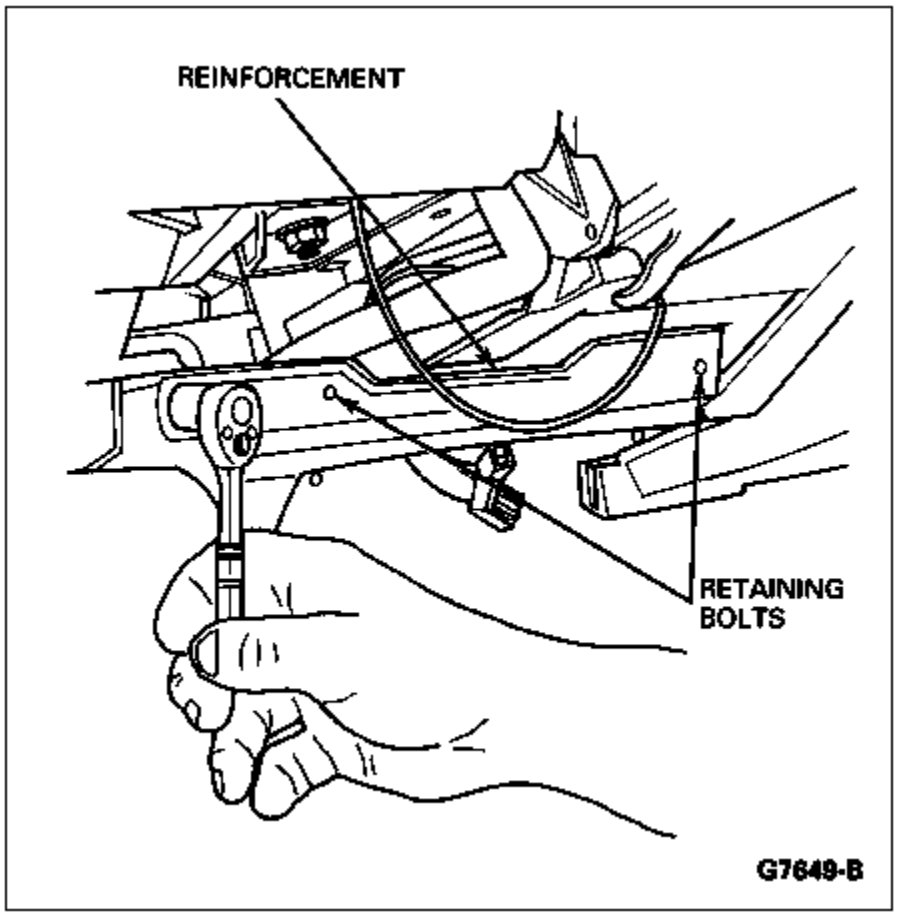
NOTE: The Aerostar instrument cluster must be serviced as a complete assembly if it is determined that any of the following components are malfunctioning:

- **speedometer (17255)**
- **instrument cluster printed circuit (10K843)**
- **instrument cluster back plate (10848)**

Removal and Installation

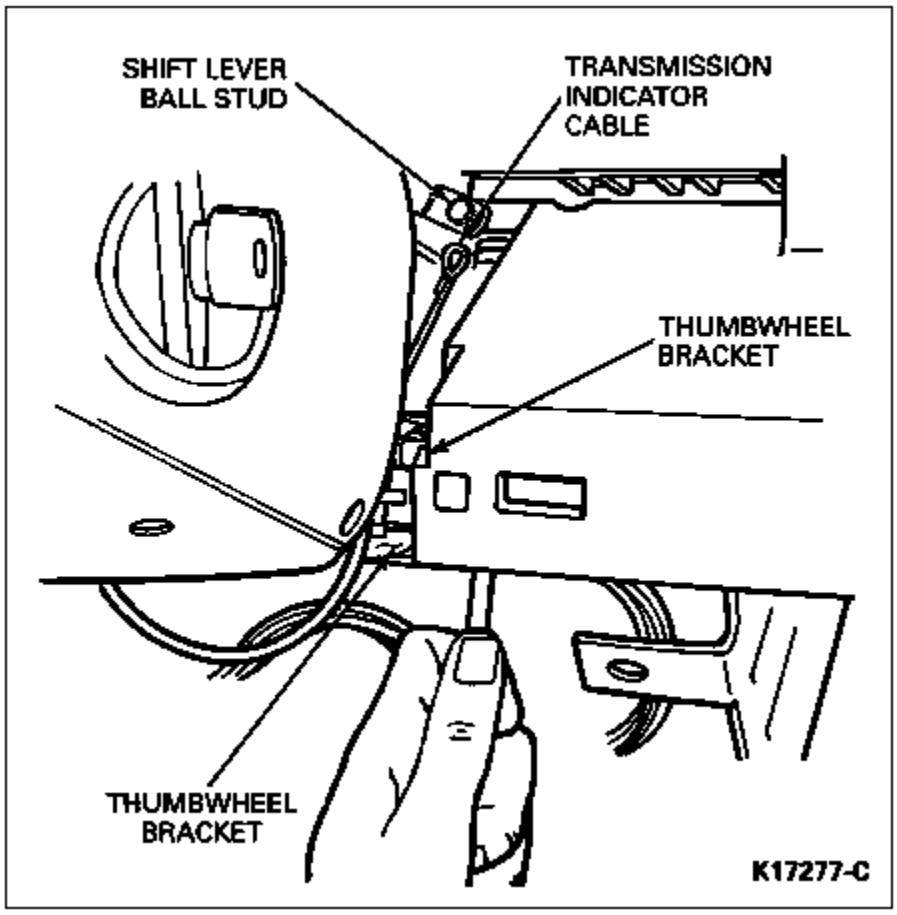
1. Disconnect the battery ground cable (14301).
2. Remove the instrument panel finish panels (044D70). Refer to Section 01-12 for procedure.
3. Remove the steering column bracket reinforcement.

tomsn048@gmail.com



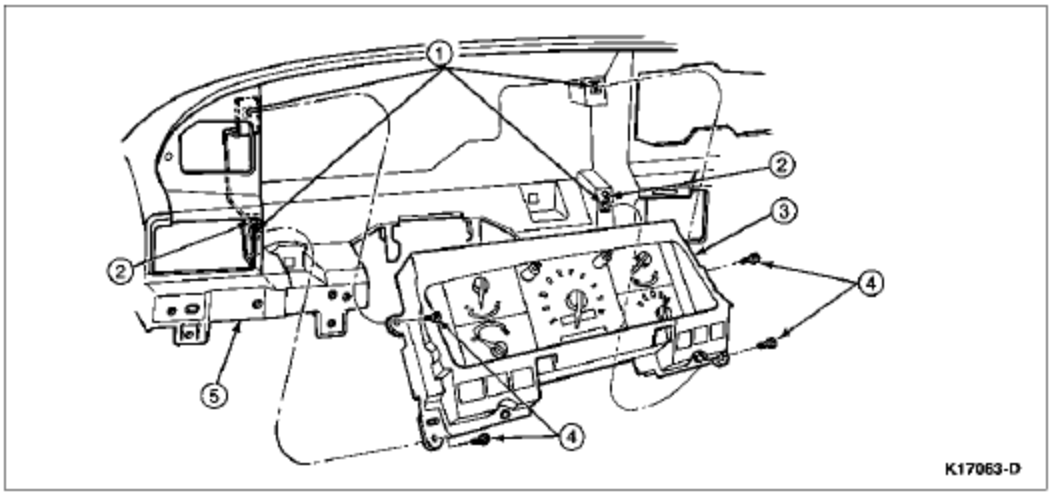
4. Remove the transmission indicator cable loop from the ball stud on the shift lever.
5. Remove the thumbwheel bracket screw and detach bracket from steering column tube (3514).

tomsn048@gmail.com



6. Remove four screws attaching the instrument cluster to the instrument panel (04320). Pull cluster out of instrument panel, bottom first, to rest on the steering column tube.

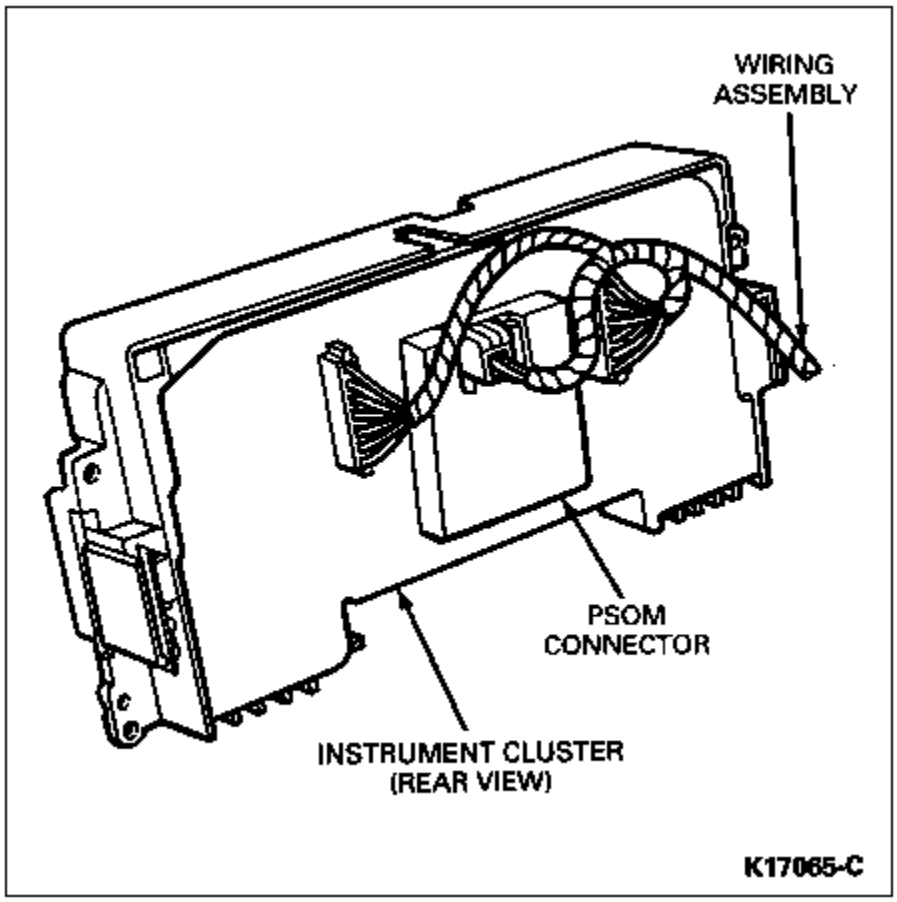
Instrument Panel and Cluster Assembly, Aerostar



tomsn048@gmail.com

Item	Part Number	Description
1	—	Nuts
2	—	Locating Pin
3	10849	Instrument Cluster
4	—	Screws
5	04320	Instrument Panel

7. Disconnect the three electrical connectors and remove the instrument cluster from the instrument panel.

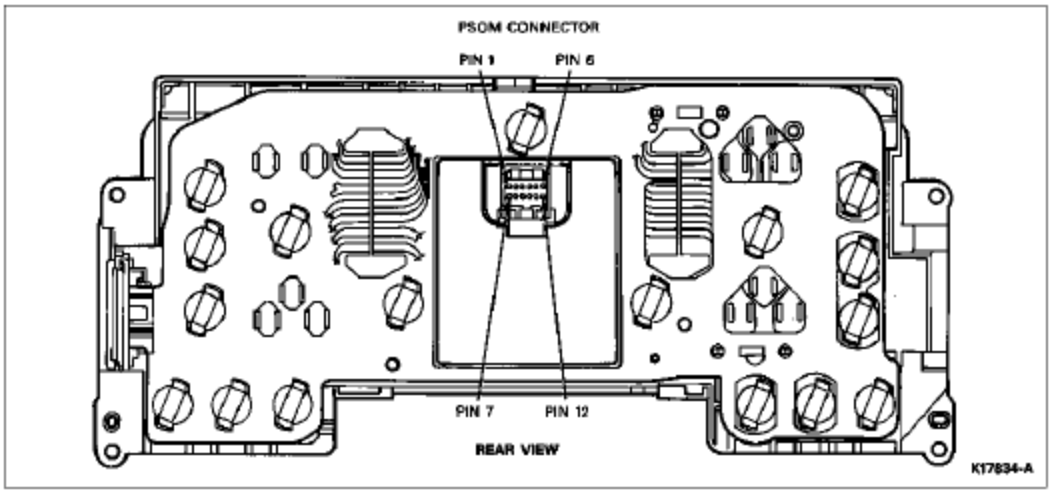


8. For installation, follow removal procedures in reverse order.

- If transmission range indicator (7A110) needs adjustment before installation of instrument panel finish panel, refer to Section 11-04B .
- When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn the strategy.

Rear View of Instrument Cluster, Aerostar

tomsn048@gmail.com



tomsn048@gmail.com

Instrument Cluster — Ranger

Removal

1. **CAUTION: If gauges are being removed from the cluster assembly, do not remove the gauge pointer. Magnetic gauges cannot be recalibrated.**

   Disconnect the battery ground cable (14301).

2. Remove radio. Refer to Section 15-01 .

3. Remove two center instrument panel finish panel screws. Disconnect electrical connectors and remove panel.

4. Remove two hood latch control handle and cable screws from lower steering column cover.

5. Remove two lower steering column cover screws and remove cover.

6. Remove six instrument panel steering column opening cover reinforcement screws and cover reinforcement.

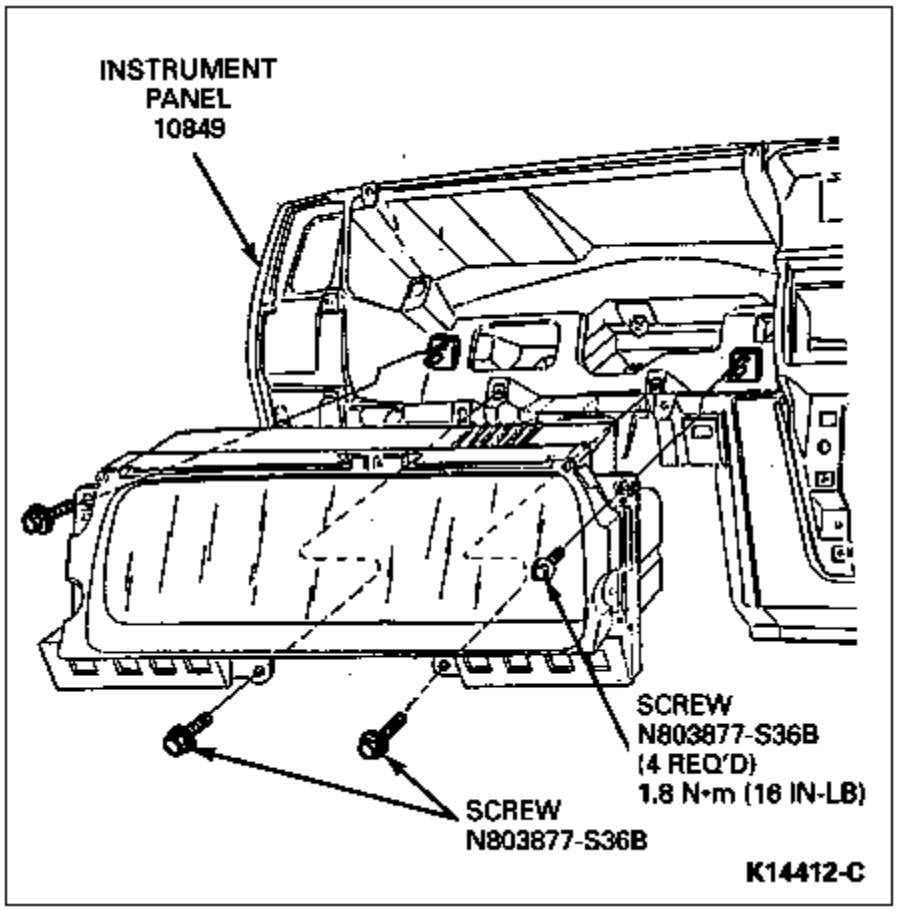
7. Remove three steering column shroud screws and separate upper/lower shroud from steering column tube (3514)

8. Remove five cluster instrument panel finish panel screws. Disconnect electrical connectors and remove panel.

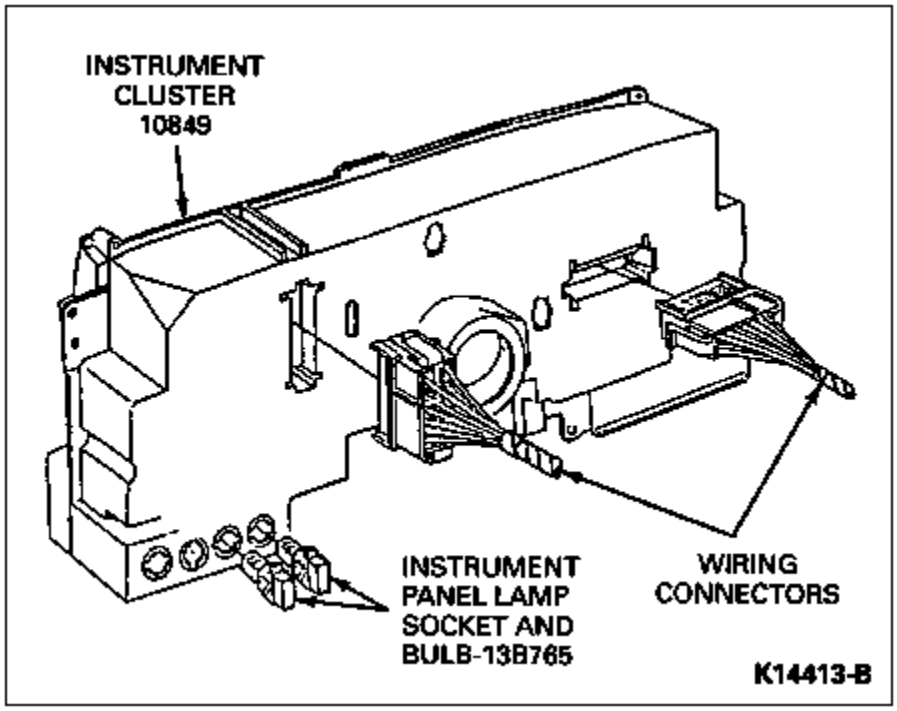
9. Disconnect transmission range (TR) indicator thumbwheel.

10. Remove four instrument cluster screws.

tomsn048@gmail.com



11. Disconnect the three instrument cluster electrical connectors and remove the instrument cluster.



tomsn048@gmail.com

Installation

To install, reverse the removal procedure.

Refer to Torque Specifications.

tomsn048@gmail.com

Bulbs, Illumination and/or Indicator

Removal and Installation

WARNING: ILLUMINATION BULBS ARE PRESSURIZED AND MAY SHATTER IF IMPROPERLY HANDLED. WEAR EYE PROTECTION WHEN SERVICING ILLUMINATION BULBS.

1. Remove instrument cluster (10849) as outlined in Removal and Installation, Instrument Cluster.
2. Remove instrument panel lamp socket and bulb (13B765) and remove bulb.
3. To install, reverse removal procedure.

tomsn048@gmail.com

Instrument Cluster Printed Circuit, Ranger

Removal

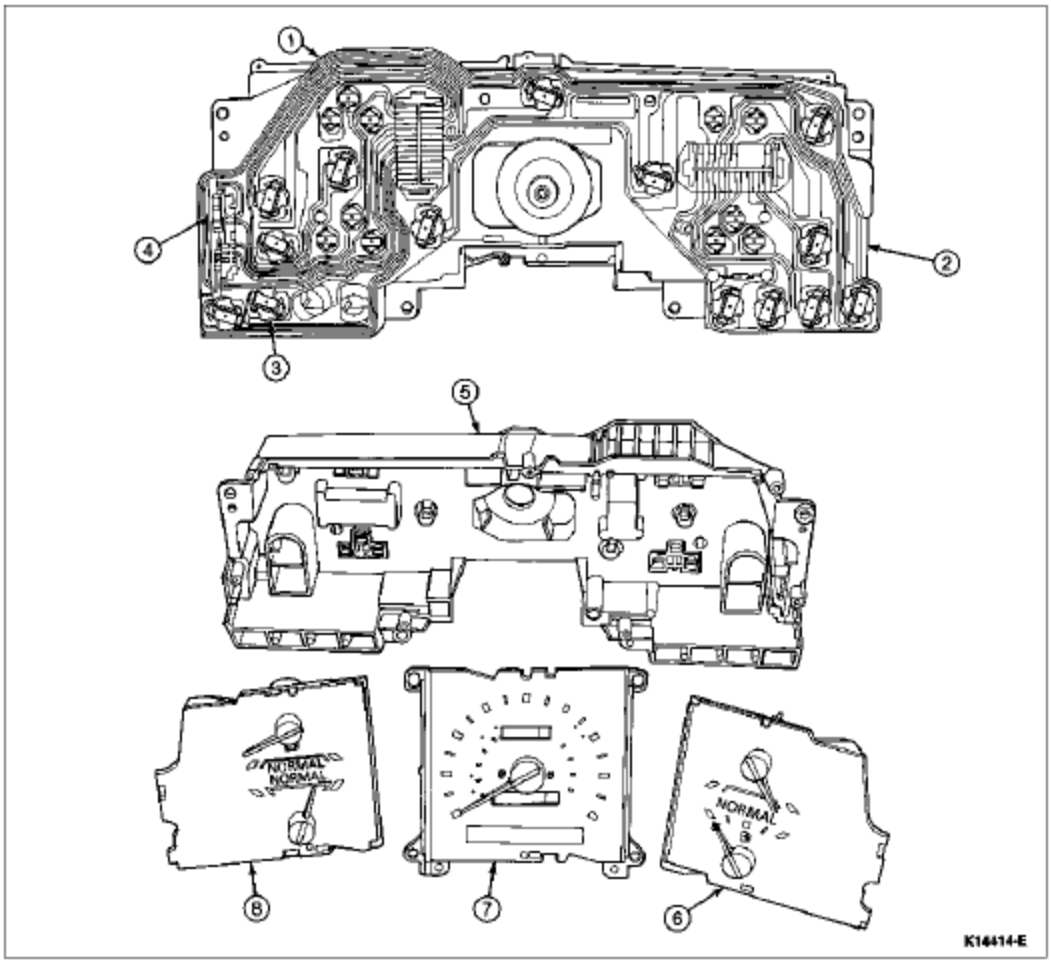
1. Remove instrument cluster (10849) as described in Removal and Installation, Instrument Cluster in this section.
2. Remove the instrument cluster gauge amplifier (10E849) as described in Removal and Installation, Instrument Cluster Gauge Amplifier in this section.
3. Remove all instrument panel lamp socket and bulbs (13B765) by twisting counterclockwise.
4. Remove instrument cluster main lens (10887) and instrument cluster mask (10890).
5. Remove individual dial assemblies by gently prying rearward. Speedometer (17255) must be the last gauge removed.
6. Remove gauge connector clips using long nose pliers. Squeeze both sides of clip equally so that locking ears pass through opening in instrument cluster back plate (10848). Push clips through opening. Do not overbend or distort clips. Do not reuse clips.
7. Ease the instrument cluster printed circuit (10K843) up off the locating pins and remove.

Installation

1. Position instrument cluster printed circuit on instrument cluster back plate and press onto locating pins.
2. Install new gauge connector clips by pressing into opening with thumb and fingers. An audible click will be heard when clips are locked in position.
3. Install all instrument panel lamp socket and bulbs, rotate clockwise to lock bulbs in place.
4. Install instrument cluster gauge amplifier as described in Removal and Installation, Instrument Cluster Gauge Amplifier in this section.
5. Install speedometer assembly first then other dial assemblies.
6. Place instrument cluster mask and instrument cluster main lens over locating pins on back plate. Make sure that gauge pointers are not trapped under instrument cluster mask.
7. Install screws attaching instrument cluster mask and instrument cluster main lens to back plate.
8. Install instrument cluster as described in Removal and Installation, Instrument Cluster in this section.

Instrument Cluster, Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	10K843	Instrument Cluster Printed Circuit
2	10E849	Instrument Cluster Gauge Amplifier with Tachometer
3	138765	Instrument Panel Lamp Sockets and Bulbs (16 Maximum)
4	10E849	Instrument Cluster Gauge Amplifier Without Tachometer
5	10848	Instrument Cluster Back Plate
6	9280	Fuel and Oil Pressure Gauge

tomsn048@gmail.com

tomsn048@gmail.com

Instrument Cluster Gauge Amplifier

Removal and Installation

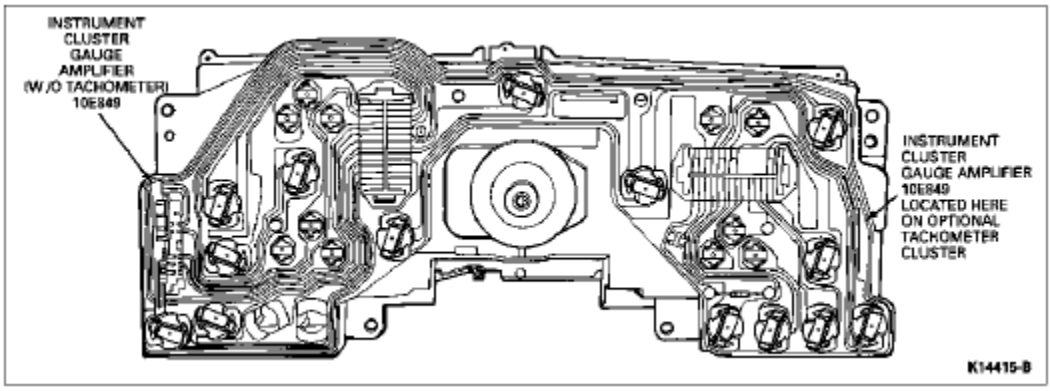
1. Remove instrument cluster (10849) as described in Removal and Installation, Instrument Cluster in this section.

2. The instrument cluster gauge amplifier (10E849) is a printed circuit board assembly located at the end on the rear of the instrument cluster. Carefully depress the retaining clip with thumb on the component side of the board, and pull the board assembly out of the instrument cluster back plate (10848).

3. To install instrument cluster gauge amplifier, insert into slots in the instrument cluster back plate and press home firmly with thumb on edge of the board. An audible click will be heard as the retaining clip engages.

4. Install instrument cluster as described in Removal and Installation, Instrument Cluster in this section and check operation.

Instrument Cluster, Aerostar Shown, Ranger Similar



tomsn048@gmail.com

tomsn048@gmail.com

Fuel and Battery Voltage Gauge, Aerostar

Removal and Installation

1. Remove instrument cluster (10849) as described in Removal and Installation, Instrument Cluster in this section.

2. Remove screws attaching the instrument cluster main lens (10887) and instrument cluster mask (10890) to the backplate.

3. Remove the instrument cluster main lens and instrument cluster mask.

4. **NOTE: The fuel gauge (9280) and battery voltage indicator gauge (10A835) is retained to the instrument cluster back plate (10848) by retaining clips.**

   Remove the fuel and battery voltage gauge from the instrument cluster back plate by grasping the outside edges of the gauge and lifting.

NOTE: When installing the fuel gaugeand battery voltage indicator gauge, make sure the gauge pins are correctly seated into the backplate retaining clips.

For installation, follow the removal procedures in reverse order and check operation.

tomsn048@gmail.com

Oil Pressure and Coolant Temperature Gauge, Aerostar

Removal and Installation

1. Remove instrument cluster (10849) as described in Removal and Installation, Instrument Cluster in this section.

2. Remove screws attaching the instrument cluster main lens (10887) and instrument cluster mask (10890) to the instrument cluster back plate (10848).

3. Remove the lens and mask.

4. **NOTE: The oil pressure gauge (9273) and engine coolant temperature gauge (10883) is retained to the instrument cluster back plate by retaining clips.**

   Remove the oil pressure gauge and engine coolant temperature gauge from the instrument cluster back plate by grasping the outside edges of the gauge and lifting.

NOTE: When installing the oil pressure gauge and engine coolant temperature gauge, make sure the gauge pins are correctly seated into the backplate retaining clips.

For installation, follow the removal procedures in reverse order and check operation.

tomsn048@gmail.com

Battery Voltage and Oil Pressure Gauge, Ranger

Removal and Installation

1. Remove the instrument cluster (10849) as described in this section.
2. Remove the instrument cluster main lens (10887) and instrument cluster mask (10890) from the instrument cluster.
3. Pull gauge terminals from backplate clips and remove the gauge.

NOTE: When installing the battery voltage indicator gauge (10A835) and oil pressure gauge (9273), make sure the gauge pins are correctly seated into the backplate retaining clips.

For installation, follow the removal procedures in reverse order.

tomsn048@gmail.com

Coolant Temperature and Fuel Gauge, Ranger

Removal and Installation

1. Remove the instrument cluster (10849) as described in Removal and Installation, Instrument Cluster in this section.

2. Remove the instrument cluster main lens (10887) and instrument cluster mask (10890) from the instrument cluster.

3. Pull the gauge terminals from backplate clips and remove the gauge.

NOTE: When installing the engine coolant temperature gauge (10883) and fuel gauge (9280), make sure the gauge pins are correctly seated into the backplate retaining clips.

For installation, follow the removal procedures in reverse order.

tomsn048@gmail.com

Speedometer/Odometer, Ranger

Removal

1. Remove the instrument cluster (10849) as described in this section.

2. Remove the instrument cluster main lens (10887) and instrument cluster mask (10890) from the instrument cluster. Remove the speedometer (17255).

Installation

Position the speedometer to the instrument cluster back plate (10848). Install the instrument cluster mask and instrument cluster main lens, then the instrument cluster. Install the instrument cluster as described in Removal and Installation, Instrument Cluster in this section.

tomsn048@gmail.com

Vehicle Speed Sensor, Ranger

Removal

1. Raise the vehicle on a hoist.
2. Separate the electrical connector to vehicle speed sensor (VSS) (9E731) on the transmission or transfer case.
3. Remove screw and washer.
4. Remove vehicle speed sensor.
5. Remove speedometer gear retainer.
6. Remove speedometer driven gear.
7. Remove O-ring from vehicle speed sensor and discard.

Installation

1. Install new O-ring to vehicle speed sensor.
2. Install speedometer driven gear on vehicle speed sensor and apply high temperature, waterproof grease.
3. **NOTE: Install retainer to driven gear with tabs on back side of clip toward teeth on speedometer driven gear.**

   Secure speedometer driven gear with speedometer driven gear retainer (17292).
4. Install vehicle speed sensor in transmission or transfer case.
5. Install and tighten retaining bolt to 2.5 Nm (22 lb-in).
6. **NOTE: Electrical connection should be near top.**

   Connect electrical connector to vehicle speed sensor on the transmission or transfer case.
7. Lower the vehicle.

tomsn048@gmail.com

tomsn048@gmail.com

Tachometer, Ranger

CAUTION: Tachometer is calibrated at factory. Excessive rough handling could disturb calibration.

Removal

1. Disconnect battery ground cable (14301).
2. Remove instrument cluster (10849) as described in Removal and Installation, Instrument Cluster in this section.
3. Remove screws attaching instrument cluster mask (10890) and instrument cluster main lens (10887) to instrument cluster back plate (10848) and remove instrument cluster mask and instrument cluster main lens.
4. **NOTE: Tachometer (17360) is retained to instrument cluster back plate by retaining clips.**

   Remove tachometer by carefully prying tachometer dial away from instrument cluster back plate.

Installation

1. **NOTE: When installing tachometer, make sure the four tachometer pins correctly seat in the cluster back plate clips.**

   Position tachometer into instrument cluster back plate and push tachometer into position.
2. Position instrument cluster main lens and instrument cluster mask to the instrument cluster back plate.
3. Install the attaching screws and tighten to 0.8-1.4 Nm (7-9 lb-in).
4. Install instrument cluster as described in Removal and Installation, Instrument Cluster in this section.
5. Connect battery ground cable.
6. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn the strategy.**

   Check operation of the tachometer.

tomsn048@gmail.com

tomsn048@gmail.com

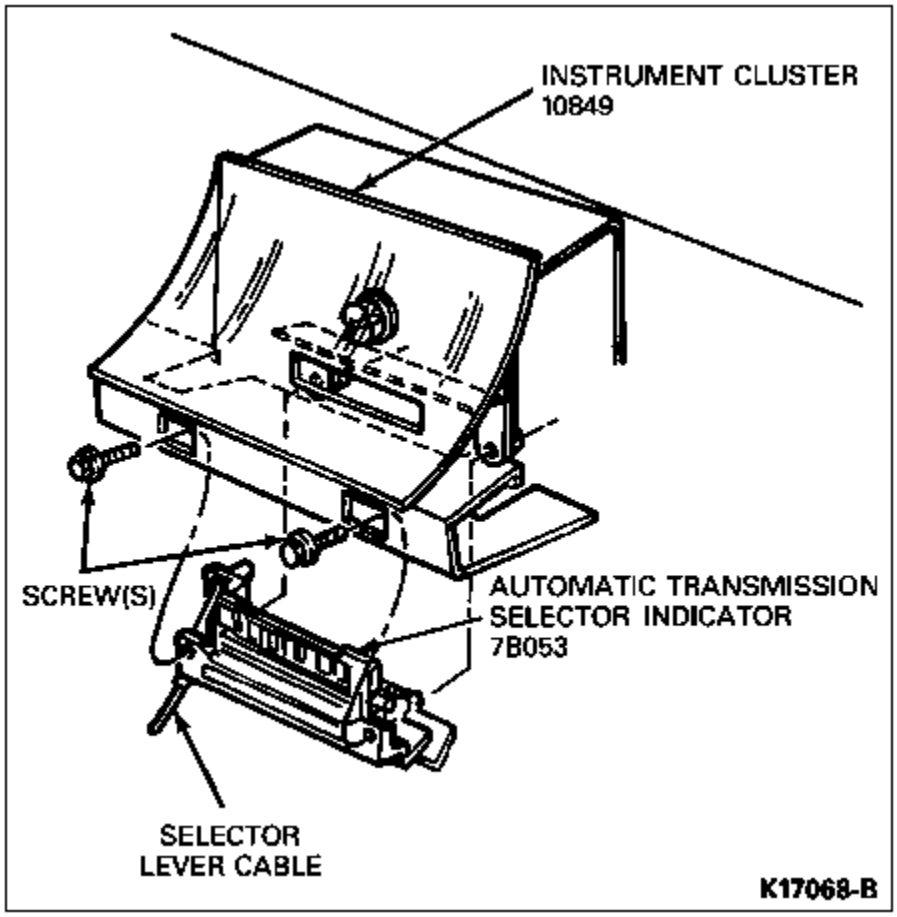
Transmission Control Selector Indicator

Removal and Installation

1. Remove instrument cluster (10849) from instrument panel (04320) as described in Removal and Installation, Instrument cluster section.

2. Remove the two screws attaching the transmission range indicator (7A110) to the cluster. Remove the transmission range indicator by sliding it out downwards from the bottom of the cluster.

For installation, follow removal procedures in reverse order.



tomsn048@gmail.com

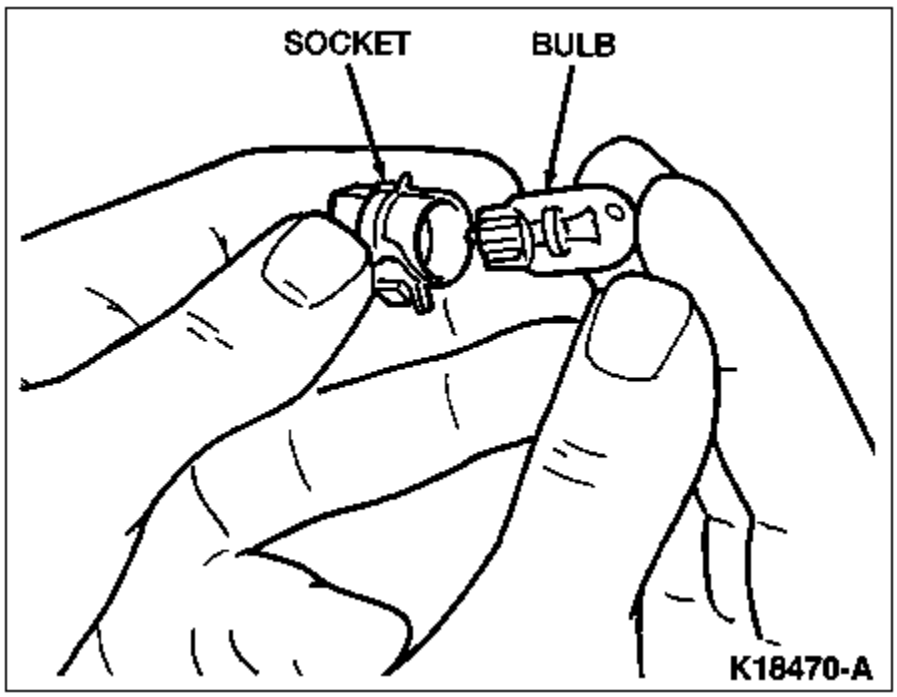
tomsn048@gmail.com

Indicators/Warning Bulbs

Removal and Installation

The removal and installation procedures are identical for all indicators/warning lamps.

1. Disconnect the battery ground cable (14301).
2. Remove instrument panel finish panel (044D70) as described in Section 01-12 .
3. Remove screws retaining instrument cluster (10849) to instrument panel (04320).
4. Pull instrument cluster rearward to provide access to back of instrument cluster.
5. Turn the desired indicator/warning lamp counterclockwise and remove it from the instrument cluster.
6. Remove the bulb from its socket.



NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn the strategy.

For installation, follow the removal procedures in reverse order.

Instrument Cluster, Aerostar

CAUTION: The instrument cluster (10849) requires special handling to avoid damaging internal components. The instrument cluster MUST be kept FACE UP or in in-vehicle position. Leaving the instrument cluster face down may result in a loss of fluid used in gauges. The lost fluid could stain the cluster face or result in excessive pointer waiver.

Aerostar instrument cluster components that are serviceable at the dealership are:

- instrument panel lamp socket and bulb (13B765)
- engine coolant temperature gauge (10883) and oil pressure gauge (9273)
- fuel gauge (9280) and voltage indicator gauge (10A835)
- instrument cluster gauge amplifier (10E849)
- instrument cluster main lens (10887)
- instrument cluster mask (10890)
- lens attaching screws

NOTE: The Aerostar instrument cluster must be serviced as a complete assembly if it is determined that any of the following components are malfunctioning:

- speedometer (17255)
- instrument cluster printed circuit (10K843)
- instrument cluster back plate (10848)

tomsn048@gmail.com

Speedometer Calibration, Ranger

Speedometer (17255) accuracy can be checked by timing the vehicle on a measured mile and performing the following speedometer calibration test. The Ford Speedo Gear Supplement Charts show the proper speedometer gears to use for various rear axle and tire size OEM combinations.

Speedometer Calibration Test

1. Time the number of seconds it takes to travel one measured mile at an indicated 30 and 60 mph.
2. Calculate the vehicle speed using the following formula:

   mph = 3600 divided by seconds
3. Acceptable ranges are the following:

kmh (mph) Indicated Test Speed	Seconds
16.1 (10)	345-275
48.3 (30)	115-125
96.5 (60)	57-62

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the horn system to duplicate the vehicle owner's concern.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Verify that horn retaining screw is tight	• Verify that the ground of the horn is good by inspecting connection for corrosion
• Verify that horns are not touching surrounding sheet metal or other components	• Check system fuse • Check wiring for obvious short or opens • Check connectors for obvious damage

Symptom Chart — Horns

HORNS

Condition	Possible Source	Action
• Horn Does Not Operate	• Relay. • Wiring. • Horn(s). • Horn switches. • Air bag module. • Sliding connector.	• GO to Pinpoint Test A.
• Horn Sounds Continuously	• Relay. • Wiring. • Horn switches. • Remote control and lock system module. • Speed control switches.	• GO to Pinpoint Test B.

Pinpoint Tests

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

PINPOINT TEST A: HORN DOES NOT OPERATE

A1 RELAY CHECK

- Place finger on horn relay while helper presses horn button.

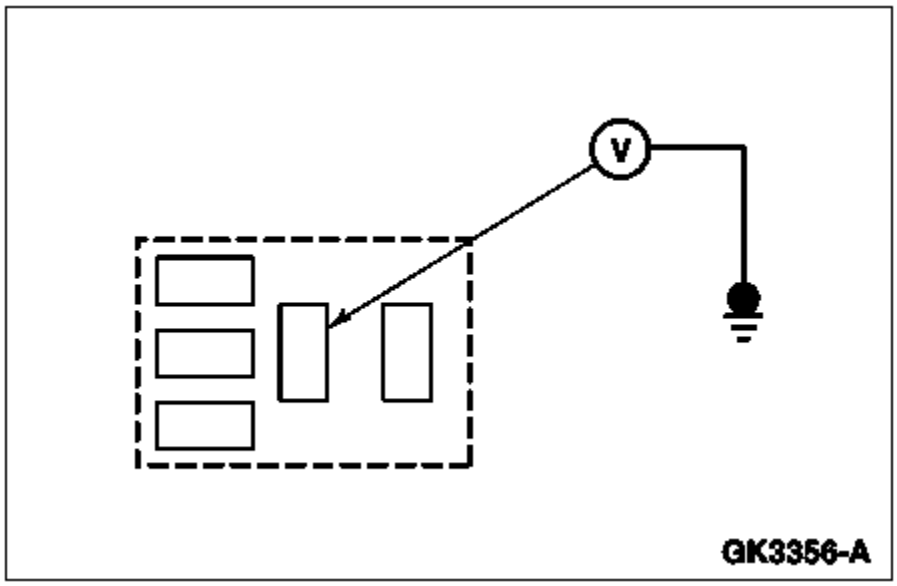
Does relay "click"?

Yes	No
GO to **A2** .	GO to **A6** .

A2 BATTERY FEED TO RELAY CONTACT SET

- Remove relay.
- Check for voltage at relay contact set feed terminal (Y/LB). Voltage reading should equal battery voltage. (Ranger shown.)

Is voltage available?

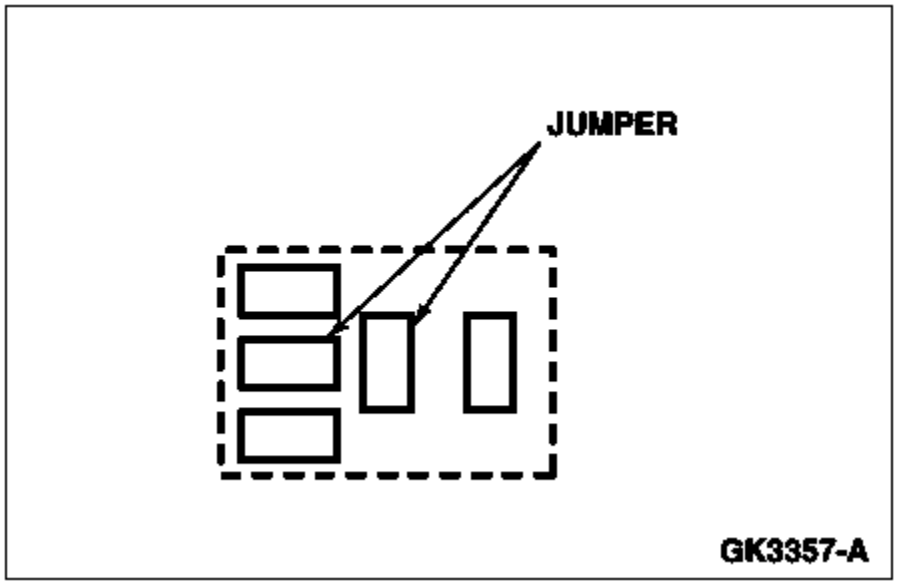


Yes	No
GO to **A3** .	REPAIR open in feed wire.

A3 ISOLATE RELAY

- Connect jumper from relay battery feed terminal (Y/LB) to horn feed terminal (DB). (Ranger shown.)

Does horn operate?



Yes	No
REPLACE relay.	GO to **A4** .

A4 RELAY-TO-HORN CIRCUIT CONTINUITY CHECK

- Install relay.
- Disconnect feed wire at horn.
- Check for voltage at horn feed wire while helper presses horn switch.

Is battery voltage available?

Yes	No
GO to **A5** .	REPAIR open in feed wire.

A5 HORN GROUND CIRCUIT CHECK

- Check for continuity between horn mounting bolt and clean chassis ground.

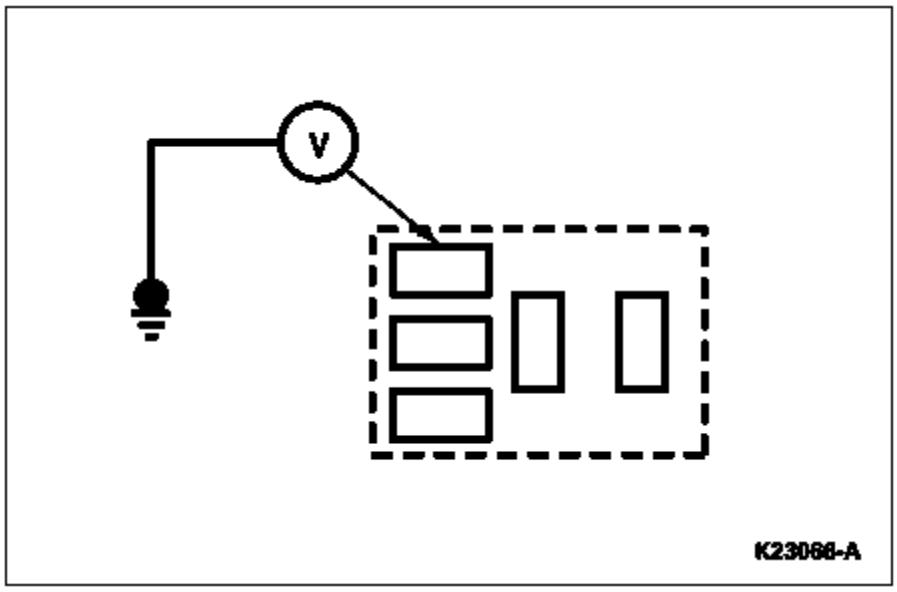
Is there continuity?

Yes	No
REPLACE horn.	CLEAN ground connection.

A6 BATTERY FEED-TO-RELAY COIL

- Remove relay.
- Check for voltage at relay coil feed terminal (Y/B). Voltage reading should equal battery voltage. (Ranger shown.)

Is voltage available?



Yes	No
GO to **A7** .	REPAIR open in coil feed wire.

A7 RELAY COIL CONTINUITY CHECK

- Check for continuity across relay coil terminals.

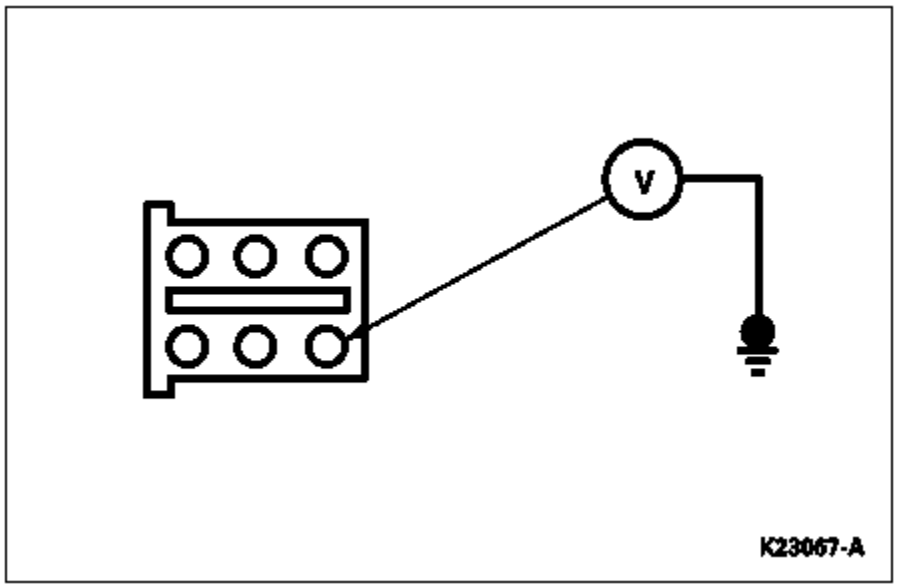
Is there continuity?

Yes	No
GO to **A8** .	REPLACE relay.

A8 RELAY TO STEERING COLUMN CIRCUIT CHECK

- Install relay.
- Disconnect 6-pin connector at base of steering column.
- Check for battery voltage at connector Pin 2 (Y/LG). (Ranger shown.)

Is voltage available?



Yes	No
GO to **A9** .	REPAIR open in wire between connector and relay.

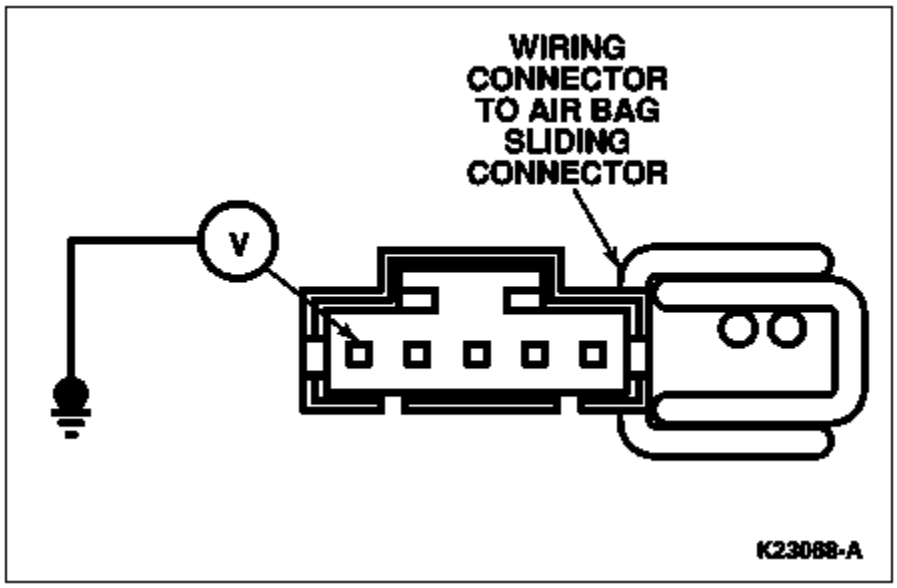
A9 STEERING COLUMN HARNESS/AIR BAG SLIDING CONTACT CHECK

- Connect 6-pin wiring connector at base of steering column.
- Remove air bag module.

CAUTION: Be sure to follow air bag removal safety precautions. Refer to Section 01-20B or Section 01-20C .

- Disconnect 5-pin connector from air bag module sliding contact.
- Check for voltage at sliding contact terminal 1. (Ranger shown.)

Is battery voltage available?



Yes	No
GO to **A10** .	REPLACE sliding contact. REFER to Section 11-04A or Section 11-04B .

A10 SLIDING CONTACT TO HORN SWITCH CHECK

- Connect 5-pin connector at sliding contact.
- Check for voltage at each horn switch upper terminal.

Is battery voltage available?

Yes	No
GO to **A11** .	If vehicle is not equipped with speed control, REPLACE steering wheel harness. If vehicle is equipped with speed control, GO to **A12** .

A11 HORN SWITCH GROUND CIRCUIT CHECK

- Check for continuity between horn switch lower contact plate and steering wheel armature.

Is there continuity?

Yes	No
GO to **A12** .	REPLACE horn switch.

A12 HORN SWITCH CONTINUITY

- Press horn switch at each of the four corners, one at a time. Check for continuity between upper and lower horn switch plate with switch pressed.

Is there continuity?

Yes	No
GO to **A13** .	REPLACE horn switch(es).

A13 SPEED CONTROL WIRE HARNESS CONTINUITY

- Remove terminals at each upper horn switch.
- Check for voltage at each terminal.

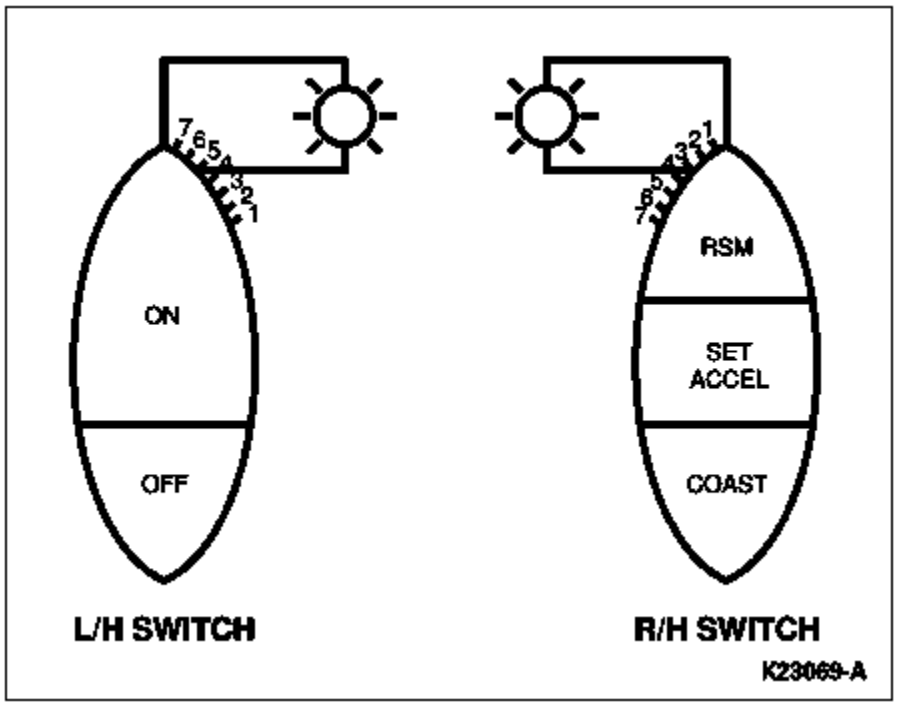
Is there battery voltage?

Yes	No
If vehicle is equipped with speed control, GO to **A14** . If vehicle is not equipped with speed control, REPAIR open in ground circuit between steering wheel and chassis ground.	REPLACE steering wheel wire harness.

A14 ISOLATE SPEED CONTROL SWITCHES

- Disconnect wiring at speed control switches.
- Using a self-powered test light, check for continuity across speed control switch terminals; 1 to 3 (RH) and 5 to 7 (LH). (Ranger shown.)

Is there continuity?



Yes	No
CHECK horn switch ground. REFER to Pinpoint Test Step **A11** .	REPLACE switch that does not show continuity.

PINPOINT TEST B: HORN SOUNDS CONTINUOUSLY

B1 SHORT TO BATTERY FEED IN HORN FEED CIRCUIT

- Remove horn relay.

Do horns stop?

Yes	No
GO to **B2** .	REPAIR short to battery feed in wire (DB) between relay and horn.

B2 STUCK RELAY CONTACTS CHECK

- Check for continuity across relay contact terminals (Y/B to DB).

Is there continuity?

Yes	No

REPLACE relay.	GO to **B3** .

B3 SHORT TO GROUND IN FEED CIRCUIT TO STEERING COLUMN CONNECTOR

- Install horn relay.
- Disconnect 6-pin connector located at base of steering column.

Do horns stop?

Yes	No
GO to **B4** .	REPAIR short to ground in wire (Y/LG) between horn relay and steering column connector. If a Ranger equipped with remote anti-theft personality (R.A.P.) module, GO to **B5** .

B4 ISOLATE HORN SWITCH

- Remove air bag module.

CAUTION: Be sure to follow air bag removal safety precautions. Refer to Section 01-20B .

- Connect 6-pin connector.
- Disconnect 5-pin connector at air bag sliding contact.

Do horns stop?

Yes	No
GO to **B5** if vehicle has speed control, otherwise, GO to **B6** .	REPLACE air bag sliding contact assembly.

B5 ISOLATE SPEED CONTROL SWITCHES

- Reconnect 5-pin connector at air bag sliding contact.
- Disconnect wiring at speed control switches.
- Using a self-powered test light, check for continuity across speed control switch terminals: 1 to 7, and 3 to 7 (RH); and 1 to 7, and 1 to 5 (LH).

Is there continuity?

Yes	No
REPLACE switch that shows continuity.	GO to **B6** .

B6 ISOLATE STEERING WHEEL WIRING

- Reconnect wiring at speed control switches.
- Disconnect connectors at each horn switch terminal.

Do horns stop?

Yes	No
REPLACE steering wheel wire harness.	CHECK for shorted horn switch and REPLACE, if necessary. If vehicle is equipped with anti-theft system, GO to **B7** .

B7 ISOLATE REMOTE CONTROL ALARM AND LOCK MODULE

- Disconnect wiring connector from R.A.P. module.

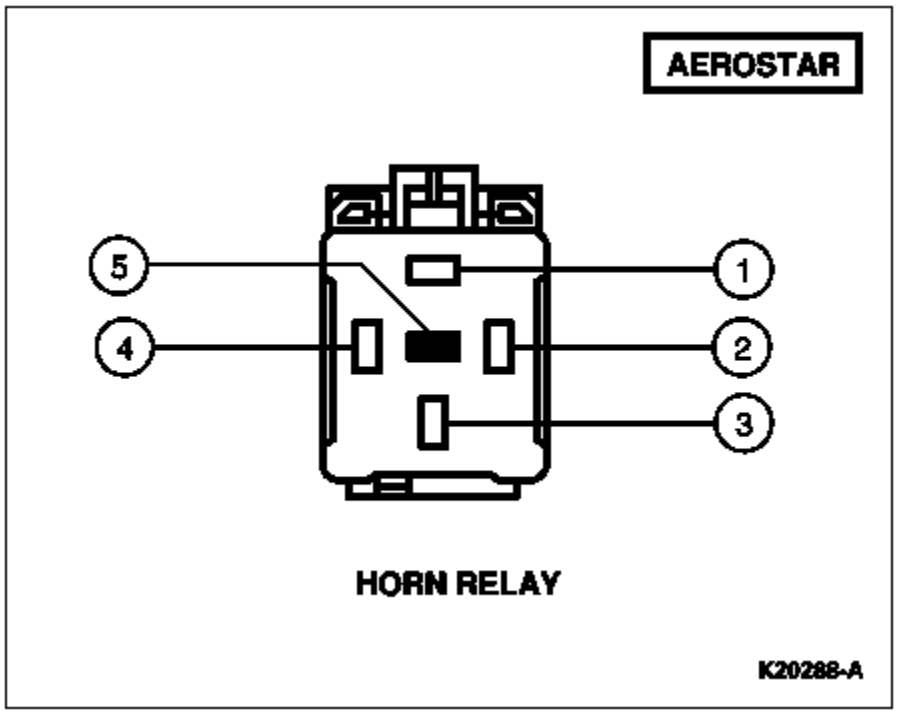
Do horns stop?

Yes	No
REPLACE R.A.P. module.	REPAIR short to ground in wire between horn relay and steering column connector or between horn relay and R.A.P. connector.

Component Tests

Horn Relay — Aerostar

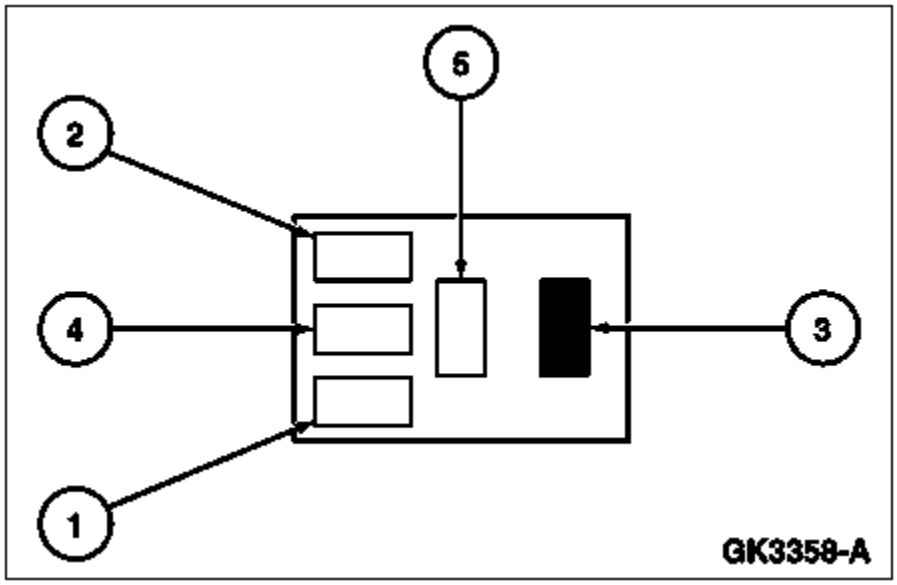
1. Connect terminal 2 to 12-volt battery source.
2. Connect terminal 4 to battery ground.
3. Check for continuity across relay terminals 1 and 3. If there is continuity, relay is serviceable. If there is no continuity, replace relay.



Pin Number	Circuit	Circuit Function
1	1 (DB)	Horn Relay to Horn
2	460 (Y/LB)	Battery Feed to Relay Coil
3	—	Not Used
4	6 (Y/LG)	Horn Relay to Switch
5	460 (Y/LB)	Battery Feed to Relay Contact Set

Horn Relay — Ranger

1. Connect terminal 4 to 12-volt battery source.
2. Connect terminal 1 to battery ground.
3. Check for continuity across relay terminals 1 and 2. If there is continuity, relay is serviceable. If there is no continuity, replace relay.

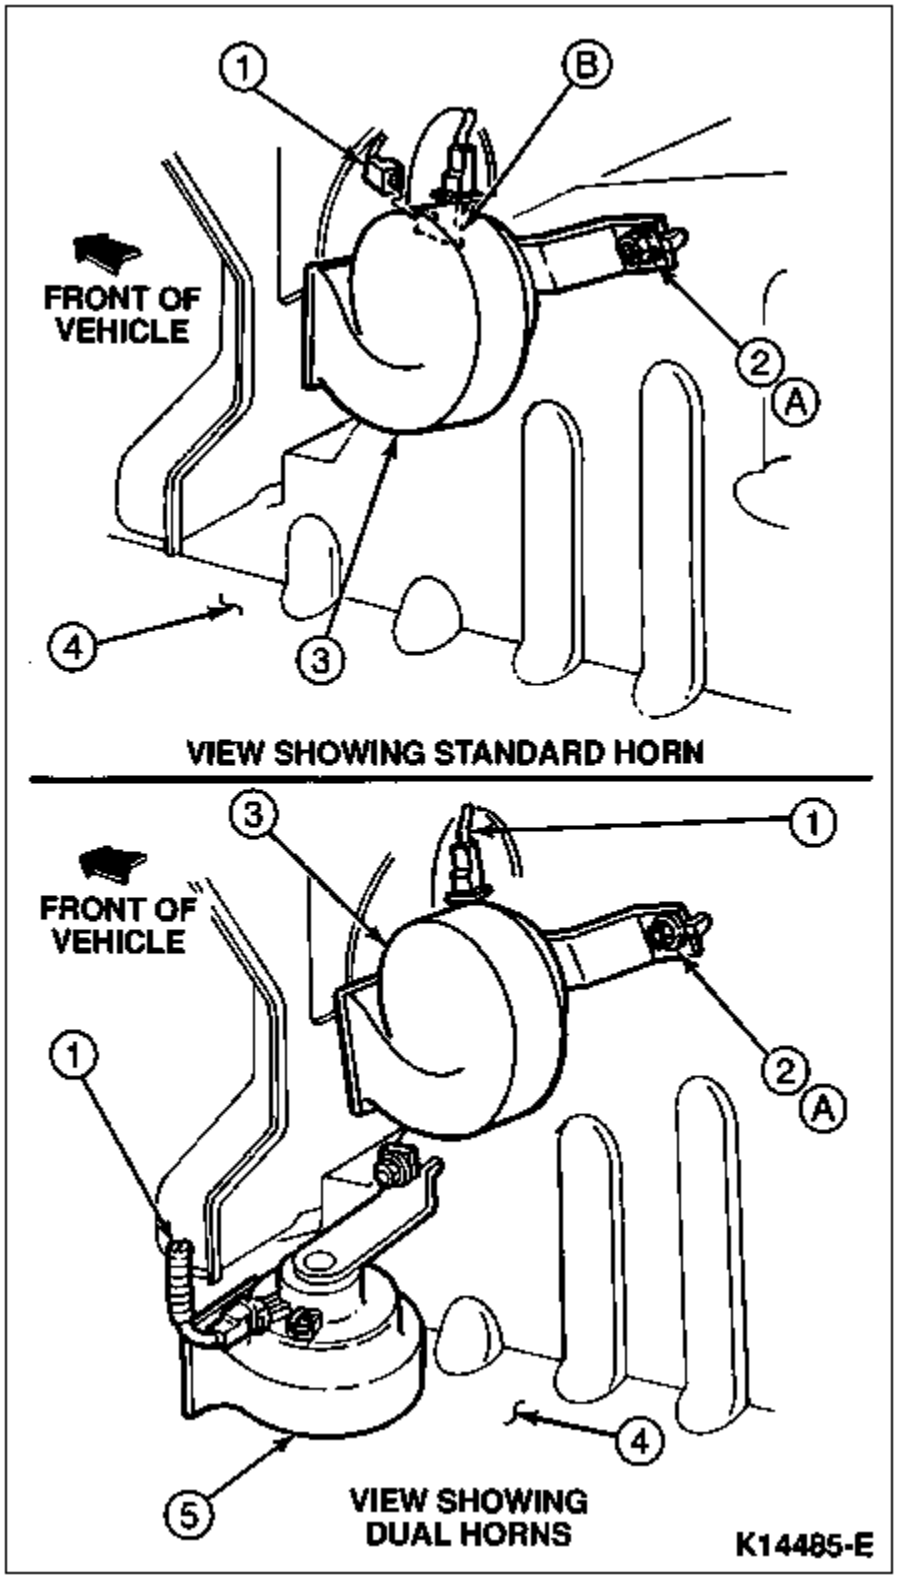


Pin Number	Circuit	Circuit Function
1	460 (Y/B)	Battery Feed to Relay Coil
2	6 (Y/LG)	Horn Relay to Horn Switch
3	—	Not Used
4	460 (Y/B)	Battery Feed to Relay Contact Set
5	1 (DB)	Horn Relay to Horn

Horn Assembly, Aerostar

Disconnect the horn wire from the terminal and remove the mounting screw. Repeat for second horn (13832), if equipped. When installing a horn mounting bracket (13830), clean the mounting surface to make sure there is a good ground connection. Tighten the mounting screw 8-12 Nm (71-106 lb-in).

Horn Assembly, Aerostar



Item	Part Number	Description
1	14290	Engine Control Sensor Wiring

2	N801939	Attaching Screw
3	13802	Horn (Low-Pitch)
4	—	Fender Apron (RH)
5	13801	Horn (High-Pitch)
A	—	Tighten to 8-12 Nm (71-106 Lb-In)
B	—	Dummy Tab to Be Used When Hi-Pitch Power Lead Is Not Used

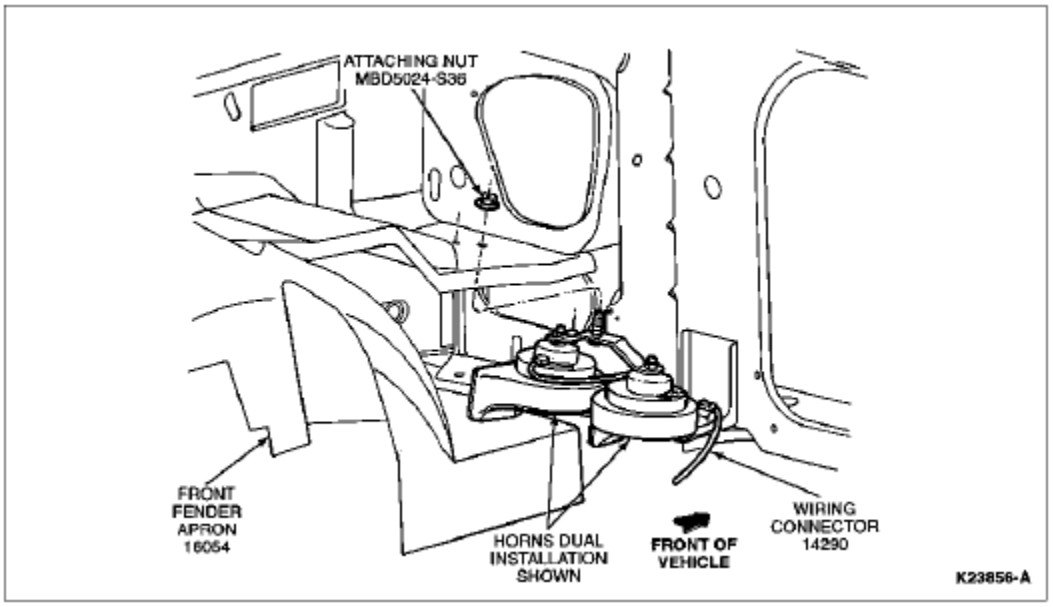
Horn Assembly, Ranger

NOTE: The horn(s) is mounted behind the radiator support on the left side of the vehicle.

1. Remove battery (10655). If necessary, refer to Section 14-01 for removal procedure.
2. Remove left fender apron (splash shield). If necessary, refer to Section 01-02 for removal procedure.
3. Disconnect wire(s) at horn(s).
4. In the engine compartment, remove horn bracket attaching nut. Nut is located at left front corner of battery tray.

To install horn(s), reverse removal procedure.

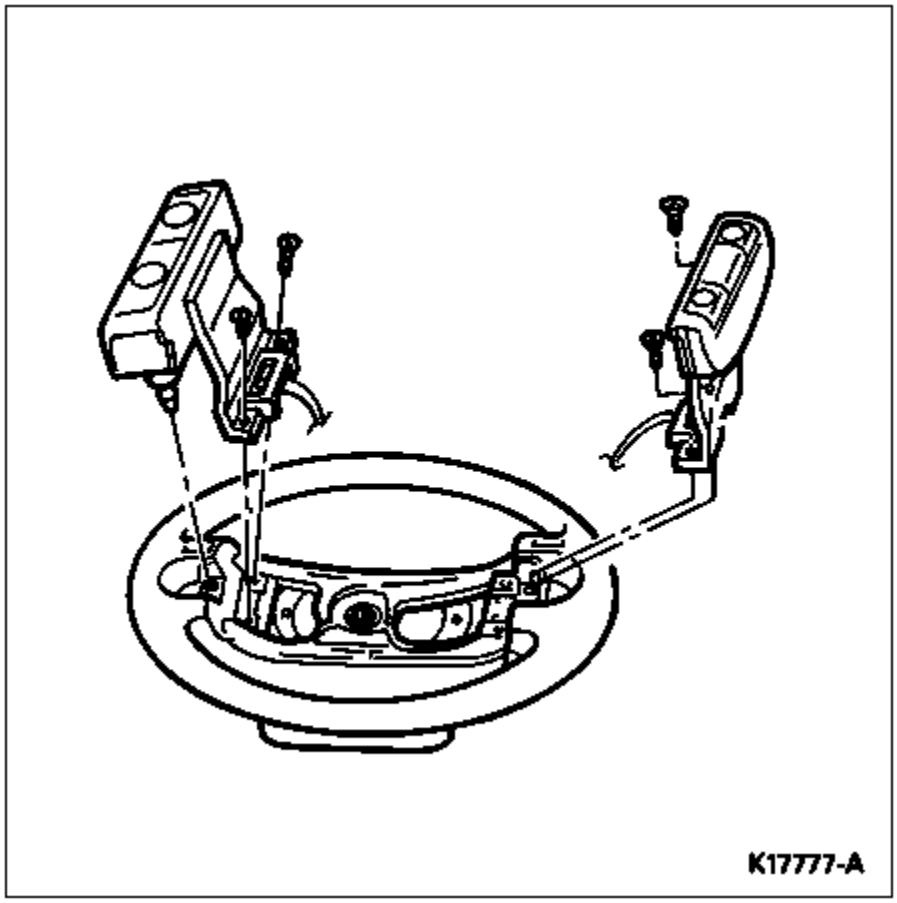
Horn Assembly, Ranger



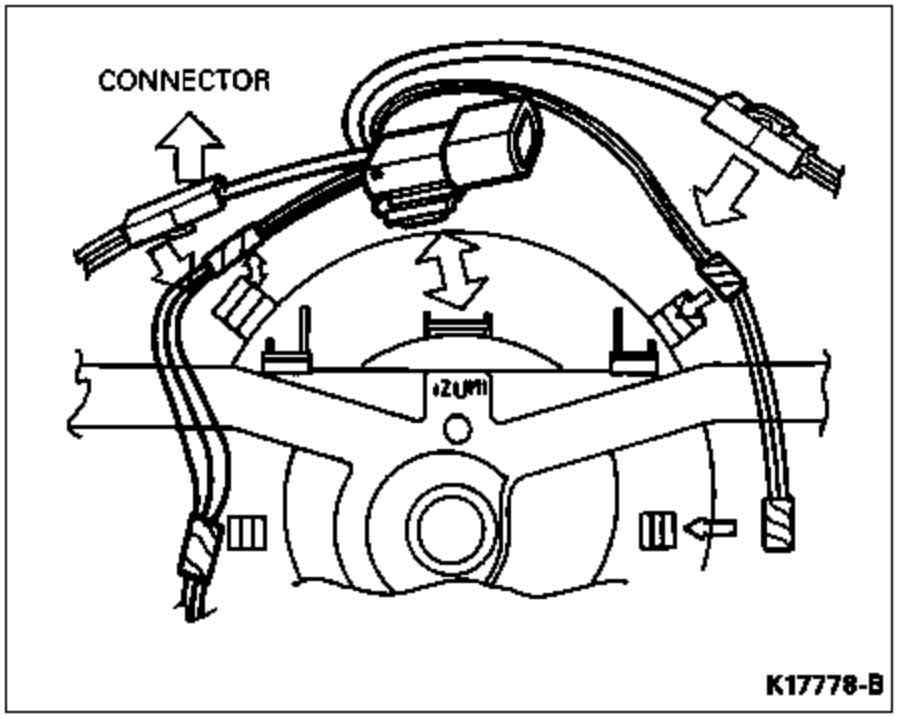
Horn Switch, Aerostar

Removal and Installation

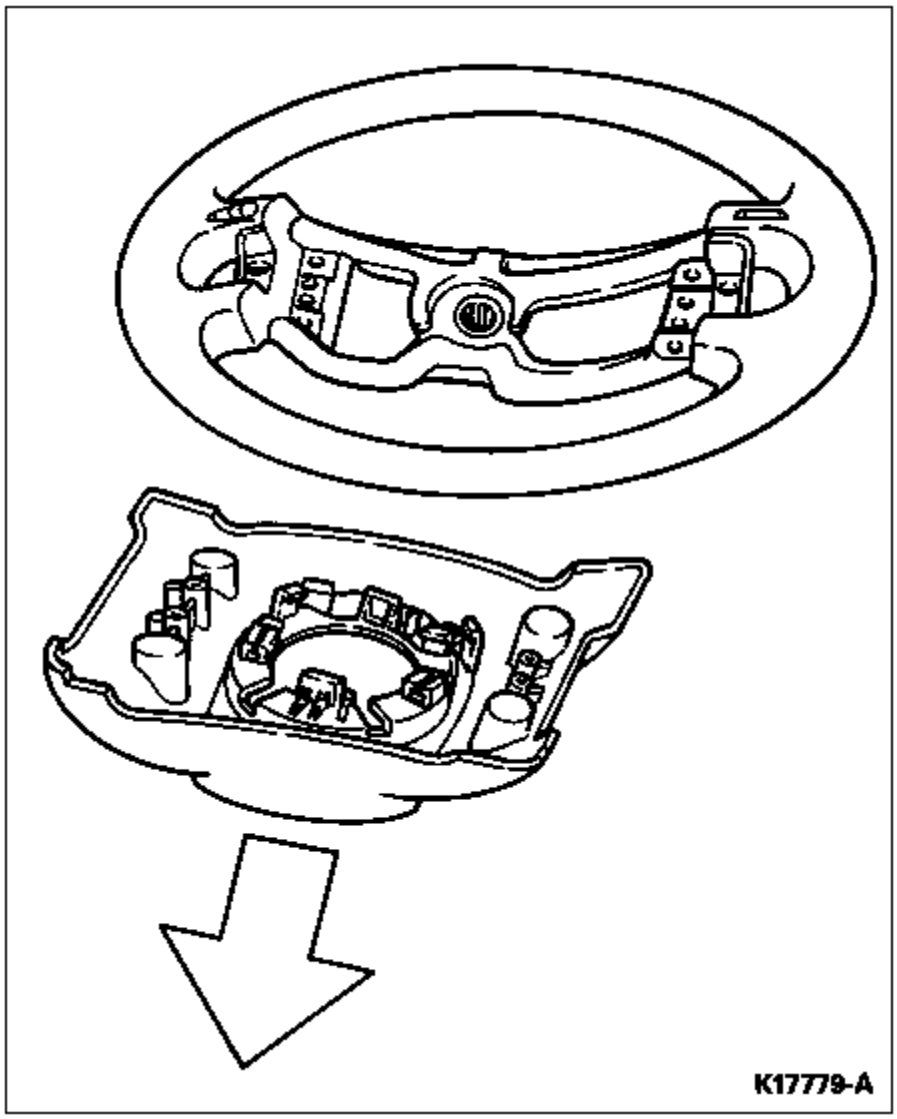
1. Follow procedure in Section 11-04B for removal of steering wheel (3600).
2. Remove four screws in steering wheel, two at 3 o'clock and two at 9 o'clock position. (On speed control steering wheels, these screws attach the speed control actuator switches (9C888) to the steering wheel.)



3. Remove wiring harness retainer (14A163) from the blade connector at 12 o'clock position in steering wheel.
4. Lift wiring out of wiring harness retainers in back cover of steering wheel.
5. Depress connector release tab and pull apart.

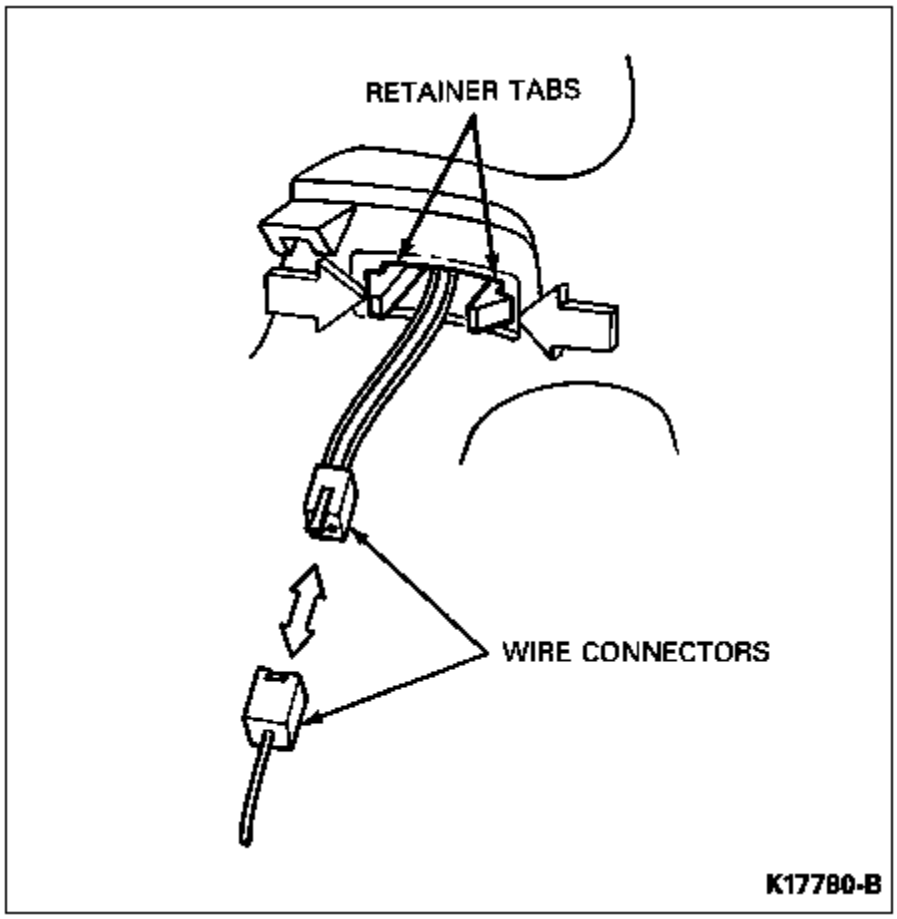


6. Remove back cover of steering wheel by detaching wiring harness retainers at 11, 1, and 6 o'clock positions.



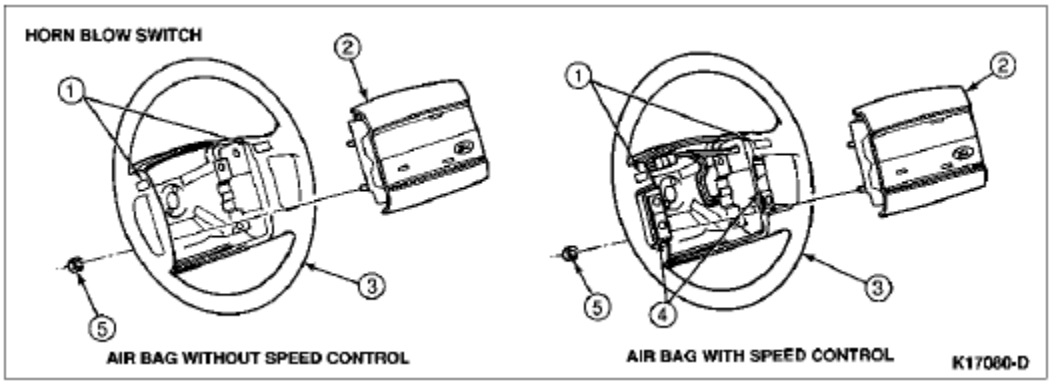
7. Remove steering wheel pad horn switch (13A805) to be serviced by carefully squeezing together the two retainer tabs and pushing the horn blow switch (13A875) up through the steering wheel.

8. Disconnect steering wheel pad horn switch wires at each wire connector.



For installation, follow removal procedures in reverse order.

Horn Blow Switch



Item	Part Number	Description
1	13A875	Horn Blow Switch
2	043B13	Driver Side Air Bag Module
3	3600	Steering Wheel
4	9C888	Speed Control Actuator Switch

5	N621903	Nut and Washer Assembly

Horn Switch, Ranger

Removal and Installation

1. Make sure the vehicle's front wheels are facing straight ahead, and the steering wheel is oriented in the straight-ahead position.
2. Disconnect the battery-to-starter relay cable. Wait at least one minute before proceeding to allow the air bag backup power supply to discharge.
3. Remove the driver side air bag module (043B13). Refer to Section 01-20B .
4. Disconnect the horn wire (Y/LG) from the switch to be removed.
5. Remove two Torx® head retaining bolts and remove horn blow switch (13A875).
6. To install, reverse removal procedure. Ensure that no wires are trapped/pinched when the new horn switch is attached to the steering wheel. Tighten retaining bolts to 6.5-7.5 Nm (58-66 lb-in).

Horn Switch	6.5-7.5	58-66

Anti-Theft Alarm System

The theft warning system provides the vehicle with protection from unauthorized entry into the passenger compartment and engine compartment (hood opening). It also protects against engine starting through ignition keylock cylinder tampering. If triggered, the system provides both audio and visual alarm signals and disables the starter circuit.

The system is controlled by a receiver assembly. This assembly also controls the electronic door lock control system functions. System anti-theft functions are:

- Perimeter sensing — doors, trunk, hood
- Ignition keylock cylinder sensing
- Starter interrupt
- LED flashing when system is armed
- Alarm (horn and lights)

For additional information and diagnostic procedures, refer to Section 18-04B .

When armed, unauthorized entry into the vehicle is detected by a hood switch or the door ajar switches. The hood switch is monitored directly by the receiver assembly. The door ajar switches are monitored by the generic electronic module (see Section 18-04A). The GEM module signals the receiver assembly when a door is ajar (opened). If the anti-theft system is armed, this signal will trigger the receiver assembly. The door ajar signal will also prevent arming of the system if a door or liftgate is not fully closed.

Once triggered, the system flashes, the parking lamps (13200), the theft LED indicator, and sounds the horn. In addition, the starter circuit is interrupted until the system is disarmed.

tomsn048@gmail.com

Components

The system is composed of the following components:

- Receiver assembly
- Anti-theft warning indicator (output)
- Door/liftgate disarm (input)
- Hood switch (input)
- Ignition keylock cylinder sensor (input)
- Starter interrupt relay (output)

The following components already exist on the vehicle and are also used in the anti-theft system:

- Horn relay (output)
- Parking lamps (13200)
- Generic Electronic Module (GEM) (input and output)
- Starter relay
- Park lamp autolamp/exit delay relay (output)

tomsn048@gmail.com

Ignition Keylock Cylinder Sensor Operation

Ignition keylock cylinder sensing is provided by monitoring the status of the ignition lock cylinder when the ignition is OFF. The keylock cylinder sensor "clip" located within the ignition key lock cylinder housing senses if the key cylinder has been removed from a damaged steering column casting (as is done in most hot wire attempts).

The receiver assembly should normally read 162 ± 40 ohms to ground through the ignition keylock cylinder sensor. If the keylock cylinder sensor or its wiring become open or shorted, the perimeter alarm will trigger even though the theft system may not be armed. If the ignition is in RUN or ACCY and the keylock cylinder sensor input senses an open or a short, the theft system will not trigger until ignition is turned OFF.

As long as the ignition keylock cylinder sensor and associated wiring remain defective, the system will not trigger again due to this input until the problem is corrected and battery power is removed and reapplied to the module with a good sensor input. The alarm may then trigger again due to the ignition keylock cylinder sensor once the resistance changes away from 162 ohms.

tomsn048@gmail.com

Starter Interrupt Function

When the anti-theft system is triggered, the receiver assembly energizes a relay that prevents cranking of the engine (6007). When the receiver assembly (module) provides a ground path for the relay coil, the normally closed contacts open. With the contacts open, the circuit between the ignition switch and starter motor relay is incomplete.

The alarm system operating sequences are designed to be passive; therefore, the system can be armed or disarmed when following normal vehicle exit and entry procedures. Following is a detailed description of the system operation.

tomsn048@gmail.com

System Arming

The system is ready to arm any time the ignition switch (11572) is turned OFF and the PANIC alarm is off. There are two ways to PREARM the anti-theft system:

1. Press the remote entry transmitter LOCK button once to lock the doors (with the doors open or closed). If the lock is pressed again within 5 seconds, the horn will either chirp once to indicate all doors are closed and the system is arming, or will chirp twice if any door is open (preventing the system from arming).

2. Open a door and press the power door lock button to lock the doors.

If a door is open, the anti-theft system is prearmed and waiting for all doors to close. The THEFT LED in the instrument panel (04320) will light continuously while the system is prearmed. Once all doors are closed, if any were open, the system will be prearmed with a 30 second countdown to become armed. The THEFT LED will remain lit continuously until the system is ARMED. When the system is armed, the THEFT LED will begin to flash for 50 mS every two seconds until the system is triggered or disarmed.

tomsn048@gmail.com

Cancelling the PREARM Sequence

If the anti-theft system is prearmed and waiting, it will wait only 30 minutes for a door to close. The THEFT LED will remain lit for this time. If a door does not close within 30 minutes, the LED will turn off and the theft system will return to a disarmed state.

An anti-theft system PREARM can also be cancelled before the system is armed by:

- pressing the unlock switch on the door
- any disarm event (see Disarming the System)

tomsn048@gmail.com

Disarming the System

NOTE: A perimeter alarm will "shut off" after 165 seconds, but the system is still triggered and is not disarmed. The starter circuit will remain disabled until the system is disarmed.

An Armed or triggered system can be disarmed by one of the four events listed.

1. Unlock the doors by pressing the remote entry transmitter UNLOCK button once.
2. Unlock any door with a key.
3. Turn ignition to RUN or ACCY.
4. The remote entry PANIC button will disarm the anti-theft system only when the perimeter alarm is triggered and sounding.

tomsn048@gmail.com

Alarm States When Battery Power Is Cycled

When the receiver assembly is powered the very first time at the vehicle assembly plant the system will be in the DISARMED state. The receiver assembly will remember whether it is ARMED, DISARMED or TRIGGERED in its non-volatile memory. When battery power is removed and then reconnected, the system will return to its state just before the battery (10655) was disconnected. If the system is in any PREARM state as described previously, then the system will return to a DISARMED state when battery is disconnected and then reconnected.

tomsn048@gmail.com

System Triggering

The alarm can be triggered by the following events if the system has been armed and has not been disarmed first.

1. Open any door.

2. Open the hood (16612) (if the hood was open when the system was armed, it must be closed before it can trigger the alarm).

3. Disturb the ignition keylock cylinder sensor affecting the monitored resistance to ground. A disturbance of this sensor is the only event which will trigger an unarmed alarm.

4. The anti-theft system may be triggered inadvertently when the module is disconnected and then reconnected. To avoid this condition, disconnect the smaller 22-pin connector first. This alarm trigger is stored by the receiver assembly as Ignition Tamper Sensor Trigger event (IGNTAM) in the diagnostic list of alarm trigger events.

NOTE: Although the remote entry PANIC alarm is not associated with the monitoring of the vehicle, the user will frequently say that the theft system was triggered when actually the PANIC button was inadvertently pressed. A panic alarm will not flash the THEFT LED. PANIC is stored in the diagnostic list of alarm events to aid in diagnosis.

When the system is triggered, the starter interrupt and perimeter alarm will operate as follows:

STARTER INTERRUPT — starter circuit interrupted until system is disarmed. The normally closed external starter interrupt relay will be pulled in to disallow power to travel through the starter circuit.

PERIMETER ALARM — approx. 250 mS on, 450 mS off cycle for two minutes and 45 seconds for North America.

- Parking lamps
- Horn
- THEFT LED

The perimeter alarm can be retriggered, after a perimeter alarm has sounded for 165 seconds. After a perimeter alarm has timed out, if any trigger input is seen as normal and then in its trigger state, the perimeter alarm will be retriggered. The perimeter alarm can be triggered a total of three times between an arming sequence and a disarm event. An active panic alarm will be deactivated when a perimeter alarm is triggered (a perimeter alarm overrides a panic alarm).

tomsn048@gmail.com

tomsn048@gmail.com

PANIC Alarm Activation

The PANIC alarm, operated from the remote keyless entry transmitter, is activated when the button marked PANIC on the remote transmitter is pressed. The PANIC alarm consists of the horn sounding and the parking lamps and tail lamps flashing.

This subsystem can only be deactivated by pressing PANIC again or turning the ignition switch (11572) to the RUN or ACC position.

20	6 (Y/LG)	Horn Relay

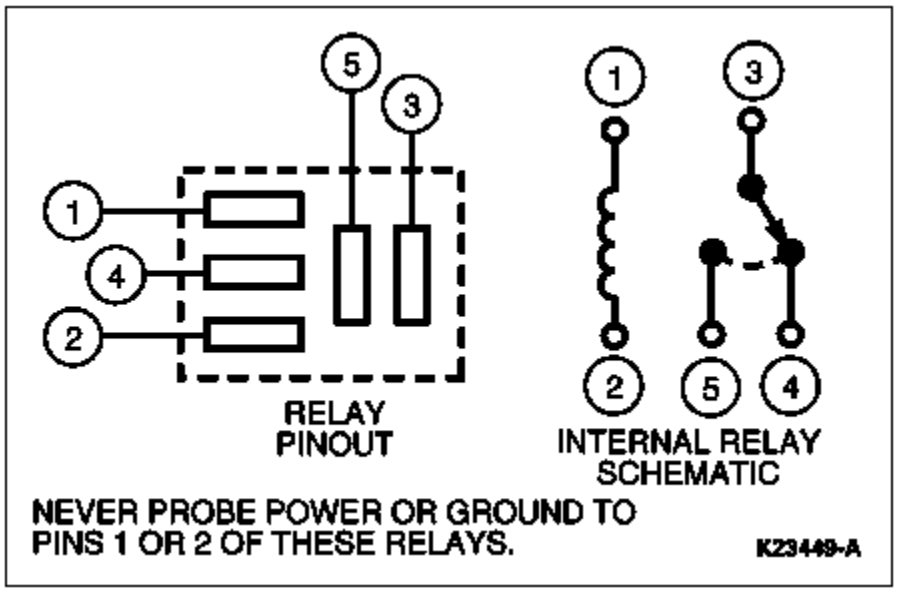
tomsn048@gmail.com

21	—	Not Used
22	119 (PK/Y)	All Lock Relay

tomsn048@gmail.com

All Relay Connectors

The harness connector to each system relay (horn, parklamp, starter interrupt) have the same pinout. Check the Electrical Schematics for circuit number, wire gauge and color.



Item	Part Number	Description
1	—	Battery Feed to Coil
2	—	Coil Ground
3	—	Battery Feed to Contacts
4	—	Normally Closed Connector
5	—	Coil Energized Contact

NOTE: NEVER probe power or ground to Pins 1 or 2 of these relays.

tomsn048@gmail.com

tomsn048@gmail.com

Inspection and Verification

The electronic door lock control system is diagnosed as part of the overall remote control alarm and lock system. Refer to Section 18-04B to initiate system self test, New Generation Star (NGS) Tester use and diagnostic test codes.

1. Verify the vehicle owner's original concern by duplicating the concern.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged liftgate door lock cylinder	• Open fuses • Loose connections • Corroded connections

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following symptom chart.

NOTE: For system inspection and verification using New Generation Star (NGS) Tester 007-00500 or equivalent, refer to Section 18-04B .

NOTE: Voltage and resistance readings can be obtained using Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

To test and service door lock system:

- Check that battery is fully charged (if not, it may be causing the concern).

NOTE: When the battery has been disconnected and reconnected, some abnormal symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Disconnect and reconnect battery to make sure system is reset.
- Perform the self test. If necessary, refer to Section 18-04B .
- Service only as specified in the tests.
- Repeat the self test to make sure the system is operational.

tomsn048@gmail.com

tomsn048@gmail.com

Symptom Chart — Anti-Theft Alarm System

ANTI-THEFT ALARM SYSTEM

Condition	Possible Source	Action
• Alarm Triggers As Soon As Ignition Is Turned OFF	• Loose ignition tamper sensor or its wiring.	• GO to Pinpoint Test A .
• Alarm Triggers When the Driver's Door Is Open After Being Unlocked with a Key	• Driver disarm switch or its wiring.	• GO to Pinpoint Test C .
• Alarm Triggers When the Passenger's Door Is Open After Being Unlocked with a Key	• Passenger disarm switch or its wiring.	• GO to Pinpoint Test C .
• Alarm Triggers Intermittently	• Any switches monitored for triggering an alarm. • Unintended presses of panic button on transmitter.	• GO to Pinpoint Test A .
• Alarm Not Triggered by Hood Switch.	• Hood switch circuit short/open. • Hood switch not depressed when hood closed.	• GO to Pinpoint Test A .
• Horn Sounds Continuously (No Honking On and Off) During Alarm	• Unusual alarm configuration programmed.	• GO to Pinpoint Test B .
• Vehicle Will Not Start, Battery Fully Charged	• No start condition other than starter interrupt relay. • Starter interrupt relay wiring short/open. • Starter interrupt relay missing.	• GO to Section 03-06 . • GO to Pinpoint Test B .
• Alarm Is Disarmed by Locking a Door with a Key (Instead of Unlocking)	• Wiring to disarm switch or switch has been reversed.	• GO to Pinpoint Test C .
• THEFT LED Does Not Light	• Wiring to LED is open. • LED is burned out due to a short in the wiring.	• GO to Pinpoint Test D .

tomsn048@gmail.com

• Anti-Theft Never Arms (THEFT LED Doesn't Light)	• Any door disarm circuit is shorted. • Any door disarm switch is shorted. • Door unlock switch or circuit shorted.	• GO to Pinpoint Test E . **NOTE: Before proceeding with Pinpoint Test, GO to Section 18-04B for system self test and diagnostic test codes.**
• Anti-Theft Never Arms (THEFT LED Lights but Never Flashes)	• Any door is ajar or open. • Any door does not close properly. • Any door ajar switch or wiring is shorted. • GEM to receiver assembly door ajar circuit is grounded.	• GO to Pinpoint Test E . **NOTE: Before proceeding with Pinpoint Test, GO to Section 18-04B for system self test and diagnostic test codes.**
• Anti-Theft Does Not Arm Only Using Door Lock Button and an Open Door	• Any door is ajar or open. • Any door ajar switch or wiring is shorted. • GEM to receiver assembly door ajar circuit is grounded. • Door lock switch to receiver assembly circuit.	• GO to Pinpoint Test E . **NOTE: Before proceeding with Pinpoint Test, GO to Section 18-04B for system self test and diagnostic test codes.**

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: FALSE ALARMS AND TRIGGERING ALARMS

A1 CHECK ALARM HISTORY FOR FALSE ALARMS

- Enter in NGS: RAP, PID/DATA and select AL EVT1 through AL EVT8 to monitor the last 8 events which have caused the alarm to trigger. AL EVT1 is the most recent and AL EVT8 occurred before all of the others.
- Write down alarm events in case display is changed by triggering alarm.

Does NGS display an alarm that shows up much more than any other alarm?

Yes	No
If display shows two door open triggers (DROPEN), GO to **A2**. If display shows two hood switch triggers (HOODTR), GO to **A3**. If display shows an ignition tamper trigger (IGNTAM), GO to **A4**. If NGS display shows several PANIC alarm triggers, GO to **A5**.	If NGS does not display a dominant trigger event or most events are no event, NOEVNT, GO to **A2** to REVIEW alarm trigger events.

A2 CHECK DOOR AJAR INPUT

Accidental triggering of an armed system can be caused by the owner. The theft system is working normally when the alarm is triggered with someone in the armed vehicle, and they later exit by pulling on the door handle to open the door. Another common trigger which is an OK system is when the customer opens a locked door through an open window. These events may have cause the DROPEN alarm history in addition to the following diagnostics.

If the door mechanically unlocks and can be open, without first having electrically sensed that the key turned to the unlock position to disarm the system, then the alarm will be triggered due to a door ajar switch (caused by door disarm switches).

- Enter in NGS: RAP, PID/DTA and select DOORRAP to monitor the GEM door ajar to see door ajar state.
- Close all doors.
- NGS DOORRAP state is CLOSED.
- Open each door separately.
- NGS DOORRAP state is AJAR.

NOTE: The alarm trigger history must be cleared after servicing the anti-theft system for inadvertent triggering. The alarm history is cleared by entering in the NGS: RAP DIAGNOSTIC TEST MODES RETRIEVE/CLEAR CONTINUOUS DTCS then press START, RECORD DTCS and press C ALL (button 7) to clear.

tomsn048@gmail.com

Do both states appear on the NGS?

Yes	No
TEST for intermittent door ajar switches (possibly due to water) in the GEM system (REFER to Section 18-04A), or TEST door disarm switches. GO to C2, or CLARIFY with the customer to IDENTIFY how alarm was triggered with the door.	If NGS display is always AJAR, SERVICE door ajar circuits/switches with GEM module diagnostics (REFER to Section 18-04A), or SERVICE Circuit 999 (R/BK) for a short to ground. If NGS display is always CLOSED, SERVICE Circuit 999 (R/BK) for an open or SERVICE door ajar input circuits/switches with GEM module diagnostics (REFER to Section 18-04A).

A3 CHECK HOOD SWITCH INPUT

The theft system is working normally when the alarm is armed with someone in the vehicle or when reaching through an open window, and they pull the hood release to open the hood. This may be a cause of the alarm trigger history.

If a cover is installed on the front of the vehicle, the hood may not close far enough to fully press the hood switch plunger. You may need to bend the hood switch bracket slightly to insure the hood switch is pressed enough.

- Close hood.
- Enter in NGS: RAP, PID/DATA and select HOOD SW to monitor the hood switch state.
- NGS HOOD SW state of not PUNCHD should be displayed.
- Check to see that wiggling the hood up and down, while it is latched and closed, does not cause the hood switch state to change from not PUNCHD.
- Open the hood.
- NGS HOOD SW state is PUNCHD should be displayed.

Do the above states appear on the NGS as described?

Yes	No
Hood switch operation is OK. CLARIFY with customer and REVIEW customer symptoms table.	If HOOD SW state is always not PUNCHD, SERVICE hood switch Circuit 23 (T/LG) for an open, or CHECK hood switch to CONFIRM that when it is not pressed its contacts close. If HOOD SW state is always PUNCHD, SERVICE Hood Switch Circuit 23 (T/LG) for a short to ground, or CHECK hood switch to CONFIRM that when it is PRESSED its contacts are open. VERIFY that hood switch plunger closes fully when hood is closed. If NGS state changes when hood is wiggled, VERIFY that hood switch plunger closes fully when hood is closed. Hood switch bracket can be bent slightly to INSURE hood switch is pressed enough.

A4 CHECK IGNITION TAMPER SENSOR INPUT

Receiver assembly deals with ignition tamper sensor differently then other systems. Read ignition

tomsn048@gmail.com

tamper sensor description and operation.

Each time battery is reapplied to the system, module will wait to see a normal tamper sensor and will then trigger alarm (armed or not) when ignition is off and sensor resistance to module changes outside of 120 to 210 ohm boundary.

- Enter in NGS: RAP, PID/DATA and select IGN RES to monitor ignition tamper sensor state.
- The receiver assembly will respond with one of three states: 162 ohm, 0 ohms, or HIGH.

Is the ING RES state 162OHM?

Yes	No
Ignition tamper sensor and SYSTEM are OK, they are unlikely now to be intermittent.	If IGN RES state is 0 ohms, SERVICE ignition tamper Circuit 936 (DG/W) for a short to ground, REMOVE and RECONNECT battery, and REPEAT Test **A4**. If IGN RES state is HIGH, SERVICE ignition tamper Circuit 936 (DG/W) for an open, or REINSTALL ignition tamper sensor, or REPLACE ignition tamper sensor.

A5 PANIC ALARM OPERATION

The receiver assembly PANIC alarm is not a theft alarm trigger event, but quite often an owner bumps the PANIC button on the transmitter by accident as they are walking away from their vehicle and say that their theft alarm is going off.

The PANIC button may be pressed by objects inside of a purse or pocket, without the customer knowing. If several PANIC codes appear in the alarm history, you know that this is the case.

The customer may need to take a couple of steps close to the vehicle from where the PANIC alarm was started in order to stop the PANIC alarm or turn the key to RUN.

Can cause of false alarms be traced to accidental triggering by owner?

Yes	No
PANIC alarm system is OK. CLARIFY operation with owner and CHECK symptom table if necessary.	RETURN to Symptom Chart.

No Starts and Alarm Outputs

The receiver assembly can only defeat the starter with the extended anti-theft (starter interrupt) relay. If a temporary jumper is installed across the normally closed contacts of the starter relay as outlined below and the vehicle does not start, check for other causes.

PINPOINT TEST B: NO STARTS AND ALARM OUTPUTS

B1 ALARM VERIFICATION — TRIGGER AND THEFT LED

tomsn048@gmail.com

- Open driver door window.
- Arm theft system.
- Trigger theft alarm by pulling on inside door handle to open driver door.

Does THEFT LED flash when theft system is triggered?

Yes	No
GO to **B2** .	If THEFT LED does not come on, GO to Pinpoint Test D . If theft system did not arm, GO to Pinpoint Test E .

B2 ALARM VERIFICATION — PARKLAMPS AND HORN

Does horn honk on and off and parking lamps flash?

Yes	No
GO to **B3** .	If only the park lamps flash, GO to **B4** . If only the horn honks, GO to **B6** . If neither the horn nor the parklamps are pulsing, GO to **B4**

B3 ALARM VERIFICATION — STARTER INTERRUPT

Does vehicle start?

Yes	No
Alarm outputs OK. CLARIFY with customer and REVIEW customer symptoms table.	GO to **B8** .

B4 CHECK RECEIVER ASSEMBLY PARKLAMPS OUTPUT

- Stop alarm with any disarm event.
- Enter in NGS: RAP, ACTIVE COMMANDS, HEAD/PARKING LAMPS and select PARK LAMP ON.

Do park lamps turn on?

Yes	No
REPLACE the RAP module. RETEST the system.	GO to **B5** .

B5 PARK LAMPS JUMPERED OPERATION

- Disconnect receiver assembly.
- Momentarily short park lamp Circuit 218 (W/P) to signal ground Circuit 570 (BK/W).

tomsn048@gmail.com

Did park lamps turn on?

Yes	No
REPLACE the RAP module. RETEST the system.	SERVICE park lamps, park lamp relay or power circuit from park lamp relay to park lamps.

B6 CHECK RAP HORN OUTPUT

- Stop alarm with any disarm event.
- Enter in NGS: RAP, ACTIVE COMMANDS, HORN and select HORN ON.

Does horn sound?

Yes	No
REPLACE the RAP module. RETEST the system.	GO to **B7** .

B7 HORN JUMPERED OPERATION

- Disconnect receiver assembly.
- Momentarily short horn Circuit 6 (Y/LG) to signal ground Circuit 570 (BK/W).

Does horn sound?

Yes	No
REPLACE the RAP module. RETEST the system.	SERVICE horn, horn relay, Circuit 6 (Y/LG) for an open or power circuit for the horn.

B8 CHECK RECEIVER ASSEMBLY STARTER INTERRUPT OUTPUT

- Stop alarm with any disarm event.
- Enter in NGS: RAP, ACTIVE COMMANDS, STARTER INTERRUPT and select STARTER ON.
- Turn ignition key to start for less than 2 seconds.

Is starter motor disabled (no cranking)?

Yes	No
System OK.	GO to **B9** .

B9 STARTER INTERRUPT JUMPERED OPERATION

- Disconnect receiver assembly.
- Momentarily short starter interrupt output Circuit 342 (LG/P) to signal ground Circuit 570 (BK/W).

tomsn048@gmail.com

Does the starter operate?

Yes	No
REPLACE the RAP module. RETEST the system.	RAP system OK. SERVICE starter, anti-theft relay, or power circuit for starter.

PINPOINT TEST C: DISARMING ANTI-THEFT

C1 CONFIRM REMOTE DISARMING SEQUENCE

- Arm theft system; THEFT LED is on.
- Perform disarming sequence by pressing UNLOCK on a transmitter as described in Description and Operation, Disarming the System.
- Confirm doors unlocked when transmitter button was pressed.

Did system disarm and THEFT LED turn OFF?

Yes	No
GO to **C2** .	If the doors did not unlock, GO to Diagnosis and Testing in Section 01-14B . If theft system did not arm, GO to Pinpoint Test E .

C2 CONFIRM DOOR KEY DISARMING SEQUENCE

NOTE: If door mechanically unlocks and can be opened, without first having electrically sensed key turned to unlock position to disarm system, then alarm will be triggered by door ajar switch.

- Arm theft system; THEFT LED is on.
- Perform disarming sequence by turning door key to unlock position as described in Description and Operation, Disarming the System.
- Confirm door unlocked (not locked) when key was turned.
- Perform above steps for passenger door.

Did system disarm and THEFT LED turn OFF?

Yes	No
GO to **C6** .	If doors did not unlock, GO to Diagnosis and Testing in Section 01-14B . There is a mechanical interference. If theft system did not disarm, GO to **C3** .

C3 CHECK THE DOOR DISARM SWITCH INPUT

NOTE: If the door mechanically unlocks, and can be opened without first having the system

tomsn048@gmail.com

disarm because it electrically sensed the key turned to unlock position, then the alarm will be triggered by the door open warning lamp switch.

- Enter in NGS: RAP, PID/DATA and select DR DARM to monitor.
- The PID/DATA DR ARM should read NOT ACT.
- Turn the key in each door lock cylinder to the UNLOCK position. While the key is in the UNLOCK position, the DR DARM PID should read ACTIVE for each door.

Did both PID states appear?

Yes	No
REPLACE the RAP module. RETEST the system.	If only the DR DARM PID state ACTIVE appeared; Go to **C4** . If only the DR DARM PID state NOT ACT appeared; Go to **C5** **.**

C4 CHECK CIRCUIT 25 (DG/P)

- Turn the ignition to the OFF position.
- Disconnect RAP module connector C1.
- Measure the resistance between the RAP connector C1 pin 9, circuit 25 (DG/P), and chassis ground.

Is the resistance 10,000 ohms or less?

Yes	No
REPAIR circuit 25 (DG/P). RETEST the system.	REPLACE the RAP module. RETEST the system.

C5 CHECK CIRCUIT 25 (DG/P)

- Turn the ignition in the OFF position.
- Disconnect RAP module connector C1.
- Measure the resistance between the RAP connector C1 pin 9, circuit (DG/P) and chassis ground, while the door lock cylinder is turned to the UNLOCK position.

Is the resistance 10,000 ohms or less?

Yes	No
REPLACE the RAP module. RETEST the system.	REPAIR circuit 25 (DG/P). RETEST the system.

C6 CHECK THE IGNITION INPUT OPERATION

- Arm the theft system; theft LED in ON.
- Perform the disarming sequence by turning the ignition switch to the RUN position.

tomsn048@gmail.com

Did the system disarm and theft LED turn OFF?

Yes	No
Anti-theft system disarming is OK.	GO to C7 .

C7 CHECK IGNITION INPUT

- Enter in NGS: RAP, PID/DATA and select IGN RAP to monitor ignition switch state.
- Turn ignition key to OFF position. NGS communication may be lost after a few seconds.
- NGS IGN RAP state is OFF should be displayed.
- Return ignition key to RUN position and resume NGS PID/DATA communication if necessary.
- NGS IGN RAP state is RUN should be displayed.

Do both states appear on the NGS?

Yes	No
Anti-theft disarming system is OK. CLARIFY with customer and REVIEW customer symptoms table.	If NGS displays a constant RUN state, SERVICE the ignition switch or SERVICE Circuit 1002 (B/PK) for a 100 ohm or less battery short. If NGS displays a constant OFF, SERVICE Circuit 1002 (B/PK) for an open, blown fuse, or short to ground or SERVICE the ignition switch.

THEFT LED Operation

PINPOINT TEST D: ANTI-THEFT LED OPERATION

D1 ANTI-THEFT LED OPERATION

CAUTION: Do not jumper battery voltage to the THEFT LED directly.

Do not treat the THEFT LED like a bulb. Most of the battery voltage is dropped across a resistor internal to the receiver assembly so that very little current is supplied to the LED. If you place battery voltage directly to the LED, the LED will burn out.

- Enter in NGS: RAP, ACTIVE COMMANDS, ALARM OUTPUT and select ALARM ON to turn on THEFT LED.

Does ANTI-THEFT LED turn on?

Yes	No
The THEFT LED output and LED are OK.	GO to D2 .

tomsn048@gmail.com

D2 CHECK ANTI-THEFT LED

- Disconnect instrument cluster and remove THEFT LED. Measure resistance across LED. With the NGS: DIGITAL MEASUREMENT, OHMMETER, select RANGE as AUTO.

Is resistance between 10 and 20 ohms?

Yes	No
SERVICE Circuit 343 (DB/LG) for an open or short, or SERVICE ground circuit for instrument cluster on low side of the LED.	REPLACE damaged LED and RETEST.

Arming Anti-Theft

When symptom is THEFT LED does not come on, this may mean that there is an issue with the LED or it may mean that the theft system is not arming at all.

PINPOINT TEST E: ARMING ANTI-THEFT

E1 CONFIRM REMOTE ARMING SEQUENCE

- Open driver door window.
- Perform arming sequence by pressing LOCK on a transmitter as described in Description and Operation, System Arming.
- Confirm that doors locked when transmitter button was pressed.
- If THEFT LED does not light, wait at least 45 seconds after all doors are closed and locked. Theft system may still arm, but LED may not be working. Reach through window and open door to trigger armed system.

Did the system arm and trigger?

Yes	No
GO to **E2** .	If doors did not lock, GO to Diagnosis and Testing in Section 01-14B . If system armed and triggered, but THEFT LED did not light, GO to Pinpoint Test D. If theft system did not arm, GO to **E3** .

E2 CONFIRM DOOR LOCK ARMING SEQUENCE

- Confirm anti-theft system is disarmed by pressing UNLOCK button on transmitter.
- Perform arming sequence by opening door, pressing LOCK on door lock switch and closing door as described in Description and Operation, System Arming.
- Confirm doors locked when door lock button was pressed.

Did system arm?

tomsn048@gmail.com

Yes	No
Anti-theft arming system is OK. CLARIFY with customer and REVIEW customer symptoms chart.	If doors did not lock, GO to Diagnosis and Testing in Section 01-14B . If theft system did not arm, GO to **E3** .

E3 CHECK DOOR AJAR INPUT

- Enter in NGS: RAP, PID/DATA and select DOORRAP to monitor GEM Door Ajar to see Door Ajar State.
- Close all doors.
- DOORRAP state is CLOSED should be displayed on NGS.
- Open any door.
- DOORRAP state is AJAR should be displayed on NGS.

Do both states appear on the NGS?

Yes	No
GO to **E4** .	If DOORRAP state is always AJAR, SERVICE door ajar input circuits/switches with GEM module diagnostics (refer to Section 18-04A), or SERVICE Circuit 999 (R/BK) for a short to ground with ignition in RUN. If DOORRAP state is always CLOSED, SERVICE Circuit 999 (R/BK) for an open or SERVICE door ajar input circuits/switches with GEM module diagnostics (refer to Section 18-04A).

E4 CHECK IGNITION INPUT

- Enter in NGS: RAP, PID/DATA and select IGN RAP to monitor ignition switch state.
- Turn ignition key to OFF position. NGS communication may be lost after a few seconds.
- IGN RAP is OFF should be displayed on NGS.
- Return ignition key to RUN position and resume NGS PID/DATA communication if necessary.
- IGN RAP state is RUN should be displayed on NGS.

Do both states appear on NGS?

Yes	No
GO to **E5** .	If IGN RAP state is always RUN, SERVICE the ignition switch or SERVICE Circuit 1002 (B/PK) for a 100 ohm or less battery short. If IGN RAP state is always OFF, SERVICE Circuit 1002 (B/PK) for an open, blown fuse, or short to ground or SERVICE ignition switch.

E5 CHECK DOOR DISARM SWITCH INPUT

tomsn048@gmail.com

If anti-theft system module receives a shorted door disarm switch-signal, the module will react by disarming theft system. Even when a valid arming sequence has been entered, theft system will immediately disarm as soon as the system is armed.

- Enter in NGS: RAP, PID/DATA and select DR DARM to monitor door disarm state.
- NGS DR DARM is notACT should be displayed on NGS.
- Turn key in each door to unlock door and leave key in unlock position. Make sure that it is unlock and not lock position.
- DR DARM is active should be displayed on NGS.

Do both states appear on NGS?

Yes	No
GO to **E6** .	If DR DARM state is always ACTIVE, CHECK door disarm switch on each key cylinder for an internal short (switches should be normally open when key is removed from cylinder), or SERVICE disarm switch Circuit 25 (DG/P) for a short to ground. If DR DARM state is always not ACT, SERVICE disarm switch Circuit 25 (DG/P) for an open. CHECK at door disarm switch that tested always notACT to see if it shorts when key is turned in unlock position.

E6 CHECK DOOR UNLOCK SWITCHES

If anti-theft system is constantly seeing a shorted door unlock switch, module will react by disarming theft system. Even when a valid arming sequence has been entered, theft system will immediately disarm as soon as system is armed.

- Press LOCK button on each door lock switch and confirm that NGS, RAP DD_ LOCK PID state changes to LOCK when switches are pressed.
- Press UNLOCK button on each door lock switch and confirm that NGS, RAP DD_ LOCK PID state changes to UNLOCK when switches are pressed.

Does LOCK and UNLOCK state for each door lock switch occur?

Yes	No
System is operating properly. RETURN to Symptom Chart.	If UNLOCK state does not occur, CHECK and SERVICE all unlock Circuit 120 (PK/LG) or door unlock switches for an open, or SERVICE grounding circuit for door lock switch. Refer to Section 01-14B . If LOCK state does not occur, CHECK and SERVICE the all lock Circuit 119 (PK/Y) or door lock switches for an open. Refer to Section 01-14B . If DD_ LOCK state is always UNLOCK, CHECK and SERVICE all unlock Circuit 120 (PK/LG) or door unlock switches for a short to ground. Refer to Section 01-14B . If DD_LOCK PID state is always LOCK, CHECK and SERVICE all lock Circuit 119 (PK/Y) or door lock switches for a short to ground. Refer to Section 01-14B .

tomsn048@gmail.com

tomsn048@gmail.com

Component Tests

Door Disarm Switch

Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, measure switch resistance with key removed from the door lock. The resistance should be more than 25,000 ohms. If not, replace the door disarm switch.

Measure the switch resistance with the key fully rotated to the end of travel in the unlock direction. The resistance should be less than 200 ohms. If not, replace the door disarm switch.

tomsn048@gmail.com

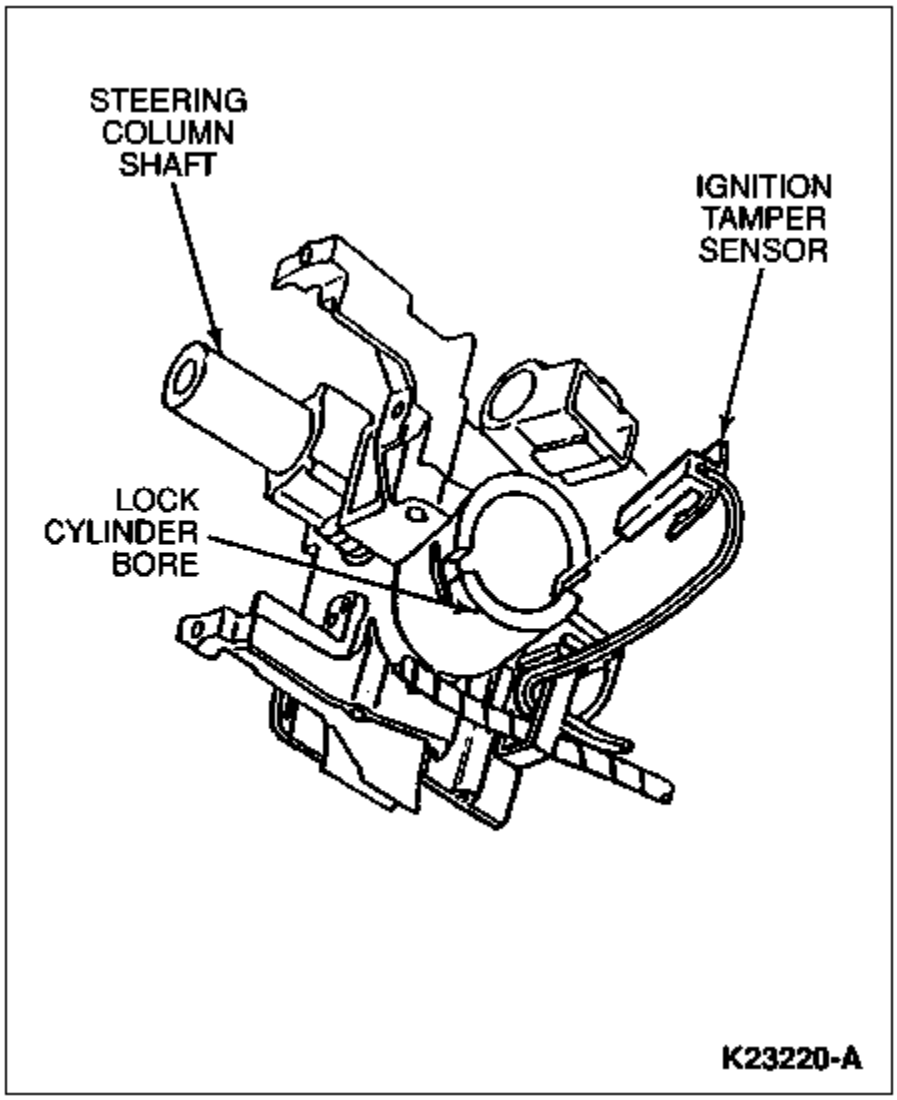
Ignition Tamper Sensor

Removal and Installation

NOTE: Disconnect and reconnect battery ground cable to ensure RAP system resets to include monitoring of this sensor.

1. Remove ignition key lock cylinder from steering column housing. Refer to Section 11-04A .
2. Slide ignition lock anti-theft switch (19A438) off steering column.
3. Disconnect ignition tamper sensor from steering column locators and wiring harness.
4. To install, reverse removal procedure.

tomsn048@gmail.com



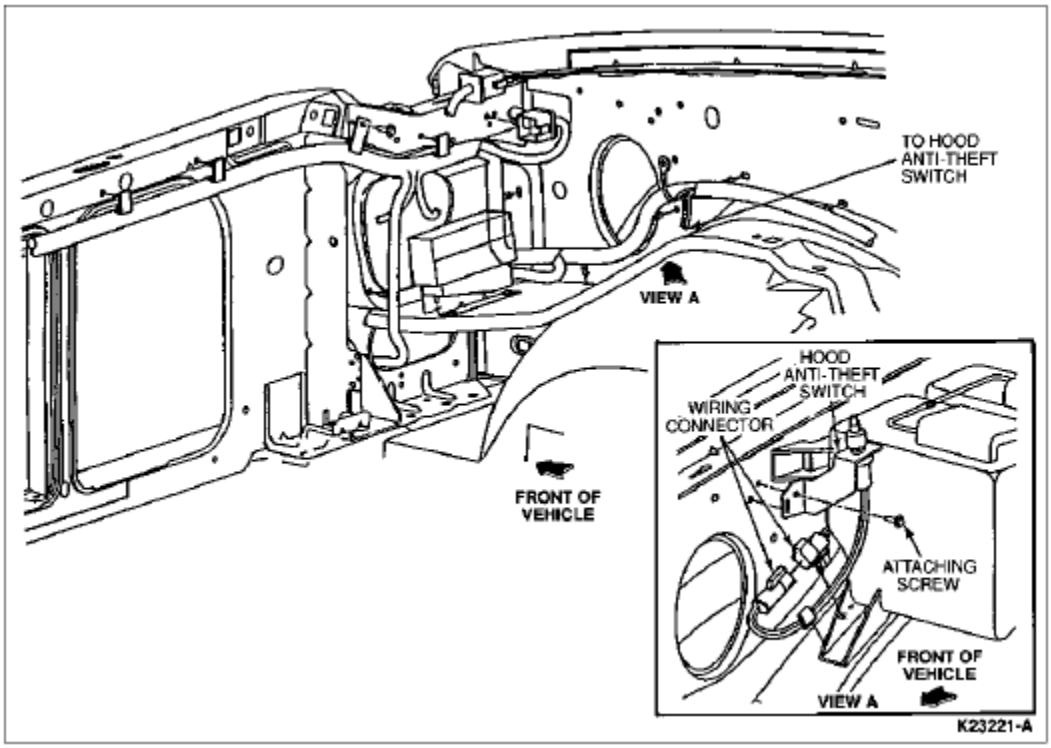
tomsn048@gmail.com

tomsn048@gmail.com

Hood Switch

Removal and Installation

1. Locate hood switch on RH side of fender apron.
2. Disconnect electrical connector from hood switch.
3. Remove one screw retaining hood switch.
4. To install, reverse removal procedure, and make sure that the hood switch bracket locator leg is seated firmly when driving screw to retain hood switch.



tomsn048@gmail.com

Charging System

The electrical charging system is a negative ground system consisting of:

- Generator (GEN) (10300).
- Voltage regulator.
- Charge indicator lamp.
- Battery (10655).
- Necessary wiring and cables.

Refer to the Electrical and Vacuum Troubleshooting Manual for schematics and locations of components and wiring.

Generator with Integral Rear Mount Voltage Regulator — Internal Fan Type

When the engine (6007) is started, the generator begins to generate alternating current (AC) which is converted to direct current (DC) by the rectifier assembly internal to the generator. This current is then supplied to the vehicle's electrical system through the output connect battery positive voltage (B+) located on the rear of the generator.

Once the generator begins generating current, a voltage signal is taken from the generator stator and coil and fed back to the voltage regulator S circuit, turning off the charge indicator.

When the system is functioning normally, the generator output current is determined by the voltage at the A-circuit (battery sense voltage). The A-circuit voltage is compared to a set voltage internal to the voltage regulator. The voltage regulator controls the generator field current to maintain proper generator output. The set voltage will vary with temperature and is typically higher in the winter than in the summer, allowing for better battery recharge in the winter and reducing the chance of overcharging the battery in the summer.

Fuse Link

The fuse link is a short length of insulated wire integral with the engine compartment wiring harness. It is several wire gauges smaller than the circuit that it protects. The fuse link for the generator (GEN) (10346) is a 12-gauge gray wire.

On Aerostar vehicles a fuse link is used in the generator output circuit and in the voltage regulator A circuit. Ranger vehicles use a fuse link in the generator output circuit and a fuse in the voltage regulator A circuit.

The fuse link is designed to burn out, thus protecting the wiring when heavy reverse current flows, such as when a booster battery is connected incorrectly, or a short to ground occurs in the wiring harness.

A burned-out link may have bare wire ends protruding from the insulation, or bubbled insulation with illegible identification. If it is hard to determine if the link is burned out, perform a continuity test.

Service fuse links are brown, green or black depending on usage. All fuse links have a flag moulded on the wire or on the terminal insulator. Color identification of the flag or connector is gray 12-gauge wire. The following illustration shows a typical fuse link installation.

Inspection and Verification

NOTE: Before performing charging system tests on the vehicle, note the concern such as: slow cranking, battery discharged, indicator lamp on. This information will aid in isolating the part of the system causing the symptom.

Test for current drain. Refer to Component Tests in this section. Following are some of the most common current drain problems:

- Interior lamp stays on constantly
- Electronic component malfunctions

NOTE: Only test the charging system with a fully charged, properly operating battery (10655). Make sure cable connections are clean and secure. Check the testing equipment and instructions.

Perform a visual inspection using the following procedure:

1. Check the fuse link located between the power distribution box and harness (14516) and the generator (GEN) (10346). Replace the fuse link if burned.

2. Check battery posts and battery cable terminals for clean and tight connections. Remove the battery cables (if corroded), clean and install them securely.

3. Check for clean and tight wiring connections at the generator, voltage regulator (VR) (10316) and engine (6007).

4. Check the drive belt tension. Refer to Section 03-05 .

5. Check battery state of charge. Refer to Component Tests in this section.

Isolating the Concern

Isolate the battery (10655), the charging system, and the electrical circuits to correctly identify the area where the difficulty lies.

Open circuits or other wiring concerns can prevent the generator (GEN) (10346) from operating normally.

Generator Check

Check the generator (GEN) (10346) to see if it is producing the proper output current and voltage. Refer to Component Tests in this section. If the generator does not meet specifications, use the symptom chart in this section to determine the correct test procedure for troubleshooting the charging system.

Symptom Chart — Charging System

CHARGING SYSTEM

Condition	Possible Source	Action
• Charge Indicator Lamp On with Engine Running	• Open A, Circuit 36 (Y/W). • Shorted I, Circuit 904 (LG/R). • Open/high resistance in S, Circuit 4 (W/BK). • Voltage regulator. • Generator.	• GO to Pinpoint Test A .
• Generator Battery Overcharging (Battery Voltage Greater than 15.5 Volts)	• Voltage drop in A, Circuit 36 (Y/W). • Voltage drop in I, Circuit 904 (LG/R). • Poor ground. • Voltage regulator. • Generator.	• GO to Pinpoint Test B .
• Indicator Lamp On, Key Off	• Lamp circuit, 584 (Y) (Ranger) or 16 (R/LG) (Aerostar) shorted to B+ . • Improper lamp circuit wiring. • Instrument cluster.	• GO to Pinpoint Test C .
• Indicator Lamp Off, Key On, Engine Not Running	• Open/high resistance in I, Circuit 904 (LG/R). • Burned out bulb. • Poor ground. • S Circuit 4 (W/BK) shorted to B+. • Voltage regulator. • Generator.	• GO to Pinpoint Test D .
• Indicator Lamp Flickers or Intermittent	• Loose connection to generator, voltage regulator battery or underhood fuse box. • Loose fuse or poor connection in Circuit 36 (Y/W). • Loose brush holder screw. • Voltage regulator.	• GO to Pinpoint Test E .

	• Generator.	
• Voltage Gauge Reads High	• Generator. • Gauge.	• GO to Pinpoint Test F .
• Voltage Gauge Reads Low	• Generator. • Gauge.	• GO to Pinpoint Test G .
• Generator Noisy	• Accessory drive belt or tensioner. • Accessory brackets. • Bent generator pulley. • Generator. • Other components.	• GO to Pinpoint Test H .
• Radio Interference	• Voltage regulator. • Generator. • Other components.	• GO to Pinpoint Test J .
• Battery Does Not Hold a Charge	• Battery connections. • Battery. • Battery drain. • Generator.	• GO to Pinpoint Test K .
• Battery Is Not Serviceable	• Battery connections. • Battery.	• GO to Pinpoint Test L .

Pinpoint Tests

CAUTION: Do not make jumper connections except as directed. Improper connections may damage the voltage regulator (VR) (10316) or fuses/fuse links.

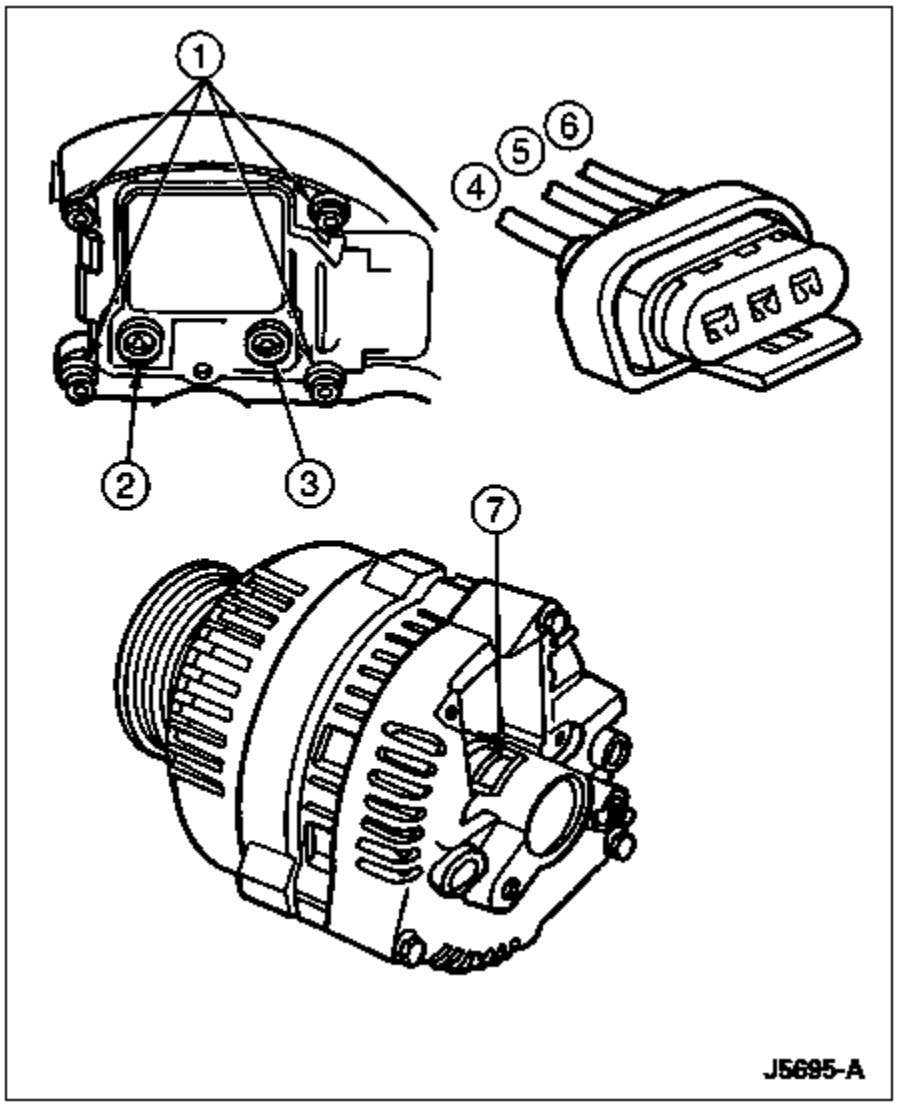
NOTE: Jumper connections and meter reading are required in the pinpoint tests. The following illustration identifies the generator test points.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

All "key ON" measurements are made with the engine (6007) not running unless directed to "start engine."

NOTE: With this charging system, four conditions can cause the charge indicator to come on during vehicle operation:

- **No generator output: damaged generator or regulator.**
- **Over-voltage condition: shorted generator rotor or regulator.**
- **No connection at generator output terminal (B+).**
- **No connection at battery voltage sensing terminal (A terminal).**



Item	Part Number	Description
1	—	Mounting Screws (Ground Connection) (Part of 10316)
2	—	Brush Holder Screw (Test Point "F") (Part of 10316)
3	—	Brush Holder Screw (Test Point "A") (Part of 10316)
4	—	I Circuit 904 (LG/R) (Part of 14305)
5	—	S Circuit 4 (W/BK) (Part of 14305)
6	—	A Circuit 36 (Y/W) (Part of 14305)
7	—	Rotor Slip Ring

		(Part of 10328)

PINPOINT TEST A: CHARGE INDICATOR LIGHT ON WITH ENGINE RUNNING

A1 PRELIMINARY CHECKS

- Check the following:
- Fuse link.
- Battery terminals and cable clamps.
- Wiring connections at generator, voltage regulator and engine-to-body grounds.
- Generator belt tension.

Are components OK?

Yes	No
GO to **A2** .	SERVICE and/or REPLACE as necessary. After servicing, PERFORM Base, No-Load and Load Tests . REFER to Component Tests in this section.

A2 SYSTEM VOLTAGE TESTS

- Perform Base, No-Load and Load Tests . Refer to Component Tests in this section.

Is system voltage below specified range (undercharging)?

Yes	No
GO to **A3** .	REFER to Pinpoint Test B for overcharging condition.

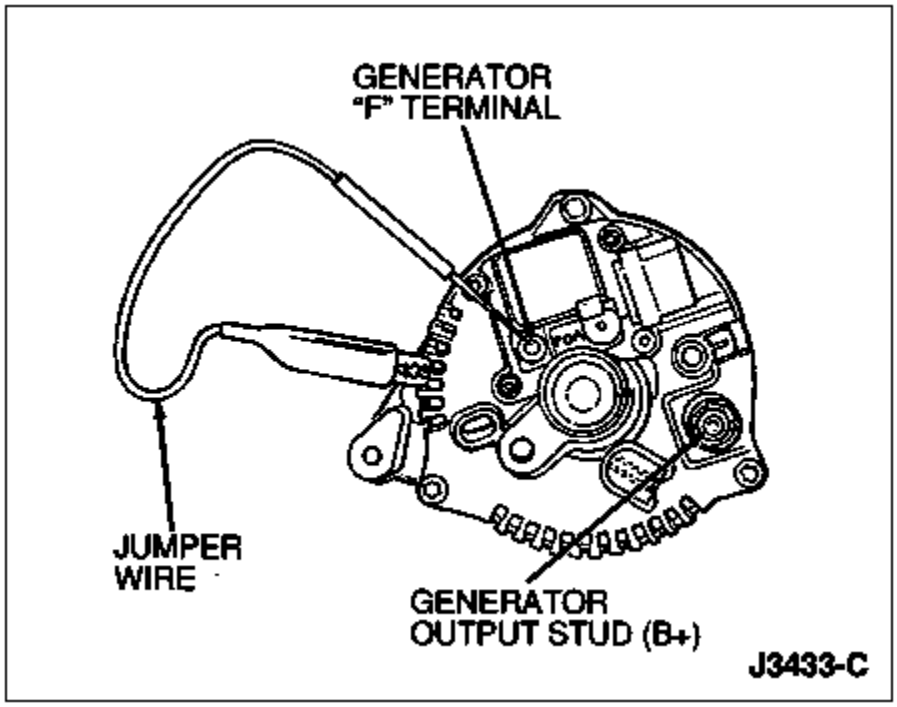
A3 ISOLATE GENERATOR

- Connect voltmeter positive lead to generator output terminal and negative lead to battery negative terminal.

CAUTION: Following test connection will bypass voltage regulator to full field generator. If voltage regulator is functioning, voltage will rise rapidly. If voltage is allowed to rise uncontrolled by voltage regulator damage may occur. Be prepared to break test connection when voltmeter reads 15.5 volts.

- Connect one end of jumper wire to clean chassis ground.
- Start engine.
- Touch other end of jumper to Test Point F.

Did voltage rise above 15 volts?



Yes	No
GO to A9.	GO to A4.

A4 A TERMINAL VOLTAGE CHECK

- Touch voltmeter positive lead to generator A terminal.

Does voltmeter read battery voltage?

Yes	No
GO to A6.	GO to A5.

A5 A CIRCUIT BATTERY SUPPLY CHECK

- Disconnect wiring at voltage regulator.
- Check for voltage at A circuit terminal.

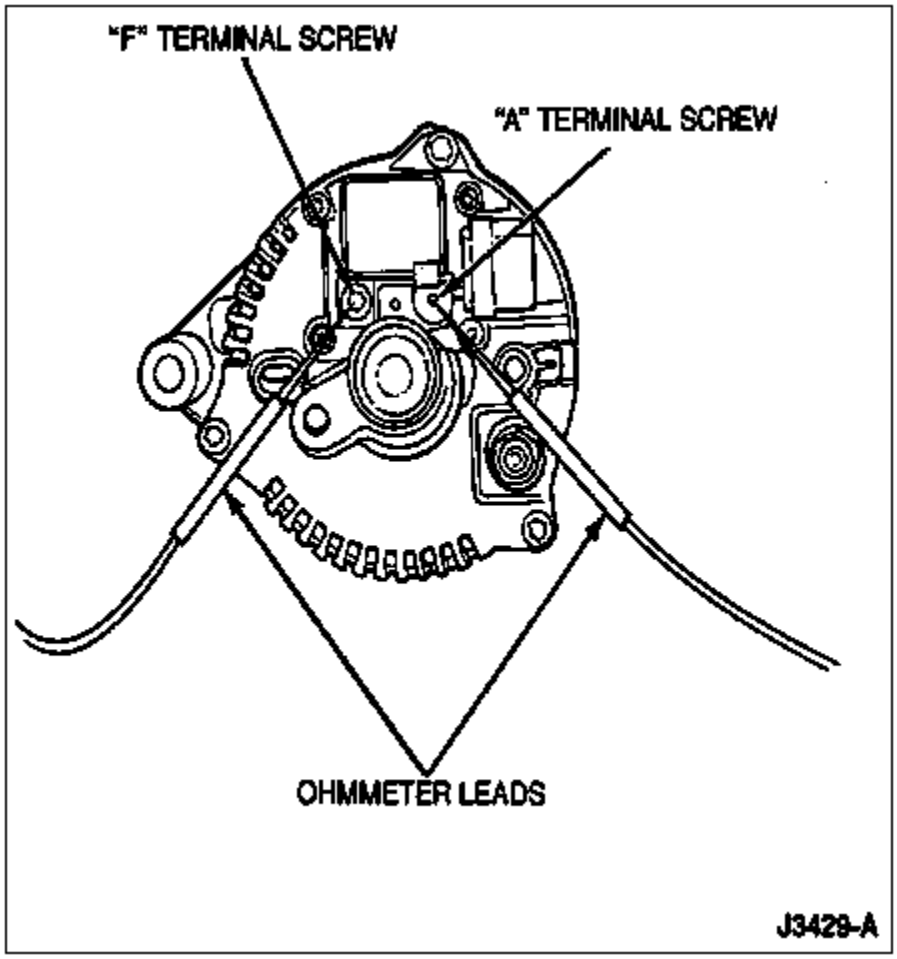
Is battery voltage present?

Yes	No
REPLACE voltage regulator.	CHECK fuse (Ranger) or fuse link (Aerostar). If OK, REPAIR open in Circuit 36 (Y/W).

A6 ROTOR COIL CHECK

- Disconnect wiring at voltage regulator.
- Measure resistance across generator test terminals A and F.

Is ohmmeter reading less than 2.4 ohms?



Yes	No
GO to A7 .	GO to A9 .

A7 SHORTED ROTOR COIL CHECK

- Remove voltage regulator and generator brush holder.
- Measure resistance across rotor slip rings.

Is ohmmeter reading less than 2.4 ohms?

Yes	No
REPLACE generator.	GO to **A8** .

A8 BRUSH/SLIP RING INSPECTION

- Inspect brushes for damage, loose wiring connections and excessive wear.
- Inspect rotor slip ring for contamination which may prevent continuity with brushes.

Are brushes and slip rings serviceable?

Yes	No
REPLACE voltage regulator.	REPLACE generator.

A9 OPEN S CIRCUIT

- Check for continuity between single S terminal and S terminal in voltage regulator terminal.

Is there continuity?

Yes	No
GO to **A10** .	REPAIR open in S circuit.

A10 STATOR OUTPUT VOLTAGE CHECK

- Start engine.
- Measure voltage at the S terminal on the back of the generator.

Is voltage at least 1/2 of battery voltage?

Yes	No
REPLACE voltage regulator.	REPLACE generator.

PINPOINT TEST B: GENERATOR OVERCHARGING (BATTERY VOLTAGE GREATER THAN 15.5 VOLTS)

B1 CHECK VOLTAGE DROP IN A CIRCUIT

- Turn key to ON position.
- Measure voltage between test point A on the voltage regulator and the positive (+) battery post.

Is voltage drop less than 0.25 volt?

Yes	No
GO to **B2** .	REPAIR excess voltage drop in Circuit 36 (Y/W). CHECK fuse or fuse link and connectors in Circuit 36 and SERVICE as required.

B2 CHECK VOLTAGE DROP IN I CIRCUIT

- Measure voltage at wiring harness I terminal, Circuit 904 (LG/R).

  NOTE: Voltage regulator must be connected to wiring harness for this test.

Is voltage greater than 1 volt?

Yes	No
GO to **B3** .	REPAIR high resistance in Circuit 904 (LG/R).

B3 CHECK FOR POOR GROUNDS

- Check for poor ground connections between voltage regulator and generator, generator and engine, or engine and battery.

Are all ground connections clean and tight?

Yes	No
GO to **B4** .	CLEAN or REPAIR grounds as required.

B4 CHECK FOR FIELD CIRCUIT DRAIN

- Turn key to OFF position.
- Measure voltage at test point F on the voltage regulator.

Is voltage at test point F equal to battery voltage?

Yes	No
Generator is OK. REPLACE voltage regulator.	GO to **B5** .

B5 CHECK FOR GROUNDED SLIP RING

- Remove generator from vehicle.
- Remove voltage regulator.
- Measure resistance from each generator slip ring to the generator housing.

Is resistance from either slip ring to housing less than 200 ohms?

Yes	No
If grease or dirt has accumulated near the slip rings, CLEAN the slip rings and RECHECK resistance. If still less than 200 ohms, REPLACE generator.	REPLACE voltage regulator.

PINPOINT TEST C: INDICATOR LAMP ON, KEY OFF

C1 CHECK LAMP CIRCUIT WIRING

- Turn key to OFF position.
- Remove three-pin voltage regulator connector.
- Measure voltage at wiring harness I terminal, Circuit 904 (LG/R).

Is voltage greater than 0 volts?

Yes	No
SERVICE Circuit 904 (LG/R). Circuit should be hot in RUN position only.	SERVICE instrument cluster. See Section 13-01 .

PINPOINT TEST D: INDICATOR LAMP OFF, KEY ON, ENGINE NOT RUNNING

D1 CHECK FOR OPEN I CIRCUIT

- Remove three-pin voltage regulator connector.
- Turn key to ON position.
- Measure voltage at wiring harness I terminal, Circuit 904 (LG/R).

Is voltage greater than 0 volts?

Yes	No
GO to **D2** .	REPAIR open in Circuit 904 (LG/R).

D2 CHECK FOR BURNED OUT BULB

- Connect wiring harness I terminal, Circuit 904 (LG/R) to ground with a jumper wire.

Is indicator lamp on?

Yes	No
REMOVE jumper wire. GO to **D3** .	REPLACE bulb or REPAIR high resistance in

	bulb socket or Circuit 904 (LG/R).

D3 CHECK FOR POOR GROUNDS

- Check for poor ground connections between voltage regulator and generator, generator and engine, or engine and battery.

Are all ground connections clean and tight?

Yes	No
GO to **D4** .	CLEAN or REPAIR grounds as required.

D4 CHECK S CIRCUIT WIRING

- Remove one-pin S connector from generator.
- Measure voltage at wiring harness S terminal, Circuit 4 (W/BK).

Is voltage greater than 0 volts?

Yes	No
SERVICE Circuit 4 (W/BK). Circuit should be hot only when engine is running. CHECK for swapped wires in voltage regulator connector.	GO to **D5** .

D5 CHECK FOR SHORTED RECTIFIER

- Measure voltage at the S terminal on the back of the generator.

Is voltage greater than 1 volt?

Yes	No
If lamp is on with one-pin S connector removed, REPLACE generator.	REPLACE voltage regulator.

PINPOINT TEST E: INDICATOR LAMP FLICKERS OR INTERMITTENT

E1 CHECK FOR LOOSE CONNECTIONS

- Check these connections for corrosion, loose or bent pins, or loose eyelets:
  - Three-pin voltage regulator connector.
  - One-pin S connector.
  - Generator B+ eyelet.

- Underhood power distribution box and harness circuit 36 (Y/W) (15A) fuse (Ranger).
- Underhood fuse box eyelets.
- Battery cables.
- Fuse links (Aerostar).

Are all connections clean and tight?

Yes	No
GO to **E2** .	CLEAN or REPAIR connections as required.

E2 CHECK FOR FIELD CIRCUIT DRAIN

- Turn key to OFF position.
- Measure voltage at test point F on the voltage regulator.

Is voltage at test point F equal to battery voltage?

Yes	No
GO to **E3** .	GO to **E5** .

E3 CHECK FOR LOOSE A CIRCUIT FUSE

- Start engine.
- Check the generator fuse in the underhood fuse box for a loose connection by wiggling the fuse with the engine running.

Does indicator lamp flicker?

Yes	No
REPAIR loose fuse connection.	GO to **E4** .

E4 CHECK A CIRCUIT CONNECTIONS

- With engine running, connect test point A on the voltage regulator to the positive (+) battery post using a jumper wire.

Does indicator lamp flicker?

Yes	No
REPLACE voltage regulator. If problem still exists, REPLACE generator.	REPAIR poor connection in Circuit 36 (Y/W).

E5 CHECK BRUSH HOLDER SCREWS

- Remove generator from vehicle.
- Check the brush holder screws, located on the voltage regulator (test points F and A).

Are the brush holder screws tight?

Yes	No
GO to **E6** .	TIGHTEN screws to 2.8-4.0 Nm (25-35 Lb-In).

E6 CHECK FOR GROUNDED SLIP RING

- Remove voltage regulator.
- Measure resistance from each generator slip ring to the generator housing.

Is resistance from either slip ring to housing less than 200 ohms?

Yes	No
If grease or dirt has accumulated near the slip rings, CLEAN the slip rings and RECHECK resistance. If still less than 200 ohms, REPLACE generator.	REPLACE voltage regulator.

PINPOINT TEST F: VOLTAGE GAUGE READS HIGH

F1 CHECK GENERATOR

- Perform the Generator/Base Voltage and No-Load Tests. Refer to Component Tests in this section.

Is generator output voltage within specified range?

Yes	No
REFER to Section 13-01 to diagnose the battery voltage gauge.	GO to Pinpoint Test A .

PINPOINT TEST G: VOLTAGE GAUGE READS LOW

G1 CHECK GENERATOR

- Perform the Generator Base Voltage and No-Load Tests. Refer to Component Tests in this section.

Is generator output voltage within specified range?

Yes	No

REFER to Section 13-01 to diagnose the battery voltage gauge.	GO to Pinpoint Test A .

PINPOINT TEST H: GENERATOR NOISY

H1 CHECK FOR ACCESSORY-DRIVE NOISE

- Check the drive belt to make sure that it is installed properly and is not damaged.
- Check the accessory mounting brackets for loose bolts or out of alignment condition.
- Check for a bent pulley.

Is accessory drive OK?

Yes	No
GO to **H2** .	GO to Section 03-05 and SERVICE accessory drive as required.

H2 SUBSTITUTE KNOWN GOOD GENERATOR

- Remove generator and replace with a known good generator.

Is noise present with known good part?

Yes	No
Generator is OK. INSTALL original part. CHECK other accessories to find the cause of the noise.	REPLACE generator.

PINPOINT TEST J: RADIO INTERFERENCE

J1 VERIFY RADIO INTERFERENCE

- Start engine.
- Tune radio to a station where interference is present.
- Remove three-pin voltage regulator connector.

Is interference present with connector removed?

Yes	No
Generator is OK. SEE Section 15-00 to find the cause of the radio interference.	GO to **J2** .

J2 SUBSTITUTE KNOWN GOOD GENERATOR

- Remove generator and replace with a known good generator.

Is interference present with known good part?

Yes	No
Generator is OK. SEE Section 15-00 to find the cause of the radio interference.	REPLACE generator.

PINPOINT TEST K: BATTERY DOES NOT HOLD A CHARGE

K1 CHECK BATTERY CONNECTIONS

- Inspect the battery cables for loose or corroded connections.

Are the battery cables clean and tight?

Yes	No
GO to **K2** .	CLEAN or TIGHTEN the battery cables.

K2 BATTERY CAPACITY TEST

- Perform battery capacity test. Refer to Pinpoint Test L in this section.

Did battery pass capacity test?

Yes	No
GO to **K3** .	REPLACE battery.

K3 BATTERY DRAIN

- Perform battery drain tests. Refer to Component Tests in this section.

Is the battery discharging due to a drain condition?

Yes	No
REPAIR cause of drain as required.	GO to **K4** .

K4 CHECK GENERATOR

- Perform Generator Output Test. Refer to Component Tests in this section.

Is generator output voltage within specified range?

Yes	No
Battery and electrical system are serviceable.	GO to Pinpoint Test A .

PINPOINT TEST L: BATTERY IS NOT SERVICEABLE

L1 VISUAL INSPECTION

- Remove battery ground cable, then battery to starter relay cable.
- Check for dirty or corroded connections.

Are connections OK?

Yes	No
GO to **L2**	CLEAN terminals and clamps. GO to **L2** .

L2 LOOSE BATTERY POST

- Check for loose battery posts.

Are posts OK?

Yes	No
GO to **L3** .	REPLACE battery.

L3 CRACKED BATTERY COVER

- Remove battery hold down clamps and shields.
- Check for broken/cracked case or battery cover.

Are case and battery cover OK?

Yes	No
GO to **L4** .	REPLACE battery.

L4 BATTERY CAPACITY TEST

- Use ARBST 010-00725, or equivalent to perform battery capacity test. Follow instructions supplied with tester for the battery capacity test.

- Recommended Discharge Rate at 27℃ (80°F): One hal f of the cold cranking amps.
- Voltage Readings at 15 seconds for Good Battery (Battery Capacity Test).

Approximate Battery Temperature	Minimum Load Voltage
27℃ (80℉) and above	9.6
21℃ (70℉) and above	9.6
16℃ (60℉) and above	9.5
10℃ (50℉) and above	9.4
4℃ (40℉) and above	9.3
-1℃ (30℉) and above	9.1
-7℃ (20℉) and above	8.9
-12℃ (10℉) and above	8.7
-18℃ (0℉) and above	8.5

- Wait 2 minutes and check the Open Circuit Voltage (OCV). Check the battery voltage.
- Measure battery voltage using Rotunda 73 Digital Multimeter 105-R0051, or equivalent.

Did battery pass the minimum load voltage and OCV above 12.40 volts?

Yes	No
Battery OK.	Passes load test but OCV voltage at 12.4 volts. GO to **L5** . Passes load test but OCV voltage below 12.4 volts. Battery worn out. REPLACE battery.

L5 OPEN CIRCUIT VOLTAGE (OCV)

- Charge battery for 20 minutes at 35 amps.
- Repeat test step procedures in step **L4** .

Did battery pass the minimum load voltage?

Yes	No
Battery OK but NEEDS CHARGING.	REPLACE battery.

Component Tests

Drain Testing

Check for current drains on the battery in excess of 50 milliamps with all the electrical accessories off and the vehicle at rest. Current drains can be tested with the following procedure.

WARNING: DO NOT ATTEMPT THIS TEST ON A LEAD-ACID BATTERY THAT HAS RECENTLY BEEN RECHARGED.

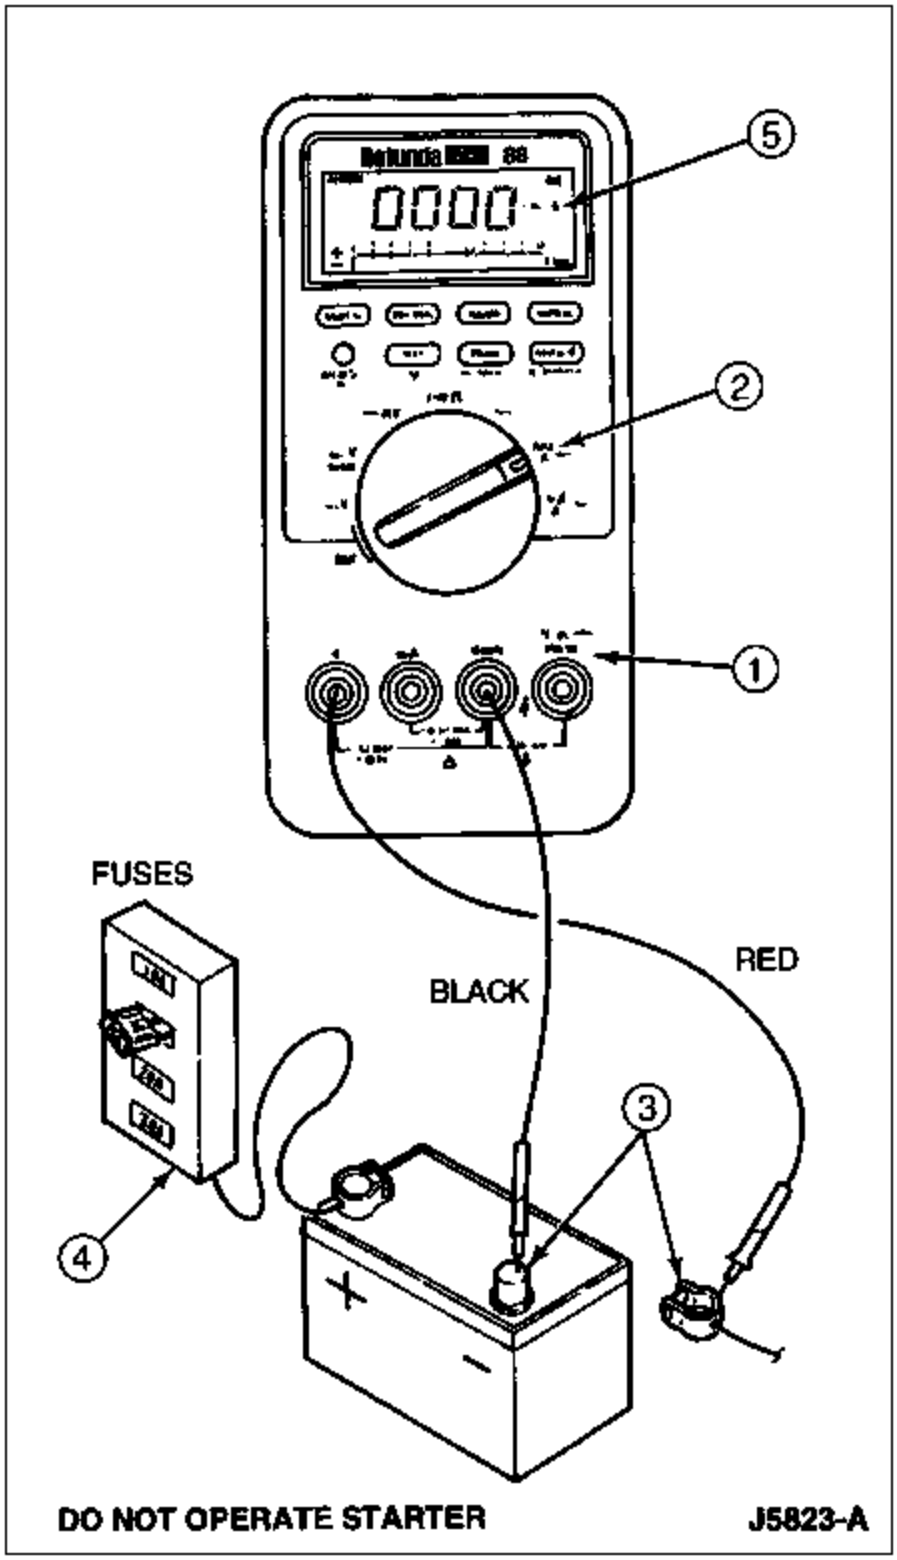
CAUTION: Do not crank the engine or operate accessories that draw more than 10A. You could blow the fuse in the meter.

NOTE: You must wait approximately 50 minutes after doors have been opened before performing this test. Some vehicles will not return to normal key-off drain for 50 minutes.

NOTE: Many computers draw 10 mA or more continuously.

NOTE: Use an in-line ammeter between the battery positive or negative post and its respective cable.

1. Insert the test leads in the input terminals shown.
2. Turn switch to mA/A dc.
3. Disconnect battery terminal and touch probes as shown.
4. Isolate circuit causing current drain by pulling out one fuse after another while reading the display.
5. Current reading will drop when the fuse on the bad circuit is pulled.
6. Reinstall fuse and test components (including connectors) of that circuit to find defective component (s).



Typically, a drain of approximately one amp can be attributed to a courtesy staying on continually. Other component failures or wiring shorts may be located by selectively pulling fuses or disconnecting fuse links to pinpoint the location of the current drain. When the current drain is found, the meter reading will fall to an acceptable level. If the short is still not located, after checking all the fuses and fuse links, the drain may be due to the generator.

NOTE: Do not start vehicle with clip on cable.

Test Conclusion

The current reading (current drain) should be less than 0.05 amps. If it exceeds 0.05 amps it indicates a constant current drain which could cause a discharged battery. Possible sources of current drain are vehicle lamps (underhood, glove compartment, luggage compartment, etc.) that do not shut off properly.

If the drain is not caused by a vehicle lamp, remove the fuses from the interior fuse junction panel, one at a time, until the cause of the drain is located. If drain is still undetermined, remove fuses one at a time at the main fuse junction panel to find the problem circuit.

With Voltmeter Test Procedure

This test requires a digital volt-ohmmeter with an appropriate low voltage scale such as Rotunda 88 Digital Multimeter 105-R0053 or equivalent. The meter must read within 0.01 millivolt. Also required is a shunt assembly similar to that shown in the illustration.

1. Turn ignition switch (11572) to the off position and make sure there are no electrical loads. After determining the compartment lamp (15702) is turning off properly, disconnect the bulb.

2. Check battery voltage. If voltage is under 11.5 volts, charge the battery (10655) to above 11.5.

3. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

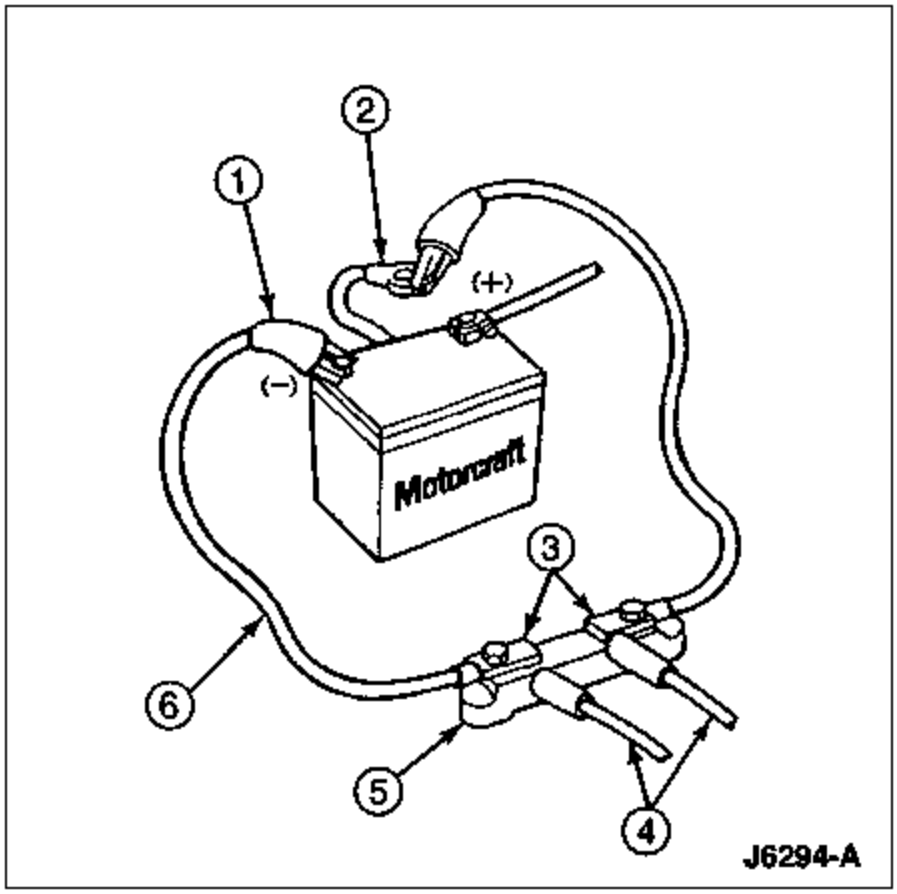
   Disconnect battery ground cable (14301).

4. **CAUTION: Do not crank the engine (6007), it could destroy the shunt. Also do not use the shunt to measure starting currents.**

   Connect shunt as shown.

5. Set volt-ohmmeter to 200 or 300 mv scale for an accurate reading (must be within 0.01 millivolt).

6. Connect meter leads to shunt as shown. With this size shunt (50 mv = 50 amps) and meter, a direct current drain measurement can be made.



Item	Part Number	Description
1	—	Negative Battery Terminal
2	—	Negative Cable Clamp
3	—	Voltage Drop (Amp Drain) Points
4	—	Voltmeter Leads
5	—	Shunt Assembly (50 MV = 50 Amp)
6	—	10-Gauge Wire (Minimum)

Test Conclusion

The current reading (current drain) should be less than 0.05 amps. If the reading is between 0.2 and 0.9, a possible drain may be a vehicle lamp (glove compartment, compartment lamp, luggage compartment lamp (13A756), etc.) that does not turn off. If the problem is not a lamp, remove the fuses (14526) from the fuse holder (14411) one at a time until the cause of the drain is located. If still undetermined, disconnect leads at starter relay one at a time to find the problem circuit.

Vehicles with Major Key OFF Loads Such As Computer-Controlled Suspension

Vehicles equipped with these features will have temporary current drains that may last up to 70 minutes after ignition switch is turned off. These drains can range from 0.1 to 20 amps if the compressor is cycling. This action can often mask a problem and must be considered when evaluating test results. To test for this kind of drain, proceed as follows.

1. Repeat Steps 1 through 5 of the Drain Testing Procedure.
2. Turn ignition switch to RUN for a moment and then off again.
3. Disconnect major key OFF load circuits.
4. Make sure interior lamp (13776) is off, if applicable.

Test Conclusion

The current reading (current drain) should be less than 0.05 amps. If it is higher, disconnect fuses and leads of the starter motor cutout relay (11433) as in the previous test to locate the problem circuit.

If the drain is less than 0.05 amps, reconnect the major key-off load circuits, turn ignition switch to RUN and then off, and wait 70 minutes to make sure they shut off properly. If current drain is still greater than 0.05 amps after 70 minutes, disconnect each of the components one at a time until the cause of the current drain is located.

Electronic Drains Which Shut Off When the Battery Cable Is Disconnected

1. Repeat Steps 1 through 5 of the Voltmeter Drain Test Procedure.
2. Without starting engine, turn ignition switch to the RUN position for a moment and then off. If applicable, wait one minute for the interior lamp to turn off.
3. Connect voltmeter and read voltage.

Test Conclusion

The current reading (current drain) should be less than 0.05 amps. If it exceeds 0.05 after a few minutes, and if this drain did not show in previous tests, the drain is most likely from a malfunctioning electronic component. As in previous tests, remove fuses and disconnect leads of the starter motor cutout relay one at a time to locate the problem circuit.

Battery

Capacity Testing

To perform this test use a high rate discharge tester, Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent, in conjunction with Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

1. Turn ARBST OFF.
2. Turn the multimeter to the DV volt position.
3. Connect ARBST and multimeter positive test leads to the positive battery post and both negative test leads to the negative battery post. The multimeter clips must contact the battery posts and not the ARBST tester clips. Unless this is done, the actual battery terminal voltage will not be indicated.
4. Adjust ARBST until the ammeter reads approximately half of the cold cranking amps of the battery.
5. With the ammeter reading the required load for 15 seconds, note the multimeter reading. Avoid

leaving the high discharge load on the battery for periods longer than 15 seconds.

6. If the multimeter reading is 9.6 volts at 21°C (70°F) or more, the battery has a good output capacity and will readily accept a charge, if required.

7. If the voltage reading obtained during the capacity test is below 9.6 volts at 21°C (70°F), and the battery is fully charged, the battery is defective and must be replaced. If unsure about the battery's state of charge, charge the battery.

8. After the battery has been charged, repeat the capacity test. If the capacity test battery voltage is still less than 9.6 volts at 21°C (70°F), replace the battery. If the voltage is 9.6 or more at 21°C (70°F), the battery is satisfactory for service.

9. If the battery is found to be discharged only, check for a loose drive belt, loose electrical connection, charging system performance, and perform battery drain testing as described in this section.

Generator Base Voltage Test

NOTE: Prior to running this test, turn the headlamp bulbs (13007) on for 10-15 seconds to remove any surface charge from the battery. Then, wait until the voltage stabilizes before performing the Generator Base Voltage Test. Battery should be at the recommended state of charge.

1. With the ignition off and no electrical loads on, connect the negative lead of Rotunda 73 Digital Multimeter 105-R0051 or equivalent to the battery ground cable clamp.

2. Connect the positive lead of the voltmeter to the battery to starter relay cable (14300) clamp.

3. Read and record the battery voltage shown on the voltmeter. This is called base voltage and will be used in later tests.

No-Load Test

1. Connect Rotunda 88 Digital Multimeter 105-R0053 or equivalent to monitor engine speed.

2. Connect the leads of Rotunda 73 Digital Multimeter 105-R0051 or equivalent across the battery terminals.

3. Read the voltage (base voltage).

4. Start the engine.

5. Run the engine at 1500 rpm with no electrical load.

6. Read the voltage. The voltage should be in the range of 13.5 to 15.1 volts. If the voltage increase is less than 2.5 volts over the base voltage, perform the following Load Test. If there is no voltage increase or the voltage increase is greater than 2.5 volts, perform the Generator On-Vehicle Tests and Generator Bench Tests in this section.

Load Test

1. With the engine running, turn on the air conditioner, if equipped, the blower motor (18527) to high speed and the headlamps to high beam.

2. Increase the engine speed to approximately 2000 rpm. The voltage should increase a minimum of 0.5 volts above the base voltage. If the voltage does not increase as specified, refer to Generator On-Vehicle Tests and Generator Bench Tests in this section.

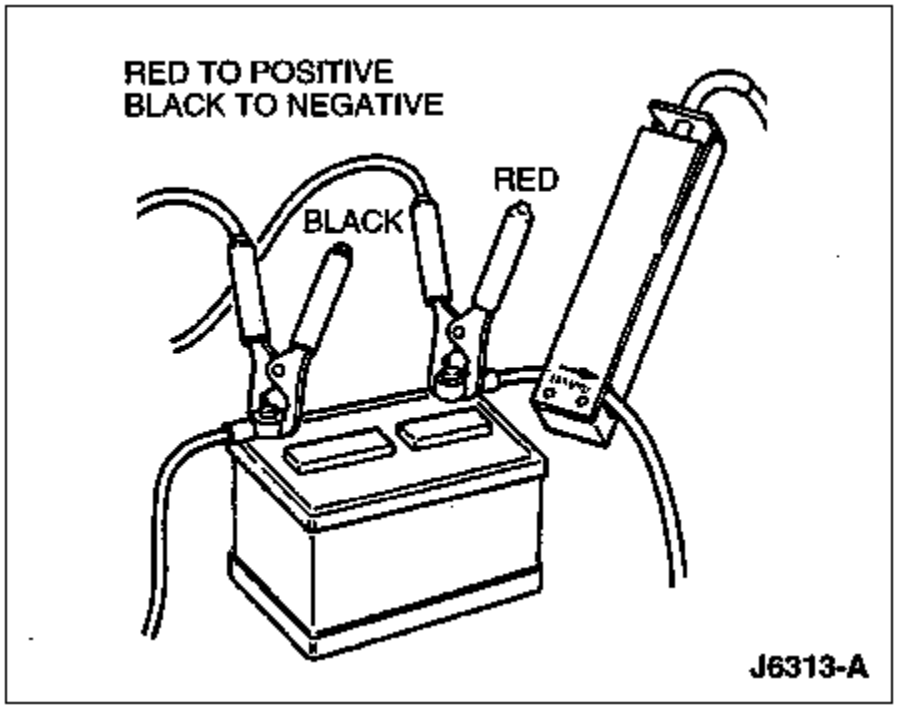
   If the voltage increases as specified, the charging system is operating normally. Proceed to the following battery tests.

Generator

Generator Output Test

NOTE: Battery and cable clamps must be clean and tight to ensure accurate meter indications. Before performing any generator tests, inspect the drive belt (8620) for looseness, damage and wear. If necessary, adjust the drive belt for proper tension. Refer to Section 03-05 .

1. Connect the leads of Rotunda ARBST 010-00725 or equivalent, to the vehicle as shown, observing proper polarity.



2. Connect current probe to generator output wire to measure generator output.
3. Turn off all electrical accessories.
4. Turn the ignition switch to ON position and read the rate of discharge on the ammeter.
5. Start the engine and run engine at 1500 to 2000 rpm.

6. **CAUTION: Do not drop the voltage below 12 volts.**

   Slowly increase the load control knob on the VAT-40 until the highest amp reading is obtained.

7. Turn off the load control knob.

8. Add the ammeter reading obtained in Step 3 and Step 5 for total generator output. If the amperage output is within 10 percent of its rated output, the generator is functioning properly. If the amperage output is below this specification, refer to the Symptom Chart in this section.

Field Circuit Drain

Connect the voltmeter negative lead to the generator (GEN) (10346) rear housing for all of the following voltage readings:

1. With ignition switch turned to OFF position, contact voltmeter positive lead to voltage regulator (VR) (10316) F terminal screw. The meter should indicate battery voltage if system is operating normally. If less than battery voltage is indicated, proceed with Step 2 to find cause of current drain.

2. Measure voltage at I terminal (ignition switch OFF). If voltage is indicated, service I circuit from ignition switch to eliminate voltage source.

3. If no voltage was indicated in Step 2, contact voltmeter positive lead to wiring plug S terminal. No voltage should be indicated. If no voltage is indicated, replace the voltage regulator.

4. If voltage was indicated in Step 3, disconnect the one pin S terminal connector. Again, contact voltmeter positive (+) lead to voltage regulator wiring plug S terminal. If voltage is indicated, service S lead wiring to eliminate voltage source. If no short is found, replace generator assembly.

Alternate Test Method

Use Rotunda Power Sensor Plus Electronic Battery Test 162-00002. Follow the manufacturer's defined test procedure.

Generator On-Vehicle Tests

Troubleshooting or diagnosis is required before actual service can be made in the electrical system. Even where an obvious condition makes replacement of a component necessary, find out why the component failed. When a condition is diagnosed correctly, unnecessary service is prevented, the time the vehicle is out of service will be decreased, and the condition will be properly corrected the first time.

NOTE: Refer to the Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 Test Procedure Manual for complete directions on checking out the charging system.

In order to check the charging system, the use of Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent tester is suggested.

When performing charging system tests, turn off all lamps and electrical components. Place transmission in neutral and apply parking brake.

CAUTION: Do not make jumper wire connections except as directed. To do so may damage generator.

CAUTION: Do not allow any metal object to come in contact with the housing and internal diode cooling fins with key on or off or short circuit will result and burn out diodes.

NOTE: Battery posts and cable clamps must be clean and tight to ensure accurate meter indications.

Load Test

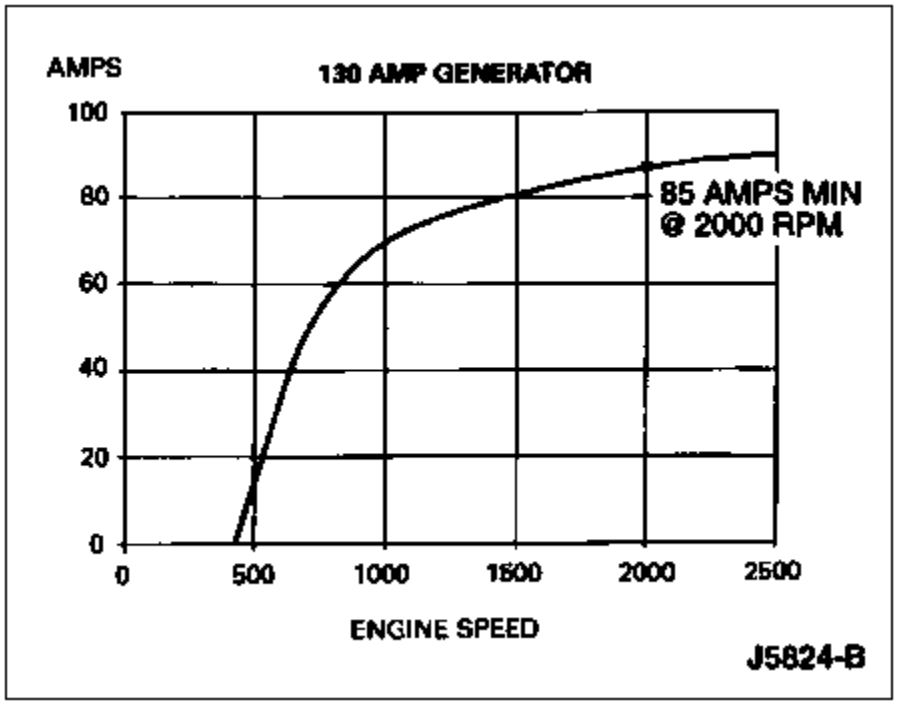
1. Switch the Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent to the ammeter function.

2. Connect the positive and negative leads of the Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent to the battery.

3. Connect the current probe to the generator B+ output lead, Circuit 38 (BK/O).

4. With the engine running at 2000 rpm, adjust the Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent load bank to determine the output of the generator (GEN)

(10300). Generator output should be greater than the graph shown below. If not, refer to the symptom chart in this section for diagnostic procedures.



No-Load Test

1. Switch the Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent to the voltmeter function.
2. Connect the voltmeter positive lead to the generator B+ terminal and the negative lead to ground.
3. Turn all electrical accessories off.
4. With the engine running at 2000 rpm, check the generator output voltage. The voltage should be between 13.0 and 15.0 volts. If not, refer to the symptom chart in this section for diagnostic procedures.

Generator Bench Tests (Integral Rear Mount Regulator, Internal Fan Generator)

NOTE: The integral rear mount regulator — internal fan type generator is serviced as an assembly only.

Replace generator as required after performing Generator On-Vehicle Tests.

Capacitor

The radio voltage regulator capacitor (18832) connected across the heat sinks may be tested on a capacitor tester if available. Its value is .158 MFD, and 100 working volts D.C.

In the absence of a capacitor tester, the unit may be checked for shorts by means of an ohmmeter connected across the terminals. A reading under 20 milli-ohms indicates a shorted or leaking radio voltage regulator capacitor which should be replaced.

Battery

Removal

1. Remove battery cables from battery terminals (battery ground cable (14301) first). On Ranger vehicles, remove battery heat shield.

2. Remove battery hold down clamp (10718).

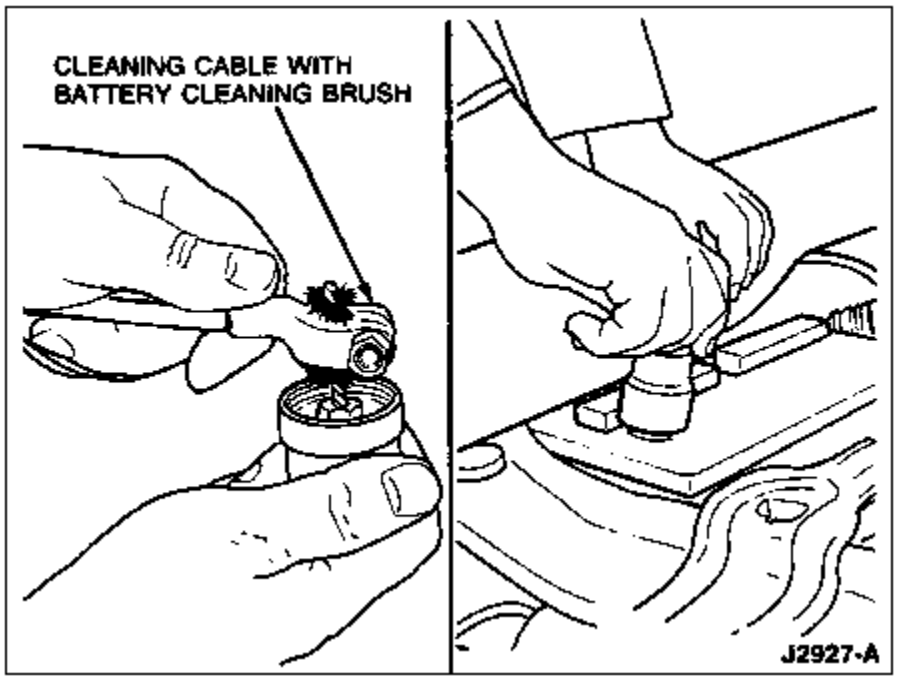
3. **CAUTION: When lifting a plastic-cased battery (10655), excessive pressure on the end walls could cause acid to spew through the vent caps, resulting in personal injury, damage to the vehicle or battery. Lift with a battery carrier or with your hands on opposite corners.**

   Remove battery from vehicle.

Installation

1. **NOTE: The battery terminal cleaning operation shown in the following illustration is typical for all vehicles.**

   Clean cable terminals and battery hold down clamp with a wire brush. Replace all cables or parts that are worn or frayed.



2. Clean battery tray (10732) with a wire brush and scraper.

3. Place battery in battery tray with positive and negative terminals in same position as previous battery (10653). On Ranger vehicles install battery heat shield.

4. Assemble and tighten battery hold down clamp so battery is secure. Do not tighten excessively.

5. **NOTE: When the battery has been disconnected and reconnected, some abnormal driving symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.**

   Secure cables (battery to starter relay cable (14300) first) to proper terminals. Tighten to 7-10 Nm (5-7 lb-ft). Apply petroleum jelly to terminals.

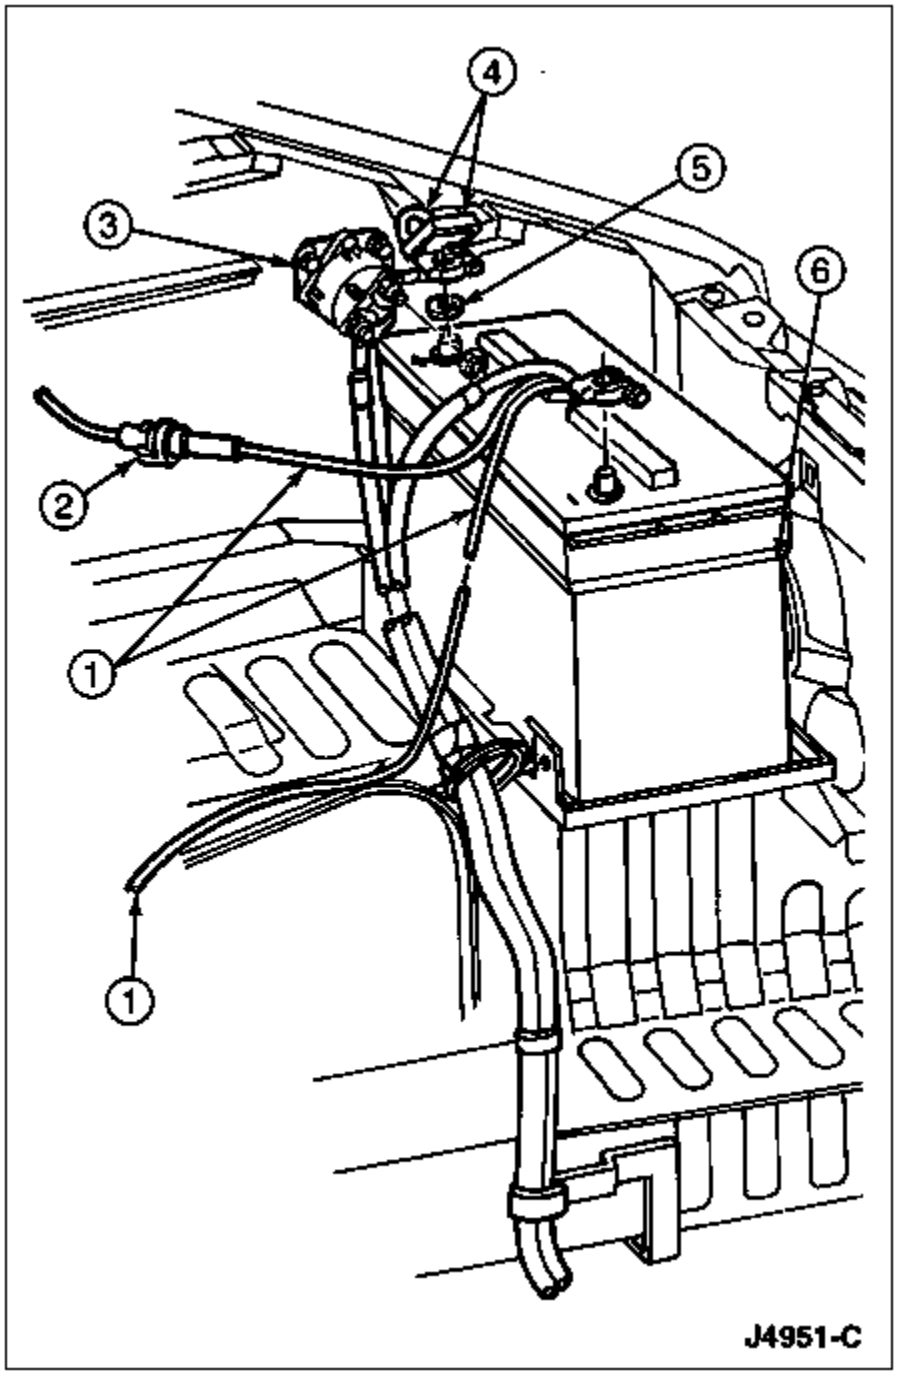
8	11450	Starter Relay

Battery Connections, Aerostar with 3.0L and 4.0L Engines



Item	Part Number	Description
1	14301	Battery Ground Cable
2	12A581	Engine Control Sensor Wiring
3	11450	Starter Motor Solenoid Relay Switch

4	14300	Battery to Starter Relay and Starter Cable
5	374043	Felt Washer
6	10655	Battery

Battery Tray

Removal

1. Remove battery (10655) from vehicle.
2. Remove attaching screws and washers from battery tray (10732).

Installation

1. Position battery tray in engine compartment and install attaching screws.
2. Install battery.
3. Tighten battery hold-down bolt to 10-14 Nm (7-10 lb-ft).

Battery Charging

NOTE: If excessive gassing or electrolyte spewing occurs during the charge, discontinue charging. The battery has reached serviceable charge. If the battery will not accept at least 5A after 20 minutes of charging, replace the battery.

WARNING: WEAR SAFETY GLASSES. BATTERY CHARGING CAN BE DANGEROUS. WHILE BEING CHARGED, THE BATTERY PRODUCES A POTENTIALLY EXPLOSIVE MIXTURE OF HYDROGEN AND OXYGEN GASSES. KEEP SPARKS, FLAMES AND LIGHTED CIGARETTES AWAY FROM BATTERIES. IN CASE OF ACID CONTACT WITH SKIN, EYES OR CLOTHING, FLUSH IMMEDIATELY WITH LARGE AMOUNTS OF WATER. GET MEDICAL ATTENTION.

Before recharging a discharged battery, inspect and service the following conditions, if they exist:

1. Loose drive belt (8620).
2. Pinched or grounded generator voltage regulator wiring (14305).
3. Loose connections of the generator voltage regulator wiring at the generator (GEN) (10346) or generator regulator (10316).
4. Loose of corroded connections at battery, grounded starter motor cutout relay or engine.
5. Excessive battery drain due to:
    a. Any courtesy lamps remaining energized (damaged or misadjusted switch, etc).
    b. Door open warning lamp switch (14018) continuously on.
    c. Inoperative autolamp module causing approximately 2 amp drain with ignition switch in the off position and autolamp off.

Maintenance-Free and Low-Maintenance Batteries

Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm up to approximately 5°C (41°F) before charging. This may require four to eight hours at room temperature depending on the initial temperature and battery size.

A battery which has been completely discharged may be slow to accept a charge initially, and in some cases may not accept charge at the normal charger setting. When batteries are in this condition, charging can be started by use of the dead battery switch on chargers so equipped.

To determine whether a battery is accepting a charge, follow charger manufacturer's instructions for use of dead battery switch. If switch is the spring-loaded type, it should be held in the ON position for up to three minutes.

After releasing switch and with charger still on, measure battery voltage. If it shows 12 volts or higher, the battery is accepting a charge and is capable of being recharged. However, it may require up to two hours of charging with batteries colder that 5°C (41°F) bef ore the charge rate is high enough to show on the charger ammeter. It has been found that all non-damaged batteries can be charged by this procedure. If a battery

cannot be charged by this procedure, it should be replaced.

A rapid recharge procedure has been developed for recharging batteries that have passed the Load Test and only need a recharge. This can be due to: in-service no-start battery failures (vehicles will not crank due to low battery state of charge) or battery discharged in vehicle due to key-off loads. Refer to Section 14-00 for Load Test procedure.

The battery can be rapidly recharged by using either of the following methods:

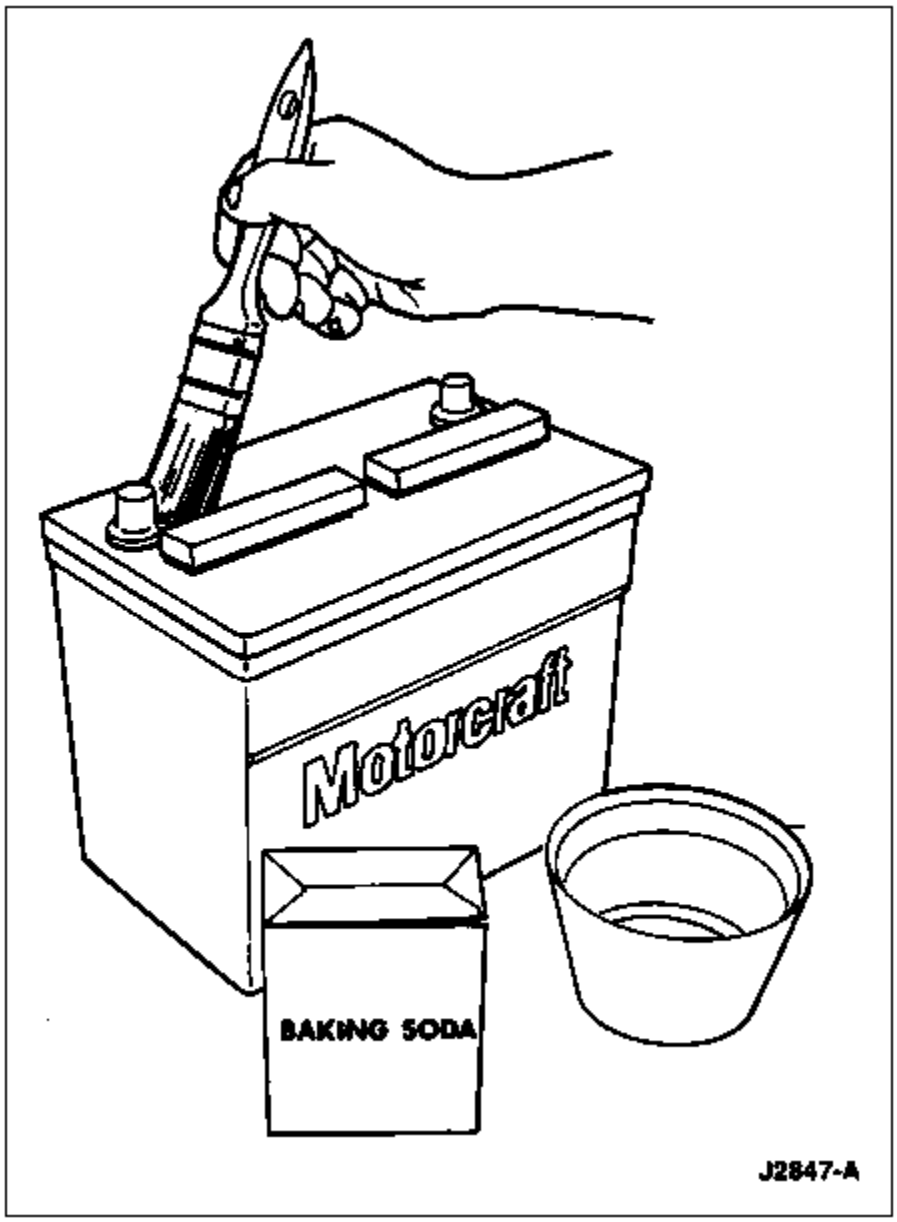
1. Perform a 2-hour charge using 20A constant current (manual setting on charge).

2. Perform a 2-hour charge using a constant potential (automatic setting on charge).

Battery Cleaning

Keeping the battery (10655) top clean and dry reduces the need for service and extends battery life. Also, make certain the cable clamps are tightly fastened to the battery posts. If corrosion is found, disconnect the cables and clean clamps and posts with a wire brush. Neutralize the corrosion with a solution of baking soda and water. After installing cables, apply a small quantity of Premium Long-Life Grease XG-1-C or -K or equivalent grease meeting Ford specification ESA-M1C75-B to each battery post to help prevent corrosion.

The battery cleaning operation shown in the following illustration is typical for all vehicles.



Tools

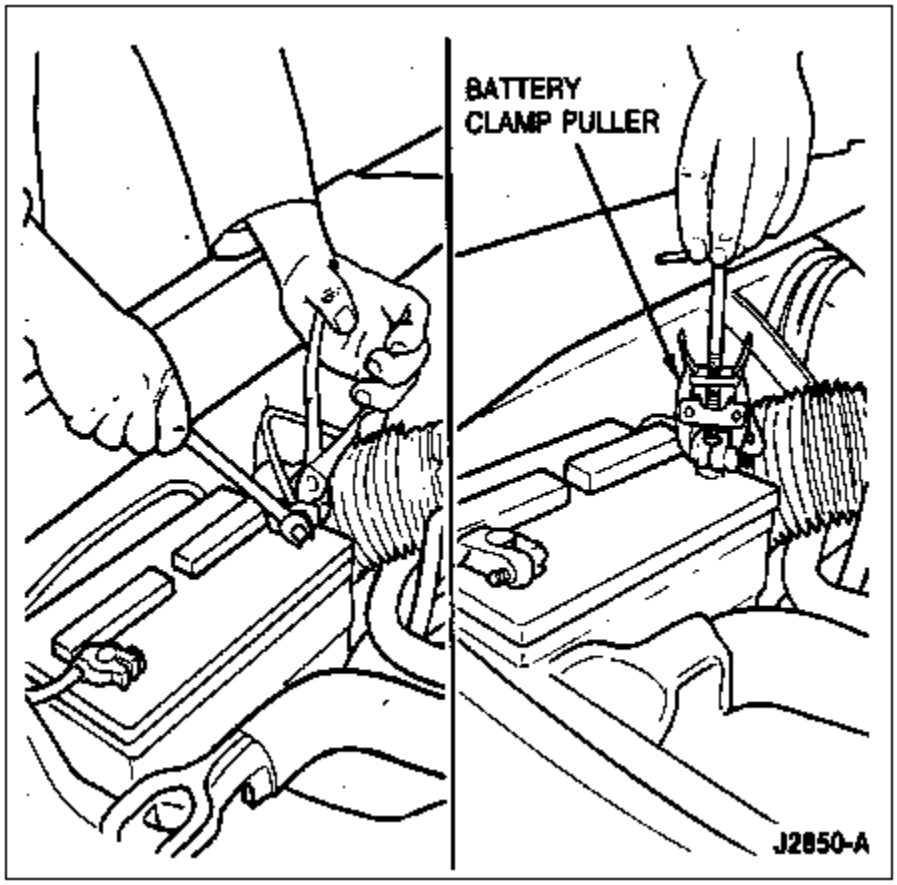
Using the proper tools will prevent damage to the battery (10655), battery cables and battery hold down clamp (10718).

Tools and equipment manufactured for servicing batteries (10653) have parts insulated to help prevent arcing should the tool be dropped or placed accidentally between a terminal and some other contact surface.

Pliers

Battery pliers have jaws specifically designed for gripping cable clamp bolts securely. Care should be taken when removing or replacing the cable clamp bolts so that the battery terminal is not subjected to any excessive lateral or twisting forces. Such forces could cause major damage to the internal components of the battery, and leakage at the terminals.

The battery terminal removal operation shown in the following illustration is typical for all vehicles.



Clamp Puller

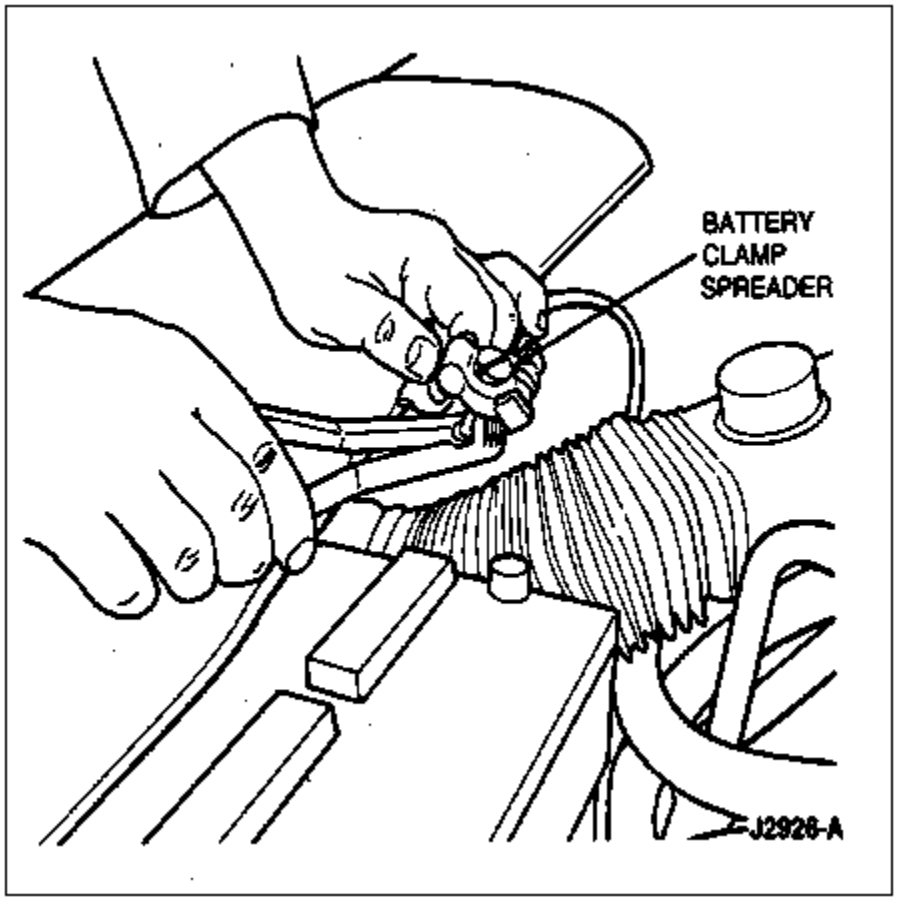
Use a clamp puller to remove a cable clamp from the battery terminal. With the jaws gripping the underside of the cable clamp, pull the clamp up by means of pressure exerted against the top of the battery terminal.

Proper use of this tool avoids the damaging lateral or twisting forces that result when using a pry bar or pliers.

Battery Clamp Spreader

The spreader is used to expand the cable clamp after it has been removed from the terminal and the clamp bolt has been loosened. The cable clamp can then be easily placed in its correct position completely on the terminal.

The battery clamp spreading operation shown in the following illustration is typical for all vehicles.



Terminal Cleaning Brush

The terminal cleaning brush is designed with units to clean both the tapered battery terminal and the mating surface of the cable clamp. Refer to illustration under Battery Installation.

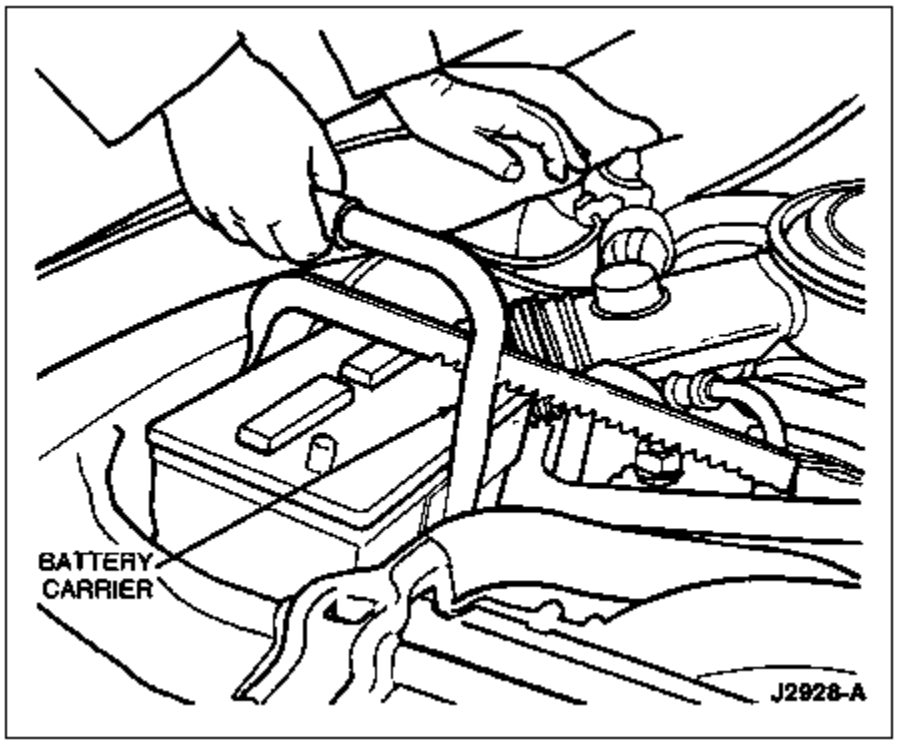
Carrier

CAUTION: Gripping the end walls on the plastic-cased battery could cause electrolyte to spew from some of the cells, resulting in personal injury and possibly cause damage to some of the internal components.

Use a suitable battery carrier for lifting and transporting the battery. The illustration shows a clamp-type carrier used to grip the sidewalls of the container just below the lip of the cover. The carrier is used on the sidewalls, rather than the end walls, since the sidewalls have additional strength from the inner cell

partitions. This is particularly important with the plastic-cased battery which has end walls that are flexible.

The battery removal operation shown in the following illustration is typical for all vehicles.



SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	Lb-Ft	Lb-In

Battery Hold-Down Bracket Bolt	10-14	7-10	—

Radio Reception

Antenna Position

The automatic antenna will adjust to the full extended height for best FM reception.

- FM stereo has a range of about 32 km (20 miles) before interference noises are heard.
- This means that in concern areas with tall buildings or hills, it is necessary to select the strongest possible station.
- The electronic radio chassis (18806) automatically tunes to the center of any given station, eliminating the need for manual fine tuning.

Antennas and Mobility

Although an automobile radio chassis will give outstanding mobile reception, it cannot provide the continuous reception of home audio components.

- The home receiver is not limited by the vehicle operating characteristics and certain geographical effects as is the mobile unit.
- For example, for the best FM reception, the automobile antenna should be designed like a TV antenna and pointed in the direction of the station.
- The best AM antenna is a long piece of wire, the higher the wire the better the reception.
- However, because of design necessity, the automobile antenna is restricted in size, height and direction and must receive both AM and FM stations. This means that a limited amount of the station's signal reaches the vehicle radio chassis.

Tuning

Tuning the radio chassis in to a station is very simple. Press the seek up or seek down button to tune the receiver to the next station.

Tone Control

Favoring the rear radio speakers (18808) in noisy areas will help to reduce noise.

FM Flutter

Flutter can best be described as follows:

- Repeated pops and hissing bursts heard in the radio speaker during an otherwise good broadcast.
- Usually this condition exists while traveling in the fringe area of the station and flutter will become more severe beyond approximately 40 km (25 miles) of the station. The signal loss becomes greater away from the station, until finally noise takes over and reception becomes impossible.
- Flutter may also be noticed near the station because of the line-of-sight characteristics of FM radio waves. This condition can happen when a building or large structure is between the radio chassis and the station being received. Some of the FM signal bends around the building, but certain spots have almost no signal. Some of these signal losses are only a few inches wide and if the vehicle is parked

in one of these dead spots, you will only hear noise from the radio speaker. After moving out of the shadow of the structure, the station will return to normal.
- Flutter will not occur on AM because the AM radio waves are much longer than FM waves.

FM Multi-Path Cancellation

Cancellation can be defined as follows:

- It is caused by the line-of-sight characteristic and exists when the radio waves are reflected from objects or structures.
- The noise produced by cancellation is similar to flutter, with the addition of distortion in the program.
- A more familiar description of cancellation is its similarity to the multiple ghosts and picture jumping that occurs on television when a low flying plane passes. The same condition exists in the vehicle, except that the vehicle is moving and the reflecting structure is stationary. The reflected signal cancels the normal signal, causing the antenna to pick up noise and distortion.
- Cancellation effects are most prominent in metropolitan areas, but can also become quite severe in hilly terrain and depressed roadways.

FM Strong Signal Capture and AM Overloading

FM capture is an unusual condition that occurs when traveling in the vicinity of a broadcast tower.

- If listening to a weak FM station, when passing the broadcast tower, a stronger station may interfere without changing the tuning control. When passing the tower, the station may switch back and forth a few times before returning to the station originally tuned.

A localized condition which will not harm the receiver is known as overloading.

- When several broadcast towers are present (common in metropolitan areas) several stations may overload the receiver resulting in considerable station changing, mixing and distortion.
- Some overloading may also be noticed on AM, but usually to a lesser degree.

Receiving FM Stereo

Because more data is carried in the FM stereo waves than in the monaural FM broadcasts, flutter, cancellation and capture are even more noticeable:

- The FM stereo noise-free broadcast range is approximately 32 km (20 miles).
- The AM/FM stereo radio chassis may never encounter any of these troublesome conditions as they are more prominent in metropolitan areas, hilly terrain and depressed roadways. However, when diagnosing FM stereo concerns, it is recommended to accurately tune to the strongest FM stereo station.

Stereo Indicator Inoperative or Flickering (AM and FM Reception Are OK)

- Verify that customer is listening to stereo stations.
- A weak or distant signal may cause the stereo indicator to flicker. Tune radio chassis to a nearby FM stereo station. If reception is good, but stereo indicator is still intermittent, remove radio chassis for service.

Interfering Noises

There are many possible sources of radio interference:

- One such source is the vehicle ignition system. This high-voltage switching system produces a radio frequency electromagnetic field that radiates at AM, FM and CB frequencies. Although components have been designed into the vehicle to minimize this concern, the noise is more noticeable if the radio chassis is tuned slightly off channel when listening to FM programs.
- Vehicle electrical accessories and owner add-on accessories may also contribute to radio interference.
- There are also many noise sources which are external to the vehicle such as power lines, communication systems, ignition systems of other vehicles and neon signs.

Ignition Noise

The most effective method of evaluating ignition noise is to compare the radio performance with the engine running, versus engine off. If ignition noise is present with engine running:

- Check to see that the ignition wires are the suppressor type and that the spark plugs (12405) are the correct resistor type.

Missing or Damaged Noise Suppression Components

- Noise suppression components may be damaged or missing.
- Check radio frequency interference suppression bond grounding effectiveness by wedging a large file between metal parts to ensure proper ground, such as between the tail pipe and body, or between the fender and frame, while radio chassis is playing and engine is running.
- Listen for a decrease in the objectionable radio noise. If a reduction in radio noise is noted, first try tightening body and exhaust system clamps and brackets. Then, if necessary, install a new radio frequency interference suppression bond (19A095) between the two metal parts to ensure proper ground.

Inspection and Verification

NOTE: Many customers do not understand the limitations of FM reception. Refer the customer to the Owner Guide for information about the limitations of FM radio performance.

Internal diagnostic examination of the radio chassis (18806) should be left to the authorized radio service center. However, the automotive technician should be able to analyze and isolate radio reception conditions to the proper area or component causing the condition. All radio conditions can be isolated to one of five general areas:

- Antenna system.
- Radio chassis.
- Radio speaker system.
- Radio noise suppression equipment.
- Premium sound system.

The diagnosis charts and tests should be used with the Electrical and Vacuum Troubleshooting Manual and an appropriate radio tester to accurately diagnose and quickly service most radio system concerns.

1. Verify the vehicle owner's original concern by operating the electronic audio system to duplicate the condition.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Radio chassis with or without tape player physically damaged, misaligned, any controls inoperative • Digital audio compact disc changer physically damaged, misaligned, any controls inoperative • Antenna and two-piece antenna cable physically damaged, misaligned connections • Radio speakers mounting/speaker cones physically damaged, misaligned • Radio ignition interference capacitor, radio frequency interference suppression bond andradio receiver hood bonding strap misaligned, cleanliness and metal-to-metal contact • Remote headphone unit physically damaged, misaligned	• Open fuses • Open connectors • Corroded connectors • Ignition switch • Open or shorted circuits

3. If the inspection reveals obvious concern(s) that can be readily identified, service as required.

4. If the concern(s) remains after the inspection, determine the symptom(s) and go to the Symptom Chart.

Symptom Charts — ESR, ESC, M-100 AND P-100 Sound System Function

Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent for the following electrical tests.

ESR, ESC, M-100 AND P-100 SOUND SYSTEM FUNCTION

Condition	Possible Source	Action
• Radio Chassis Inoperative — Does Not Operate Properly	• Bad ground circuit. • Blown fuse(s). • Open or shorted power feed circuit(s). • Damaged radio chassis.	• GO to Pinpoint Test A.
• Radio Chassis/Tape Player Inoperative — Does Not Operate Properly	• Fuse. • Circuitry. • Radio chassis. • Tape player. • Ignition switch.	• GO to Pinpoint Test A.
• Tape Player Only Inoperative — Does Not Operate Properly	• Fuse. • Circuitry. • Radio chassis. • Tape player. • Ignition switch.	• GO to Pinpoint Test A.
• Radio Chassis Display Blank — Radio Chassis Operates	• Bad ground circuit. • Blown fuse(s). • Open or shorted power feed circuit(s). • Damaged radio chassis.	• GO to Pinpoint Test B.
• Radio Chassis/Tape Player Display Blank — Radio Chassis/Tape Player Operates	• Fuse. • Circuitry. • Radio chassis. • Tape player. • Ignition switch.	• GO to Pinpoint Test B.
• Digital Audio Compact Disc (CD) Changer Only Inoperative— Does Not Operate Properly	• Fuse. • Circuitry. • Radio chassis. • Compact disc changer. • Ignition switch.	• GO to Pinpoint Test C.
• Radio Chassis/Digital Audio Compact Disc (CD) Changer Inoperative — Does Not Operate Properly	• Fuse. • Circuitry. • Radio chassis. • Compact disc changer. • Ignition switch.	• GO to Pinpoint Test C.
• Radio Chassis/Digital Audio Compact Disc (CD) Changer Display Blank — Does Not Operate Properly	• Fuse. • Circuitry. • Radio chassis. • Compact disc changer. • Ignition switch.	• GO to Pinpoint Test D.
• Digital Audio Compact Disc (CD)	• Fuse.	• GO to

Changer Display Blank — Does Not Operate Properly	• Circuitry. • Radio chassis. • Compact disc changer. • Ignition switch.	Pinpoint Test D .
• Noisy Reception — AM and FM	• Bad antenna connections. • Improper or damaged noise suppression equipment. • Damaged radio chassis.	• GO to Pinpoint Test E .
• Noisy Reception — AM Only	• Bad connections at battery, antenna leads, speaker leads or radio receiver. • Worn or damaged lead-in cable male pins. • Worn or damaged female receptacle or incorrect receptacle to insulator position. • Damaged radio chassis. • Speakers. • Check suppression equipment.	• GO to Pinpoint Test F .
• Noisy Reception — FM Only	• Antenna mount. • Loose, worn or damaged radio lead-in cable or antenna. • Bad connections at battery, antenna leads, speaker leads or radio receiver. • Damaged radio chassis. • Speakers. • Check suppression equipment.	• GO to Pinpoint Test G .
• One or More Speakers Distorted — Not All Speakers	• Speaker(s) bad. • Wiring to speaker(s) open or shorting. • Damaged radio chassis.	• GO to Pinpoint Test H .
• All Speakers Distorted	• Speaker(s) bad. • Wiring to speaker(s) open or shorting. • Damaged radio chassis. • Bad audio cable. • Bad amplifier.	• GO to Pinpoint Test J .
• No Sound from One or More Speakers — Not All Speakers	• Speaker(s) bad. • Wiring to speaker(s) open or shorting. • Damaged radio chassis. • Bad antenna system. • Bad amplifier.	• GO to Pinpoint Test K .
• No Sound from All Speakers	• Speaker(s) bad. • Wiring to speaker(s) open to shorting. • Damaged radio chassis. • Bad audio cable. • Bad amplifier.	• GO to Pinpoint Test L .

• Poor Sound Quality from One or More Speakers — Not All Speakers	• Speaker(s) bad. • Wiring to speaker(s) open or shorting. • Bad audio cable. • Bad amplifier.	• GO to Pinpoint Test M .
• Poor Sound Quality from All Speakers	• Speaker(s) bad. • Wiring to speaker(s) open or shorting. • Bad amplifier.	• GO to Pinpoint Test N .

Pinpoint Tests

Sound System Function

PINPOINT TEST A: RADIO CHASSIS INOPERATIVE — DOES NOT OPERATE PROPERLY

A1 CHECK OPERATION OF RADIO CHASSIS

- Turn ignition switch to RUN or ACC.
- Press radio POWER on.

Is radio chassis display illuminated?

Yes	No
GO to **A3**.	GO to **A2**.

A2 CHECK QUALITY SOUND FROM RADIO SPEAKERS

- Verify that quality sound is coming from radio speakers.

Is quality sound coming from radio speakers?

Yes	No
GO to Pinpoint Test B.	GO to **A28**.

A3 DISPLAY TEST — AM BAND INDICATOR

- Press AM/FM button for AM band.
- Press TUNE, SCAN or SCAN/TUNE button to station 1000 AM.

Is display correct and AM indicator lit?

Yes	No
GO to **A4**.	REMOVE radio chassis for service.

A4 DISPLAY TEST — FM1/FM2 BAND INDICATORS

- Press AM/FM button FM1 band.
- Press TUNE, SCAN or SCAN/TUNE button to station 88.9 FM.
- Verify for FM2 band.

Is display correct and FM1 and FM2 indicators lighting respectively?

Yes	No
GO to **A5** .	REMOVE radio chassis for service.

A5 DISPLAY TEST — ST STEREO INDICATOR

- Press TUNE, SCAN, SEEK or SCAN/TUNE buttons to a local FM stereo station.

Is display correct and ST indicator lit?

Yes	No
GO to **A6** .	REMOVE radio chassis for service.

A6 SEEK — HIGHER FREQUENCY STATION

NOTE: If display reads 1610 AM or 107.9 FM, display will not increase. The SEEK (>) button should be pressed until display reads less than 1610 AM or 107.9 FM.

- Press SEEK (>) and verify that number on display increases.

Is SEEK (>) operating properly?

Yes	No
GO to **A7** .	REMOVE radio chassis for service.

A7 SEEK — LOWER FREQUENCY STATION

NOTE: If display reads 530 AM or 88.1 FM, display will not decrease. The SEEK (<) button should be pressed until display reads greater than 530 AM or 88.1 FM.

- Press SEEK (<) and verify that number on display decreases.

Is SEEK (<) operating properly?

Yes	No
GO to **A8** .	REMOVE radio chassis for service.

A8 STATION RECALL MEMORY TEST

- Press SCAN, TUNE, SEEK or SCAN/TUNE buttons to a desired station.
- Press and hold one of the (1 through 6) memory buttons for two seconds until station sound is returned (repeat for all six buttons).
- Do for AM, FM1 and FM2 bands using eighteen stations.
- Turn radio chassis off, then on.
- Press each station recall button and verify memory storage.

Is memory test successful?

Yes	No
GO to **A9** .	REMOVE radio chassis for service.

A9 VOLUME CONTROL TEST

- Press VOLUME (+) and (-) to verify an increase and decrease in volume sound from radio chassis.

Does volume change properly?

Yes	No
GO to **A10** if TUNE button equipped. Otherwise, GO to **A11** for SCAN or SCAN/TUNE.	CHECK radio speakers and connections. REFER to Symptom Chart if diagnosis finds radio speakers inoperative. REPEAT volume test. If volume still inoperative, REMOVE radio chassis for service.

A10 TUNE CONTROL TEST (ESR)

- Press TUNE button (>) or (<) to change the frequency station up or down one increment at a time. Change frequencies quickly by holding the (>) or (<) side of button. Verify for all bands.

Does TUNE operate properly?

Yes	No
GO to **A12** .	REMOVE radio chassis for service.

A11 SCAN MODE TEST (ESC OR P-100)

- Press SCAN or SCAN/TUNE buttons to enter scan mode. (Go to PAC or ESC equipped.)
- Display will blink "SCN".
- Press (>) side of SEEK button to begin forward scan mode up to next radio station for a five second sampling. Verify several stations.
- Press (<) side of SEEK button to begin reverse scan mode. Verify several stations.
- Stop scan mode by pressing SCAN/TUNE; or repress the side of SEEK button presently matching

direction of scanning.

NOTE: Change stations quickly by pressing and holding SEEK (>) or (<).

- Press SCAN/TUNE button twice to change radio stations up or down one increment of frequency at a time. (Display will read "TUNE"), then within five seconds press (>) or (<) side of SEEK button.
- (ESC) Scan mode will begin to scan up to next radio selection for a five second sampling.
- Stop scan mode by pressing SCAN button.

(ESC/PAC) Does scan mode operate properly?

Yes	No
GO to **A12** .	REMOVE radio chassis for service.

A12 TUNE ANTENNA TEST (OPTIONAL)

- Tune radio on AM band outside of building.
- Press SEEK to observe all listenable stations on band. Count number that can be tuned.
- Compare to a vehicle with known good radio chassis.

Are normal number of stations received?

Yes	No
GO to **A13** .	If an absolute number of stations cannot be tuned. REMOVE radio chassis for service.

A13 AUTO PRESET — AUTOMATIC MEMORY STORE (P-100)

- Press AUTO PRESET button for three seconds.
- Verify that radio chassis automatically presets six strong stations sequentially on memory recall buttons (1 through 6).
- Turn off radio chassis, then turn back on.
- Verify the same six stations are in memory for buttons (1 through 6).

Does AUTO PRESET operate properly?

Yes	No
GO to **A14** .	REMOVE radio chassis for service.

A14 TONE CONTROL TEST (RANGER)

- Bass: Press Bass rocker switch to increase low frequency sounds. Press bottom of rocker switch to decrease low frequency sounds.
- Treble: Press Treble rocker switch to increase high frequency sounds. Press bottom of rocker switch to decrease high frequency sounds.

Do Bass and Treble operate properly?

Yes	No
GO to **A15** .	CHECK connections on radio chassis speakers and amplifier. REFER to Symptom Chart if diagnosis finds radio speakers inoperative. If radio speakers OK, REMOVE radio chassis for service.

A15 BALANCE CONTROL TEST (RANGER)

- BALANCE: Press BAL rocker switch top to increase sound level from right radio speakers. Press rocker switch bottom to increase sound level from left radio speakers.

Does balance operate properly?

Yes	No
GO to **A16** .	CHECK connections on radio chassis speakers and amplifier. REFER to Symptom Chart if diagnosis finds radio speakers inoperative. If radio speakers OK, REMOVE radio chassis for service.

A16 FADER CONTROL TEST (RANGER)

- FADER: Press FADE rocker switch bottom to increase sound level from rear radio speakers. Press rocker switch top to increase sound level from front radio speakers.

Does FADE operate properly?

Yes	No
GO to **A17** .	CHECK connections on radio chassis speakers and amplifier. REFER to Symptom Chart if diagnosis finds radio speakers inoperative. If radio speakers OK, REMOVE radio chassis for service.

A17 TAPE PLAYER — LOADING TEST (ESC OR P-100)

NOTE: If tape is at the end, playing will start on reverse side of tape.

- With radio chassis POWER on and ignition switch in RUN or ACC, insert known good cassette into tape player opening (with open edge of tape to the right). Verify automatic powerloading (tape player draws tape in and begins playing tape).
- Display will indicate arrows for tape side one or two.

Does loading of tape and display operate properly?

Yes	No
GO to **A18** if premium system. Otherwise, GO to **A22**.	REMOVE radio chassis with tape player for service.

A18 TAPE PLAYER — SEEK TEST (P-100)

- With tape playing, press SEEK (>) to go to the beginning of next tape selection. Press SEEK (<) to tune tape back to beginning of previous tape selection.

Does SEEK operate properly?

Yes	No
GO to **A19**.	REMOVE radio chassis with tape player for service.

A19 TAPE PLAYER — SCAN MODE TEST (P-100)

- Press SCAN button.
- Press SEEK (>) to begin forward tape scan for a five second sampling of each selection.
- Press SEEK (<) to begin reverse tape scan for a five second sampling of previous selection.
- Stop scan mode by pressing the side of SEEK button matching the direction tape is currently scanning.

Does scan mode operate properly?

Yes	No
GO to **A20**.	REMOVE radio chassis with tape player for service.

A20 TAPE PLAYER — REW/FF TEST (P-100)

- Press REW button to rewind tape. The radio will automatically begin playing until rewind is manually stopped by pressing TAPE button or tape is completely rewound.
- Press FF button to fast-forward tape. Again, radio will begin playing until fast-forward is manually stopped by pressing TAPE button or tape reaches end.

Do REW and FF operate properly?

Yes	No
GO to **A21**.	REMOVE radio chassis with tape player for service.

A21 TAPE PLAYER — REVERSE TEST (ESC)

- Press the REW button to rewind tape playing forward. Return to tape play by pressing right side of button.
- Press the FF button to fast-forward tape playing forward. Return to play by pressing left side of button.
- Press the TAPE buttons to reverse tape to opposite side (track) of tape.

Do buttons operate properly?

Yes	No
GO to **A22** .	REMOVE radio chassis with tape player for service.

A22 TAPE PLAYER — DOLBY TEST (ESC OR P-100)

- (PAC) Press Dolby® Noise Reduction button (Expressed by symbols of two half-circles with round edge facing each other). Verify sound. Press to turn off.
- Eject tape and verify Dolby® for Dynamic Noise Reduction on an FM stereo station. Verify sound.

Does Dolby® operate properly?

Yes	No
GO to **A23** .	REMOVE radio chassis with tape player for service.

A23 TAPE PLAYER — EJECT TEST

- Press EJECT or EJCT button to eject tape from opening. Radio chassis will resume playing if power is on.

Does EJECT operate properly?

Yes	No
GO to **A24** .	REMOVE radio chassis with tape player for service.

A24 CHECK INOPERATIVE OR INTERMITTENT

- Verify if condition is intermittent or inoperative.

Is condition intermittent?

Yes	No
GO to **A27** .	GO to **A25** .

A25 CHECK FUSE

- Turn ignition switch OFF.
- Check fuse 8 (15A) and fuse 11 (15A) in the fuse junction panel (Aerostar).
- Check fuse 20 (7.5A) in fuse junction panel (M-100 or P-100), (Ranger).
- Check fuse 29 (10A) in fuse junction panel (Ranger).

Is fuse open?

Yes	No
REMOVE open fuse(s) and GO to **A26** .	GO to **A27** .

A26 CHECK FOR GROUNDED POWER FEED

- With ignition switch OFF, check fuse 20 (7.5A) or 11 (15A) Circuit 137 (Y/BK) at radio chassis connector for a short to ground.
- Check fuse 29 (10A) Circuit 797 (LG/P) and/or 8 (15A) circuit 54 (LG/Y).

Is power feed grounded?

Yes	No
LOCATE short to ground and SERVICE the circuit. REPLACE fuse(s). RETEST.	REPLACE fuse and GO to **A1** . If fuse still fails, REMOVE radio chassis for service.

A27 CHECK POWER FEED

- Connect voltmeter between radio chassis connector Circuit 137 (Y/BK) and known good ground.
- Turn ignition switch to RUN or ACC.

Does voltmeter indicate 10 volts or more?

Yes	No
GO to **A31** .	GO to **A28** .

A28 CHECK WIRING CONTINUITY — FUSE

- Remove fuse 20 (7.5A) temporarily (Ranger).
- Check continuity between 20 (7.5A) and radio chassis connector Circuit 137 (Y/BK), (Ranger).
- Check continuity between fuse 20 (7.5A) andradio chassis Circuit 797 (LG/P), (Ranger).
- Remove fuse 8 (15A) temporarily (Aerostar).
- Check continuity between fuse 11 (15A) and radio chassis connector Circuit 137 (Y/BK) (Aerostar).
- Check continuity between fuse 8 (15A) and radio chassis Circuit 54 (LG/Y) (Aerostar).

Does continuity exist?

Yes	No
GO to **A29** .	SERVICE wiring as required. GO to **A1** .

A29 CHECK WIRING CONTINUITY — ACCY FUSE

- Check continuity between fuse 20 (7.5A) (Ranger) or 8 (10A) (Aerostar) and ignition switch Circuit 137 (Y/BK).

Does continuity exist?

Yes	No
RECONNECT fuse and GO to **A30** .	SERVICE wiring as required. GO to **A1** .

A30 CHECK IGNITION SWITCH POWER

- Connect voltmeter between ignition switch connector Circuit 137 (Y/BK).
- Turn ignition switch to ON or ACC.

Does voltmeter indicate 10 volts or more?

Yes	No
REMOVE radio chassis for service.	SERVICE ignition switch. REFER to Section 11-05 .

A31 CHECK RADIO SPEAKERS

- With radio chassis operating, check if condition is on all radio speakers.

Is condition present on all radio speakers?

Yes	No
GO to **A32** .	GO to **A33** .

A32 CHECK RADIO ANTENNA

- Check radio antenna, cable connections and wiring. (Refer to Section 15-02 .)

Is antenna system operating properly?

Yes	No
GO to **A33** .	CONNECT, SERVICE OR REPLACE antenna components as required.

A33 CHECK RADIO CHASSIS

- Substitute known good radio speaker to radio chassis .
- Verify if condition is in radio speakers or radio chassis operation.

Is radio chassis operating?

Yes	No
CONNECT, SERVICE OR REPLACE radio speakers and wiring as required. GO to **A1** .	REMOVE radio chassis for service.

PINPOINT TEST B: RADIO CHASSIS DISPLAY BLANK — RADIO CHASSIS OPERATES

B1 CHECK OPERATION OF RADIO CHASSIS

- Turn ignition switch to RUN or ACC.
- Press radio VOLUME button on.

Is radio chassis display lit?

Yes	No
GO to Pinpoint Test A .	GO to **B2** .

B2 CHECK QUALITY SOUND FROM RADIO SPEAKERS

- Verify that quality sound is coming from radio speakers.

Is quality sound coming from radio speakers?

Yes	No
DISCONNECT fuse panel fuses and GO to **B3** .	GO to Pinpoint Test A .

B3 CHECK WIRING CONNECTIONS

- Check wiring connectors and wires for damage, corrosion or open wire at radio chassis connector Circuit 137 (Y/BK) (Aerostar, Ranger), Circuit 797 (LG/P) (Ranger) or Circuit 54 (LG/Y) (Aerostar).

Are wires and connections OK?

Yes	No
RECONNECT fuses and GO to **B4** .	SERVICE harness, connector and wiring as required. GO to **B1** .

B4 CHECK LCD SUPPLY

- Connect voltmeter between radio chassis connector Circuit 137 (Y/BK) and known good ground (Aerostar, Ranger).
- Turn ignition switch to RUN or ACC.
- Measure voltage from Circuit 797 (LG/P) and ground (Ranger).
- Measure voltage from Circuit 54 (LG/Y) and ground (Aerostar).

Does voltmeter indicate 10 volts or more?

Yes	No
REMOVE radio chassis for service. LCD display is internally inoperative.	GO to **B5** .

B5 CHECK FUSE

- Turn ignition switch OFF.
- Check fuse 20 (7.5A) in fuse junction panel (Ranger). Check fuse 29 (10A) (Ranger). Check fuse 8 (15A) and fuse 11 (15A) (Aerostar).

Are fuse(s) OK?

Yes	No
REPAIR circuit(s) in question.	GO to **B6** .

B6 CHECK FOR GROUNDED ILLUMINATION FEED

- Turn radio chassis OFF.
- Check Circuit 137 (Y/BK) for continuity to known good ground (Aerostar, Ranger).
- Check for continuity of Circuit 797 (LG/P) to ground (Ranger).
- Check for continuity of Circuit 54 (LG/Y) (Aerostar).

Does continuity exist?

Yes	No
LOCATE short to ground and SERVICE. REPLACE fuse. GO to **B1** .	REPLACE fuse. Operate. If fuse still opens, REMOVE radio chassis for service.

PINPOINT TEST C: DIGITAL AUDIO COMPACT DISC CHANGER ONLY INOPERATIVE — DOES NOT OPERATE PROPERLY

C1 CHECK OPERATION OF DIGITAL AUDIO COMPACT DISC CHANGER

- Turn ignition switch to RUN or ACC.
- Press radio POWER on.
- Verify radio chassis operates properly. (Refer to Pinpoint Test A .)
- Handling test disc by its edge (label-side up), insert into digital audio compact disc changer. Verify powerloading.

Is digital audio compact disc changer display lit?

Yes	No
GO to **C3** if equipped with M100 CDR (Ranger). Otherwise, GO to **C7** .	GO to **C2** .

C2 CHECK QUALITY SOUND FROM RADIO SPEAKERS

- Verify that quality sound is coming from radio speakers.

Is quality sound coming from radio speakers?

Yes	No
GO to Pinpoint Test D .	GO to **C15** .

C3 TUNE BUTTON (CD MODE) (RANGER)

- Pushing the Tune > rocker increases the CD playback speed by a factor of 5. The audio is slightly muted, but still audible, and the display shows the time into the current track in minutes and seconds. If the TUNE > button is held more than 3 seconds, the speed will increase to 10 times the normal speed. At the end of a track, the CD will advance to the next track and continue at high speed. When the end of the CD is reached, it stops. In a similar manner, holding down the < TUNE button will back up the CD, until the beginning of the disc is reached.

Does the TUNE button operate properly?

Yes	No
GO to **C4** .	REMOVE the digital audio compact disc changer for service.

C4 SEEK BUTTON (CD MODE) (RANGER)

- Momentary depression of the SEEK > button during CD play mode will cause the CD to advance to the next track and start playing. If the SEEK > button is pushed during the last selection on the CD, the CD will advance to the first track on the disc. If the < SEEK button is pushed during the first 3 seconds of a track, the CD will back up to the beginning of the previous track. If the < SEEK button is

pushed after the first 3 seconds of a track, the CD will back up to the beginning of the current track. If the < SEEK button is pushed during the first 3 seconds of the first track on the disc, the CD will back up to the beginning of the last track, and start playing.

Does the SEEK button operate properly?

Yes	No
GO to **C5** .	REMOVE the digital audio compact disc changer for service.

C5 SCAN BUTTON (CD MODE) (RANGER)

- Pushing the SCAN button causes the CD to advance to the next track, then to play for 8 seconds, then advance to the next track. This continues until the SCAN button is pushed a second time, or the CD button is pushed, or a different tuning function is selected. The radio mutes between tracks while scanning. TR-XX is displayed, where XX is the current track number flashing at a 1 hz rate while the track is being played.

Does the SCAN button operate properly?

Yes	No
GO to **C6** .	REMOVE the digital audio compact disc changer for service.

C6 COMP BUTTON (CD MODE)

- While in the CD mode, depressing the COMP button causes the dynamic range of the CD program material to be reduced by a factor of 2:1. An indication will be made in the VF display that this feature is selected. Pushing the button toggles the compress function on and off. A "C" will show up in the VF display whenever compression is enabled.

Does the COMP button operate properly?

Yes	No
GO to **C7** .	REMOVE the digital audio compact disc changer for service.

C7 DIGITAL AUDIO COMPACT DISC CHANGER — PLAY/STOP TEST

- STOP: Press PLAY/STOP button and verify disc stops playing, stop indicator (J) illuminates and operation returns to radio or tape mode.
- PLAY: Press PLAY/STOP button and verify disc resumes playing at point of stop, play indicator, track number and elapsed time illuminate.

Do play and stop operate properly?

Yes	No

GO to C8.	REMOVE digital audio compact disc changer for service.

C8 DIGITAL AUDIO COMPACT DISC CHANGER — REVERSE/FAST-FORWARD TEST

NOTE: Observe elapsed time to indicate where to stop.

- Press REV/FF (>>) to fast-forward disc to a particular point.
- Press REV/FF (<<) to reverse disc to a particular point.

Do reverse and fast forward operate properly?

Yes	No
GO to C9.	REMOVE digital audio compact disc changer for service.

C9 DIGITAL AUDIO COMPACT DISC CHANGER — SCAN MODE TEST

- Press SCAN button to activate scan mode.
- Verify that disc scans to next selection and plays a five second sample then advances to next until SCAN button is pressed again.
- Verify display indicates track number and elapsed time.

Does scan mode operate properly?

Yes	No
GO to C10.	REMOVE digital audio compact disc changer for service.

C10 DIGITAL AUDIO COMPACT DISC CHANGER — SEEK CONTROL TEST

- Press SEEK (>>) to search for a later selection.
- Press SEEK (<<) to search for a previous selection.
- Verify during play and stop modes.

Does AMS control operate properly?

Yes	No
GO to C11.	REMOVE digital audio compact disc changer for service.

C11 DIGITAL AUDIO COMPACT DISC CHANGER — COMPRESS TEST

- Press COMPRESS to bring the softer and louder passages together.

- Verify display indicates COMP.

Does COMPRESS operate properly?

Yes	No
GO to **C12** .	REMOVE digital audio compact disc changer for service.

C12 DIGITAL AUDIO COMPACT DISC CHANGER — SHUFFLE TEST

- Press SHUFFLE to allow digital audio compact disc changer to randomly select and play music tracks.
- Verify display indicates SHUF.

Does SHUFFLE operate properly?

Yes	No
GO to **C13** .	REMOVE digital audio compact disc changer for service.

C13 DIGITAL AUDIO COMPACT DISC CHANGER — EJECT TEST

- Press EJECT button to eject disc and stop unit.
- Verify display turns off and radio program or tape resumes playing.

Does EJECT operate properly?

Yes	No
GO to **C14** .	REMOVE digital audio compact disc changer for service.

C14 DIGITAL AUDIO COMPACT DISC CHANGER — SPEAKER CONTROL TEST

- With disc inserted, press AUDIO button on radio chassis for bass, treble, balance and fader operating the Volume (+) and (-) for all conditions.
- Perform just volume in both conditions to verify sound loudness.

Do all radio speaker controls operate properly?

Yes	No
REFER to Symptom Chart to determine if an inoperative condition exists. PERFORM tests as directed.	GO to **C15** .

C15 CHECK CONNECTIONS BETWEEN UNITS

- Check continuity of wiring between radio chassis connector and digital audio compact disc player chassis connector.
- Check connectors for damage, corrosion, open or shorted wires.

Are all wiring connections OK?

Yes	No
REMOVE digital audio compact disc changer for service.	REPLACE or SERVICE wiring as required. TEST the system for proper operation.

PINPOINT TEST D: DIGITAL AUDIO COMPACT D ISC (CD) CHANGER DISPLAY BLANK — DOES NOT OPERATE PROPERLY

D1 CHECK OPERATION OF DIGITAL AUDIO COMPACT DISC CHANGER

- Turn ignition switch to RUN or ACC.
- Press radio POWER on.
- Verify radio chassis operates properly. (Refer to Pinpoint Test A .)
- Handling test disc by its edge (label-side up), insert into digital audio compact disc changer. Verify powerloading.

Is digital audio compact disc changer display illuminated?

Yes	No
GO to Pinpoint Test C .	GO to **D2** .

D2 CHECK SOUND QUALITY FROM RADIO SPEAKERS

- Verify that quality sound is coming from radio speakers.

Is quality sound coming from radio speakers?

Yes	No
GO to **D3** .	GO to Pinpoint Test C .

D3 CHECK WIRING CONNECTIONS

- Check wiring connectors and wires for damage, corrosion or open wire at digital audio compact disc changer connector.

Are wires and connections OK?

Yes	No
GO to **D4**.	SERVICE harness, connectors and wiring as required. GO to **D1**.

D4 CHECK MEMORY SUPPLY

- Connect voltmeter between digital audio compact disc changer connector Circuit 797 (LG/PK) (Ranger) or Circuit 54 (LG/Y) (Aerostar) and known good ground.

Does voltmeter indicate 10 volts or more?

Yes	No
REMOVE digital audio compact disc changer for service. LCD display is internally inoperative.	GO to **D5**.

D5 CHECK RADIO CHASSIS DISPLAY

- Verify that radio chassis display is illuminated with power on.

Is radio chassis display illuminated?

Yes	No
GO to **D6**.	GO to Pinpoint Test B.

D6 CHECK WIRING — MEMORY FUSE

- Check continuity between memory fuse and digital audio compact disc changer chassis connector Circuit 797 (LG/PK) (Ranger) or Circuit 54 (LG/Y) (Aerostar).

Does continuity exist?

Yes	No
REMOVE digital audio compact disc changer for service.	SERVICE wiring as required. GO to **D1**.

Sound Quality

PINPOINT TEST E: NOISY RECEPTION — AM AND FM

E1 CHECK ANTENNA CABLE CONNECTIONS

- Verify condition by operating radio chassis while engine is running, with vehicle in or not in motion.
- Check antenna cable connectors including extension cable (if equipped).

Are connections clean and secure?

Yes	No
GO to **E2** .	CLEAN and/or SECURE electric antenna cable connections as required.

E2 CHECK ANTENNA MOUNTING

- Check to make sure antenna is securely mounted to body at ground points.

Are contacts securely mounted, clean and have metal-to-metal contact?

Yes	No
GO to **E3** .	CLEAN and/or SECURE connections as required.

E3 CHECK SUPPRESSION EQUIPMENT

- Check for presence of all required suppression equipment, radio frequency interference suppression bond and radio receiver hood bonding strap (if equipped) for security, cleanliness and metal-to-metal connection.

Are connections OK?

Yes	No
GO to **E4** .	REPLACE missing radio frequency interference suppression bonds, related equipment and/or CLEAN connections as required.

E4 CHECK MOUNTING AND CONNECTING WIRES OF FOLLOWING COMPONENTS

NOTE: The capacitor mounting points are used to complete the electrical circuit and must be mounted securely to clean surfaces.

- Check the mounting and connecting wires of the generator's radio voltage regulator capacitor (if equipped) and radio ignition interference capacitor for secureness, cleanliness and metal-to-metal contact.

Are connections OK?

Yes	No
GO to **E5** .	CLEAN and/or SECURE connections as required.

E5 CHECK OPERATION OF THE FOLLOWING COMPONENTS

- Check the operation of the generator's radio voltage regulator capacitor and radio ignition interference capacitor by replacing with known good components.
- Check generator by disconnecting wiring harness from voltage regulator.
- Verify radio reception.

Is noise eliminated?

Yes	No
SERVICE or REPLACE damaged components as required.	GO to **E6**.

E6 CHECK IGNITION WIRES

- Check ignition wires for proper routing, grounding and secureness of connections.

Are wires OK?

Yes	No
GO to **E7**.	REROUTE or REPLACE ignition wires or SECURE connections as required. REFER to Section 03-07A, Section 03-07B, or Section 03-07C.

E7 CHECK IGNITION SYSTEM

- Check ignition system for proper operation. (Use Rotunda Electronic Vibration Analyzer 014-00344 or equivalent or check for open circuit ignition wires using ohmmeter.) Also, check spark plugs for cracked insulators.

Is ignition system OK?

Yes	No
GO to **E8**.	SERVICE or REPLACE components as required. REFER to Section 03-07A, Section 03-07B, or Section 03-07C.

E8 CHECK CHASSIS MOUNTING POINTS

- Check all radio chassis mounting points for secureness, cleanliness and metal-to-metal contact.

Are mounting points OK?

Yes	No
GO to **E9**.	CLEAN and/or SECURE as required.

E9 SUBSTITUTE RADIO

- Substitute known good radio chassis.
- Verify operation of radio chassis.

Is noise eliminated?

Yes	No
Have radio chassis serviced at an authorized Service Center.	GO to **E10** .

E10 CHECK AMPLIFIER

- Substitute a known good radio amplifier (P-100 system only).
- Verify operation of radio chassis.

Is noise eliminated?

Yes	No
Have radio amplifier serviced at an authorized Service Center.	GO to **E11** .

E11 REPOSITION THE FOLLOWING COMPONENTS

- Check if noise can be eliminated by repositioning radio speaker or radio power feed wires away from other wires and/or brackets.
- Verify operation of radio chassis.

Is noise eliminated?

Yes	No
REPOSITION permanently by taping.	GROUND various parts of the vehicle to the frame using a jumper cable. For example: engine, fenders, quarter panels, stone deflectors, engine air cleaner, body sheet metal. When noise is eliminated, PROVIDE a permanent ground where required.

PINPOINT TEST F: NOISY RECEPTION — AM ONLY

F1 CHECK ANTENNA CABLE CONNECTIONS

- Verify condition by operating radio chassis while engine is running, with vehicle in or not in motion.
- Check antenna cable connections including extension cable (if equipped).

Are connections clean and secure?

Yes	No
GO to **F2** .	CLEAN and/or SECURE antenna cable connections as required.

F2 CHECK ANTENNA MOUNTING

- Check to make sure antenna is securely mounted to body at ground points.

Are contacts clean and have metal-to-metal contact?

Yes	No
GO to **F3** .	CLEAN and/or SECURE connections as required.

F3 CHECK SUPPRESSION EQUIPMENT

- Check for presence of all required suppression equipment, radio frequency interference suppression bond and radio receiver hood bonding strap (if equipped) for security, cleanliness and metal-to-metal connection.

Are connections OK?

Yes	No
GO to **F4** .	REPLACE missing equipment and/or CLEAN connections as required.

F4 CHECK MOUNTING AND CONNECTING WIRES OF FOLLOWING COMPONENTS

NOTE: The capacitor mounting points are used to complete the electrical circuit and must be mounted securely to clean surfaces.

- Check the mounting and connecting wires of the radio voltage regulator capacitor (if equipped), radio ignition interference capacitor and radio interference capacitor for secureness, cleanliness and metal-to-metal contact.

Are connections OK?

Yes	No
GO to **F5** .	CLEAN and/or SECURE connections as required.

F5 CHECK OPERATION OF THE FOLLOWING COMPONENTS

- Check the operation of the radio voltage regulator capacitor, radio ignition interference capacitor and radio interference capacitor by replacing with known good components.
- Check generator by disconnecting wiring harness from voltage regulator.
- Verify radio chassis reception.

Is noise eliminated?

Yes	No
SERVICE or REPLACE damaged components as required.	GO to **F6** .

F6 CHECK IGNITION WIRES

- Check ignition wires for proper routing, grounding and secureness of connections.

Are wires OK?

Yes	No
GO to **F7** .	REROUTE or REPLACE ignition wires or SECURE connections as required.

F7 CHECK IGNITION SYSTEM

- Check ignition system for proper operation. (Use Rotunda Electronic Vibration Analyzer 014-00344 or equivalent or check for open circuit ignition wires using ohmmeter.) Also check spark plugs for cracked insulators.

Is ignition system OK?

Yes	No
GO to **F8** .	SERVICE or REPLACE components as required.

F8 CHECK CHASSIS MOUNTING POINTS

- Check all radio chassis mounting points for secureness, cleanliness and metal-to-metal contact.

Are mounting points OK?

Yes	No
GO to **F9** .	CLEAN and/or SECURE as required.

F9 SUBSTITUTE ANTENNA

- Substitute a known good radio speaker and antenna, making sure to ground antenna base to an unpainted metal surface.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
REPLACE or SERVICE radio speaker or antenna.	GO to **F10** .

F10 SUBSTITUTE ANTENNA CABLE

- Substitute a known good antenna cable.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
REPLACE antenna extension cable.	GO to **F11** .

F11 SUBSTITUTE RADIO

- Substitute known good radio.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
Have radio chassis serviced at an authorized Service Center.	GO to **F12** .

F12 CHECK AMPLIFIER

- Substitute a known good radio amplifier (P-100 system only).
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
Have radio amplifier serviced at an authorized Service Center.	GO to **F13** .

F13 REPOSITION THE FOLLOWING COMPONENTS

- Check if noise can be eliminated by repositioning antenna, radio speaker or radio power feed wires away from other wires and/or brackets.
- Verify operation of radio chassis.

Is noise eliminated?

Yes	No
REPOSITION permanently by taping.	GROUND various parts of the vehicle to the frame using a jumper cable. For example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal. When noise is eliminated, PROVIDE a permanent ground where required.

PINPOINT TEST G: NOISY RECEPTION — FM ONLY

G1 DETERMINE IF CONCERN IS WITH FM RECEPTION LIMITATION

- Verify condition by operating radio chassis with engine running and vehicle not in motion.
- If noise is on FM stereo, determine if customer concern is due to FM stereo reception limitation. Refer to Description and Operation, Radio Reception .

Is reception normal?

Yes	No
EXPLAIN and DEMONSTRATE to customer. INFORM customer of methods for obtaining best reception.	GO to **G2** .

G2 CHECK ANTENNA CABLE CONNECTIONS

- Check antenna cable connections.

Are connections clean and tight?

Yes	No
GO to **G3** .	CLEAN and/or SECURE as required.

G3 CHECK ANTENNA MOUNTING

- Check to make sure antenna is securely mounted to body and base screws are tight.

Are mounting points tight?

Yes	No
GO to **G4**.	SECURE as required.

G4 CHECK IGNITION WIRES ROUTING

- Check ignition wires for proper routing and secureness of connections.

Are wires OK?

Yes	No
GO to **G5**.	REROUTE and/or SECURE connections as required.

G5 CHECK IGNITION SYSTEM COMPONENTS

- Check if ignition wires are suppressor-type and if spark plugs are the correct type.

Are ignition wires and spark plugs correct?

Yes	No
GO to **G6**.	REPLACE spark plug or ignition wires with the correct type.

G6 CHECK IGNITION SYSTEM

- Check ignition system for proper operation. (Use Rotunda Electronic Vibration Analyzer 014-00344 or equivalent or check for open circuit ignition wires using ohmmeter.) Also check spark plugs for cracked insulators.

Is ignition system OK?

Yes	No
GO to **G7**.	SERVICE or REPLACE components as required.

G7 CHECK CHASSIS MOUNTING

- Check all radio chassis mounting points for secureness, cleanliness and metal-to-metal contact.

Are radio mounting points OK?

Yes	No

GO to **G8** .	CLEAN and/or SECURE as required.

G8 SUBSTITUTE ANTENNA

NOTE: All surfaces used for grounding must be clean to ensure good electrical contact. Remove any dirt, rust, grease, paint, or other contaminants.

- Substitute a known good antenna, making sure to ground antenna base to an unpainted metal surface.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
REPLACE antenna.	GO to **G9** .

G9 SUBSTITUTE ANTENNA CABLE

- Substitute a known good antenna cable.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
REPLACE antenna extension cable.	GO to **G10** .

G10 CHECK GENERATOR

- Check generator by disconnecting wiring from voltage regulator.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
CHECK generator. REFER to Section 14-02 . SERVICE or REPLACE as required.	GO to **G11** .

G11 SUBSTITUTE RADIO CHASSIS

- Substitute a known good radio chassis.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
Have radio chassis serviced by an authorized service center.	GO to **G12**.

G12 CHECK AMPLIFIER

- Substitute a known good radio amplifier (P-100 system only).
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
Have radio amplifier serviced at an authorized Service Center.	GO to **G13**.

G13 REPOSITION THE FOLLOWING COMPONENTS

NOTE: All surfaces used for grounding must be clean to ensure good electrical contact. Remove any dirt, rust, grease, paint, or other contaminants.

- Check if noise can be eliminated by repositioning antenna, radio speaker or radio power feed wires away from other wires and/or brackets.
- Verify radio chassis operation.

Is noise eliminated?

Yes	No
REPOSITION permanently by taping.	GROUND various parts of the vehicle to the frame using a jumper cable. For example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal. When noise is eliminated, PROVIDE permanent ground where required.

PINPOINT TEST H: ONE OR MORE SPEAKERS DISTORTED — NOT ALL SPEAKERS

H1 CHECK FOR DISTORTION

- Check all radio speakers for distortion.

Are all radio speakers distorted?

Yes	No
GO to Pinpoint Test J.	GO to **H2**.

H2 CHECK FOR RADIO SPEAKER CONCERNS

- Check for loose trim panels, grilles or attachments which might cause rattles in the area of the radio speaker which is considered distorted.
- Check for pinched or broken wires at or near the radio chassis or radio speakers considered distorted.
- Check for foreign material in radio speaker(s) cone.

Are there any visible radio speaker concerns?

Yes	No
SERVICE as required. If still distorted, GO to **H3**.	GO to **H3**.

H3 CONNECT TEST SPEAKER

- Connect a test radio speaker to the wiring for each distorted radio speaker.

Does the test radio speaker get distorted?

Yes	No
GO to **H4**.	REPLACE radio speaker as required.

H4 CHECK CONNECTIONS AND WIRING

- Check for shorts between radio speaker connector.
- Check radio chassis and (if equipped) radio amplifier, wiring harness for damage and shorts.

Are any shorts or damage found?

Yes	No
SERVICE as required.	GO to **H5** if radio amplifier equipped. Otherwise, REMOVE radio chassis for service.

H5 CONNECT TEST AMPLIFIER

- Connect a test radio amplifier in place of system radio amplifier.
- Verify radio amplifier and radio chassis performance.

Does test radio amplifier cause distortion in radio speakers?

Yes	No
REMOVE radio chassis for service.	REMOVE radio amplifier for service.

PINPOINT TEST J: ALL SPEAKERS DISTORTED

J1 CHECK FOR DISTORTION

- Check all radio speakers for distortion.

Are all radio speakers distorted?

Yes	No
GO to **J2** .	GO to Pinpoint Test H .

J2 CHECK VOLUME RANGE FOR DISTORTION

- Check volume range for distortion.

Is distortion only at high volume?

Yes	No
System OK. STOP test.	GO to **J3** .

J3 CONNECT TEST RADIO CHASSIS

- Connect a test radio chassis in place of system radio chassis.

Is distortion still present?

Yes	No
REMOVE radio amplifier for service.	REMOVE radio chassis for service.

PINPOINT TEST K: NO SOUND FROM ONE OR MORE SPEAKERS — NOT ALL SPEAKERS

K1 CHECK FOR SOUND AT EACH RADIO SPEAKER

- Check for sound at each radio speaker.

Are all radio speakers without sound?

Yes	No

GO to Pinpoint Test L .	GO to **K2** .

K2 CHECK CONNECTORS TO RADIO SPEAKERS

- Check wiring to inoperative radio speakers from radio chassis and radio amplifier for opens or shorts.

Are all connections and wiring OK?

Yes	No
GO to **K3** .	CONNECT, REPLACE or SERVICE as required.

K3 CHECK WITH TEST SPEAKER

- Check system with test radio speaker substituted for system inoperative radio speaker.

Does test radio speaker operate?

Yes	No
REPLACE inoperative radio speaker.	GO to **K4** .

K4 CHECK RADIO CHASSIS AND RADIO AMPLIFIER WIRING

- Check wiring between radio chassis and radio amplifier (if equipped) for damage, broken pins in connectors, solder bridges or stray wires that could cause shorts.

Are connections and wiring OK?

Yes	No
GO to **K5** .	CONNECT, REPLACE or SERVICE as required.

K5 CHECK WITH TEST RADIO

- Substitute a test radio chassis for the system radio chassis.

Does test radio chassis provide sound to all radio speakers?

Yes	No
REMOVE radio chassis for service.	REMOVE radio amplifier for service.

PINPOINT TEST L: NO SOUND FROM ALL SPEAKERS

L1 CHECK FOR SOUND AT EACH RADIO SPEAKER

- Check for sound at each radio speaker.

Are all radio speakers without sound?

Yes	No
GO to **L2** .	GO to Pinpoint Test K .

L2 CHECK POWER OF SYSTEM

- Verify power ON and all radio speaker, radio chassis and radio amplifier connections and wiring are not damaged, loose, open or shorting.
- With voltmeter, verify power from radio chassis Circuit 137 (Y/BK) to ground with ignition switch in ACC or RUN.
- Measure voltage of Circuit 797 (LG/P) (Ranger) from amplifier to ground.

Does voltmeter indicate 10 or more volts?

Yes	No
GO to **L4** .	GO to **L3** .

L3 CHECK CONTINUITY OF POWER CIRCUITS

- Turn ignition switch OFF.
- Using proper schematic for system inoperative, verify continuity of power circuits to source.
- Verify voltage at ignition switch in RUN (engine off) or ACC.

Are the power circuits operating?

Yes	No
GO to **L4** .	SERVICE or REPLACE as required.

L4 CHECK FOR SHORT TO GROUND AT SPEAKER(S)

- Check for short to ground at one or more radio speakers which can cause radio amplifier shut-down.

Are any shorts found?

Yes	No
SERVICE as required.	REMOVE radio amplifier for service if equipped. Otherwise, REMOVE radio chassis for service.

PINPOINT TEST M: POOR SOUND QUALITY FROM ONE OR MORE SPEAKERS — NOT ALL SPEAKERS

M1 CHECK POOR SOUND QUALITY IN RADIO SPEAKERS

- Listen to sound quality of radio speakers.

Is poor sound quality in all radio speakers?

Yes	No
GO to Pinpoint Test N .	GO to **M2** .

M2 CHECK RESISTANCE OF RADIO SPEAKER(S)

- With power off, check resistance of radio speakers that have poor quality sound from radio amplifier or radio chassis output, back to the return input on radio amplifier or radio chassis.

Is resistance load excessive of the ohm rating printed on the radio speaker?

Yes	No
CHECK for load in radio speakers or wiring. Excess wire may cause loading effect. SERVICE and RETEST for quality sound.	GO to **M3** .

M3 CHECK RADIO SPEAKER(S)

- Check radio speakers for damage to cone or a foreign material causing poor sound.
- Verify radio speakers are securely mounted.

Is radio speaker(s) OK?

Yes	No
GO to **M4** .	SERVICE or REPLACE radio speaker and RETEST for quality sound.

M4 CHECK CONNECTIONS AND WIRING

- Check connections and wiring at radio speakers, radio amplifier and radio chassis for damage, corrosion or shorts to grounds or loads.

Are connections and wiring OK?

Yes	No

GO to **M5** .	SERVICE or REPLACE connections and wiring as required. RETEST for quality sound.

M5 CHECK WITH TEST RADIO SPEAKER

- Substitute a test radio speaker for system radio speakers that have poor quality sound.

Does test speaker have poor quality sound?

Yes	No
GO to **M6** if separate radio amplifier equipped. Otherwise, REMOVE radio chassis for service.	REPLACE or SERVICE radio speakers as required. RETEST for quality sound.

M6 CHECK WITH TEST RADIO AMPLIFIER

- Substitute a test radio amplifier for system radio amplifier.

Does test amplifier perform with poor quality sound?

Yes	No
REMOVE system radio chassis for service.	REMOVE system radio amplifier for service.

PINPOINT TEST N: POOR SOUND QUALITY FROM ALL SPEAKERS

N1 CHECK POOR SOUND QUALITY IN RADIO SPEAKERS

- Listen to sound quality of radio speakers.

Is poor sound quality in all radio speakers?

Yes	No
GO to **N2** .	GO to Pinpoint Test M .

N2 CHECK CONNECTIONS AND WIRING

- Check connection and wiring at radio speakers, radio amplifier and radio chassis for damage, corrosion or shorts to ground or loads.

Are connections and wiring OK?

Yes	No

GO to **N3** if external radio amplifier equipped. Otherwise, REMOVE radio chassis for service.	SERVICE or REPLACE connections and wiring as required. RETEST for quality sound.

N3 CHECK WITH TEST RADIO AMPLIFIER

- Substitute a test radio amplifier for system radio amplifier.

Does test radio amplifier perform with poor quality sound?

Yes	No
REMOVE system radio chassis for service.	REMOVE system radio amplifier for service.

Sound Systems

The AM radio is standard on all Ranger and Aerostar vehicles. All radio chassis (18806) have an electronic display and an integral clock. An AM/FM/MPX cassette, AM/FM/MPX Premium Analog Cassette and Compact Disc radio are optional on Ranger. An AM/FM/MPX radio and AM/FM/MPX cassette radio are optional on Aerostar.

A Premium Sound System option is available in conjunction with the AM/FM/MPX cassette radio on Aerostar, and with the Premium Cassette and CD radio on Ranger.

Special Features

Automatic Local/Distant SEEK and SCAN

The audio system will automatically seek and scan in the "distant" mode while in the FM frequency band. When using the SEEK or SCAN function, the radio will automatically stop on both strong and weak stations. When in AM, SEEK and SCAN will be in the "distant" mode with the vehicle's headlamps off; they will be in the "local" mode when the headlamps are on. If no stations are found in the "local" mode while in the AM with the headlamps on, the radio automatically tries the "distant" mode again.

Automatic Bass/Loudness

The audio system is equipped to automatically increase the bass level when the volume is decreased, and decrease the bass level when the volume is increased.

Electronic Radio-Clock, Ranger (Except AM)

Clock Controls

The electronic stereo radios are equipped with a built-in clock. The radio display can be in either a clock or radio mode. When the radio is off with the ignition on, the radio display is in the clock mode continuously and current time will be indicated.

When the radio is on, the radio display can be in the radio or the clock mode. Pushing the clock button will switch the display mode from clock to radio or radio to clock as desired. While in the clock mode, activating any of the radio tuning controls (tune, memory, seek) will change the display to radio frequency. After approximately 10 seconds, the display will revert to the clock display.

Setting Time

The clock may be set in radio or tape mode. First hold down the CLOCK button, and then simultaneously depress the SEEK to advance the minutes or SEEK to advance the hours. The seconds are automatically reset to zero when a new minute is set.

Electronic Radio-Clock, Ranger (AM Radio Only) and Aerostar

Clock Controls

The electronic radios are equipped with a built-in clock. The radio display can be in either clock or radio mode.

When the radio is off with the ignition on, the radio chassis display is in the clock mode continuously and current time will be indicated.

When the radio chassis is on, the radio chassis display can be in the radio or the clock mode. Pushing the volume control will switch the display mode from clock to radio or radio to clock as desired.

While in the clock mode, activating any of the radio tuning controls (tune, memory, seek) will change the display to radio frequency. After approximately 10 seconds, the display will revert to the clock display.

Setting Time

Push and hold in the radio volume control and use the tune control (±) to set the time.

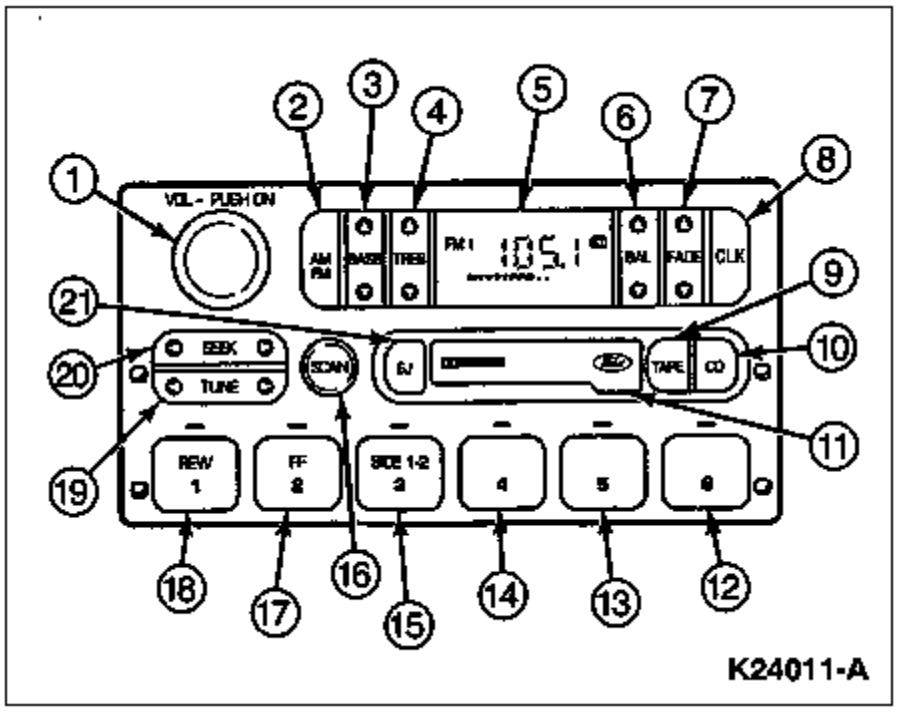
Pushing on the left side (-) of the tune control sets hours. Pushing on the right side (+) sets minutes. Releasing the volume control after setting the time automatically sets the seconds to zero (although seconds are not displayed).

Electronic Search Cassette (ESC) Sound System

The Electronic Search Cassette (ESC) radio is a self-contained four-speaker system which includes an AM/FM/MPX radio, cassette transport deck and an integral digital clock. The ESC system has no external amplifier.

Refer to Electronic Audio Systems portion of the Owner Guide for complete operating guidelines.

Electronic Search Cassette Radio Chassis Controls



Item	Part Number	Description

19	—	Radio Tuner Fine Tuning Control
20	—	Radio Tuner Seek Control
21	—	Cassette Eject Button

Premium

The premium sound system available on Aerostar includes an electronic cassette radio, four-channel radio amplifier (18B849), and four premium radio speakers (18808) (two in the rear wall panel, and two in the liftgate or rear doors). The radio amplifier is located directly under the radio chassis. On Aerostar wagon only, the system includes a remote headphone control which allows the rear speakers to be turned off.

The premium sound system in the Ranger includes an electronic premium cassette radio, four-channel radio amplifier and four premium radio speakers (two in the front doors and two in the rear quarter panel or rear doors). The amplifier is located behind the back trim panel for Ranger Regular Cab and behind the RH quarter trim panel for Ranger Super Cab.

- The instrument panel wiring harness is unique for the premium sound system.

22	—	Eject Button

Cassette Tape Player — ESC and Premium

NOTE: Before turning off radio or ignition, always eject any cassette being played. Cutting power to the radio while a tape is engaged can result in damage to the tape, pinch roller or capstan.

Insert the tape cassette, open edge to the right, to play (radio on, ignition switch (11572) in RUN or ACC position). Adjust volume, tone and speaker balance as for radio programs. At the end of the tape, the cassette automatically reverses and plays the other side of the tape. At any time the tape transport mechanism can be changed to play the other side of the tape by pressing the SIDE 1-2 button.

The Dolby® System is a noise reduction system manufactured under license from Dolby Laboratories. Dolby® and the double-D symbol are trademarks of Dolby Laboratories Licensing Corporation.

Operating Precautions

When inserting a tape cassette into the tape slot, it should be firmly pushed in and down to ensure that it is properly seated. To play a full tape, insert the cassette so the empty hub of the cassette goes into the slot first.

Do not leave a tape cassette engaged in the tape player slot when not in use. Remove it completely to permit the slot door to close and keep out airborne dirt. Disengaging the cassette from the tape playback head in this manner will also prevent a flat spot from developing on the capstan roller.

Take care to protect the open edge of the cassette from damage, dirt, oil and grease. When not in use, store cassettes in their protective cases with hub locks in place. Otherwise, there will be a risk of having the tape loosen on its hubs, which could cause the tape to spill or jam in the player. If a cassette is found with loose tape, make sure it is rewound firmly around the hubs before using it. Never try to open a cassette or try to pull the tape out of it. To avoid tape player damage, do not use cassettes that have been soiled by liquid spills.

Cassette Irregularities

Cassette tapes can vary in performance and size, resulting in occasional concerns with certain cassettes.

If any one cassette gives continual trouble, it is best to discontinue use.

For best results, use cassette tapes with no more than 90 minutes of playing time. The thinness of the tapes used in C120 and C180 cassettes makes the tape more likely to stretch and break. A stretched tape will result in poor sound quality.

Tape Player Will Not Accept Cartridge, Eats Tape, Plays Too Fast or Too Slow, etc. (AM and FM Operating Properly)

- Make sure cassette has not come to the end of the tape.
- Check operation of the tape player by using a known good cassette/cartridge.
- If the condition is not corrected by the substitution of a known good cassette/cartridge, the radio chassis (18806) must be removed and sent to an authorized service facility for service.

Temperature Extremes

Do not expose tape cassettes to intense sunlight or other temperature extremes. If they do become exposed to high or low temperatures, allow each cassette to reach a moderate temperature before playing. During cold weather, it is advisable to take cassettes indoors overnight to protect them.

In extremely cold weather, the tape player may need a few minutes to warm up before delivering full sound quality.

Tape Error Messages — ESC

The ESC radio chassis is designed to diagnose certain inoperative cassette player conditions. The error codes are as follows:

- Error 1 — Possible tape cartridge jam.
- Error 2 — Tape eject or load concern.

Tape Error Messages — Premium

The Premium Analog Cassette radio is designed to diagnose certain inoperative cassette player conditions which will appear on the digital display. The error codes are as follows:

- Error 0 — Communication error between radio controller and tape controller.
- Error 1 — Possible tape cartridge jam.
- Error 2 — Tape eject or load concern.

Radio Control, Rear Seat — Aerostar Wagon

1. Speaker control — Push to turn rear speakers on/off as desired.
2. Volume — Volume adjustment on speakers or headphones is limited to volume setting on radio.
3. Band — Push "BAND" button to select AM or FM frequency band.
4. Memory — Push to sequentially choose stations stored in radio memory.
5. Seek Control — Seek up/down controls operate the same as those on radio chassis.

Compact Disc Player, Digital Audio

WARNING: USE OF CONTROLS AND ADJUSTMENTS OR PERFORMANCE OF PROCEDURES OTHER THAN THOSE SPECIFIED MAY RESULT IN HAZARDOUS RADIATION EXPOSURE.

THE USE OF OPTICAL INSTRUMENTS WITH THIS PRODUCT WILL INCREASE EYE HAZARD AS THE LASER BEAM USED IN THE DIGITAL AUDIO COMPACT DISC PLAYER IS HARMFUL TO THE EYES. DO NOT ATTEMPT TO DISASSEMBLE THE CASE. REFER SERVICING TO QUALIFIED PERSONNEL ONLY.

NOTE: The digital audio compact disc changer has heat-protection circuitry to protect the laser diode. If the temperature of the digital audio compact disc changer reaches 80°C (176°F), the heat detection circuit will shut off the player and H will appear in the display. When the temperature is within normal operating range, the H indicator will turn off and the digital audio compact disc changer will again be operational.

NOTE: If a disc is inserted then ejected and ERROR begins scrolling in the display, remove disc and re-insert right side up (label side up).

Insert disc, 8cm or 12cm (3-inch or 5-inch), into opening. When inserted, the disc automatically loads into the unit and play starts at the beginning of the first track. Once the disc is inserted, the disc opening is secured to prevent the accidental insertion of a second disc.

The CD player has a heat protection circuitry to protect the laser diode. If the temperature of the player reaches 75°C (167°F), the heat detection circuit w ill shut off the player and TOO HOT will scroll in the display for five seconds (radio will resume playing) before the CD player will again be operational.

Operating Precautions

Before playing, inspect the disc for any contamination. If needed, clean the disc with an approved disc cleaner. Do not clean disc with solvents such as benzine, thinner, or antistatic spray intended for analog records.

- If a disc has already been inserted, do not try to insert another disc. Doing so may damage the disc player.

Push the EJECT button to stop play, eject the disc and resume radio operation of audio system. A disc can be ejected while the radio power and/or ignition is on or off. If the disc is ejected from the CD player and the disc is not removed from the disc opening within 10 seconds, the player will automatically reload the disc for storage, unless the disc is automatically ejected due to a focus error (disc inserted upside down). In this case, the disc will not be automatically reloaded and stored.

Refer to Electronic Audio Systems portion of the Owner Guide for detailed operative instructions.

CD Irregularities

Different manufacturers of compact discs may produce discs with different dimensions or tolerances, some of which may not be within industry standards or in accordance with the CD format. Because of this, a new disc that is free of dust and scratches could be defective and may not play on Ford compact disc player. Badly scratched discs or extremely rough loads will cause the sound to skip. Skipping will not damage the

disc player or scratch the discs.

Radio Chassis, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Radio Removing Tool	T87P-19061-A

Removal

1. Disconnect the battery ground cable (14301).
2. Remove finish panel. Refer to Section 01-12 .
3. Insert Radio Removing Tool T87P-19061-A into tool insertion holes on the edge of the radio face plate. Press in 25.4mm (1 inch) to release radio retaining clips. Pull radio chassis (18806) from finish panel using tool as handles.
4. Disconnect the radio antenna lead in cable (18812) and wiring connectors (14487).

Installation

If radio chassis is being replaced, transfer support to new radio chassis.

1. Connect the radio antenna lead in cable andwiring connectors.
2. Position the radio chassis in the instrument panel and slide the radio chassis on the mounting bracket until holding brackets engage.
3. Install finish panel. Refer to Section 01-12 .
4. Connect the battery ground cable.
5. Check the operation of the radio chassis and engine (6007).
6. Reset clock.

Description	Tool Number
Radio Removing Tool	T87P-19061-A

Removal

1. Disconnect battery ground cable (14301).
2. Insert Radio Removing Tool T87P-19061-A into radio face plate. Press in 25.4mm (1 inch) to release radio retaining clips. Pull radio chassis (18806) from instrument panel using tool as handles.
3. Disconnect wiring connectors and radio antenna lead in cable (18812).
4. Transfer rear mounting bracket to new radio chassis, if necessary.

Installation

1. Connect wiring connectors (14487) and radio antenna lead in cable to radio chassis.
2. Slide radio chassis into instrument panel (04320). Engage rear mounting bracket to track in instrument panel.
3. **NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable.
4. Test radio chassis and/or tape player operation.
5. Reset clock.

Radio Frequency Interference Suppression Equipment

When replacing any radio suppression equipment components, make sure that a good contact is made at all attachments. Remove any paint or dirt from between a capacitor and its ground. Tighten all nuts and bolts securely.

The radio suppression devices required for engines are:

- Transmission-to-body strap
- Ignition coil-capacitor
- Hood shield and ground strap
- Engine-to-dash strap

Refer to the following illustrations as an aid in removing and installing radio noise suppression equipment and vehicle ground straps.

Radio Suppression Equipment

Radio Speakers

All vehicles are equipped with standard or premium sound radio speakers (18808). Aerostar vehicles equipped with the standard AM radio chassis (18806) have one radio speaker installed in the instrument panel (04320). Ranger vehicles with AM radio chassis have two door radio speakers.

On Aerostar, the AM/FM stereo system includes two radio speakers and four for Premium sound. All Ranger AM/FM stereo systems have two door and two rear radio speakers, which in Ranger Regular Cab are mounted in the rear door pillars. Additionally, Ranger SuperCab has two rear stereo radio speakers.

Standard radio speakers are 3.2 ohms. Premium sound radio speakers are either 6 ohms or 8 ohms (coaxial).

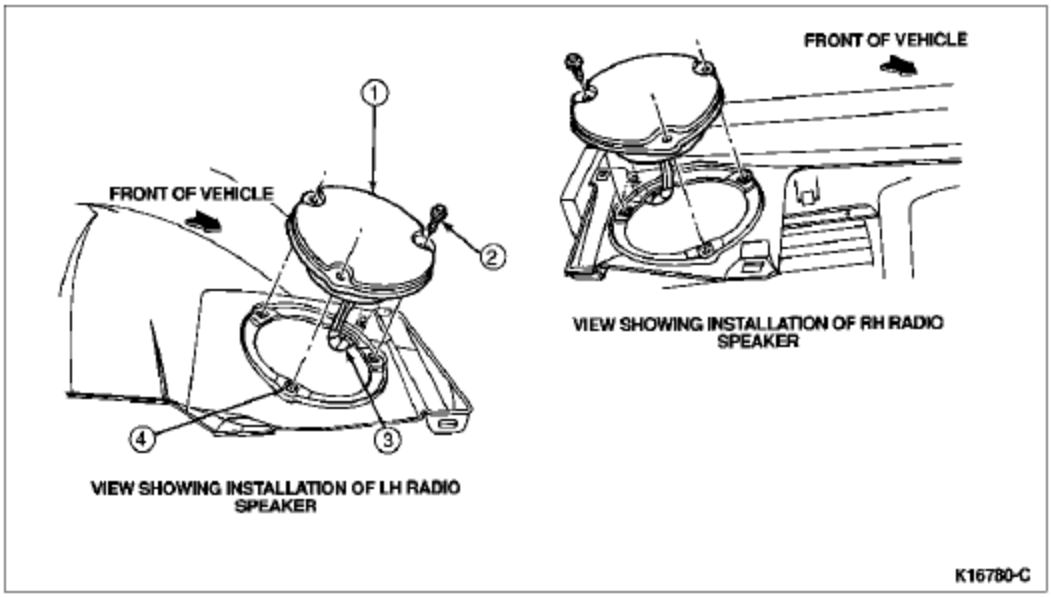
Radio Speakers, Instrument Panel, Aerostar

Removal and Installation

1. Remove the instrument panel pad. Refer to Section 01-12 .
2. Remove the three retaining screws.
3. Lift the radio speaker (18808), disconnect the wiring connector (14487) and remove the radio speaker from the vehicle.

For installation, follow removal procedures in reverse order.

Radio Speakers, Instrument Panel, Aerostar



Item	Part Number	Description

Headlamps

Aerodynamic

Two aerodynamically styled headlamps are used. Each lamp uses a dual filament halogen headlamp bulb (13007). A burned out headlamp bulb on the Ranger may be replaced without removing the headlamp. On Aerostar, replacing a burned-out headlamp bulb requires removal of the headlamp. Headlamps are controlled by the headlamp switch (11654) on the instrument panel (04320) and the multi-function switch (13K359) for high beams on the left side of the steering column.

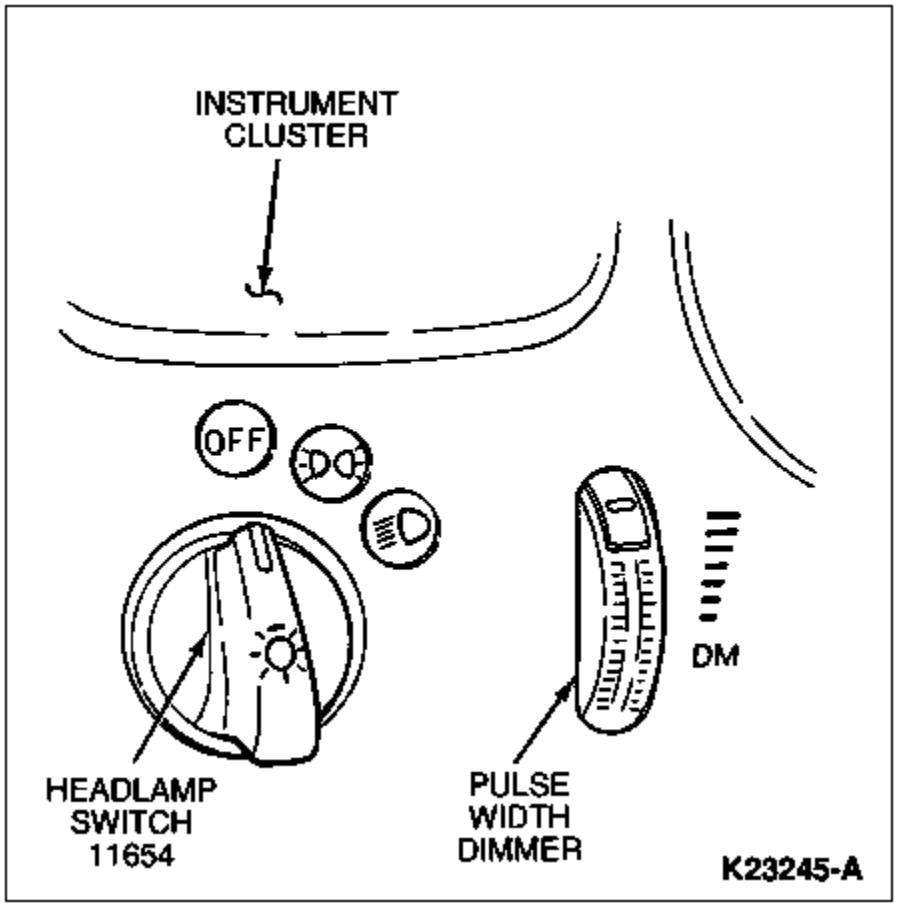
tomsn048@gmail.com

Headlamp Switch

The headlamp switch (11654) on an Aerostar is a pull-type. Pulling the switch to the first detent turns on the park, tail and marker lamps. Pulling the knob all the way out to the second detent turns on the headlamps. The switch also contains the rheostat for dimming the instrument cluster illumination lamps.

Ranger vehicles are equipped with a rotary type headlamp switch. Turning the knob to the first detent turns on the park and other exterior lamps. The second position turns on the headlamps. This switch does not contain a dimming rheostat. Intensity of the instrument panel lights is controlled by a separate pulse width dimmer located to the right of the headlamp switch.

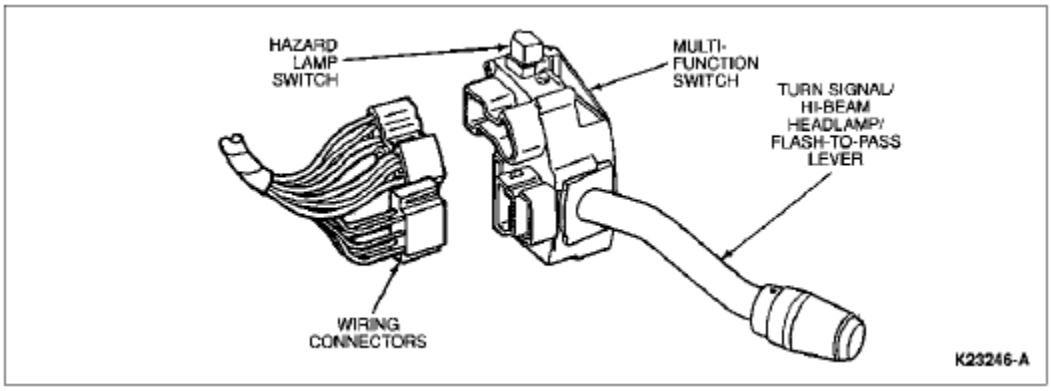
Rotary-Type Headlamp Switch, Ranger



On all vehicles, the headlamp switch is not directly connected to the headlamps. The switch feeds the dimmer switch which is directly connected to the headlamps. The dimmer switch is part of the multi-function switch which is mounted on the left side of the steering column. The turn signal lever is used to switch the headlamp between high and low beams. In its normal, centered position, the dimmer switch completes the circuit to the low beam headlamps. Pushing the lever away from the steering wheel turns on the high beam headlamps. The switch also contains the flash-to-pass function. When the lever is pulled toward the steering wheel, the switch completes the circuit to the high beam headlamps. The switch is spring loaded and will return to the OFF or low beam position when the turn signal lever is released.

tomsn048@gmail.com

Multi-Function Switch



Headlamps On Warning Buzzer/Chime

For description and operation, refer to Section 13-09 .

tomsn048@gmail.com

Lamps, Fog

The fog lamps (15200) are mounted to the front bumper (17757). The lamp circuit is controlled by a fog lamp switch (15A214) on the instrument panel (04320). A fuse in the fuse junction panel (14A067) protects the circuit. Fog lamps can only be operated with the headlamp switch (11654) in the low beam position. The circuit will not be completed with the headlamps in the high beam position, parking lamp position, or the OFF position.

tomsn048@gmail.com

Switch, Fog Lamp

Thefog lamp switch (15A214) is the bottom switch in the row of switches to the right of the radio.

- Push fog lamp switch in to turn fog lamps (15200) on.
- Push fog lamp switch out to shut off fog lamps.

The fog lamp switch is not directly connected to the fog lamps. In the ON position, the switch provides a ground circuit for the fog lamp relay coil. The coil closes the relay contacts which complete the battery feed circuit to the fog lamps.

A separate circuit on the lamp side of the relay illuminates a light emitting diode (LED) in the switch when the fog lamps are on.

tomsn048@gmail.com

Brake ON/OFF (BOO) Switch

The mechanical brake ON/OFF switch is installed onto the pin of the brake pedal arm. It straddles the vacuum booster input rod, but is not attached directly to the input rod. The brake ON/OFF switch moves with the pedal arm when the brake pedal (2455) is pressed.

The circuit from the brake ON/OFF switch to the stoplamps provides a signal indicating the brake pedal has been pressed. The signal is routed to the following electrical systems:

- Electronic engine control (EEC)
- Brake shift interlock
- Electronic 4-wheel drive
- Anti-lock brake (ABS)
- Speed control
- Generic electronic module (GEM)
- Trailer tow

tomsn048@gmail.com

Inspection and Verification — Headlamps (Without Autolamps/Exit Delay)

1. Verify the customer concern by operating the headlamp system.
2. Visually inspect the components of the headlamp system.
3. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
4. Check for improperly installed accessories.
5. If fault is not visually evident, determine the symptom and proceed to the following Symptom Chart.

VISUAL INSPECTION CHART

Mechanical	Electrical
• None	• Blown fuse(s) • Damaged headlamp bulb(s) • Damaged wiring harness • Loose or corroded connections

tomsn048@gmail.com

Symptom Chart — Headlamps (Without Autolamps/Exit Delay)

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

HEADLAMPS

Condition	Possible Source	Action
• Headlamps Inoperative	• Fuse. • Circuit. • Headlamp switch.	• GO to Pinpoint Test A.
• Headlamps On Continuously	• Autolamp system (if equipped). • DRL system (if equipped). • Headlamp switch. • Dimmer switch.	• REFER to autolamp system diagnosis in this section. • REFER to DRL system diagnosis in Section 17-04. • GO to Pinpoint Test B.
• High Beam Headlamps Inoperative	• Fuse. • Headlamp switch. • Multi-function switch. • Circuit.	• GO to Pinpoint Test C.
• Low Beam Headlamps Inoperative	• Fuse. • Multi-function switch. • Bulbs.	• GO to Pinpoint Test D.
• One High or One Low Beam Headlamps Inoperative	• Headlamp bulb. • Circuit. • Headlamp switch.	• GO to Pinpoint Test E.
• Flash-to-Pass Inoperative	• Circuit. • Multi-function switch.	• GO to Pinpoint Test F.

tomsn048@gmail.com

tomsn048@gmail.com

Pinpoint Tests — Headlamps (Without Autolamps/Exit Delay)

PINPOINT TEST A: HEADLAMPS INOPERATIVE

A1 CIRCUIT PROTECTION

- On Ranger move turn signal lever to flash-to-pass position. On Aerostar, move headlamp switch to parking light position.

Does flash-to-pass operate (Ranger) or do parking lights come on (Aerostar)?

Yes	No
GO to **A2** .	CHECK fuse 11 in power distribution box (Ranger) or fuse 4 (Aerostar). If fuse is not blown, REPAIR open in wire between fuse panel and headlamp switch.

A2 BATTERY FEED TO HEADLAMP SWITCH

- Remove headlamp switch.
- Check for battery voltage at switch battery feed terminal.

Is battery voltage present?

Yes	No
GO to **A3** .	REPAIR open battery feed wire.

A3 HEADLAMP SWITCH CHECK

- Connect wiring to switch.
- Turn headlamps on.
- Check for battery voltage at headlamp switch to dimmer switch terminal (R/Y).

Is battery voltage present?

Yes	No
GO to **A4** .	REPLACE headlamp switch.

tomsn048@gmail.com

A4 DIMMER SWITCH FEED WIRE

- Disconnect wiring at multi-function switch.
- Turn headlamp switch on.
- Check for battery voltage at dimmer switch feed wire (R/Y).

Is battery voltage present?

Yes	No
REPLACE multi-function switch.	REPAIR open in switch feed wire.

PINPOINT TEST B: HEADLAMPS ON CONTINUOUSLY

B1 SHORTED HEADLAMP SWITCH

- Disconnect wiring at headlamp switch.

Are headlamps off?

Yes	No
REPLACE headlamp switch.	GO to **B2** .

B2 SHORTED DIMMER SWITCH

- Disconnect wiring at multi-function switch.

Are headlamps off?

Yes	No
REPLACE multi-function switch.	REPAIR short to battery power in headlamp circuit.

PINPOINT TEST C: HIGH BEAM HEADLAMPS INOPERATIVE

C1 CIRCUIT PROTECTION (RANGER)

- Check fuse 33; interior fuse panel.

Is fuse blown?

Yes	No

tomsn048@gmail.com

REPLACE fuse. If fuse blows again, REPAIR short to ground in LG/BK wire.	GO to **C2** .

C2 DIMMER SWITCH CHECK

- Turn headlamp switch on and dimmer switch in high beam position.
- Check for battery voltage at multi-function switch terminal with LG/BK wire (Aerostar) or GY/O wire (Ranger).

Is battery voltage present?

Yes	No
GO to **C3** .	REPLACE multi-function switch.

C3 ISOLATE HEADLAMP BULBS

- Remove a headlamp bulb.
- Inspect bulb for broken filament.

Is bulb OK?

Yes	No
REPAIR open in wire from multi-function switch to headlamps. **NOTE: If high beam indicator light comes on, CHECK for open in engine compartment wiring. If indicator light does not come on, CHECK for open in instrument panel wiring.**	REPLACE headlamp bulbs.

PINPOINT TEST D: LOW BEAM HEADLAMPS INOPERATIVE

D1 CIRCUIT PROTECTION (RANGER ONLY)

- Check fuses 4 and 8.

Are fuses blown?

Yes	No
REPLACE fuses. If fuse blows again, REPAIR shorts to ground in wires between fuse panel and headlamps.	GO to **D2** .

tomsn048@gmail.com

D2 DIMMER SWITCH CHECK

- Turn headlamp switch on and dimmer switch in LO beam position.
- Check for battery voltage at multi-function switch terminal (R/BK).

Is battery voltage present?

Yes	No
GO to **D3** .	REPLACE multi-function switch.

D3 ISOLATE HEADLAMP BULBS

- Remove a headlamp bulb.
- Inspect bulb for broken filament.

Is bulb OK?

Yes	No
REPAIR open in wires from multi-function switch to headlamps.	REPLACE headlamp bulbs.

PINPOINT TEST E: ONE HIGH OR ONE LOW BEAM HEADLAMP INOPERATIVE

E1 ISOLATE BULB

- Remove headlamp bulb.
- Inspect bulb for broken filament. Inspect bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **E2** .	SERVICE as required.

E2 BATTERY FEED TO LAMP

- Turn headlamp switch ON and dimmer switch in required position.
- Check for battery voltage at headlamp feed wire (Aerostar, Ranger HI beam — LG/BK; Aerostar LO beam — R/BK; Ranger LH LO beam — W/LG; Ranger RH LO beam — DB/LG).

Is battery voltage present?

Yes	No

tomsn048@gmail.com

GO to **E3** .	On Aerostar, REPAIR open in battery feed wire. On Ranger, CHECK fuse 4 for LH LO beam headlamp or fuse 8 for RH LO beam headlamp. On Ranger with HI beam headlamp inoperative, REPAIR open in battery feed wire.

E3 GROUND CIRCUIT

- Check for continuity between headlamp connector ground terminal (Circuit 57 [BK]) and clean chassis ground.

Is there continuity?

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	REPAIR ground Circuit 57 (BK).

PINPOINT TEST F: FLASH-TO-PASS INOPERATIVE

F1 ISOLATE DIMMER SWITCH

- Headlamps on and dimmer switch in HI beam position.

Are HI beam headlamps on?

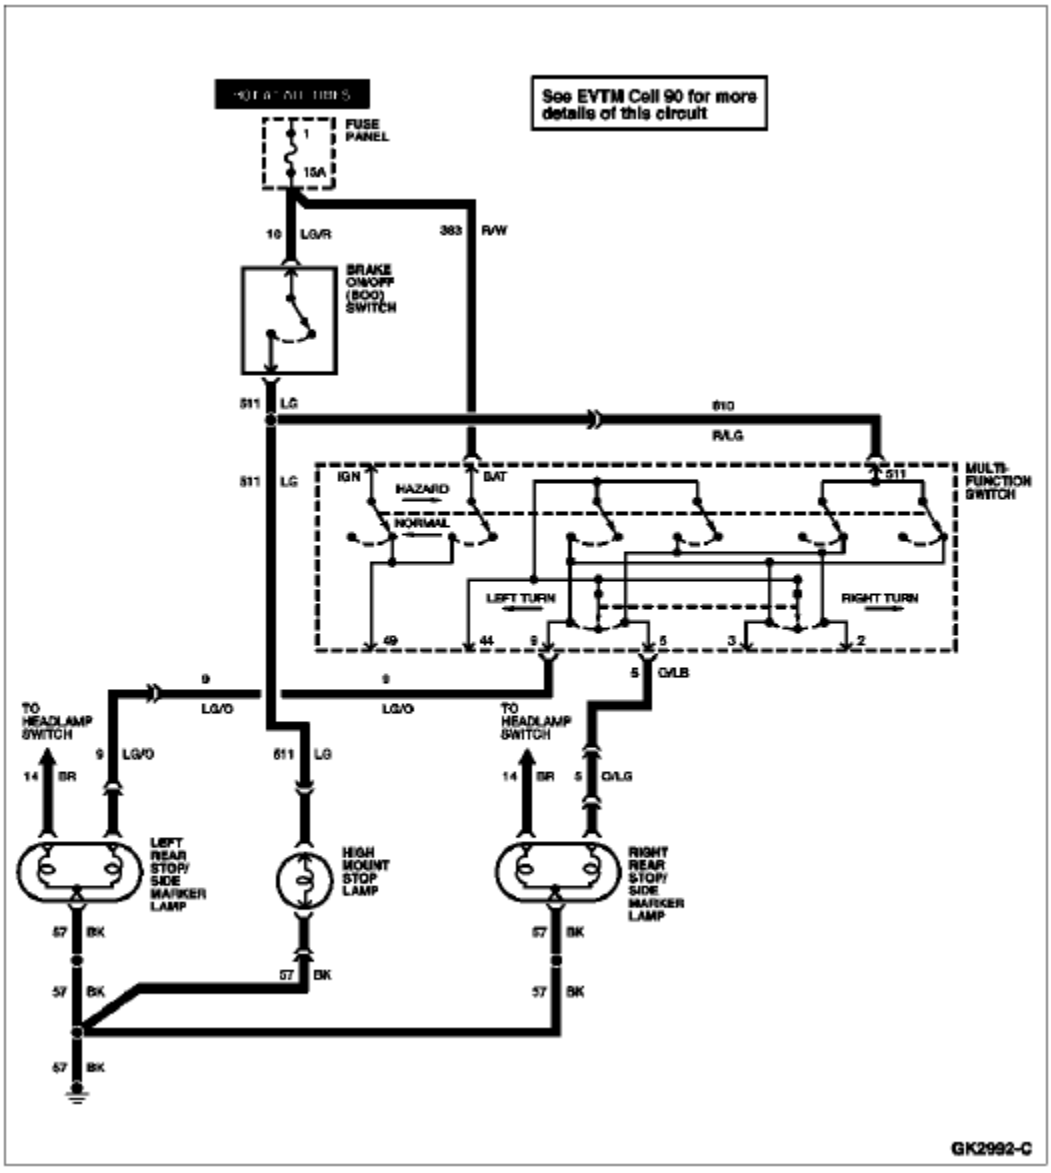
Yes	No
REPLACE multi-function switch.	GO to Pinpoint Test C .

tomsn048@gmail.com

tomsn048@gmail.com

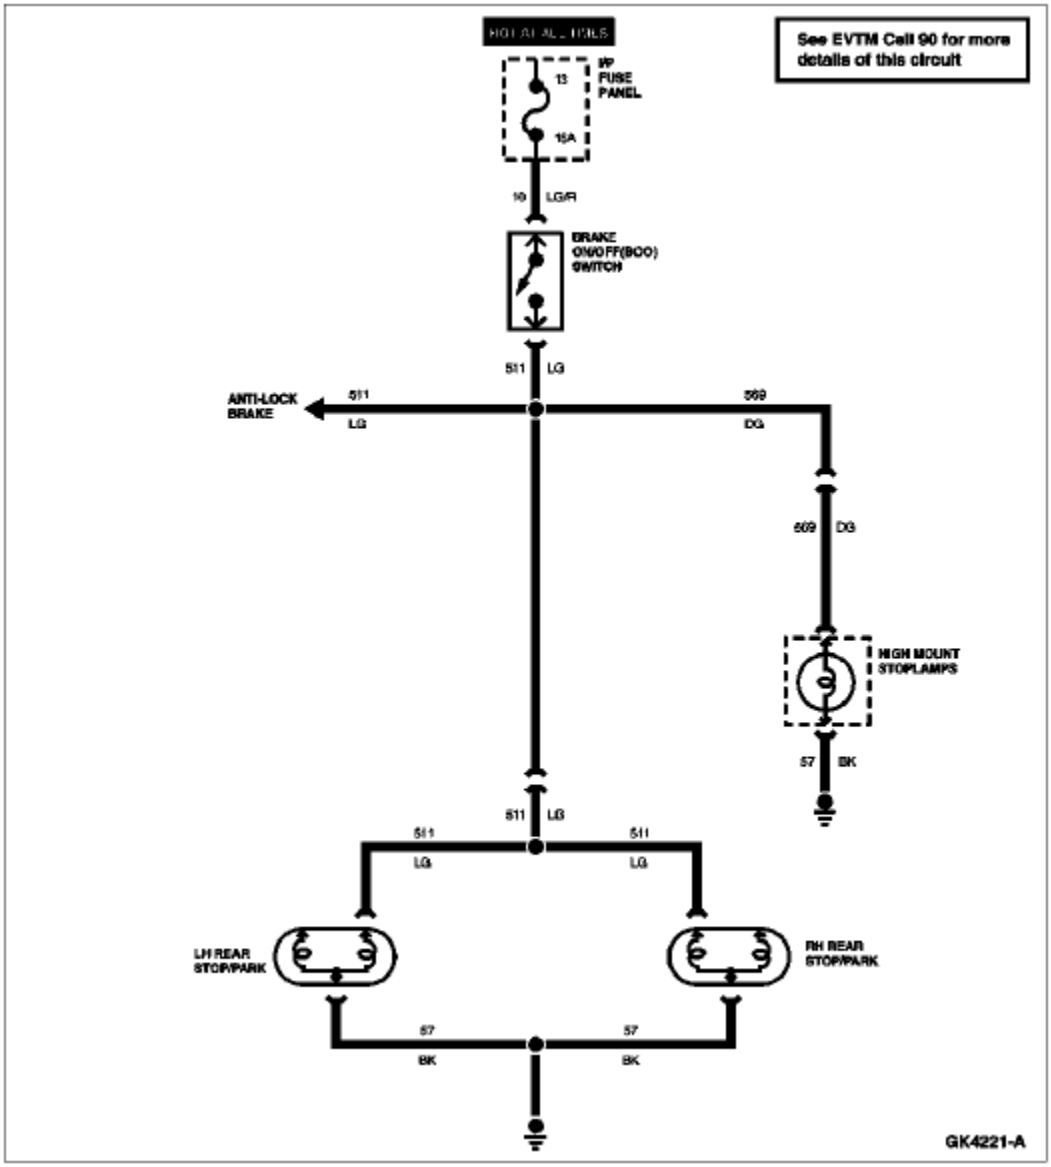
Electrical Schematics — Stoplamps

Stoplamps, Aerostar



Stoplamps, Ranger

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Inspection and Verification — Stoplamps

1. Verify customer concern by operating the stoplamp system.
2. Visually inspect the components of the stoplamp system.

VISUAL INSPECTION CHART

Mechanical	Electrical
• None	• Blown fuse • Damaged stoplamp bulbs • Damaged wiring harness • Loose or corroded connections

3. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
4. If fault is not visually evident, determine the symptom and proceed to the following Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Stoplamps

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

STOPLAMPS

Condition	Possible Source	Action
• Stoplamps Inoperative	• Fuse. • Circuit. • Brake On/Off (BOO) switch.	• GO to Pinpoint Test G.
• Stoplamps On Continuously	• Brake On/Off (BOO) switch.	• GO to Pinpoint Test H.
• Individual Stoplamp Inoperative	• Stoplamp bulb. • Circuit.	• GO to Pinpoint Test J.

tomsn048@gmail.com

Pinpoint Tests — Stoplamps

PINPOINT TEST G: STOPLAMPS INOPERATIVE

G1 BATTERY FEED TO LAMPS

- Remove a stoplamp bulb.
- Have assistant press brake pedal.
- Check for battery voltage at lamp socket battery feed terminal.

Is battery voltage present?

Yes	No
GO to **G2** .	REPAIR open in lamp feed circuit.

G2 COMMON GROUND CIRCUIT CHECK

- Set headlamp switch in park lamp position.

Are park lamps ON?

Yes	No
CHECK bulbs. Service as required.	REPAIR ground Circuit 57 (BK).

PINPOINT TEST H: STOPLAMPS ON CONTINUOUSLY

H1 SHORTED STOPLAMP SWITCH

- Disconnect wiring at stoplamp switch.

Are stoplamps off?

Yes	No
REPLACE switch.	GO to **H2** .

tomsn048@gmail.com

H2 ISOLATE 14401 WIRING HARNESS

- Disconnect 14401 wiring harness to 14405 (Aerostar) or 14A488 (Ranger) wiring harness connector.
- Check for battery voltage at Pin 7 (Aerostar) or Pin 77 (Ranger).

Is battery voltage present?

Yes	No
REPAIR short to battery power in 14401 wiring harness.	REPAIR short to battery power in wiring harness from 14405 (Aerostar) or 14A488 (Ranger).

PINPOINT TEST J: INDIVIDUAL STOPLAMP INOPERATIVE

NOTE: If neon stoplamp is inoperative, refer to Pinpoint Test P.

J1 BULB AND SOCKET

- Remove bulb.
- Inspect bulb for broken filament. Check bulb socket for corrosion or damage.

Are bulb and socket OK?

Yes	No
GO to **J2** .	SERVICE as required.

J2 BATTERY FEED TO STOPLAMP

- Disconnect wiring at lamp.
- Have assistant press brake pedal.
- Check for battery voltage at connector feed terminal.

Is voltage present?

Yes	No
GO to **J3** .	REPAIR open in wire between connector and stoplamp splice.

J3 STOPLAMP GROUND

- Check for continuity between connector ground terminal (BK) and clean chassis ground.

Is there continuity?

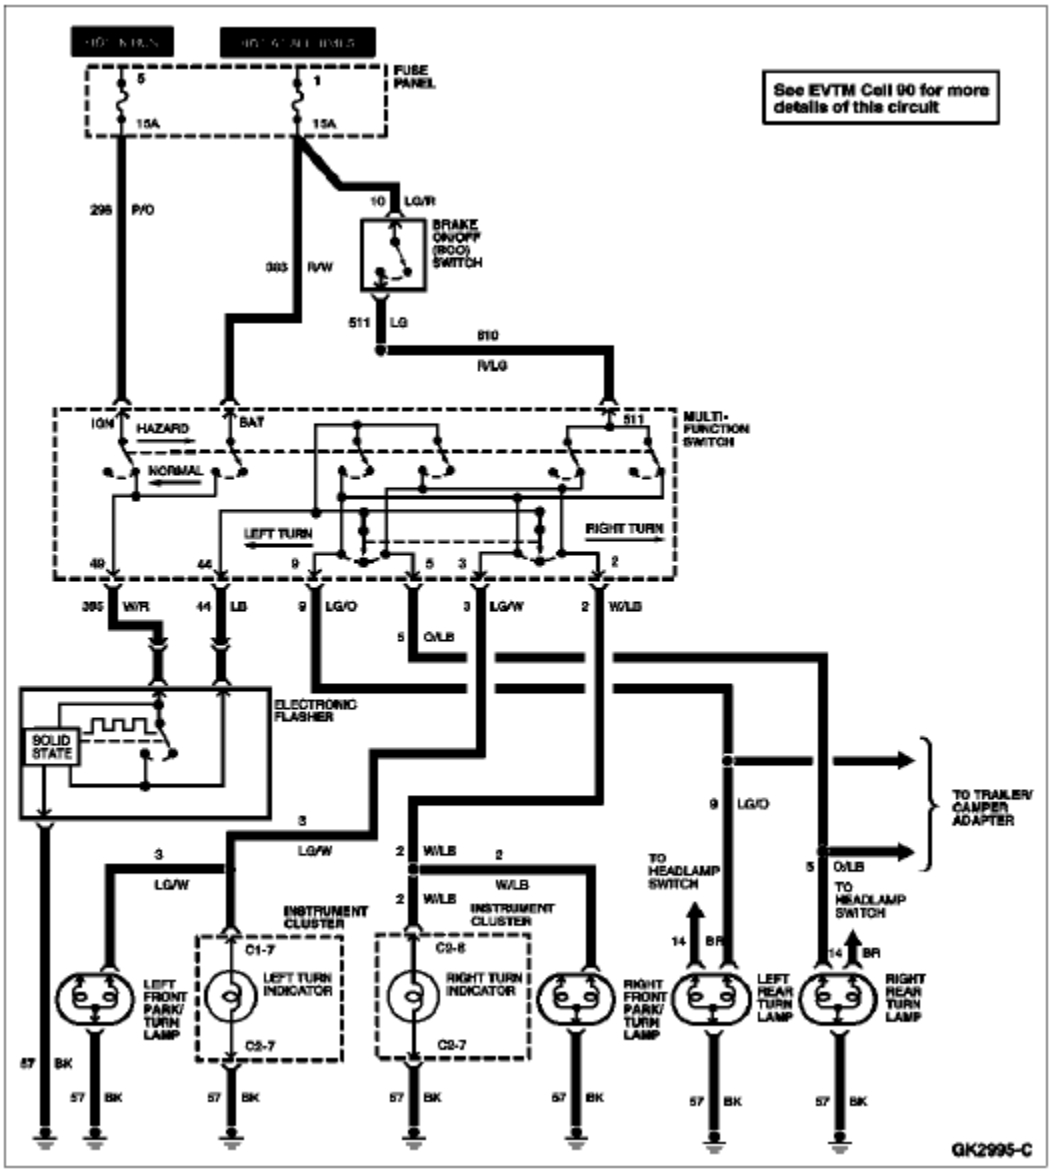
tomsn048@gmail.com

Yes	No
CHECK lamp assembly for condition that would prevent bulb from coming on.	REPAIR open in ground circuit (BK).

tomsn048@gmail.com

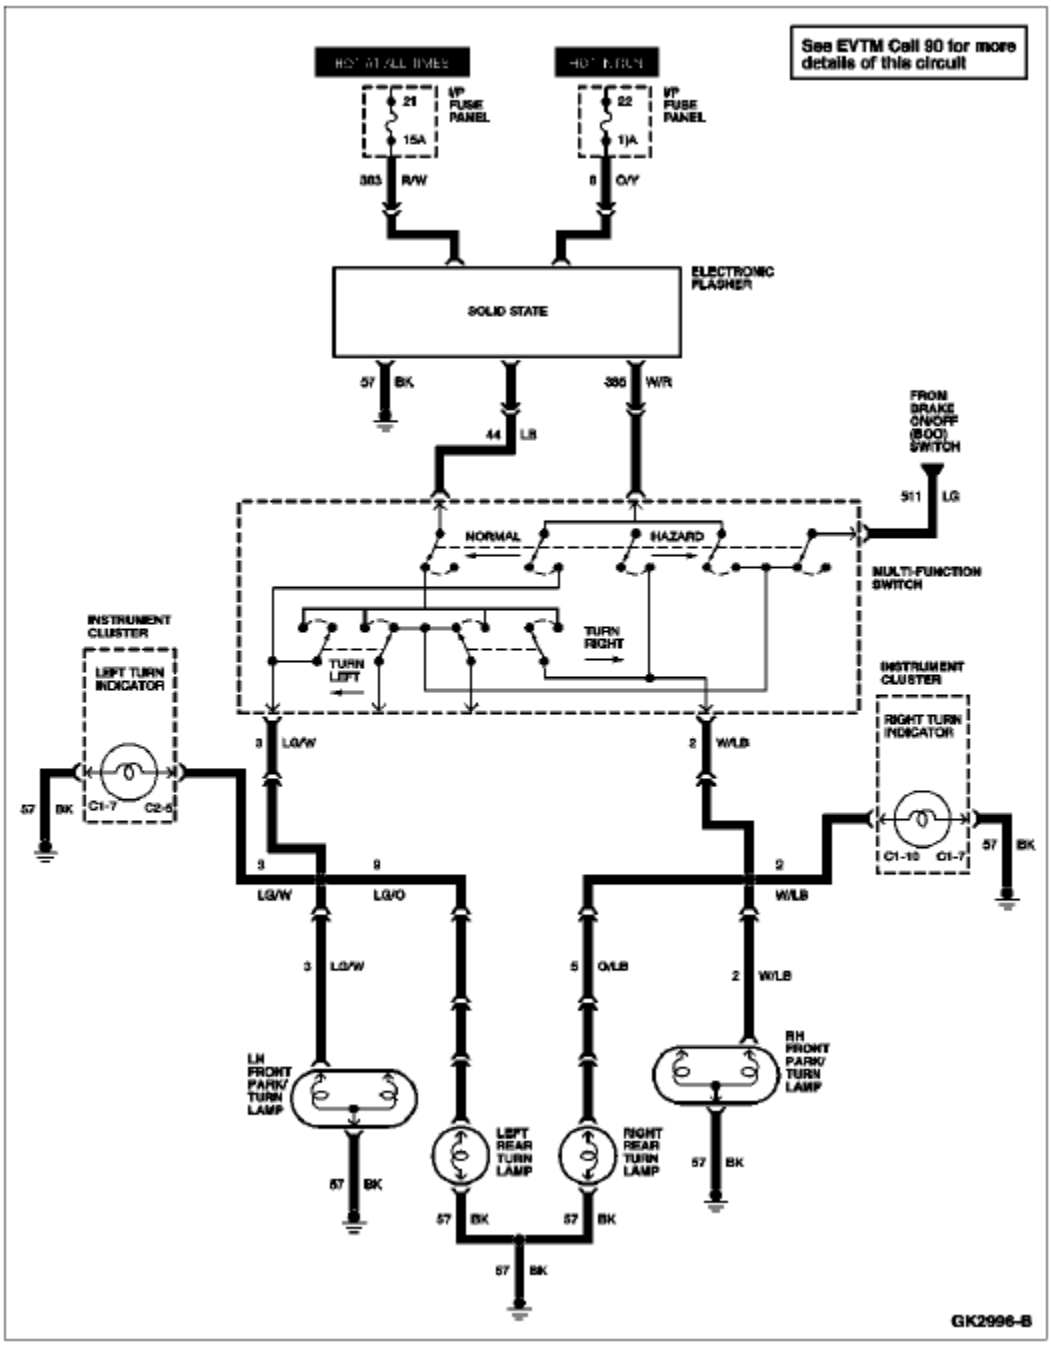
Electrical Schematics — Turn Signal Lamps/Hazard Flasher Lamps

Turn Signal Lamps/Hazard Flasher Lamps, Aerostar



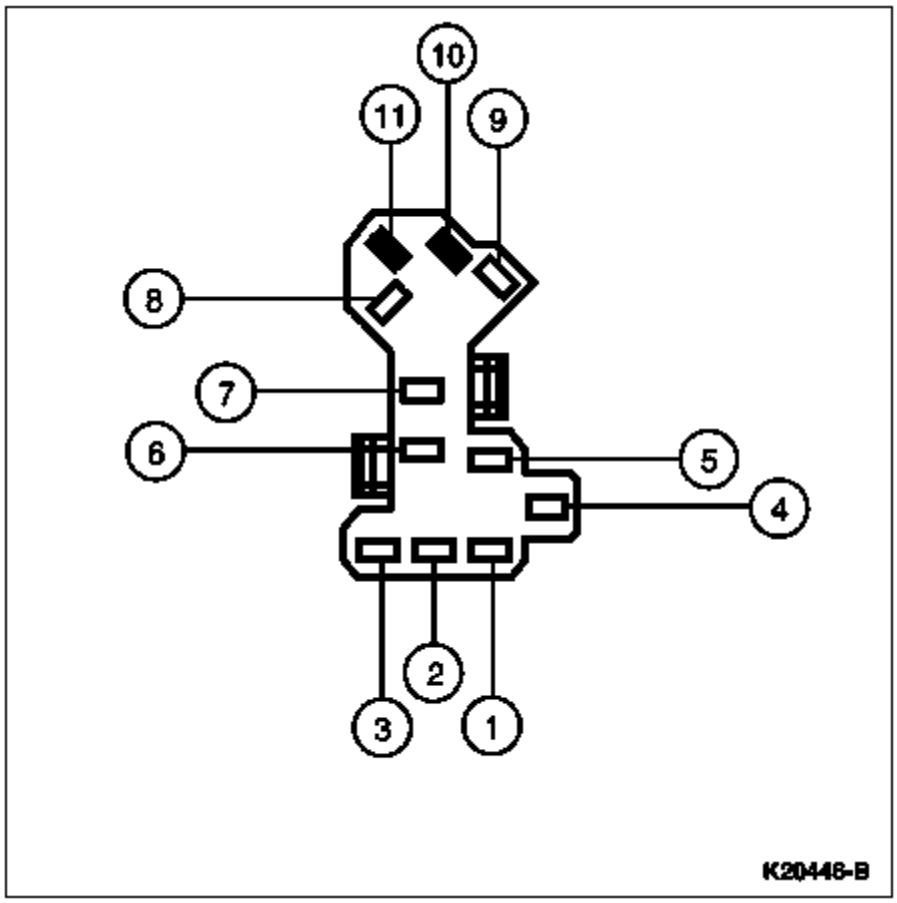
Turn Signal Lamps/Hazard Flasher Lamps, Ranger

tomsn048@gmail.com



Multi-Function Switch Connector, Aerostar

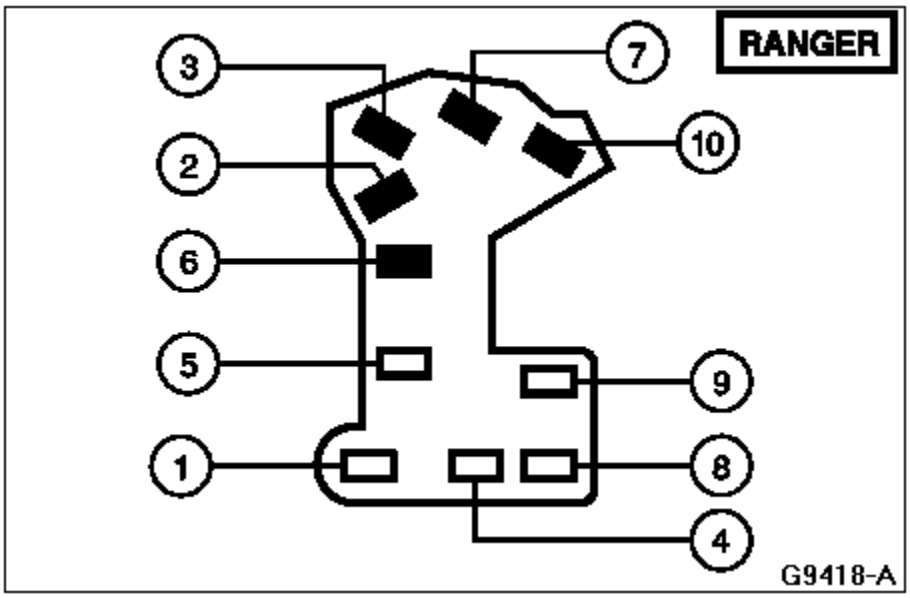
tomsn048@gmail.com



Pin Number	Circuit	Circuit Function
1	3 (LG/W)	Front Turn Signal Lamp (LH)
2	383 (R/W)	Emergency Warning Flasher Feed
3	298 (P/O)	Fused Run Only Feed
4	385 (W/R)	Flasher to Emergency Warning Switch
5	810 (R/LG)	Stoplamp Switch to Stoplamps
6	2 (W/LB)	Front Turn Signal Lamp (RH)
7	44 (LB)	Turn Signal Flasher to Turn Signal Switch
8	64 (DG)	Trailer Turn Signal (RH)
9	52 (Y)	Trailer Turn Signal (LH)
10	—	Not Used
11	—	Not Used

Multi-Function Switch Connector, Ranger

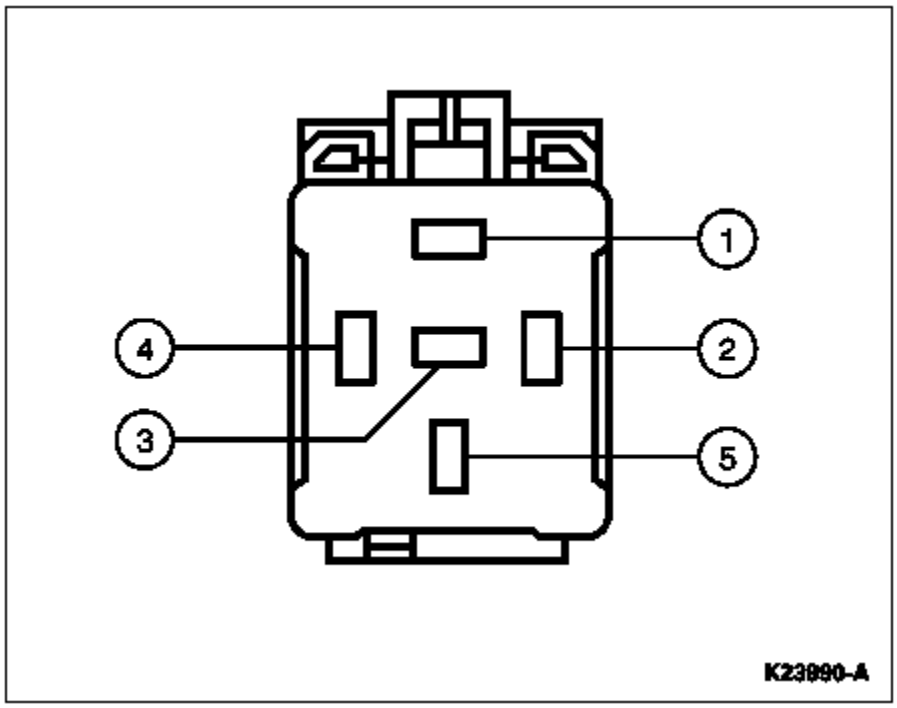
tomsn048@gmail.com



Pin Number	Circuit	Circuit Function
1	44 (LB)	Turn Signal Flasher to Turn Signal Switch
2	—	Not Used
3	—	Not Used
4	385 (W/R)	Hazard Lamp Switch
5	2 (W/LB)	Turn Signal Lamps (RH)
6	—	Not Used
7	—	Not Used
8	3 (LG/W)	Turn Signal Lamps (LH)
9	511 (LG)	Brake On/Off Switch to Turn Signal Switch
10	—	Not Used

Flasher Unit, Ranger

tomsn048@gmail.com



Pin Number	Circuit	Circuit Function
1	44 (LB)	Turn Signal Flasher to Turn Signal Switch
2	57 (BK)	Ground Circuit
3	385 (W/R)	Flasher to Hazard Lamp Switch
4	383 (R/W)	Battery Feed to Flasher Unit — Turn Signals
5	8 (D/Y)	Ignition Feed to Flasher Unit — Hazard Lamps

tomsn048@gmail.com

tomsn048@gmail.com

Inspection and Verification — Turn Signal Lamps/Hazard Flasher Lamps

1. Verify customer concern by operating the turn signal/emergency warning system.
2. Visually inspect the components of the turn signal/emergency warning system.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged turn signal and windshield wiper switch • Damaged hazard lamp switch	• Blown fuse(s) • Damaged turn signal bulb(s) • Damaged wiring harness • Loose or corroded connections • Damaged indicator flasher

3. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
4. If fault is not visually evident, determine the symptom and proceed to the following Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Turn Signal Lamps/Hazard Flasher Lamps

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

TURN SIGNAL LAMPS/HAZARD FLASHER LAMPS

Condition	Possible Source	Action
• Turn Signal Lamps/Hazard Flasher Lamps Inoperative	• Fuse(s). • Circuit. • Hazard flasher switch. • Turn signal switch. • Diode junction box. • Indicator flasher.	• GO to Pinpoint Test K.
• Individual Lamp Inoperative	• Turn signal bulb (s). • Circuit.	• GO to Pinpoint Test L.
• Turn Signal Lamps On Continuously	• Turn signal switch.	• GO to Pinpoint Test M.
• Hazard Flasher Lamps Inoperative	• Fuse. • Circuit. • Hazard flasher switch.	• GO to Pinpoint Test N.

tomsn048@gmail.com

tomsn048@gmail.com

Pinpoint Tests — Turn Signal Lamps/Hazard Flasher Lamps

PINPOINT TEST K: TURN SIGNAL LAMPS/HAZARD FLASHER LAMPS INOPERATIVE

K1 ISOLATE FLASHER UNIT

- Substitute known good flasher unit.

Do turn signals and hazard lamps operate?

Yes	No
REPLACE flasher unit.	GO to K2 .

K2 FLASHER UNIT GROUND

- Check for continuity between flasher unit connector ground terminal (BK) and clean chassis ground.

Is there continuity?

Yes	No
GO to K3 .	REPAIR ground Circuit 57 (BK).

K3 CIRCUIT PROTECTION

- Check fuses 5 and 1 (Aerostar) or fuses 21 and 22 (Ranger).

Are fuses blown?

Yes	No
REPLACE fuses.	REPLACE turn/hazard switch.

PINPOINT TEST L: INDIVIDUAL LAMP INOPERATIVE

L1 ISOLATE BULB AND SOCKET

tomsn048@gmail.com

- Remove bulb.
- Check bulb for broken filament. Check bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **L2** .	SERVICE as required.

L2 BATTERY FEED TO LAMP

- Turn signal switch to side of vehicle with inoperative lamp.
- Check for battery voltage at lamp battery feed wire.

Is battery voltage present?

Yes	No
GO to **L3** .	REPAIR open in battery feed wire.

L3 GROUND CIRCUIT

- Check for continuity between lamp ground wire and clean chassis ground.

Is there continuity?

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	REPAIR open in ground Circuit 57 (BK).

PINPOINT TEST M: TURN SIGNAL LAMPS ON CONTINUOUSLY

M1 ISOLATE FLASHER UNIT

- Substitute known good flasher unit.

Are turn signals off?

Yes	No
REPLACE flasher unit.	REPLACE turn/hazard switch.

PINPOINT TEST N: HAZARD FLASHER LAMPS INOPERATIVE

tomsn048@gmail.com

N1 CIRCUIT PROTECTION (RANGER)

- Check fuse 21 in interior fuse panel.

Is fuse blown?

Yes	No
REPLACE fuse.	GO to N2 .

N2 ISOLATE FLASHER UNIT

- Substitute known good flasher.

Do hazard flasher lamps operate?

Yes	No
REPLACE flasher unit.	GO to N3 .

N3 BATTERY FEED TO FLASHER UNIT

- Check for battery voltage at flasher unit connector battery feed terminal 383 (R/W) (Ranger).
- Check for battery voltage at flasher unit connector battery feed Circuit 385 (W/R) (Aerostar).

Is battery voltage present?

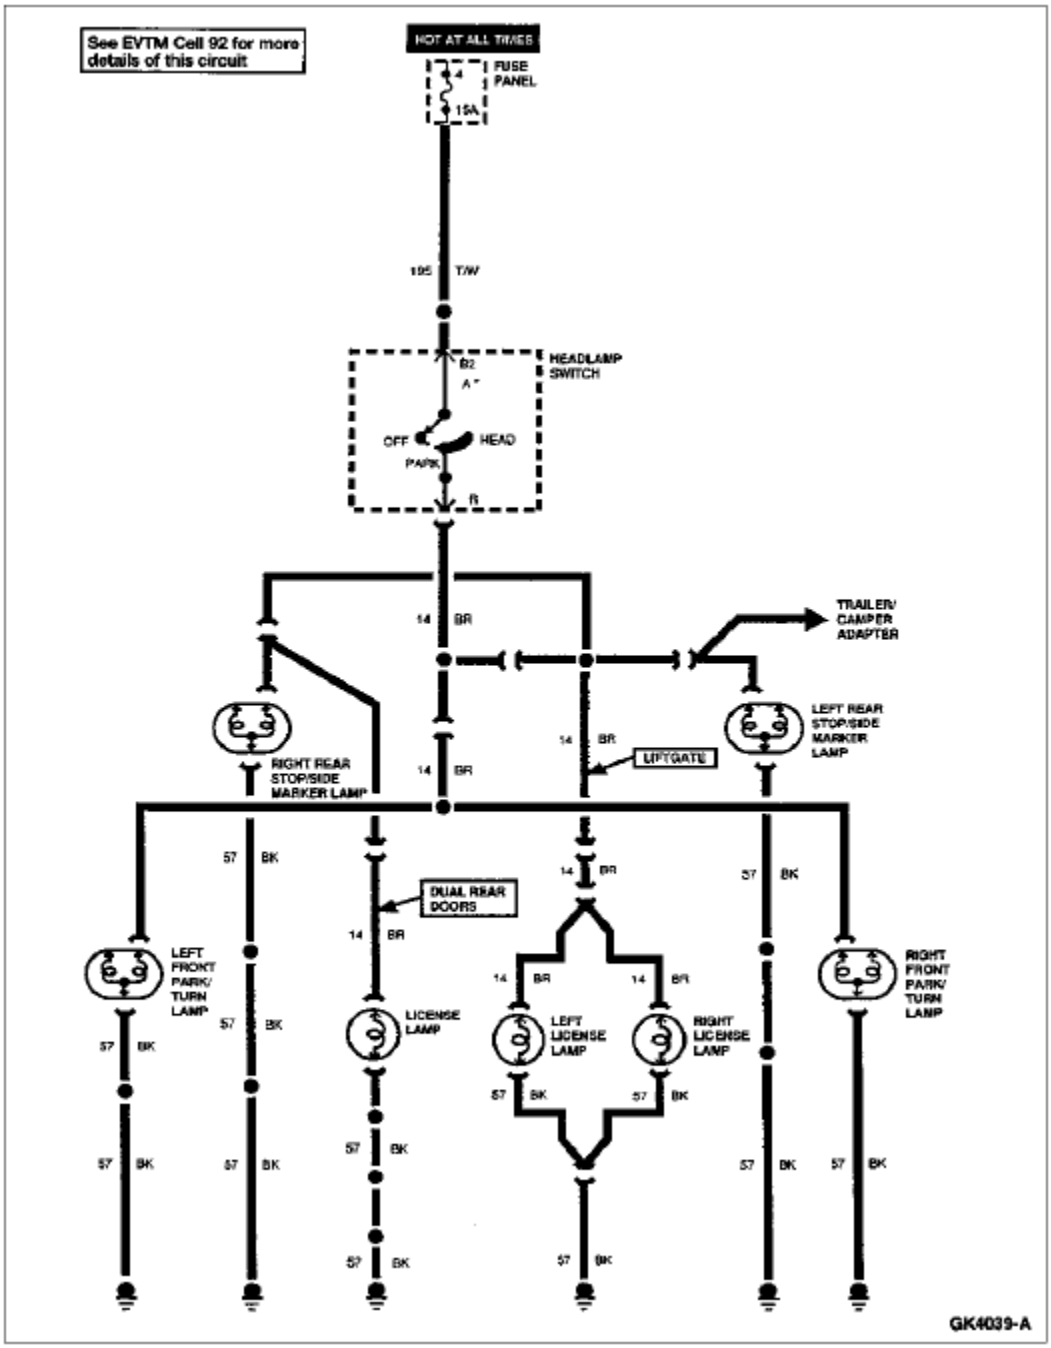
Yes	No
REPLACE turn/hazard switch.	REPAIR Circuit 383 (R/W): (Ranger) or Circuit 385 (W/R) (Aerostar).

tomsn048@gmail.com

tomsn048@gmail.com

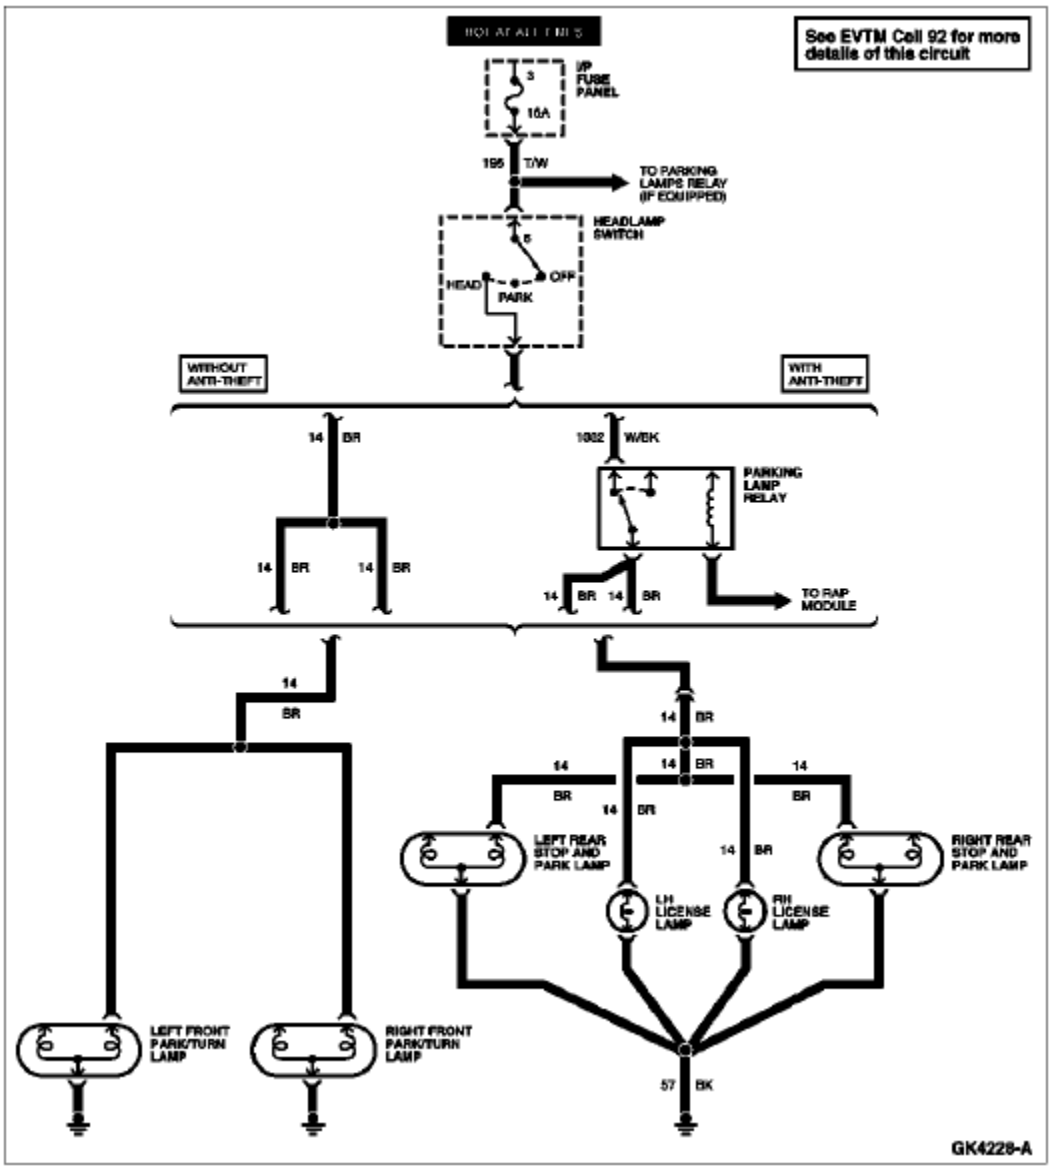
Electrical Schematics — Parking Lamps

Parking Lamp, Aerostar



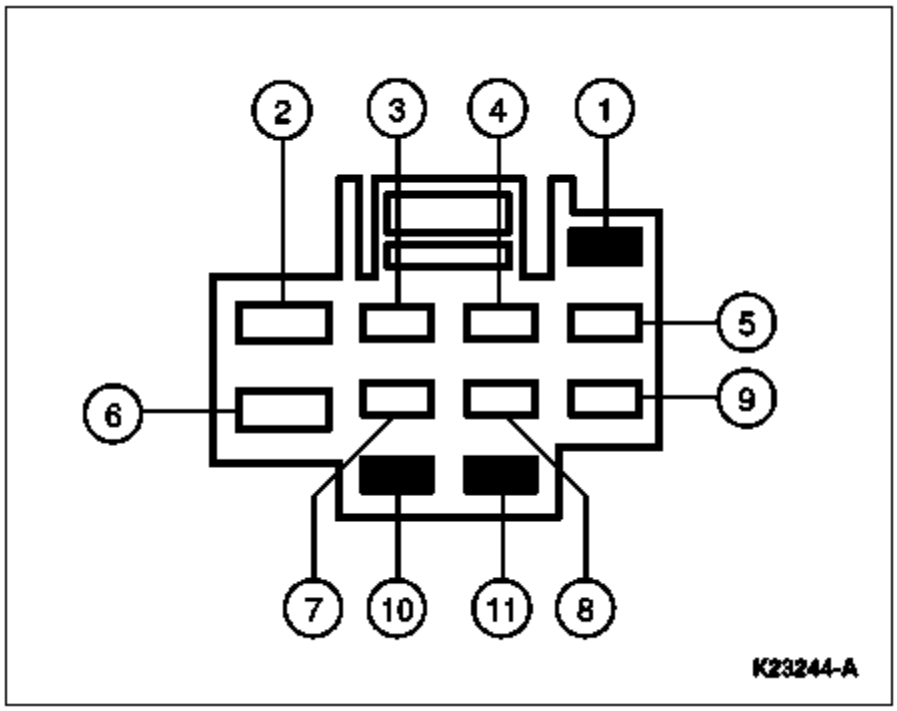
tomsn048@gmail.com

Parking Lamps, Ranger



Headlamp Switch, Ranger

tomsn048@gmail.com



Pin Number	Circuit	Circuit Function
1	—	Not Used
2	15 (R/Y)	Headlamp Switch to Dimmer Switch
3	1032 (W/BK) 14 (BR)	Headlamp Switch to Park Lamp Relay (Ranger with Anti-Theft) Headlamp Switch to Park Lamps (Ranger Without Anti-Theft)
4	640 (R/Y)	Fused Ignition Feed
5	195 (T/W)	Park Lamp Battery Feed
6	196 (DB/O)	Battery Feed to Headlamp Switch
7	57 (BK)	Switch Illumination Ground

Inspection and Verification — Parking Lamps

1. Verify customer concern by operating the parking lamps.
2. Visually inspect the components of the parking lamp system.

VISUAL INSPECTION CHART

Mechanical	Electrical

• None	• Blown fuse(s)
	• Damaged bulb(s)
	  ▪ side marker
	  ▪ parking
	  ▪ license
	• Damaged wiring harness
	• Loose or corroded connections

3. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
4. If fault is not visually evident, determine the symptom and proceed to the Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Parking Lamps

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

PARKING LAMPS

Condition	Possible Source	Action
• Parking Lamps Inoperative	• Fuse. • Circuit. • Headlamp switch.	• GO to Pinpoint Test P.
• One or More Parking Lamps Inoperative	• Parking lamp bulb (s). • Circuit.	• GO to Pinpoint Test Q.
• Parking Lamps On Continuously	• Headlamp switch.	• GO to Pinpoint Test R.
• One or More Side Marker Lamps Inoperative	• Side marker bulb (s). • Circuit.	• GO to Pinpoint Test S.
• Tail Lamps Inoperative	• Circuit. • Bulbs.	• GO to Pinpoint Test T.
• One or More Tail Lamps Inoperative	• Bulb. • Circuit.	• GO to Pinpoint Test U.
• One or More License Plate Lamps Inoperative	• License lamp bulb (s). • Circuit.	• GO to Pinpoint Test V.

tomsn048@gmail.com

tomsn048@gmail.com

Pinpoint Tests — Parking Lamps

PINPOINT TEST P: PARKING LAMPS INOPERATIVE

P1 CIRCUIT PROTECTION

- Check fuse 4 (Aerostar) or 3 (Ranger).

Is fuse blown?

Yes	No
REPLACE fuse.	GO to **P2** .

P2 BATTERY FEED TO HEADLAMP SWITCH

- Remove headlamp switch.
- Check for battery voltage at connector terminal B2 (Aerostar) or 5 (Ranger).

Is battery voltage present?

Yes	No
GO to **P3** .	REPAIR open in Circuit 195 (T/W).

P3 ISOLATE HEADLAMP SWITCH

- Install jumper between connector terminals B2 and R (Aerostar) or 5 and 3 (Ranger).

Are parking lamps on?

Yes	No
REPLACE headlamp switch.	REPAIR open in Circuit 14 (BR) or REPLACE the parking lamp relay (Ranger).

PINPOINT TEST Q: ONE OR MORE PARKING LAMPS INOPERATIVE

tomsn048@gmail.com

Q1 ISOLATE BULB AND SOCKET

- Remove bulb.
- Check bulb for broken filament. Check bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **Q2** .	SERVICE as required.

Q2 BATTERY FEED TO LAMP

- Set headlamp switch in PARK position.
- Check for battery voltage at lamp battery feed wire.

Is battery voltage present?

Yes	No
GO to **Q3** .	REPAIR open in battery feed wire Circuit 14 (BR).

Q3 GROUND CIRCUIT

- Check for continuity between lamp ground wire and clean chassis ground.

Is there continuity?

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	REPAIR open in ground Circuit 57 (BK).

PINPOINT TEST R: PARKING LAMPS ON CONTINUOUSLY

R1 ISOLATE HEADLAMP SWITCH

- Remove headlamp switch.
- Disconnect wiring at headlamp switch.

Are parking lamps off?

Yes	No
REPLACE headlamp switch.	On Aerostar and Ranger without anti-theft, REPAIR short to battery power in Circuit 14

tomsn048@gmail.com

	(BR). On Ranger with anti-theft, GO to R2 .

R2 ISOLATE PARKING LAMP RELAY

- Remove parking lamp relay.

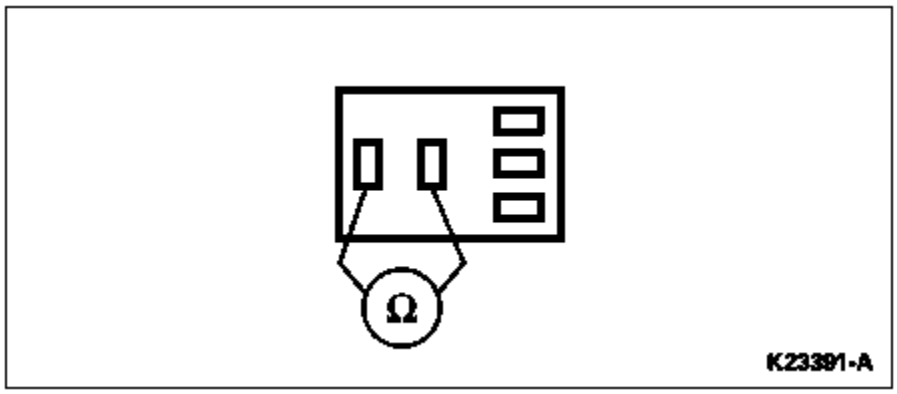
Are parking lamps off?

Yes	No
GO to R3 .	REPAIR short to battery power in Circuit 14 (BR).

R3 SHORTED PARKING LAMP RELAY

- Check for continuity across relay contact terminals as shown below.

Is there continuity?



Yes	No
REPLACE relay.	If equipped with autolamps/exit delay or anti-theft system, GO to R4 . If not equipped with system, REPAIR short to battery power in Circuit 14 (BR).

R4 SHORTED RELAY COIL

- Headlamp switch in parking lamp position.
- Install parking lamp relay.

Did relay "click" when installed?

tomsn048@gmail.com

Yes	No
REPAIR short to ground in relay coil Circuit 15 (R/Y).	REPAIR short to battery power in Circuit 14 (BR).

PINPOINT TEST S: ONE OR MORE SIDE MARKER LAMPS INOPERATIVE

S1 ISOLATE BULB AND SOCKET

- Remove bulb.
- Check bulb for broken filament. Check bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **S2** .	SERVICE as required.

S2 BATTERY FEED TO LAMP

- Set headlamp switch in PARK position.
- Check for battery voltage at lamp battery feed wire.

Is battery voltage present?

Yes	No
GO to **S3** .	REPAIR open in battery feed wire Circuit 14 (BR).

S3 GROUND CIRCUIT

- Check for continuity between lamp ground wire and clean chassis ground.

Is there continuity?

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	REPAIR open in ground Circuit 57 (BK).

PINPOINT TEST T: TAIL LAMPS INOPERATIVE

tomsn048@gmail.com

T1 ISOLATE OPEN CIRCUIT (AEROSTAR, RANGER ONLY)

- Set headlamp switch in ON position.

Are license plate lamps on?

Yes	No
GO to **T2** .	REPAIR open ahead of rear lamp splice (Circuit 14 [BR]).

T2 ISOLATE BULBS AND SOCKETS

- Remove a tail lamp bulb.
- Inspect bulb for a broken filament. Inspect lamp socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	SERVICE as required and REPEAT repair on opposite lamp.

PINPOINT TEST U: ONE OR MORE TAIL LAMPS INOPERATIVE

U1 ISOLATE BULB AND SOCKET

- Remove bulb.
- Check bulb for broken filament. Check bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **U2** .	SERVICE as required.

U2 BATTERY FEED TO LAMP

- Set headlamp switch in PARK position.
- Check for battery voltage at lamp battery feed wire.

Is battery voltage present?

Yes	No
GO to **U3** .	REPAIR open in battery feed wire Circuit 14 (BR) or REPLACE the parking lamp relay

tomsn048@gmail.com

	(Ranger).

U3 GROUND CIRCUIT

- Check for continuity between lamp ground wire and clean chassis ground.

Is there continuity?

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	REPAIR open in ground Circuit 57 (BK).

PINPOINT TEST V: ONE OR MORE LICENSE PLATE LAMPS INOPERATIVE

V1 ISOLATE BULB AND SOCKET

- Remove bulb.
- Check bulb for broken filament. Check bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **V2** .	SERVICE as required.

V2 BATTERY FEED TO LAMP

- Set headlamp switch in PARK position.
- Check for battery voltage at lamp battery feed wire.

Is battery voltage present?

Yes	No
GO to **V3** .	REPAIR open in battery feed wire Circuit 14 (BR) or REPLACE the parking lamp relay (Ranger).

V3 GROUND CIRCUIT

- Check for continuity between lamp ground wire and clean chassis ground.

Is there continuity?

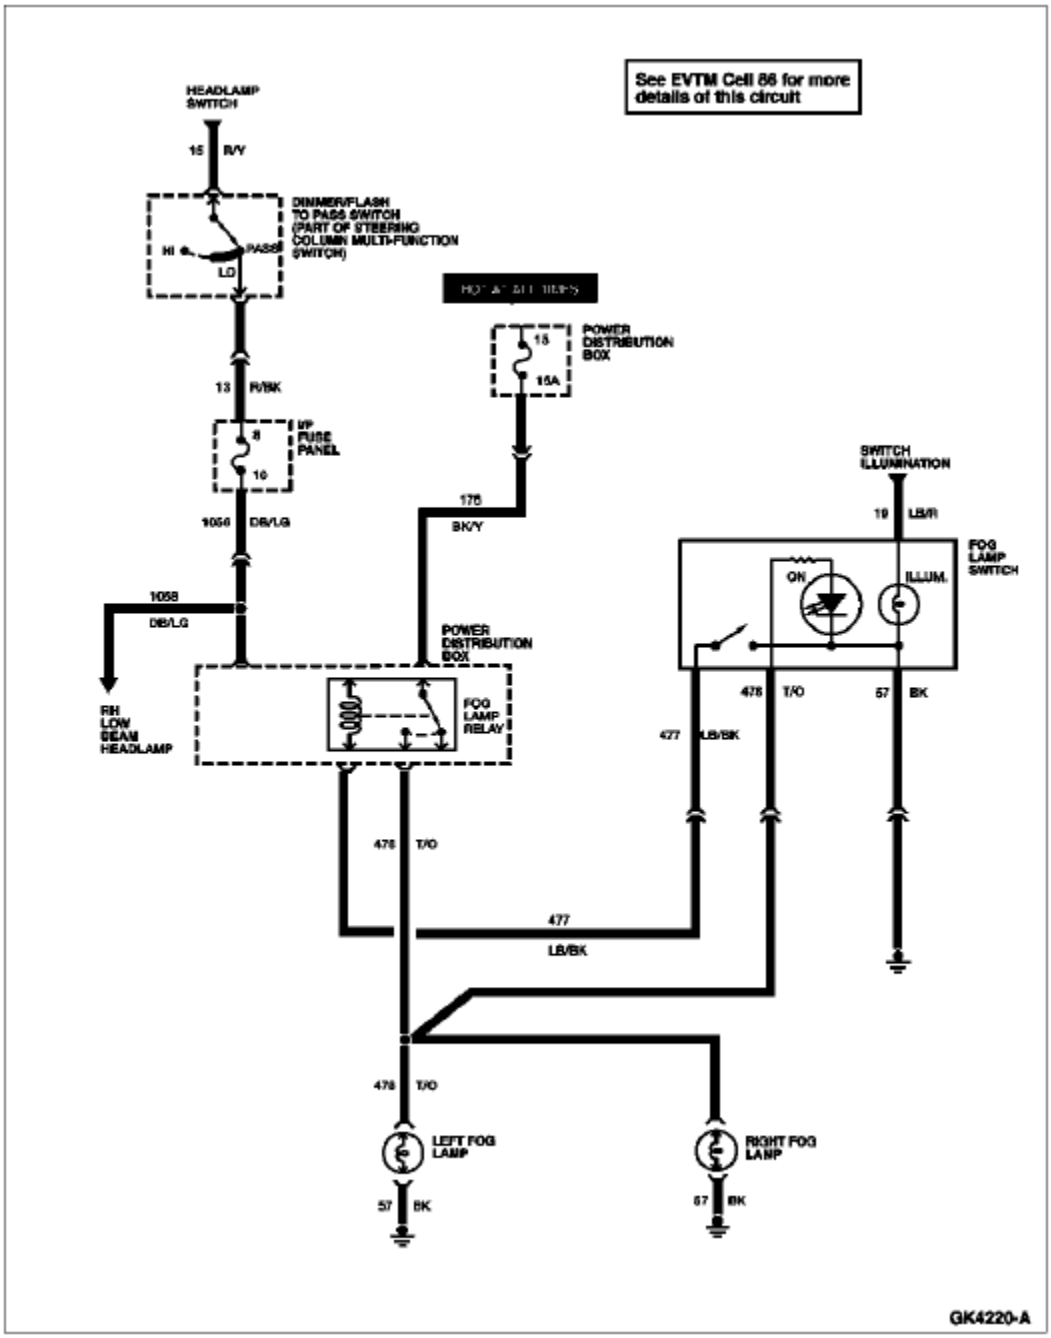
tomsn048@gmail.com

Yes	No
INSPECT lamp assembly for condition that could prevent lamp from coming on.	REPAIR open in ground Circuit 57 (BK).

tomsn048@gmail.com

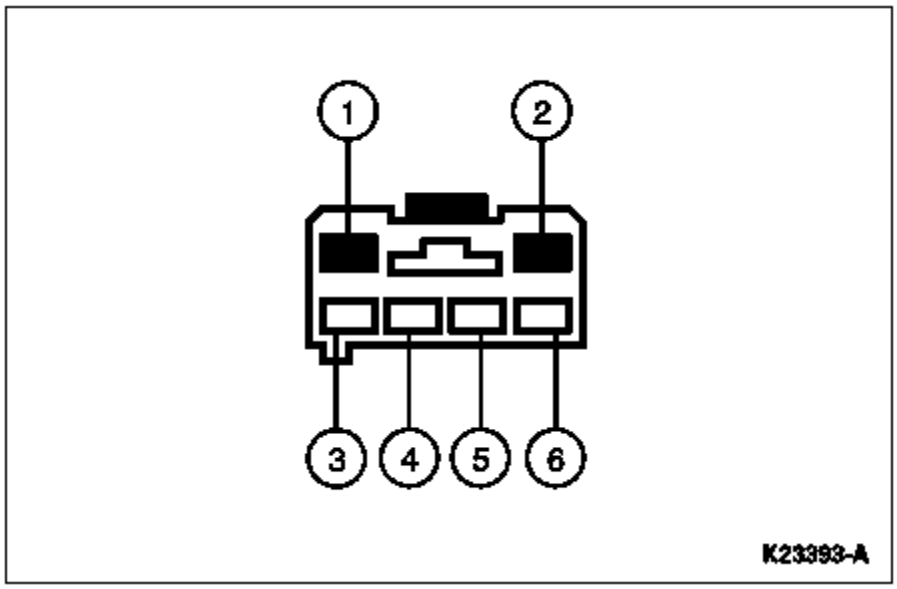
Electrical Schematics — Fog Lamps

Fog Lamps, Ranger



tomsn048@gmail.com

Fog Lamp Switch, Ranger



Pin Number	Circuit	Circuit Function
1	—	Not Used
2	—	Not Used
3	477 (LB/BK)	Fog Lamp Relay Coil to Fog Lamp Switch
4	57 (BK)	Ground Circuit
5	19 (LB/R)	Feed to Switch Illumination
6	478 (T/O)	Feed to Switch Indicator LED

tomsn048@gmail.com

tomsn048@gmail.com

Inspection and Verification — Fog Lamps

1. Verify the customer concern by operating the fog lamps.
2. Visually inspect the components of the fog lamp system.

VISUAL INSPECTION CHART

Mechanical	Electrical
• None	• Blown fuse • Damaged fog lamp • Damaged wiring harness • Loose or corroded connections

3. Verify the headlamps are working. If the headlamps are not working, refer to Pinpoint Test A, Headlamps Inoperative.
4. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
5. If fault is not visually evident, determine the symptom and proceed to the following Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Fog Lamps

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

FOG LAMPS

Condition	Possible Source	Action
• Fog Lamps Inoperative	• Fuse. • Circuit. • Headlamp switch. • Fog lamp switch. • Fog lamp relay. • Fog lamp.	• GO to Pinpoint Test W .
• Individual Fog Lamp Inoperative	• Circuit. • Fog lamp.	• GO to Pinpoint Test X .

tomsn048@gmail.com

Pinpoint Tests — Fog Lamps

PINPOINT TEST W: FOG LAMPS INOPERATIVE

W1 ISOLATE RELAY

- Headlamp ON; LO beam.
- Have assistant place finger on fog lamp relay.
- Turn fog lamp switch on.

Did relay "click"?

Yes	No
GO to **W2** .	GO to **W4** .

W2 BATTERY FEED TO RELAY CONTACTS

- Remove fog lamp relay.
- Check for battery voltage at relay contact feed terminal (BK/Y).

Is battery voltage present?

Yes	No
GO to **W3** .	CHECK fuse 15 in power distribution box. If fuse is not blown, REPAIR open in wire between fuse and relay.

W3 RELAY TO FOG LAMP WIRING

- Connect jumper across relay battery feed (BK/Y) and fog lamp terminals (T/O).

Are fog lamps ON?

Yes	No
REPLACE relay.	REPAIR open in wire to fog lamps.

W4 BATTERY FEED TO RELAY COIL

tomsn048@gmail.com

- Turn headlamps ON; LO beams.

Is right-hand LO beam headlamp on?

Yes	No
GO to **W5** .	CHECK fuse 8 in interior fuse panel. If fuse is not blown, REPAIR open in wire between fuse panel and relay coil.

W5 RELAY COIL GROUND CIRCUIT

- Set fog lamp switch in ON position.
- Check for continuity between relay coil ground wire terminal (LB/BK) and clean chassis ground.

Is there continuity?

Yes	No
REPLACE relay.	GO to **W6** .

W6 SWITCH GROUND

- Remove fog lamp switch.
- Check for continuity between connector ground terminal (BK) and clean chassis ground.

Is there continuity?

Yes	No
GO to **W7** .	REPAIR open in ground circuit.

W7 ISOLATE SWITCH

- Turn headlamps ON; LO beam.
- Connect jumper between switch connector terminal (LB/BK) and clean chassis ground.

Did relay "click"?

Yes	No
REPLACE switch.	REPAIR open in relay to switch wire.

PINPOINT TEST X: INDIVIDUAL FOG LAMP INOPERATIVE

X1 BULB AND SOCKET

tomsn048@gmail.com

- Remove fog lamp bulb.
- Inspect bulb for broken filament. Check bulb socket for corrosion or damage.

Are bulb and lamp OK?

Yes	No
GO to **X2** .	SERVICE as required.

X2 BATTERY FEED TO FOG LAMP

- Disconnect wiring at fog lamp.
- Turn headlamps ON; LO beam.
- Check for battery voltage at connector feed terminal (T/O).

Is battery voltage present?

Yes	No
GO to **X3** .	REPAIR open in battery feed wire.

X3 FOG LAMP GROUND

- Check for continuity between connector ground terminal and clean chassis ground.

Is there continuity?

Yes	No
CHECK lamp assembly for condition that would prevent bulb from coming on.	REPAIR open in ground circuit.

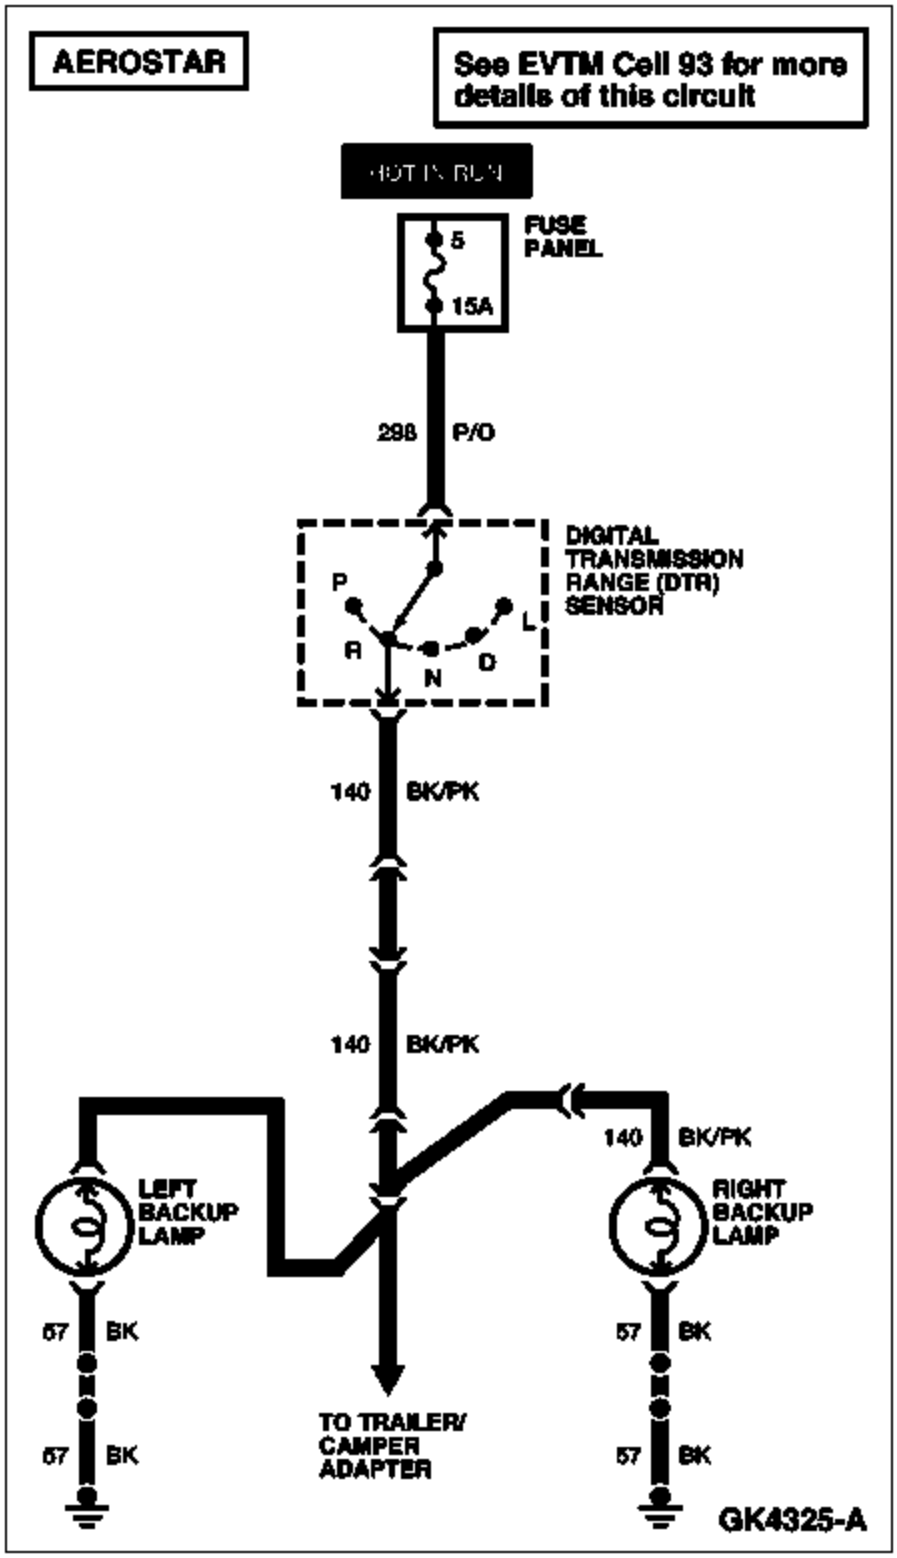
tomsn048@gmail.com

tomsn048@gmail.com

Electrical Schematics — Backup Lamps

Backup Lamps, Aerostar

tomsn048@gmail.com



Backup Lamps, Ranger

tomsn048@gmail.com

Inspection and Verification — Backup Lamps

1. Verify customer concern by operating the backup lamps.
2. Visually inspect the components of the backup lamp system.

VISUAL INSPECTION CHART

Mechanical	Electrical
• None	• Blown fuse • Damaged backup lamp bulb(s) • Damaged wiring harness • Loose or corroded connections

3. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
4. If fault is not visually evident, determine the symptom and proceed to the following Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Backup Lamps

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

BACKUP LAMPS

Condition	Possible Source	Action
• Backup Lamps Inoperative	• Fuse. • Circuit. • Manual lever position switch.	• GO to Pinpoint Test Y.
• Backup Lamps On Continuously	• Manual lever position switch.	• GO to Pinpoint Test Z.
• Individual Backup Lamp Inoperative	• Circuit. • Backup lamp bulb.	• GO to Pinpoint Test AA.

tomsn048@gmail.com

Pinpoint Tests — Backup Lamps

PINPOINT TEST Y: BACKUP LAMPS INOPERATIVE

Y1 CHECK BULBS AND BULB SOCKETS

- Remove backup lamp bulbs.
- Inspect bulbs for broken filament.
- Inspect bulb sockets for corrosion and damage.

Are bulbs and sockets OK?

Yes	No
GO to **Y2** .	SERVICE as required.

Y2 CHECK BATTERY FEED TO BULB SOCKET

- Set parking brake.
- Turn ignition switch to ON position.
- Shift transmission into reverse.
- Check for battery voltage at socket battery feed terminal (BK/PK).

Is battery voltage present?

Yes	No
GO to **Y3** .	GO to **Y4** .

Y3 CHECK GROUND CIRCUIT

- Check for continuity between bulb socket and clean chassis ground.

Is there continuity?

Yes	No
Circuit should function. RETURN to **Y1** .	SERVICE ground Circuit 57 (BK).

Y4 BACKUP LAMP SWITCH FEED

tomsn048@gmail.com

- Set parking brake.
- Turn ignition switch to ON position.
- Disconnect wiring at backup lamps:
  - Backup lamp switch: with manual transmission.
  - Digital transmission range sensor: with automatic transmission.
- Check for battery voltage at switch feed wire (P/O).

Is battery voltage present?

Yes	No
GO to **Y5** .	REPAIR open in battery feed wire Circuit 298 (P/O).

Y5 CHECK SWITCH CONTINUITY

- Shift transmission into reverse.
- Check for continuity across switch battery feed terminal and terminal feeding backup lamps.

Is there continuity?

Yes	No
REPAIR open in Circuit 140 (BK/PK) between switch and backup lamps.	REPLACE switch.

PINPOINT TEST Z: BACKUP LAMPS ON CONTINUOUSLY

Z1 SHORTED SWITCH CHECK

- Disconnect wiring at switch operating backup lamps:
  - Backup lamp switch (all MT).
  - Digital transmission range sensor (all AT).

Are lamps off?

Yes	No
REPLACE switch.	REPAIR short to battery power in lamp Circuit 140 (BK/PK).

PINPOINT TEST AA: INDIVIDUAL BACKUP LAMP INOPERATIVE

AA1 BULB AND SOCKET

tomsn048@gmail.com

- Remove bulb.
- Inspect bulb for broken filament. Check bulb socket for corrosion or damage.

Are bulb and sockets OK?

Yes	No
GO to **AA2** .	SERVICE as required.

AA2 BATTERY FEED TO BACKUP LAMP

- Disconnect wiring at lamp.
- Set parking brake.
- Turn ignition switch to ON position.
- Shift transmission into reverse.
- Check for battery voltage at connector feed terminal (BK/PK).

Is battery voltage present?

Yes	No
GO to **AA3** .	REPAIR open in battery feed wire Circuit 140 (BK/PK).

AA3 BACKUP LAMP GROUND

- Check for continuity between connector ground terminal and clean chassis ground.

Is there continuity?

Yes	No
CHECK lamp assembly for condition that would prevent bulb from coming on.	REPAIR open in ground Circuit 57 (BK).

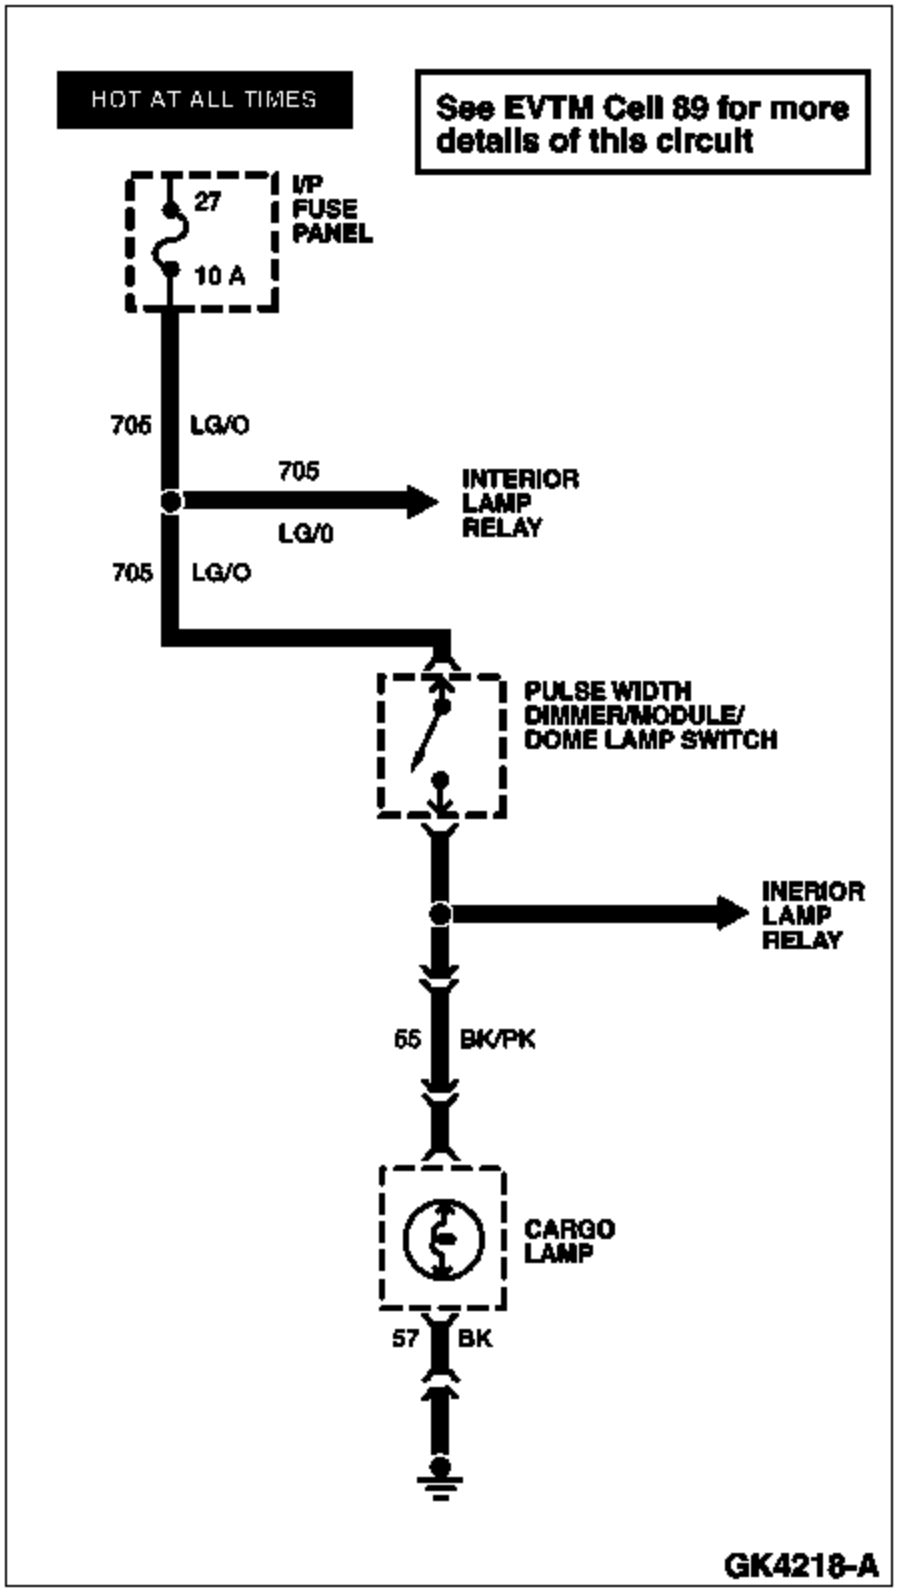
tomsn048@gmail.com

tomsn048@gmail.com

Electrical Schematics — Cargo Lamp

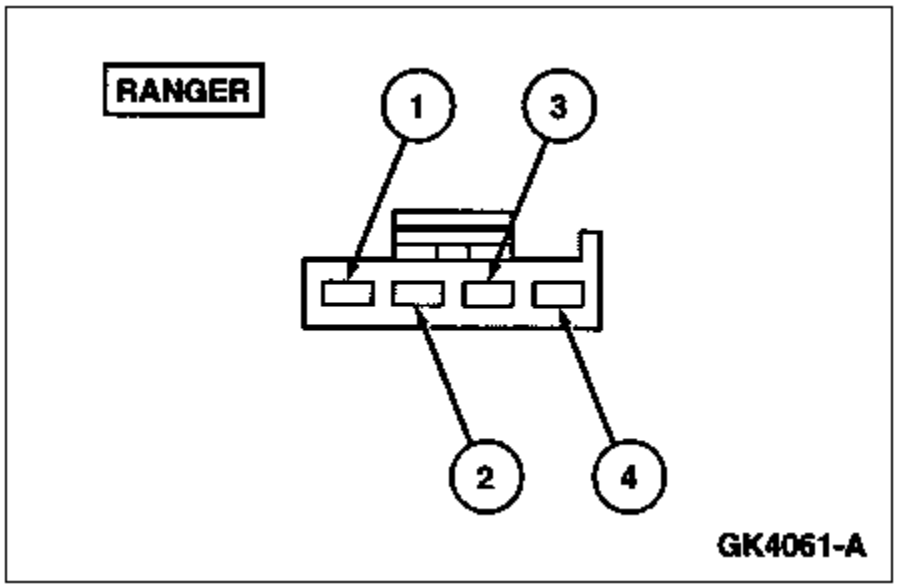
Cargo Lamp, Ranger

tomsn048@gmail.com



Pulse Width Dimmer, Ranger

tomsn048@gmail.com



Pin Number	Circuit	Circuit Function
1	1011 (T/O)	Pulse Width Dimmer Module — Fused Feed
2	705 (LG/O)	Battery Saver Lamp Feed
3	19 (LB/R)	Instrument Panel Lamps Feed
4	55 (BK/PK)	Cargo Lamp Switch to Cargo Lamp/Dome Lamp

tomsn048@gmail.com

Inspection and Verification — Cargo Lamp

1. Verify the customer concern by operating the cargo lamp.
2. Visually inspect the components of the cargo lamp system.

VISUAL INSPECTION CHART

Mechanical	Electrical
• None	• Blown fuse • Damaged cargo lamp bulb • Damaged wiring harness • Loose or corroded connections

3. Check the wiring harness for obvious signs of shorts, opens, bad connections, or damage.
4. If fault is not visually evident, determine the symptom and proceed to the following Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Cargo Lamp

NOTE: Use 73 Digital Multimeter 105-R0051, or equivalent, to perform electrical pinpoint tests.

CARGO LAMP

Condition	Possible Source	Action
• Cargo Lamp Inoperative	• Circuit. • Bulb.	• GO to Pinpoint Test AB .

tomsn048@gmail.com

Pinpoint Tests — Cargo Lamp

PINPOINT TEST AB: CARGO LAMP INOPERATIVE

AB1 ISOLATE BULB AND SOCKET

- Remove bulb.
- Check bulb for broken filament. Check bulb socket for damage or corrosion.

Are bulb and socket OK?

Yes	No
GO to **AB2** .	SERVICE as required.

AB2 BATTERY FEED TO LAMP

- Check for battery voltage at lamp connector battery feed terminal (DG).

Is battery voltage present?

Yes	No
GO to **AB3** .	REPAIR open in battery feed Circuit 569 (DG).

AB3 GROUND CIRCUIT

- Check for continuity between lamp connector ground terminal and clean chassis ground.

Is there continuity?

Yes	No
CHECK lamp assembly for condition that could cause lamp from coming on.	REPAIR open in ground Circuit 57 (BK).

tomsn048@gmail.com

tomsn048@gmail.com

Headlamp Bulb, Ranger

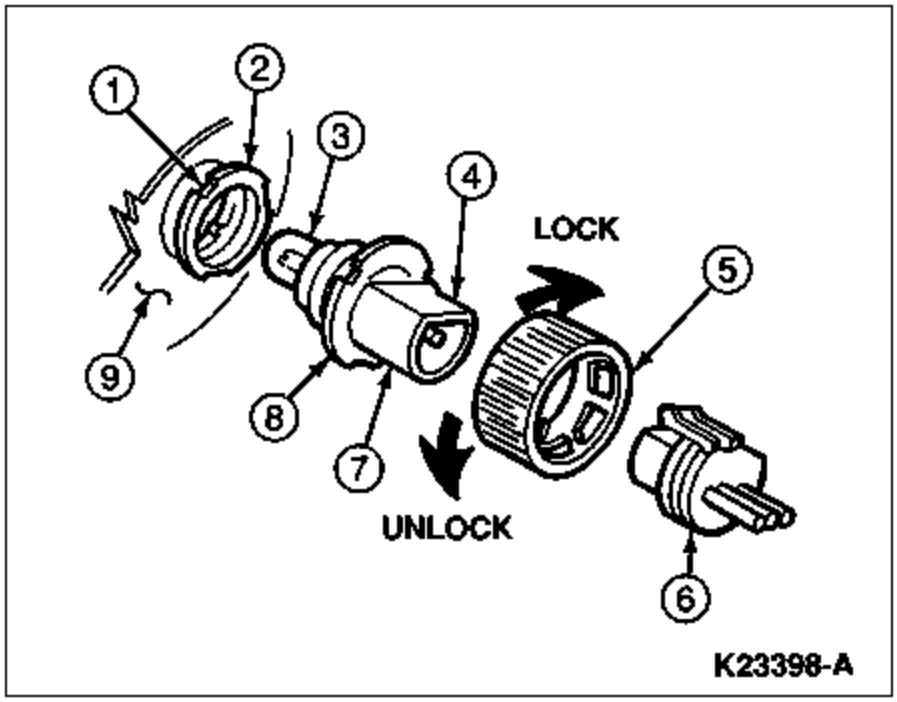
Removal

WARNING: THE HEADLAMP BULB CONTAINS HALOGEN GAS UNDER PRESSURE. THE HEADLAMP BULB MAY SHATTER IF THE GLASS ENVELOPE IS SCRATCHED OR DROPPED. HANDLE CAREFULLY. GRASP ONLY BY PLASTIC BASE. AVOID TOUCHING THE GLASS ENVELOPE. KEEP OUT OF REACH OF CHILDREN. ENERGIZE ONLY WHEN INSTALLED IN THE HEADLAMP.

NOTE: A properly aimed headlamp normally need not be reaimed after installation of this headlamp bulb (13007). A burned out headlamp bulb should not be removed from the headlamp (13008) until just before a replacement is to be installed. Removal for an extended period of time may allow contaminants (dust, moisture, smoke) to affect the performance of the headlamp.

1. Check that headlamp switch (11654) is in the off position.
2. Lift hood (16612).
3. Release latch and swing filler panel to left or right.
4. Remove electrical connector from headlamp bulb by releasing lock tab and grasping wires firmly and snapping connector rearward.
5. Remove headlamp bulb retainer (13N019) by rotating counterclockwise (when viewed from rear) about one-eighth turn and sliding ring off plastic base. Keep headlamp bulb retainer as it may be used again to retain new headlamp bulb.
6. Carefully remove headlamp bulb from socket by gently pulling straight backward out of socket. Do not rotate headlamp bulb during removal.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Rear Face of Socket (Part of 13005)
2	—	Bulb Socket (Part of 13005)
3	—	Bulb (Part of 13007)
4	—	Flat Side of Plastic Base (Part of 13007)
5	13N019	Locking Retaining Ring
6	—	Electrical Connector (Part of 14290)
7	—	Plastic Base (Part of 13007)
8	—	Mounting Flange (Part of 13007)
9	—	Reflector (Part of 13005)

Installation

1. With flat side of plastic base of headlamp bulb facing upward, insert glass envelope of headlamp bulb into socket. Turn base slightly to left or right, if necessary, to align grooves in forward part of plastic base with corresponding locating tabs inside socket. When grooves are aligned, push headlamp bulb firmly into socket until mounting flange on base contacts rear face of socket.

2. Slip headlamp bulb retainer over rear of plastic base against mounting flange. Lock headlamp bulb retainer into socket by rotating clockwise. A stop will be felt when headlamp bulb retainer is fully engaged.

3. Push electrical connector into rear of plastic base until it snaps and locks into position.

tomsn048@gmail.com

4. Close filler panel.
5. Turn headlamps on and check for proper operation.

---

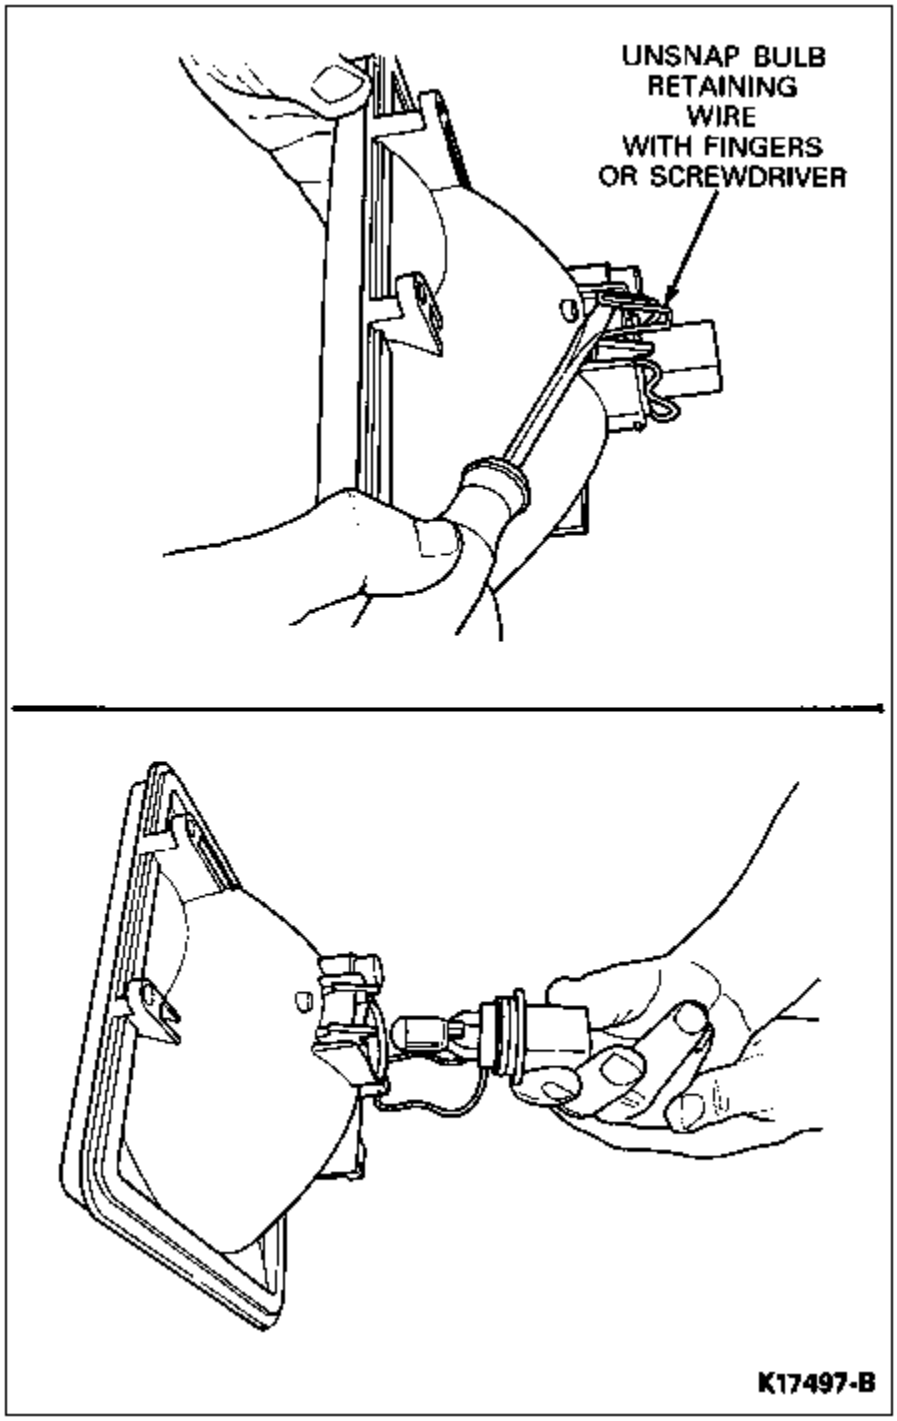
tomsn048@gmail.com

Headlamp Bulb, Aerostar

Removal and Installation

1. Remove the headlamp door (13064) attaching screws and remove the headlamp door.
2. Remove the four retaining screws. Do not disturb the headlamp adjusting screw (13032) settings.
3. Pull the headlamp (13008) forward and disconnect the wiring assembly plug from the headlamp bulb and retainer.
4. Unsnap bulb retaining wire and pull headlamp bulb and retainer out of headlamp.

tomsn048@gmail.com



5. **NOTE: A properly aimed headlamp normally need not be reaimed after installation of this headlamp bulb (13007). A burned out headlamp bulb should not be removed from the headlamp until just before a replacement is to be installed. Removal for an extended period of time may allow contaminants (dust, moisture, smoke) to affect the performance of the headlamp.**

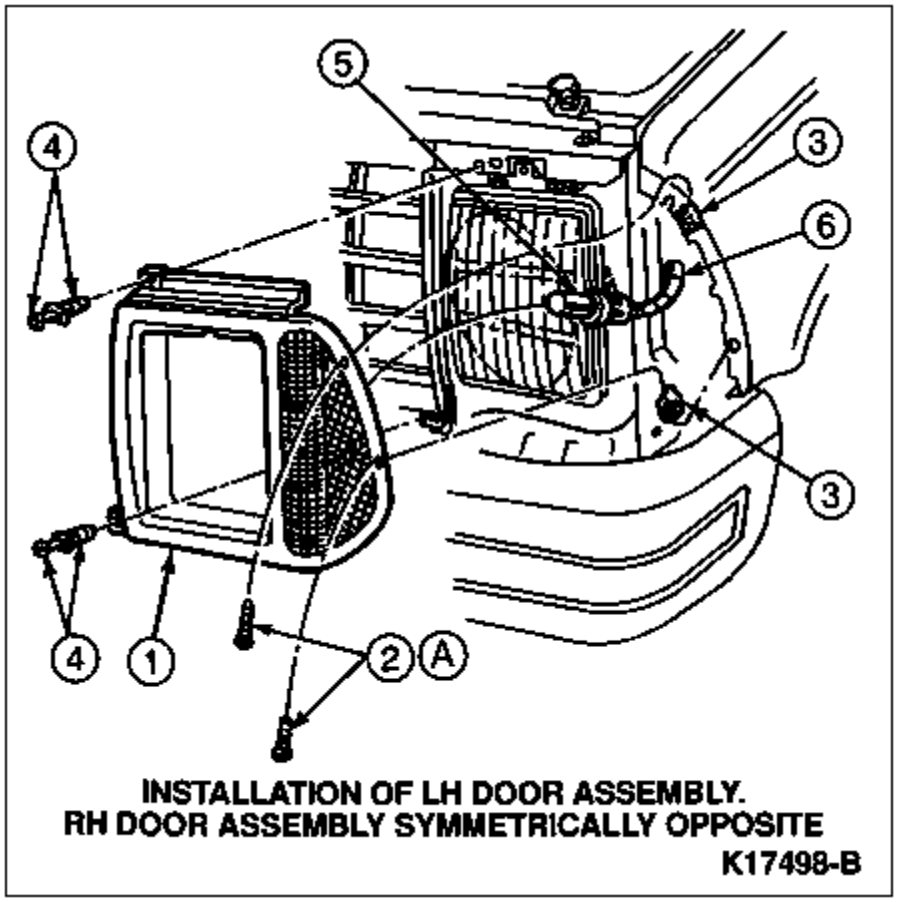
   Install new headlamp bulb and retainer (13N021) into position.

6. Connect the wiring to the bulb. Place the headlamp in position and install the attaching screws.

tomsn048@gmail.com

7. Place the headlamp door into position and install the retaining screws.

Headlamp Door Assembly, Aerostar



Item	Part Number	Description
1	13064	Headlamp Door
2	N802586	Screw
3	N803822	Clip, Push-In
4	N803494	Nut, Push-In
5	13N021	Headlamp Bulb and Retainer
6	12A581	Engine Control Sensor Wiring
A	—	Tighten to 1.4-2.3 Nm (12-20 Lb-In)

tomsn048@gmail.com

tomsn048@gmail.com

Headlamp Assembly, Ranger

Removal

1. Disconnect wiring from the back of the headlamp housing (13100) by releasing the locking tab and grasping the wires and carefully "snapping" rearward.
2. Remove radiator grille (8200) as described in Section 01-02 .
3. Remove the three retainers securing the headlamp to the opening panel in radiator grille.
4. Remove the headlamp (13008) from the vehicle by pulling it forward.
5. Transfer the headlamp bulb retainer (13N019) and the headlamp adjusting screw (13032) to the replacement headlamp if service lamp kit is not being used.

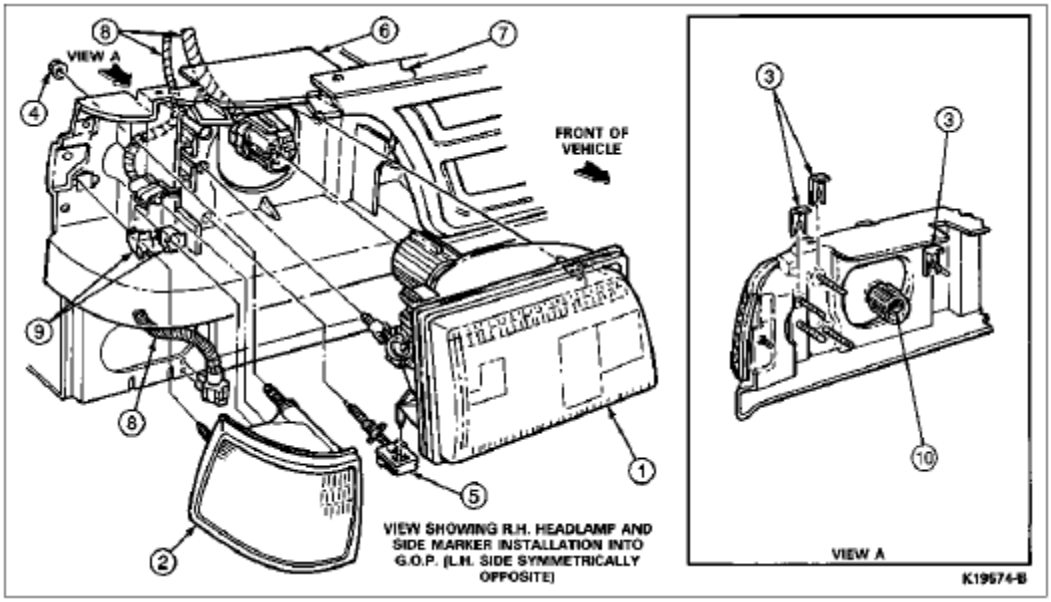
Installation

1. **NOTE: The lower outboard aiming screw installs into a slide track on the opening panel of radiator grille while inserting it into the attachment hole.**

   Position the lamp to the opening in radiator grille panel making sure the locating pin is installed in the aiming screw. Align and insert the three attaching studs.
2. Install the three retainers securing the headlamp to the grille opening panel.
3. Connect wiring.
4. Install radiator grille.
5. Check headlamp aim.

Headlamp Assembly, Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	13008	Headlamp
2	13200	Parking Lamp
3	13N129	Headlamp Mounting Clip
4	N621906	Nut and Washer Assembly
5	13032	Headlamp Adjusting Screw
6	8190	Radiator Grille Opening Panel
7	8200	Radiator Grille
8	14290	Headlamp Dash Panel Junction Wire
9	N807872	Clip
10	13007	Headlamp Bulb

tomsn048@gmail.com

tomsn048@gmail.com

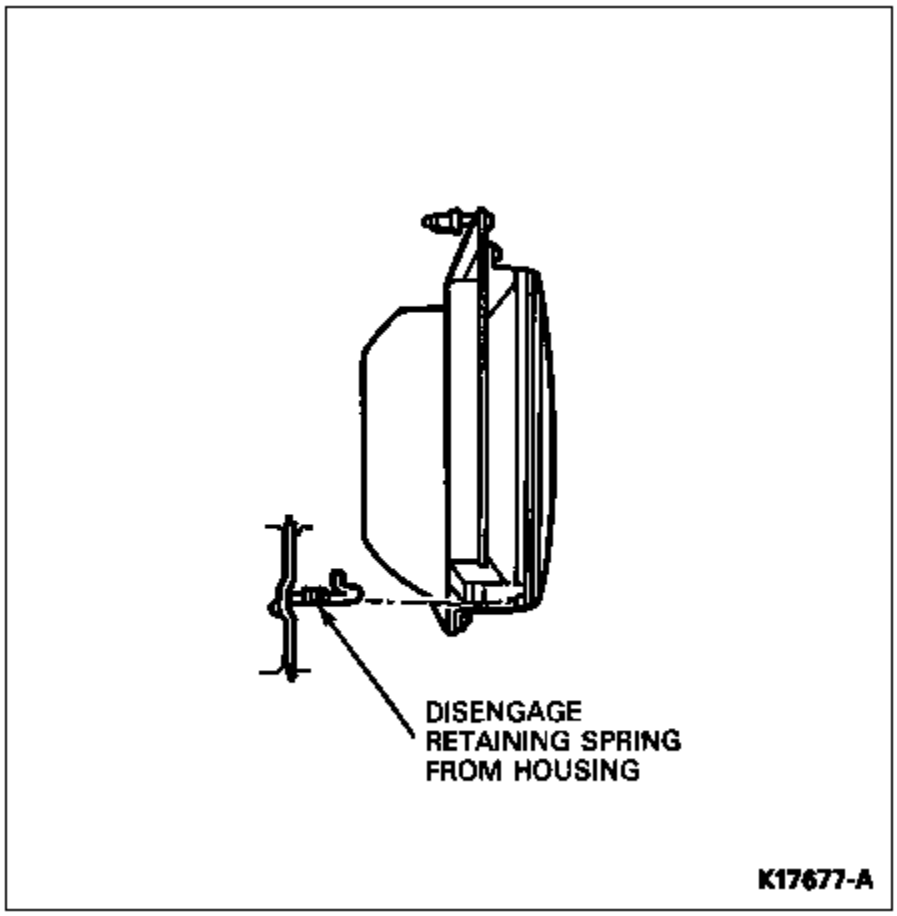
Headlamp Assembly, Aerostar

NOTE: Removal of radiator grille (8200) will make headlamp assembly removal easier.

Removal and Installation

1. Remove headlamp door (13064) and headlamp bulb and retainer (13N021) as described in this section.

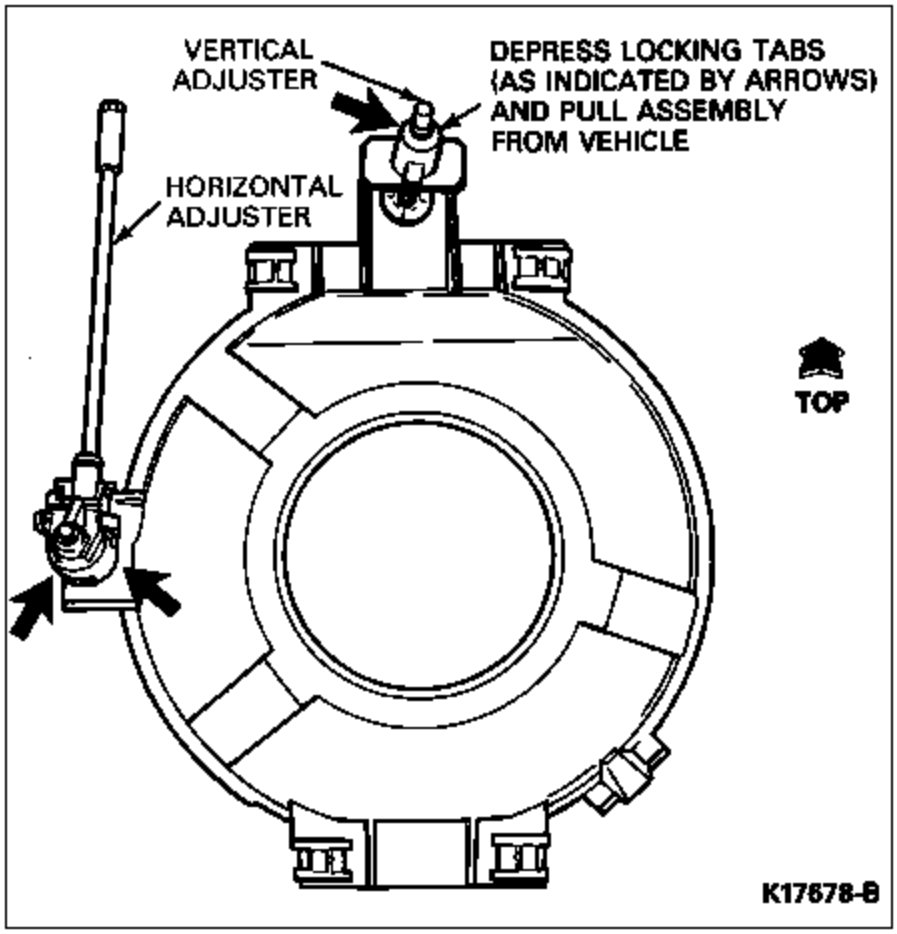
2. Disengage retaining spring from housing.



3. Remove verticalheadlamp adjusting screw (13032) by squeezing the tabs with pliers and pulling.

4. Remove horizontal headlamp adjusting screw assembly by squeezing the tabs of the metal clip with a flat-blade screwdriver and pulling.

tomsn048@gmail.com



5. Remove assembly from vehicle.

For installation, follow removal procedures in reverse order. Make sure horizontal headlamp adjusting screw is inserted through slot in sheet metal above lamp. Re-aim headlamp.

tomsn048@gmail.com

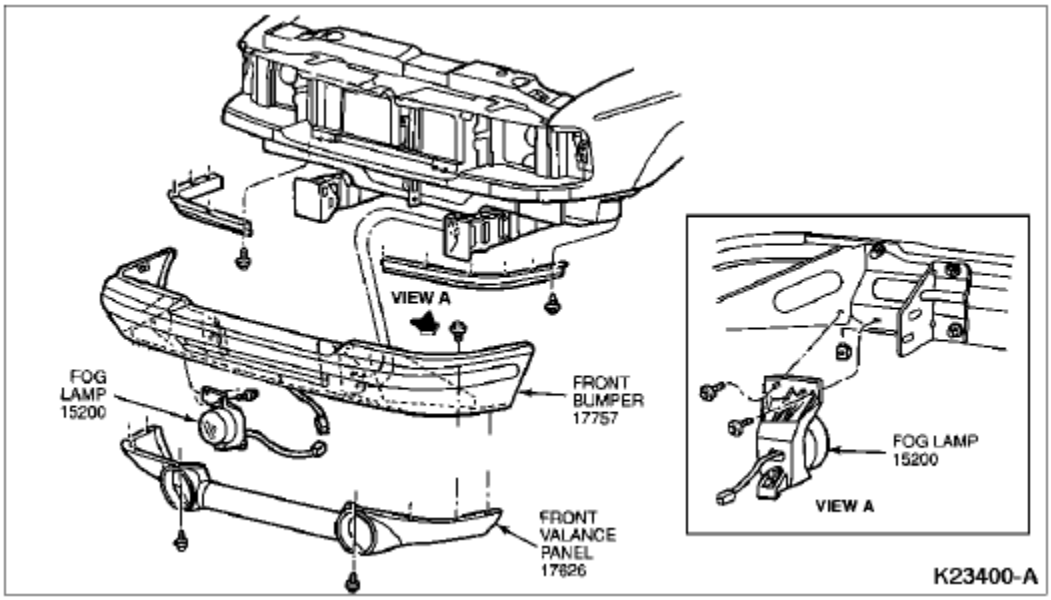
Lamp Assembly, Fog

Removal and Installation

1. Disconnect electrical wiring connector.
2. Remove nut retaining lamp to fog lamp mounting bracket (15266).
3. Remove fog lamp (15200) by pulling out through fascia opening.

For installation, follow removal procedure in reverse order.

Fog Lamp Installation, Ranger



Bulb, Fog Lamp

Removal and Installation

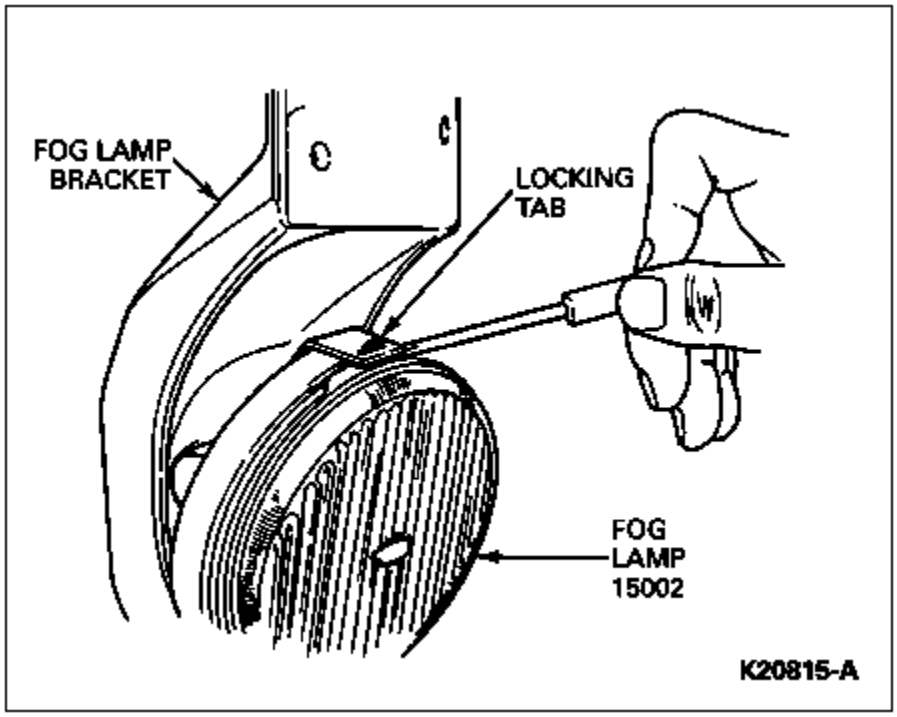
The fog lamp uses a halogen bulb and socket assembly. In the event of a bulb failure, perform the following procedure.

1. **NOTE: Do not touch the new bulb with bare hands. The oil from your skin will cause contamination of the quartz which may result in early failure of the lamp. Do not remove the protective plastic sleeve until the lamp is inserted into the socket. Make sure the circuit is not energized. If the quartz was inadvertently handled, it should be cleaned with a clean cloth moistened with alcohol before installation.**

   Lift up on tab retaining fog lamp lens to the lamp housing. Use caution to avoid dropping the fog lamp

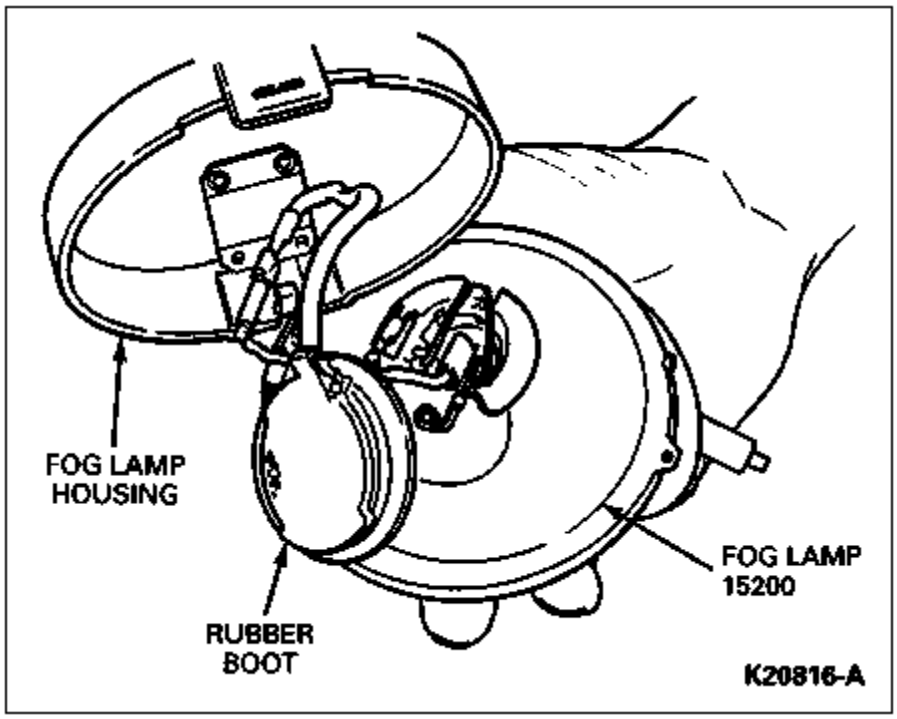
tomsn048@gmail.com

lens.



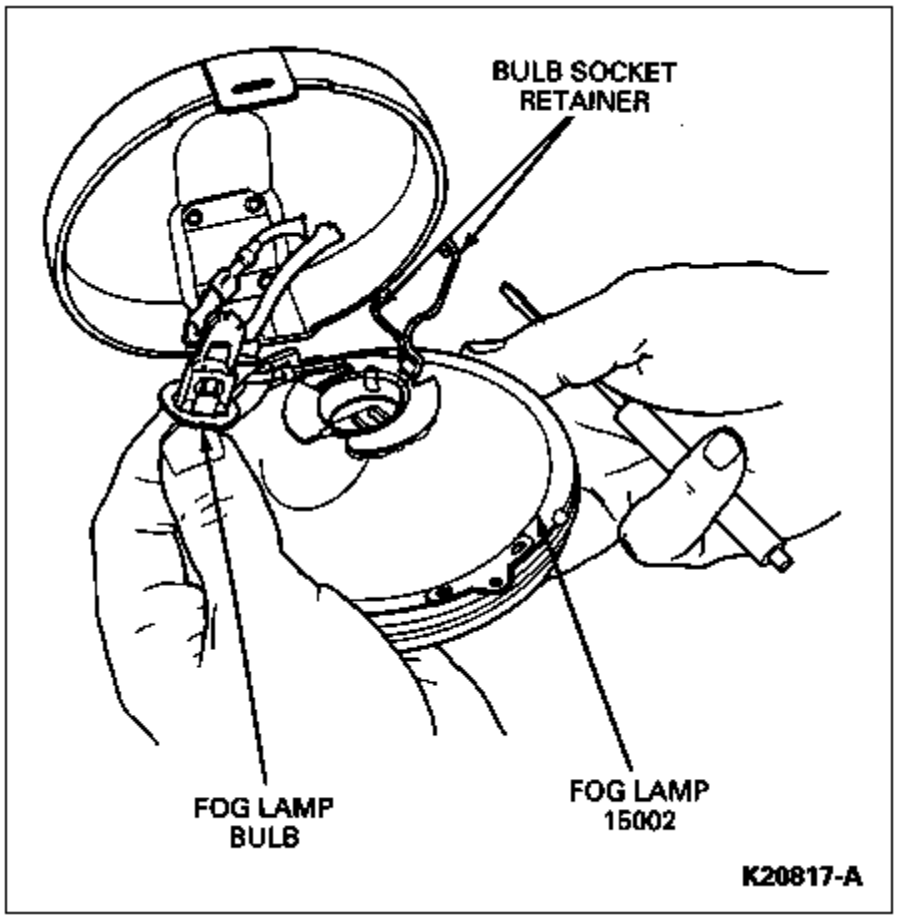
2. Remove fog lamp lens from lamp housing and turn it to gain access to the rear of lamp body.
3. Disconnect bulb wire lead from pigtail connector.
4. Remove rubber boot from back of lens assembly to access bulb socket.

tomsn048@gmail.com



5. Release the bulb socket retainer from the locking tab.
6. Remove bulb and socket assembly from lamp body and pull the bulb directly out of the socket.

tomsn048@gmail.com



For installation, follow removal procedures in reverse order.

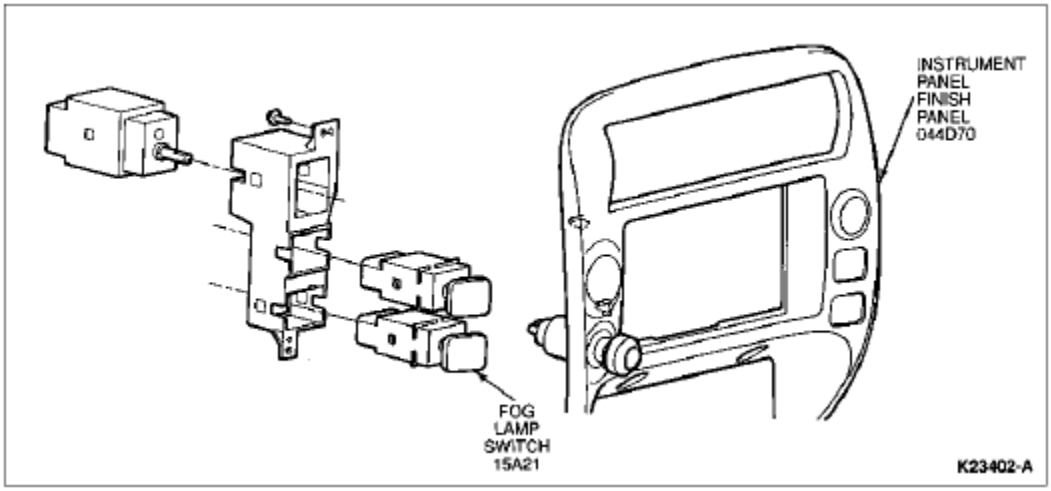
tomsn048@gmail.com

Fog Lamp Switch

Removal and Installation

1. Remove the instrument panel finish panel, refer to Section 01-12 .
2. Reach behind and squeeze tabs on both sides of fog lamp switch (15A214).
3. Pull fog lamp switch out of finish panel and disconnect wiring.
4. To install, reverse removal procedure.

Fog Lamp Switch



tomsn048@gmail.com

tomsn048@gmail.com

Headlamp Switch, Aerostar

Removal and Installation

1. **NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Disconnect battery ground cable (14301).

2. Remove headlamp switch knob from shaft by inserting screwdriver into knob slot, depressing clip and sliding knob off shaft.

3. Remove three screws attaching steering column shroud (3530).

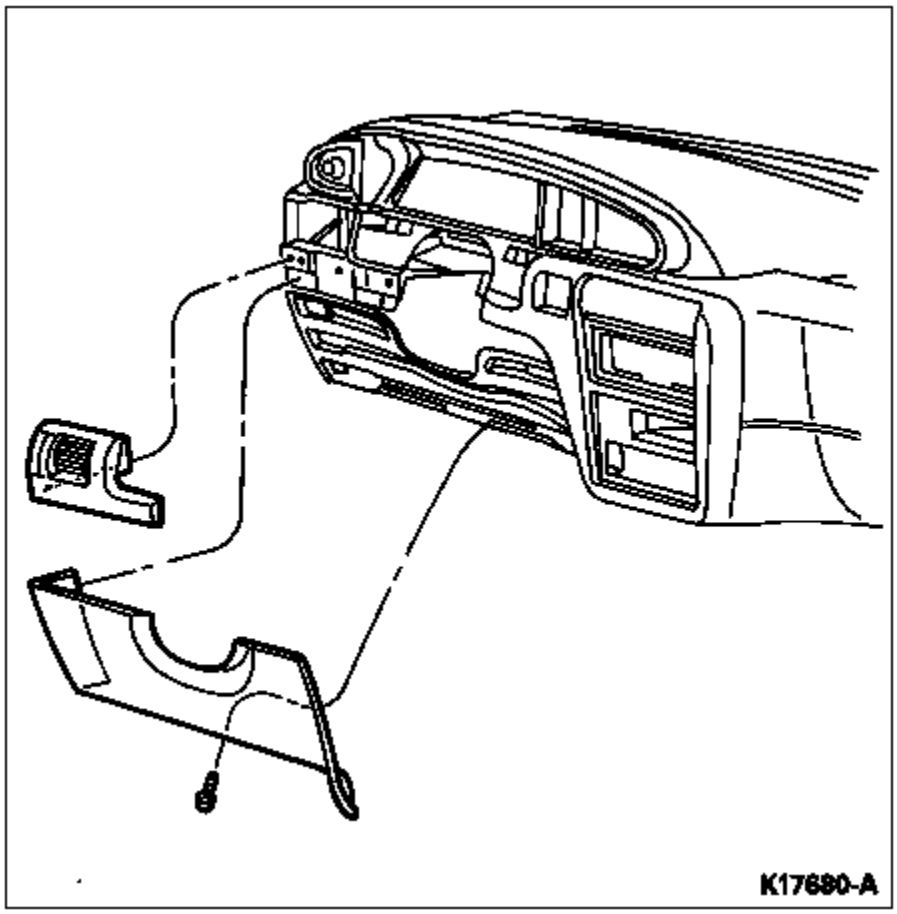
4. Pull off steering column shroud held by four clips.

5. Remove two screws located below instrument panel ash receptacle in depression.

6. Pull center finish panel loose (held by five clips) and hang down to allow access to cluster finish panel screws.

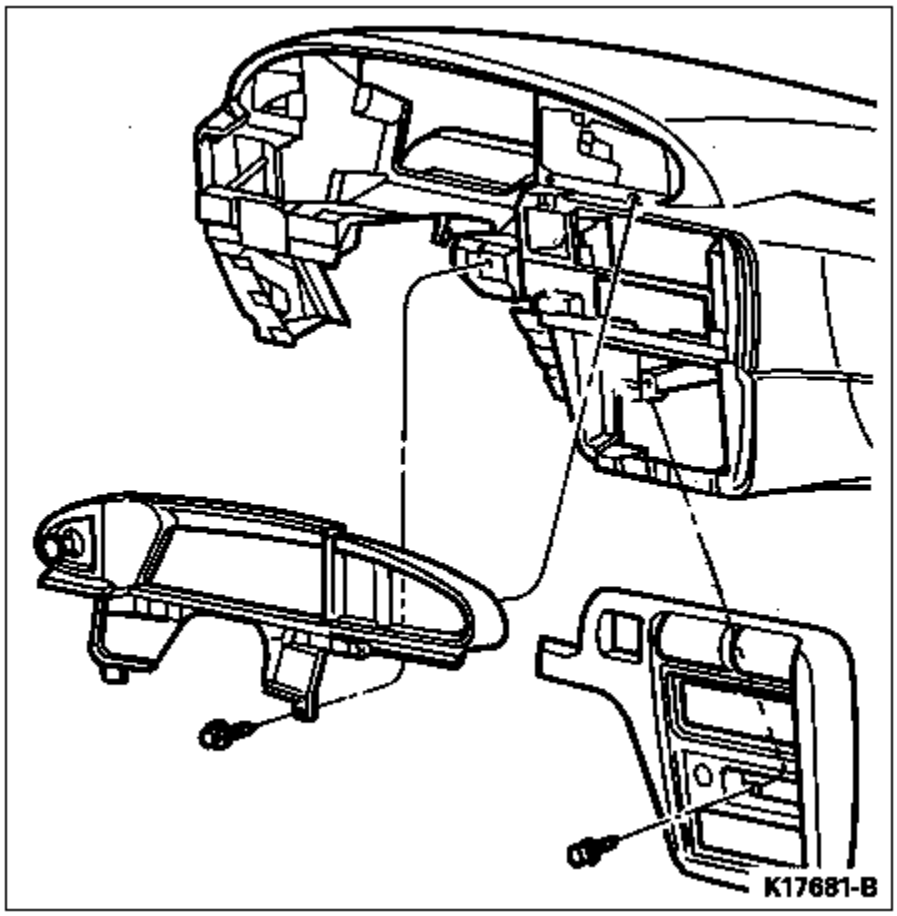
7. Remove left finish panel held by four clips.

tomsn048@gmail.com



8. Remove five cluster finish panel attaching screws.
9. Remove cluster finish panel held by two clips.

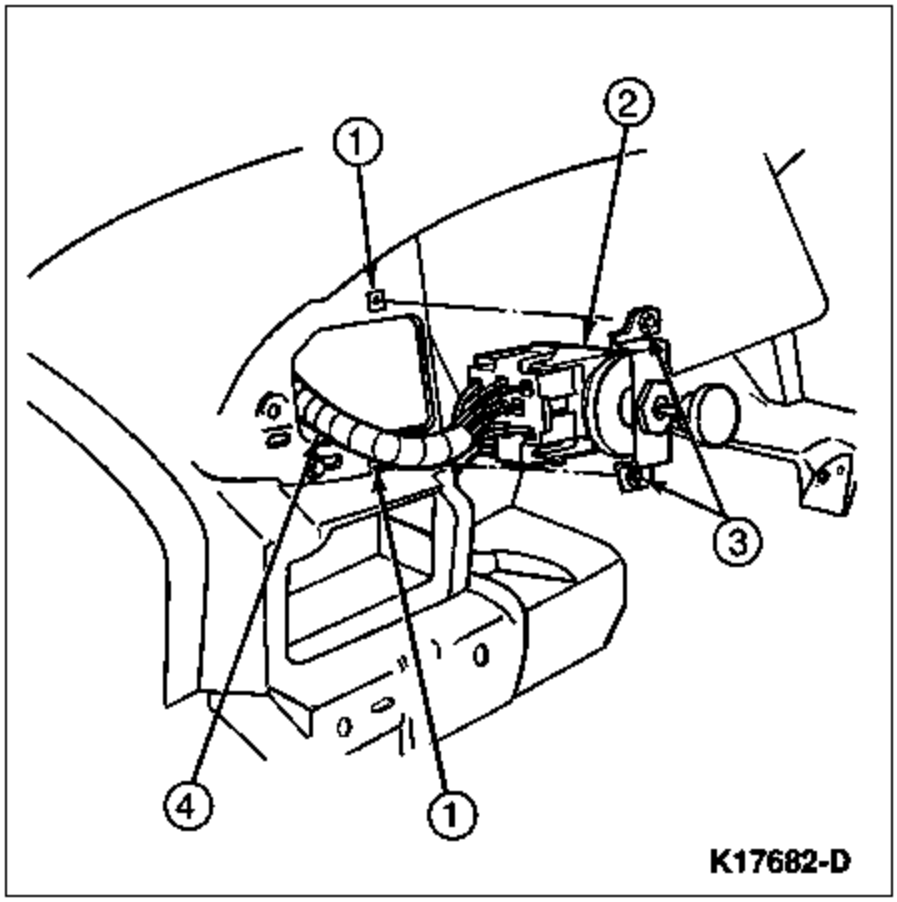
tomsn048@gmail.com



10. Remove two headlamp switch (11654) mounting bracket screws.
11. Pull headlamp switch through opening to expose connectors.
12. Remove electrical connectors.

Headlamp Switch, Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	—	Nut
2	11654	Headlamp Switch
3	N803876-S36	Screw
4	14401	Main Wiring

13. Remove headlamp switch knob and shaft (11661) from headlamp switch by pulling to full ON position then depressing release button while pulling headlamp switch knob and shaft out.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

tomsn048@gmail.com

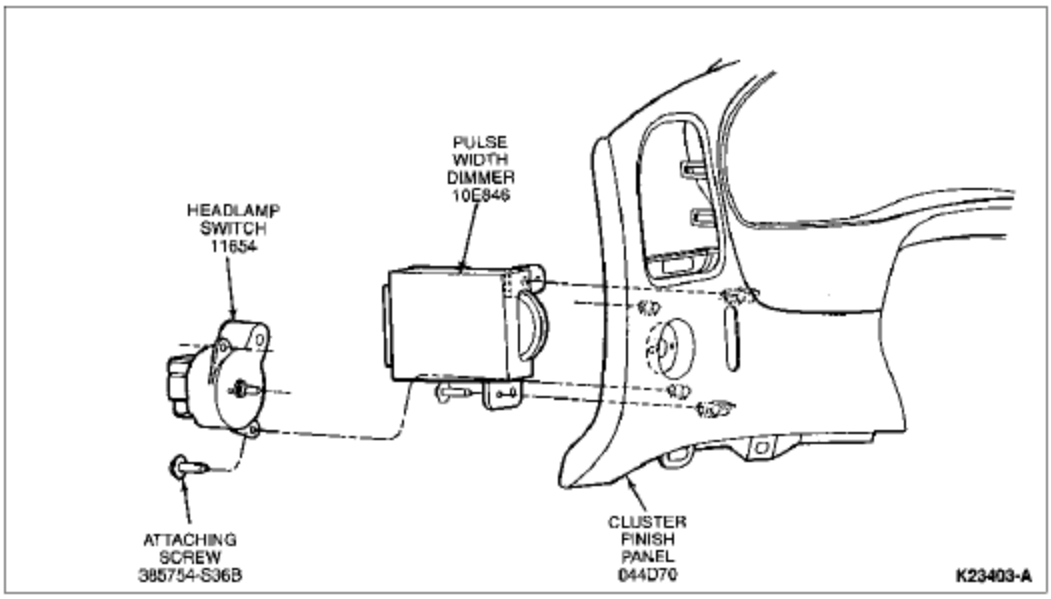
Headlamp Switch, Ranger

Removal and Installation

1. Remove instrument cluster finish panel. If necessary refer to Section 01-12 for procedure.
2. Remove attaching screws and switch from cluster finish panel.

For installation, follow removal procedure in reverse order.

Headlamp Switch, Ranger



tomsn048@gmail.com

tomsn048@gmail.com

Parking, Turn and Front Side Marker Lamps, Ranger

Removal and Installation

1. Remove two screws attaching the parking lamp (13200) to the opening panel in radiator grille (8200).
2. Pull parking lamp away from vehicle to disengage the three barbed retainers.
3. Twist the lamp socket and remove from lamp.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Parking, Turn and Front Side Marker Lamps, Aerostar

Removal

1. Remove attaching screws and headlamp (13008).
2. Remove parking lamp (13200) by removing the screws retaining parking lamp to headlamp door (13064).
3. Remove socket from lamp.
4. To remove miniature bulb (13466), push and turn socket counterclockwise one quarter turn and pull miniature bulb directly out from socket.

Installation

1. Push miniature bulb into socket.
2. Install socket to parking lamp and twist one quarter turn clockwise.
3. Position parking lamp to grille and install screws.

tomsn048@gmail.com

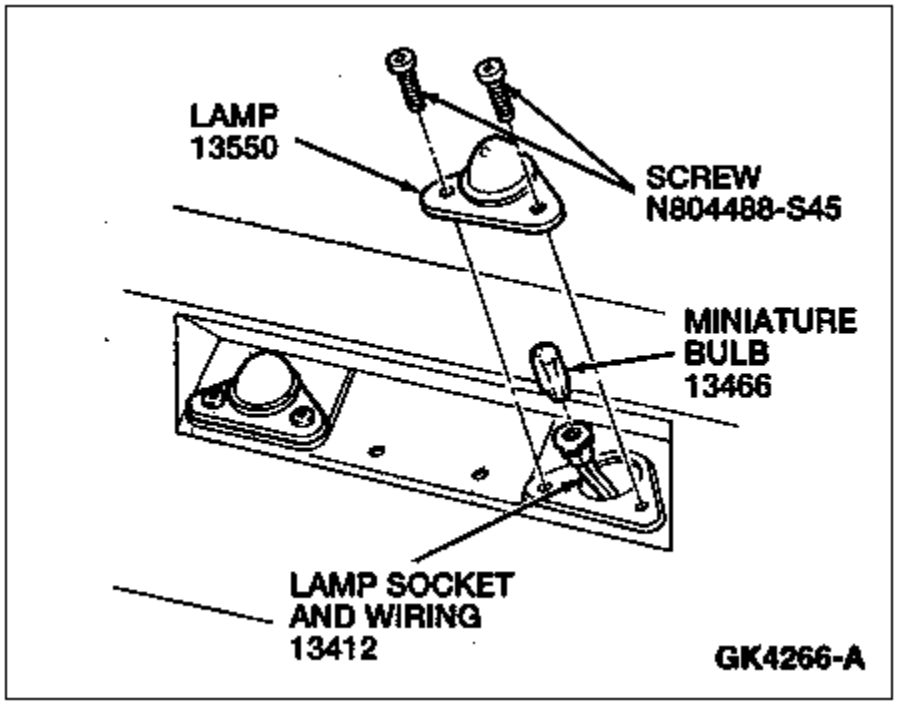
Lamp, License Plate, Aerostar

Removal

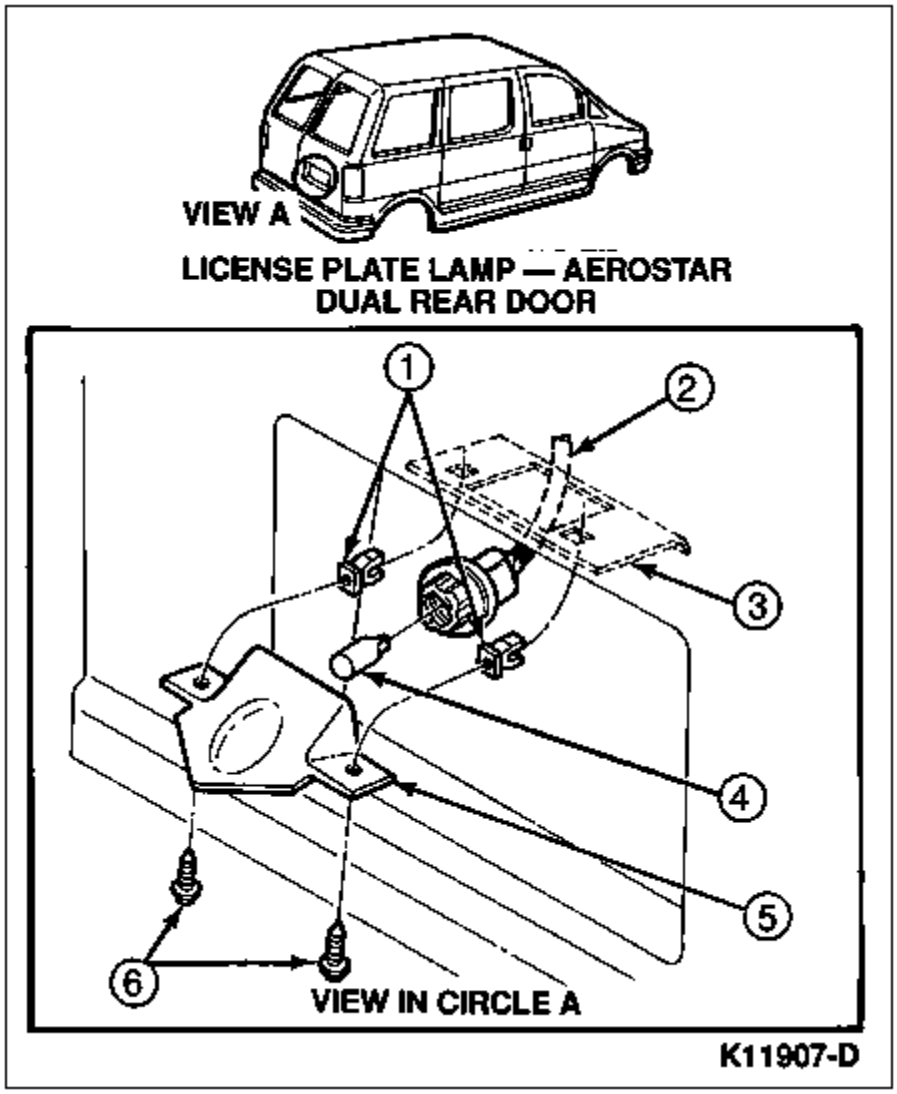
1. Remove two screws retaining the lamp to the liftgate (40010).
2. Rotate socket one quarter turn from backside of lamp and remove the miniature bulb (13466).

Installation

1. Install new miniature bulb into socket.
2. Install socket in lamp.
3. Secure lamp to liftgate with two screws.



tomsn048@gmail.com



Item	Part Number	Description
1	383356-S	Nut
2	14A583	Door Lock Lead Wire
3	—	Body Bracket
4	13466	Miniature Bulb

tomsn048@gmail.com

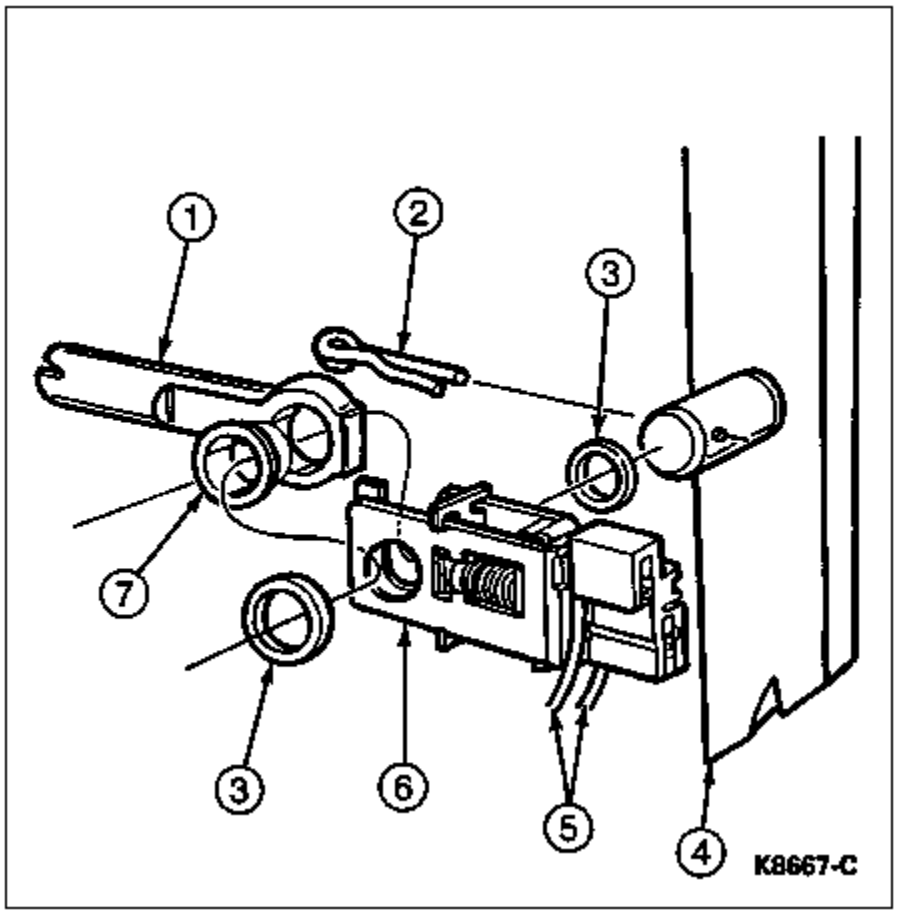
Brake On/Off (BOO) Switch

Removal

1. Disconnect wire harness at connector from brake on/off (BOO) switch.
    - Locking tab must be lifted before connector can be removed.
2. Remove the hairpin clip, slide the brake on/off (BOO) switch, the push rod, the nylon washer and brake master cylinder push rod bushing (2474) away from the brake pedal (2455).
3. Remove the brake master cylinder push rod spacer (2B129) and then the brake on/off (BOO) switch by sliding brake on/off (BOO) switch up or down.
    - Since the switch side plate nearest the brake pedal is slotted it is not necessary to remove the vacuum booster input rod and one brake master cylinder push rod bushing from the brake pedal pin.



Item	Part Number	Description

tomsn048@gmail.com

1	—	Vacuum Booster Input Rod (Part of 2005)
2	380699-S100	Hairpin Clip
3	2B129	Brake Master Cylinder Push Rod Spacer
4	2455	Brake Pedal
5	14401	Main Wiring
6	—	Brake On/Off (BOO) Switch
7	2474	Brake Master Cylinder Push Rod Bushing

Installation

1. Position brake on/off (BOO) switch so the U-shaped side is nearest the brake pedal and directly over/under the pin. Then slide switch up/down trapping the vacuum booster input rod and bushing between the switch side plates.

2. Push brake on/off (BOO) switch and push rod assembly firmly toward brake pedal arm.

3. **CAUTION: Do not substitute other types of pin clips. Use only factory supplied hairpin clips.**

   Assemble outside white plastic washer to pin and install hairpin clip to hold entire assembly.

4. **CAUTION: Brake on/off (BOO) switch wire harness must have sufficient length to travel with brake on/off (BOO) switch during full stroke of brake pedal. If wire length is too short, reroute or repair harness as required.**

   Assemble the connector to the brake on/off (BOO) switch.

5. Check brake on/off (BOO) switch for proper operation.

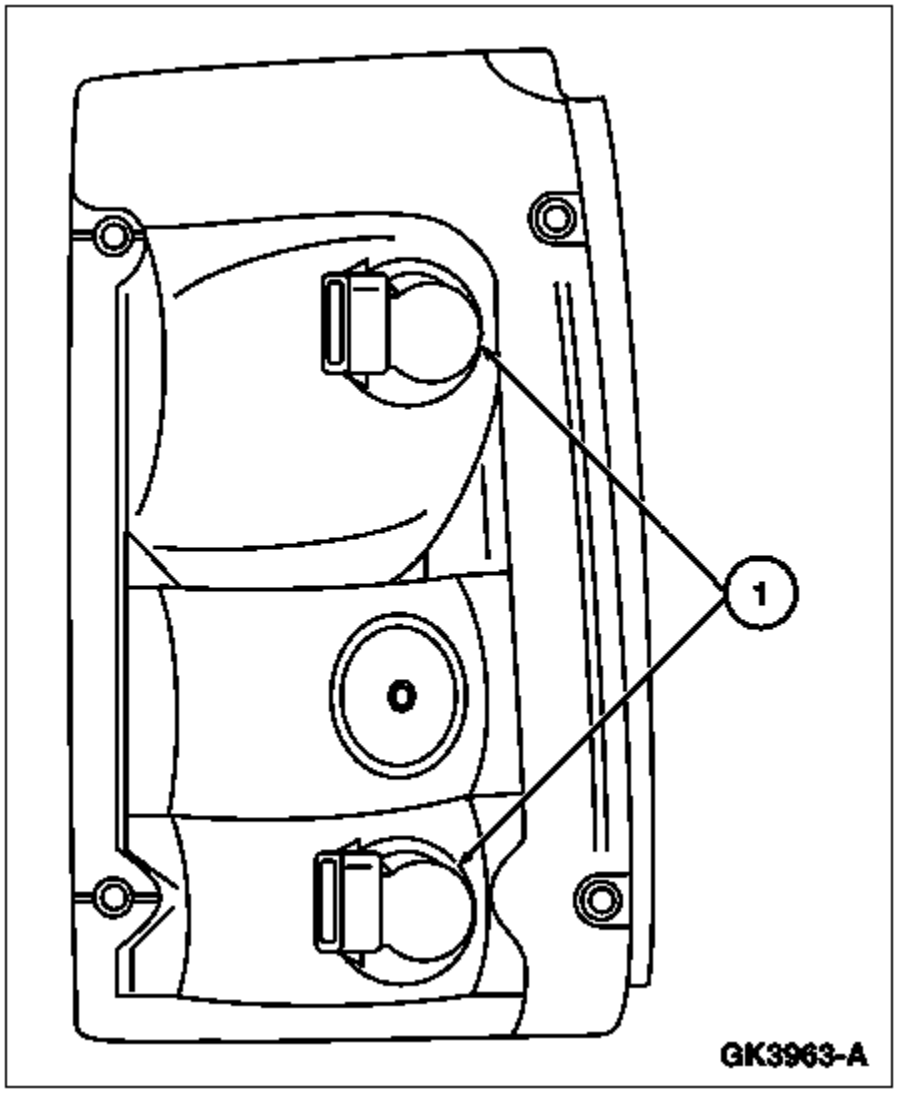
tomsn048@gmail.com

tomsn048@gmail.com

Stop/Tail Lamp, Rear, Aerostar

Removal

1. Remove four screws retainingrear lamp (13404) to vehicle.
2. Remove rear lamp and remove the electrical connector from lamp assembly.
3. Turn the miniature bulbs (13466) counterclockwise and remove.



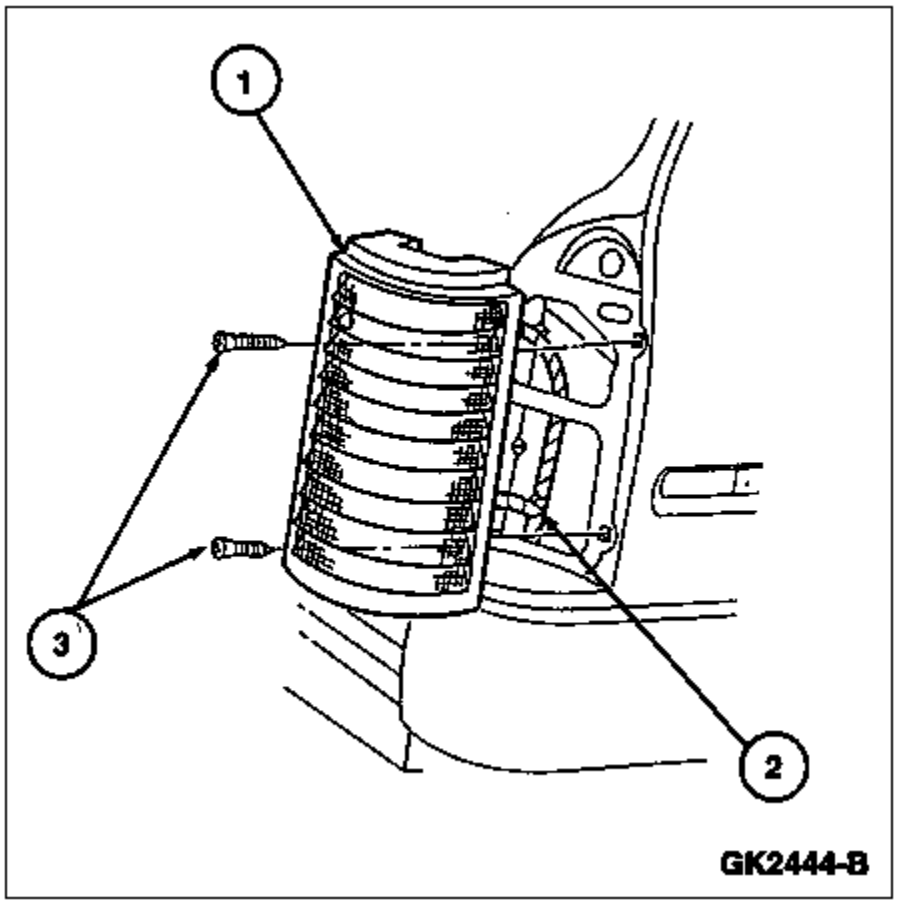
Item	Part Number	Description

tomsn048@gmail.com

1	10B982	Miniature Bulb

Installation

1. Install miniature bulb or bulbs.
2. Install sockets to rear lamp and position rear lamp to vehicle.
3. Install four screws to secure rear lamp to vehicle.



Item	Part Number	Description
1	13404	Rear Lamp
2	13A409	Wiring Assembly
3	56002-S45	Screw

tomsn048@gmail.com

tomsn048@gmail.com

Lamp Switch, Backup, 5-Speed Manual Transmission

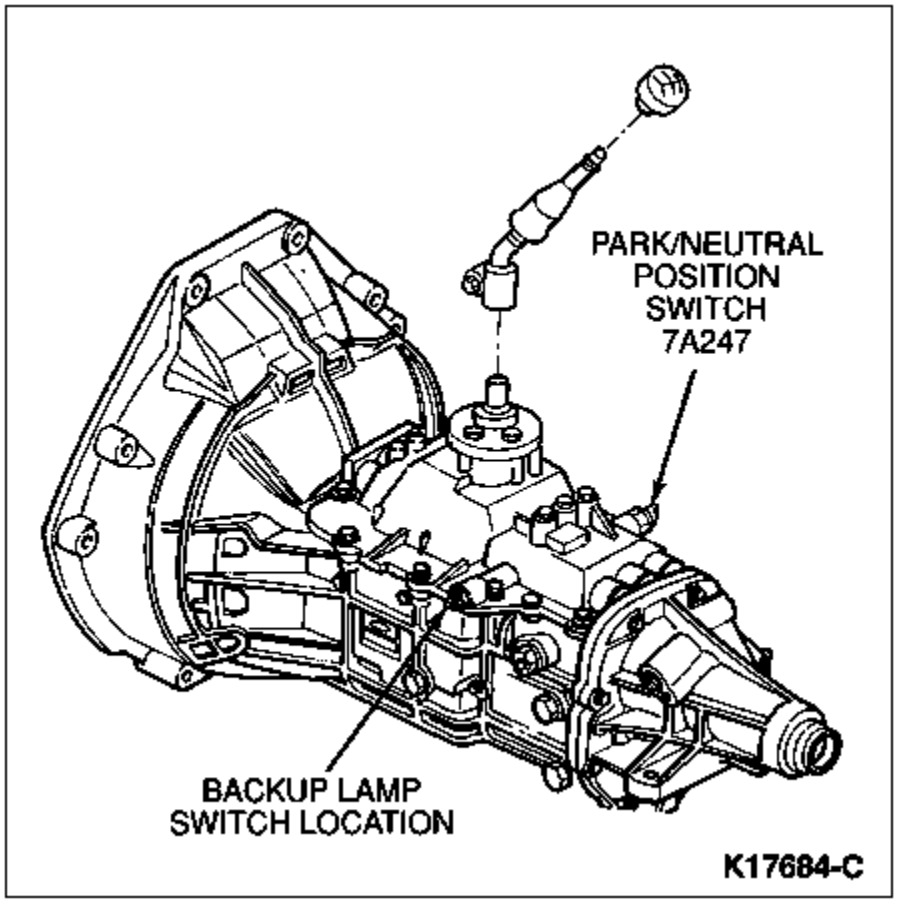
Removal and Installation

1. **NOTE: The backup lamp switch (15520) is located on the shift cover left side.**

   Place the transmission (7003) in any position other than reverse or neutral and disconnect the backup lamp switch to rear lamp feed wire from the backup lamp switch.

2. Remove the backup lamp switch from the transmission.

For installation, follow removal procedures in reverse order. Tighten the new backup lamp switch to 11-16 Nm (8-12 lb-ft).



tomsn048@gmail.com

tomsn048@gmail.com

Lamp Switch, Backup, Automatic Transmission

On Aerostar vehicles equipped with an automatic transmission (7003), the backup lamp housing (15502) is an integral part of the park/neutral position switch (PNP switch) (7A247). For removal and installation procedures, refer to Section 07-01A or Section 07-01B .

On Ranger vehicles equipped with an automatic transmission, the backup lamp switch is an integral part of the transmission range sensor. For removal and installation procedures, refer to Section 07-01A or Section 07-01B .

tomsn048@gmail.com

Lamp, Rear Hi-Mount, Ranger

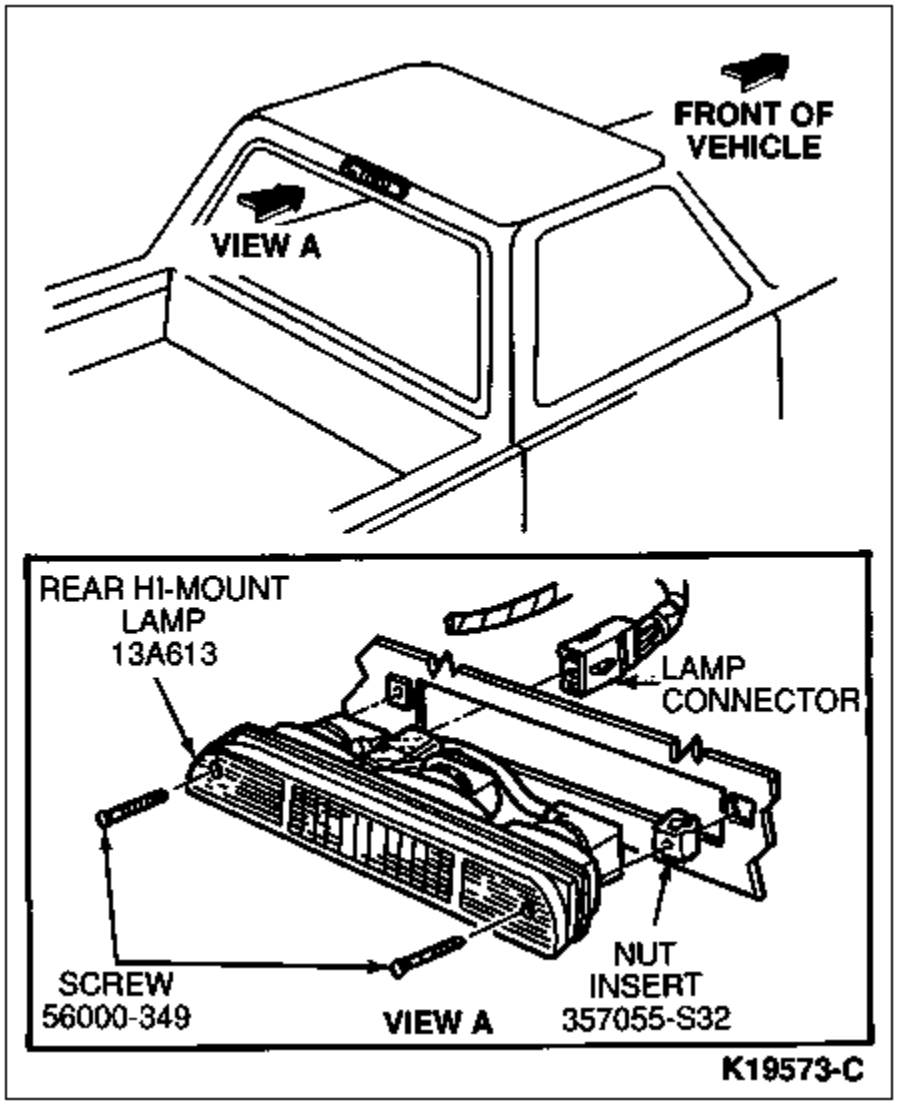
Removal

1. Remove two screws securing rear hi-mount lamp (13A613) to vehicle.
2. Pull lamp away from vehicle and disconnect wiring connector.
3. Replace miniature bulbs (13466) if required by rotating socket to remove from rear hi-mount lamp and pull miniature bulb from socket.

Installation

1. Press miniature bulb into socket. Place socket into rear hi-mount lamp and rotate to secure in place.
2. Position gasket on rear hi-mount lamp and connect wiring connector.
3. Position rear hi-mount lamp on vehicle and install two screws.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Hi-Mount, Aerostar

Removal

1. Remove two screws securing rear hi-mount lamp (13A613) to liftgate (40010).
2. Pull rear hi-mount lamp away from liftgate and disconnect rear hi-mount lamp wiring.
3. Replace bulbs, if required, by removing the retaining screw from the bulb holders assembly.
4. Pull the bulb holder away from the lamp. Pull bulb straight out of the holder.

Installation

1. Press bulb into bulb holder assembly. Place bulb holder assembly on lamp and install retaining screw. Tighten screw.
2. Position gasket on rear hi-mount lamp and connect rear hi-mount lamp wiring.
3. Position rear hi-mount lamp in liftgate and install two screws.

Lamp, Rear Hi-Mount, Bulb, Aerostar with Dual Rear Doors

Removal and Installation

1. Remove the two screws retaining the lens.
2. Pull the lens assembly out of the lamp housing.
3. Pull the bulb socket out of the lens assembly. It is not necessary to twist the socket.
4. Pull the bulb out of the socket.
5. Replace the bulb and assemble the lamp.

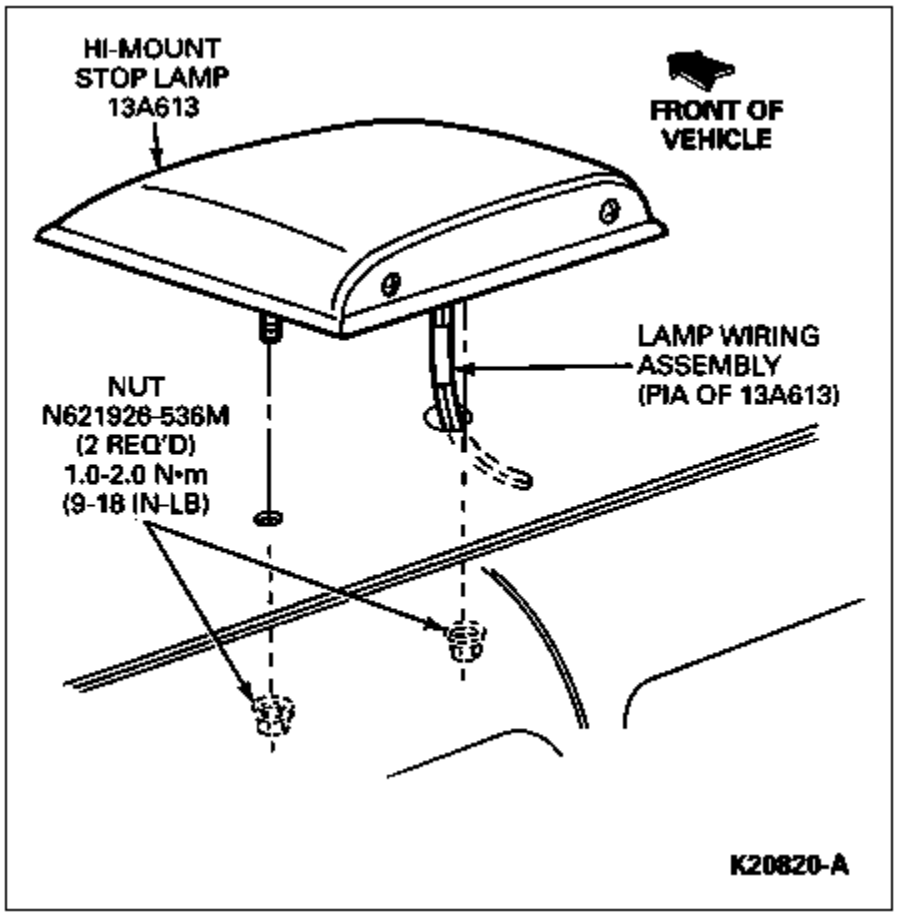
tomsn048@gmail.com

Lamp, Rear Hi-Mount, Aerostar with Dual Rear Doors

Removal and Installation

1. Remove interior cargo lamp. Refer to Section 17-02 .
2. Disconnect the rear hi-mount lamp (13A613) wiring connector.
3. Remove the two attaching nuts retaining the hi-mount stoplamp to the roof panel.
4. Lift the rear hi-mount lamp off the roof, disengage the wiring grommet and pull the wiring through the hole in the roof.

For installation, follow removal procedures in reverse order.



tomsn048@gmail.com

tomsn048@gmail.com

Headlamp Aim

NOTE: The condition of the vehicle springs, improper wheel alignment or improper rear axle tracking may affect headlamp aim.

Before making any adjustment, perform the following preparatory steps:

1. Remove ice or mud from under fenders.
2. Make sure all tires are inflated to recommended pressures.
3. Make sure that the vehicle attitude is typical of how the vehicle is normally operated, i.e., with full load, carrying a trailer, etc.
4. Clean lenses and aiming pads.
5. Check for proper beam switching.
6. Make sure output is well toward normal new lamp value.
7. Bounce the vehicle and allow to settle.

Perform headlamp aim adjustments with Rotunda Headlamp Aiming Kit 107-00001 or equivalent. To aim the aerodynamically styled headlamps, the adjustable aimer adapters provided in the kit must be used. Adjustment aimer adapter positions are molded into the face of the headlamp lens, near the bottom.

Set and lock the adjustable adapters, attach each adapter to its mechanical aimer, and aim headlamps per latest instructions in the kit.

The equipment in Rotunda Headlamp Aiming Kit 107-00001 or equivalent can be calibrated to accommodate a slight slope in the floor, making it usable almost any place in the garage. However, area must be reasonably flat.

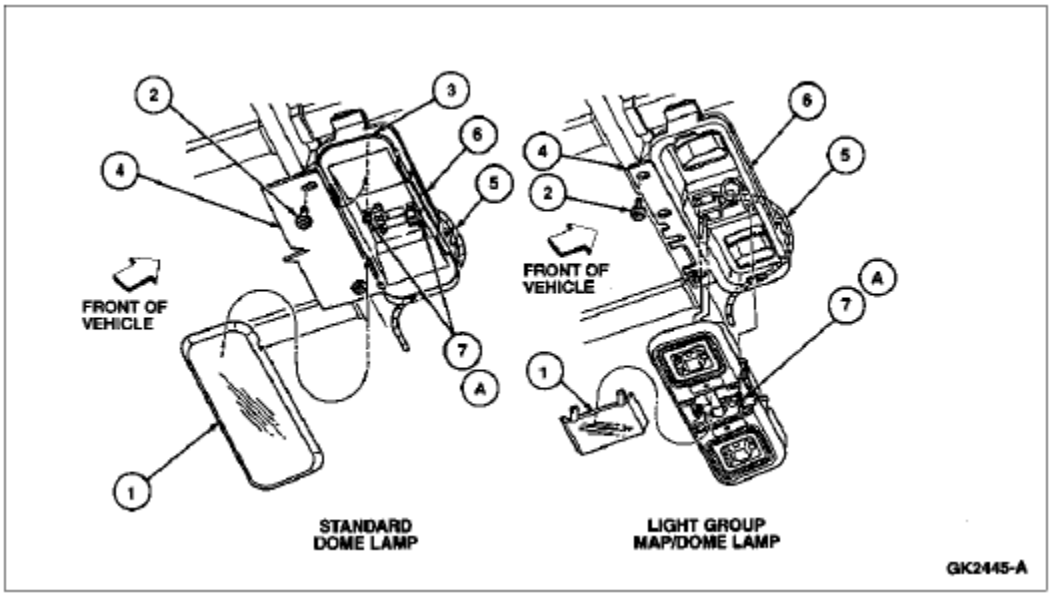
Lamp, Dome, Aerostar

The overhead interior lamp (13776) is controlled by the instrument panel lamp thumbwheel (dimming rheostat). Rotating the thumbwheel toward the rear of the vehicle turns the interior lamp on; rotating the thumbwheel toward the front of the vehicle turns the interior lamp. The interior lamp is also controlled by the door lamp switches (13713). All models have a lamp switch located in the driver's door hinge pillar which activates the interior lamp when the front door (20124) is opened. Passenger side lamp switch and cargo door lamp switch are available on some models as an option.

Dome Lamps, Aerostar



Item	Part Number	Description

tomsn048@gmail.com

Lamp, Dome, Ranger

The interior lamp (13776) and rear cargo lamp are energized when the pulse width dimmer module is rotated fully to the up position. All models have a lamp switch (13713) located in the driver's door latch that activates the interior lamp when the front door (20124) is opened. Passenger side lamp switch is available as an option.

tomsn048@gmail.com

Lamp, Cargo, Aerostar

The interior lamp (13776) is located on the roof trim panel (51968). With the switch in the AUTO position it will turn on with the thumbwheel or when opening liftgate (40010). The interior lamp can also be turned on by using the ON position of the switch.

tomsn048@gmail.com

tomsn048@gmail.com

Lamps, Courtesy

The GEM illuminates the interior courtesy lamps when any door is set ajar or is opened. The following are inputs used for controlling the courtesy lamps.

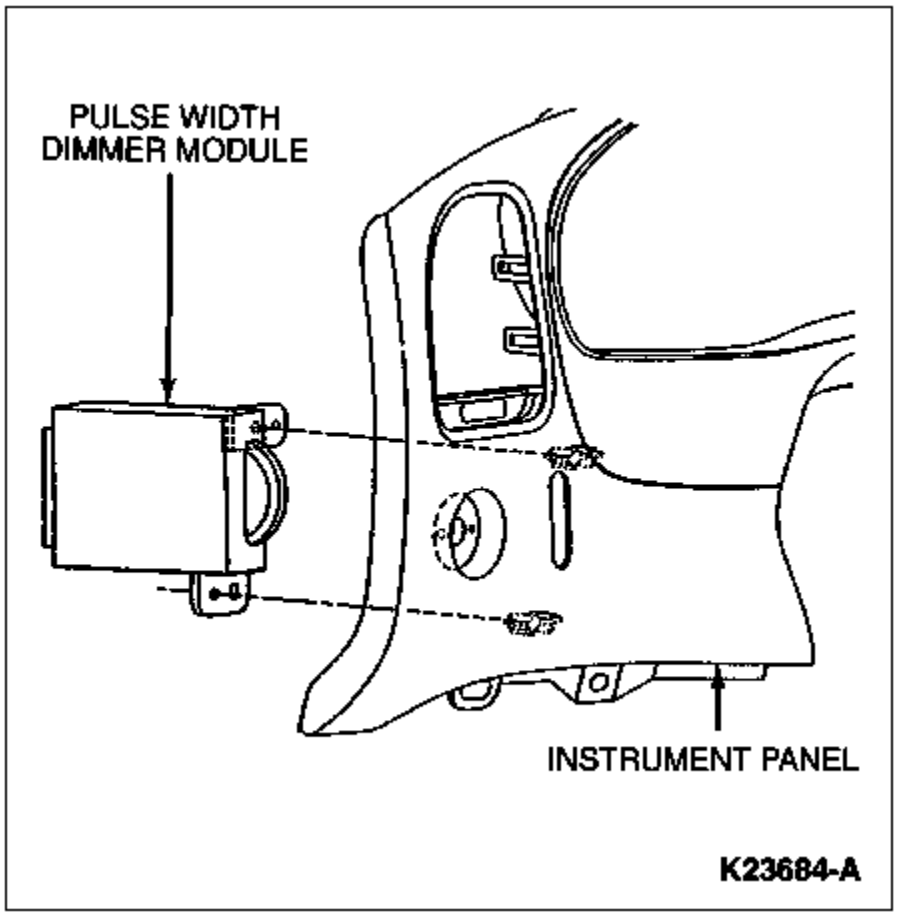
- all door ajar switches
- illuminated entry request — RAP module
- two step unlock

All interior courtesy lamps are turned off when any of the following occurs:

- twenty-five seconds have elapsed after all the doors are closed.
- the ignition switch (11572) is turned to RUN.
- vehicle speed is over 8 km/h (5 mph) (once the interior courtesy lamps are turned OFF, a new ajar signal will be honored only if vehicle speed is below 16 km/h [10 mph]).
- a power door lock command is received before the five seconds have elapsed.

Panel Mounted Pulse Width Dimmer Module, Ranger

tomsn048@gmail.com



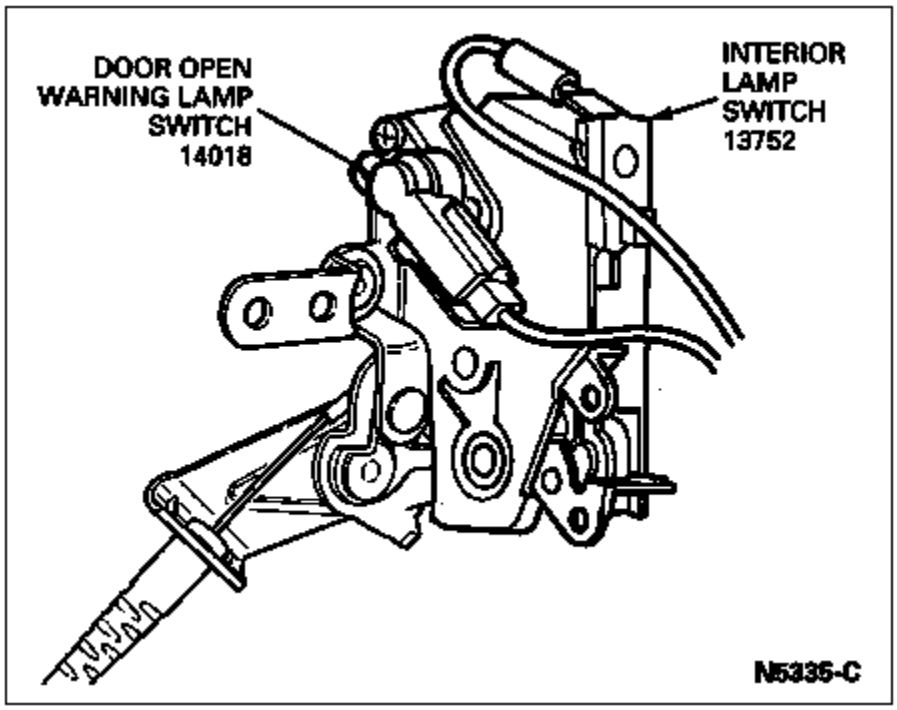
tomsn048@gmail.com

Illuminated Entry, Aerostar

The illuminated entry system assists vehicle entry by illuminating the vehicle interior lamps (13776).

The system consists of three main components: electronic actuator module, door latch switch, and wiring harness.

The interior lamp switch (13752) is a grounding type leaf switch and is attached to the front door latch (21812) by one screw.



The system is activated by raising the door handle (22404).

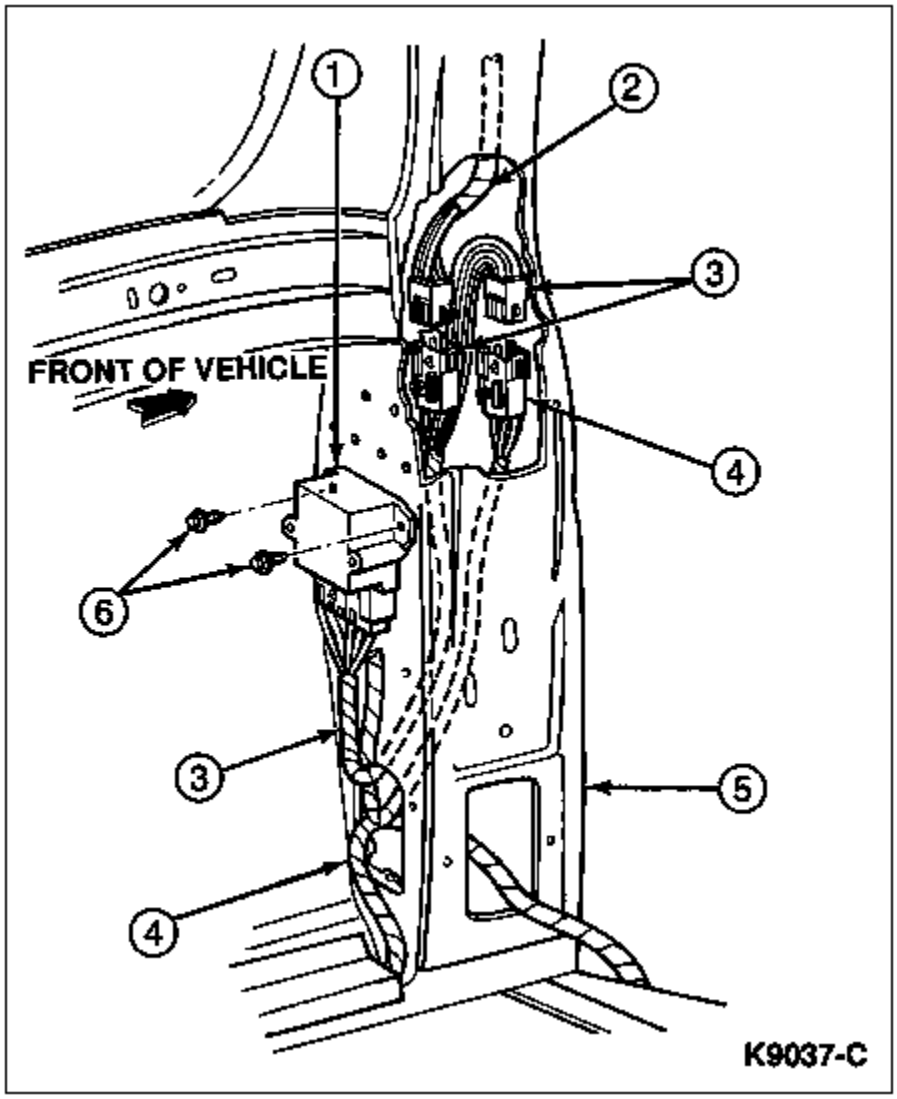
This action momentarily closes a switch mounted on the front door latch, which completes the ground circuit of the electronic module and switches the system on. The vehicle interior lamps turn on, remain on for approximately 25 seconds, then automatically turn off. During this 25 second period, the system can be manually deactivated by turning the ignition switch (11572) to either RUN or ACC position.

The system will be activated every time the door handles are operated. Opening the interior lamp switch from the inside of the vehicle will not activate the system.

If the door handle is held up indefinitely so that the interior lamp switch is continuously closed, the system will operate as normal and turn off after 25 seconds. At the completion of this cycle, if the door handle is still in the raised position, the system will remain off, and it will be impossible to activate the system from the other door handle until the raised door handle is returned to its normal position. This function is built into the logic circuitry of the system to prevent battery discharge, should the door handle be intentionally propped up or become jammed in any way.

The electronic actuator module is located on the rear of the B-pillar tray.

tomsn048@gmail.com



Item	Part Number	Description
1	13C718	Illuminating Entry Actuator
2	14334	Courtesy or Interior Lamp Switch Wiring
3	13B712	Courtesy Lamp Feed Wire
4	14405	Wiring
5	—	B-Pillar
6	56928-S2	Screw (2 Req'd)

Housed within the module is a printed circuit board, the logic circuitry, and a relay to switch B+ to the various circuits. The normal module operating voltage is 9 to 16 volts. However, the unit will withstand voltage up to 24 volts for a period of 15 minutes. It cannot be damaged by reverse voltages and is unaffected by vehicle electrical transients.

tomsn048@gmail.com

tomsn048@gmail.com

Generic Electronic Module (GEM) Illuminated Entry, Ranger

The illuminated entry system assists vehicle entry by illuminating the vehicle interior lamp (13776).

The system consists of three main components: generic electronic module, door ajar switch and wiring harness.

The interior lamp switch (13752) is a grounding type leaf switch and is attached to the front door latch (21812) by one screw.

Interior Courtesy Lamp Control

The following are inputs used for controlling the interior courtesy lamps to the generic electronic module.

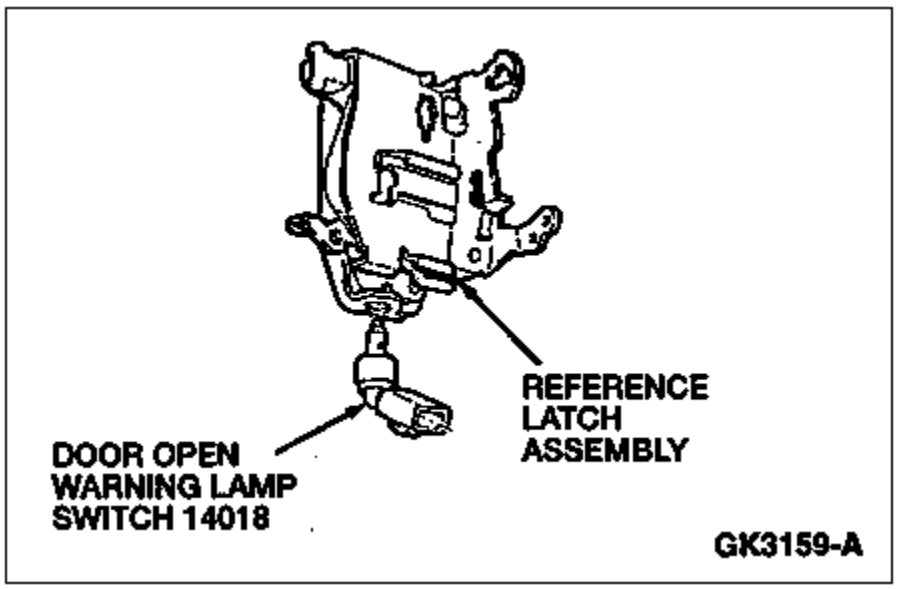
- all door ajar switches
- illuminated entry request — from RAP module
- two step unlock — door disarm switches

All interior lights will shut off after 25 seconds (if all doors are closed) or:

- immediately after the ignition switch is turned to the RUN position
- or if the vehicle speed is above 8 km/h (5 mph).

If no wake up command is received and any of the doors are left open, the interior lights will turn off after 40 minutes when the battery saver times out.

Ranger



The system is activated by raising the door handle (22404).

tomsn048@gmail.com

This action momentarily closes a switch mounted on the front door latch, which completes the ground circuit of the generic electronic module and switches the system on. The vehicle interior lamps turn on, remain on for approximately 25 seconds, then automatically turn off. During this 25 second period, the system can be manually deactivated by turning the ignition switch (11572) to either RUN or ACC position.

The system will be activated every time the door handles are operated. Opening the door from the inside of the vehicle will not activate the system.

If the door handle is held up indefinitely so that the interior lamp switch is continuously closed, the system will operate as normally and turn off after 25 seconds. At the completion of this cycle, if the door handle is still in the raised position, the system will remain off, and it will be impossible to activate the system from the other door handle until the raised door handle is returned to its normal position. This function is built into the logic circuitry of the system to prevent battery discharge, should the door handle be intentionally propped up or become jammed in any way.

tomsn048@gmail.com

Central Timer Module, Ranger

The central timer module (CTM) shall activate the interior lights when any one of the following states are met.

1. Opening of the driver door (as indicated when ground potential is present at the CTM's driver door ajar switch input).

2. Opening of the passenger door (if applicable,as indicated when ground potential is present at the CTM's passenger door ajar switch input).

Inspection and Verification — Courtesy Lamps

1. Verify the vehicle owner's original concern by operating the courtesy lamps to duplicate the condition.

2. **NOTE: Clear all DTCs after fault has been repaired. Disconnecting relays and connectors may set DTCs.**

   NOTE: When a passenger door or liftgate has been left ajar upon exit of vehicle, the CTM will not recognize a change of state upon re-entry of those doors in order to wakeup the CTM and illuminate interior.

   Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged lamps	• GEM
• Open fuses	
• Damaged switches	• Damaged bulbs
• Stuck switches • Connectors damaged/corroded	• Circuitry open/shorted

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following symptom chart.

tomsn048@gmail.com

Pinpoint Tests — Courtesy Lamps

PINPOINT TEST A: COURTESY LAMPS INOPERATIVE

A1 PRELIMINARY CHECKS

- Check fuses for continuity.
- Check connections for clean tight fit.
- Check for loose or damaged wires.

Do components and wiring check OK?

Yes	No
GO to **A2** .	SERVICE or REPLACE as required. GO to **A2** .

A2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to data link connector (DLC).
- Retrieve continuous DTCs.
- Perform On-Demand Self Test. Refer to Section 18-04A .

Are any DTCs retrieved?

Yes	No
DTC B1315 Self Test and continuous — REPAIR battery short in Circuit 792 (T/Y) between GEM and battery saver relay. DTC B1314 Self Test and continuous — CHECK for open contacts in battery saver relay. REPLACE relay. DTC B1371 Self Test and continuous — GO to **A3** . DTC B1373 Self Test and continuous — REPAIR battery short in Circuit 1008 (LG/O) between GEM and interior lamp relay. DTC B1371 — GO to **A5** .	GO to **A9** .

tomsn048@gmail.com

A3 CHECK CIRCUIT 705 (LG/O) FOR BATTERY VOLTAGE

- Run battery saver and illuminated entry functional test.
- Energize battery saver relay.
- Check for B+ on Circuit 705 (LG/O) between battery saver relay and interior lamp relay.

Does voltage check OK?

Yes	No
GO to **A4** .	LOCATE open in 705 (LG/O) battery saver relay and interior lamp relay. REPAIR as required.

A4 CHECK CIRCUIT 1008 (LG/O) FOR OPEN

- Check for open coil in interior lamp relay.

Is relay OK?

Yes	No
REPAIR open in Circuit 1008 (LG/O) between GEM and interior lamp relay.	REPLACE relay.

A5 CHECK I/P FUSE 27

- Check continuity of fuse 27 (15A).

Does fuse check OK?

Yes	No
GO to **A6** .	GO to **A8** .

A6 CHECK CIRCUIT 705 (LG/O)

- Disconnect battery saver relay.
- Check for B+ on Circuit 705 (LG/O).

Is B+ present?

Yes	No
REPAIR battery short in Circuit 705 (LG/O) between GEM and battery saver relay.	GO to **A7** .

A7 CHECK RELAY

tomsn048@gmail.com

- Check battery saver relay coil for open.

Is coil open?

Yes	No
REPLACE relay.	GO to **A10** .

A8 CHECK CIRCUIT 53 (BK/LB) FOR SHORT TO GROUND

- Check for ground short in Circuit 53 (BK/LB) between power feed and interior lamp relay.

Is circuit OK?

Yes	No
LOCATE ground short between interior lamp relay and interior lamps. REPAIR as required.	REPAIR ground short in Circuit 729 (R/W) as required.

A9 CHECK CIRCUIT 53 (BK/LB) FOR BATTERY VOLTAGE

- Energize interior lamp relay.
- Check for B+ in Circuit 53 (BK/LB) at interior lamps.

Does voltage check OK?

Yes	No
GO to **A10** .	REPAIR open in Circuit 53 (BK/LB) between interior lamp relay and interior lamps.

A10 CHECK CIRCUIT 53 (BK/LB) FOR OPEN

- Exit functional test.
- Disconnect battery negative cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the PCM to relearn the adaptive strategy.

- Check circuit for open between interior lamps and ground.

Is circuit OK?

Yes	No
GO to **A11** .	REPAIR open in Circuit 53 (BK/LB) between interior lamps and ground.

tomsn048@gmail.com

A11 READ PID L GATE SW STATUS

- Read PID L GATE SW.
- Open liftgate.
- Close rear doors.

Is liftgate status OPEN?

Yes	No
GO to **A12** .	CHECK for open in Circuit 700 (W/P) between right and left liftgate ajar switches and GEM.

A12 READ PID RFDR SW STATUS

- Read PID RFDR SW.
- Open passenger door.

Is RFDR SW AJAR?

Yes	No
GO to **A13** .	REPAIR open in ground circuit between passenger door ajar switch and GEM.

A13 READ PID LFDR SW STATUS

- Read PID LFDR SW.
- Open driver door.

Is LFDR SW AJAR?

Yes	No
GO to **A14** .	GO to **A16** .

A14 READ PID LRDR SW STATUS

- Read PID LRDR SW.
- Open left rear door.

Is LRDR SW AJAR?

Yes	No
GO to **A15** .	GO to **A20** .

tomsn048@gmail.com

A15 READ PID RRDR SW STATUS

- Read PID RRDR SW.
- Open right rear door.

IS RRDR SW AJAR?

Yes	No
System OK.	GO to **A21** .

A16 CHECK CIRCUIT 765 (Y/BK)

- Disconnect driver's door ajar switch.
- Ground Circuit 765 (Y/BK).
- Read PID LFDR SW.

Does tester indicate driver door AJAR?

Yes	No
GO to **A17** .	REPAIR open in Circuit 765 (Y/BK) between driver door ajar switch and GEM.

A17 CHECK DRIVER DOOR AJAR SWITCH

- Jumper driver door ajar switch ground Circuit to Circuit 765 (Y/BK).
- Read PID LFDR SW.

Does tester indicate driver door CLOSED

Yes	No
REPAIR open in driver door ajar ground circuit.	REPLACE switch.

A18 CHECK CIRCUIT 761 (GY/R)

- Disconnect passenger door ajar switch.
- Ground Circuit 761 (GY/R).
- Read PID RFDR SW.

Does tester indicate passenger door AJAR?

Yes	No
GO to **A19** .	REPAIR open in Circuit 761 (GY/R) between passenger door ajar switch and GEM.

tomsn048@gmail.com

A19 CHECK PASSENGER DOOR AJAR SWITCH GROUND

- Jumper passenger door ajar switch ground circuit to Circuit 761 (GY/R).
- Read PID RFDR SW.

Does tester indicate passenger door AJAR?

Yes	No
CHECK for open in passenger door ajar switch. REPLACE switch.	REPAIR passenger door ajar ground open Circuit 57 (BK). GO to **A20** .

A20 CHECK CIRCUIT 759 (LG/Y)

- Disconnect LR door ajar switch.
- Ground Circuit 759 (LG/Y).
- Read PID LRDR SW.

Does tester indicate door CLOSED?

Yes	No
GO to **A21** .	REPAIR open in Circuit 759 (LG/Y) between door ajar switch and GEM.

A21 CHECK DOOR AJAR SWITCH GROUND

- Jumper door ajar ground circuit to Circuit 760 (PK/LB).
- Read PID RRDR SW.

Does tester indicate door CLOSED?

Yes	No
CHECK for open in door ajar switch. REPLACE switch.	REPAIR door ajar ground open Circuit 57 (BK).

PINPOINT TEST B: INTERIOR LAMPS STAY ON

B1 PRELIMINARY CHECKS

- Check fuses for continuity.
- Check connections for clean tight fit.
- Check for loose or damaged wires.

Do components and wiring check OK?

tomsn048@gmail.com

Yes	No
GO to **B2** .	SERVICE or REPLACE as required. GO to **B2** .

B2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent to data link connector (DLC).
- Retrieve continuous DTCs.
- Perform on-demand self test. Refer to Section 18-04A .

Are DTCs retrieved?

Yes	No
DTC B1371 Self Test and continuous — REPAIR ground short in Circuit 1008 (LG/O) between GEM and interior lamp relay. DTC B1322 Self Test. GO to **B3** . DTC B1338 Self Test. GO to **B4** . DTC B1334 Self Test. GO to **B6** . DTC B1330 Self Test. GO to **B7** . DTC B1574 Self Test. GO to **B8** .	GO to **B9** .

B3 CHECK CIRCUIT 765 (Y/BK)

- Disconnect driver door ajar switch.
- Read PID LFDR SW.

Does tester indicate driver's door AJAR?

Yes	No
REPAIR ground short in Circuit 765 (Y/BK) between GEM and driver door ajar switch.	CHECK driver door ajar switch for short. REPLACE switch.

B4 CHECK CIRCUIT 760 (PK/LB)

- Disconnect door ajar switch.
- Ground Circuit 760 (PK/LB).
- Read PID RRDR SW.

Does tester indicate sliding door CLOSED?

tomsn048@gmail.com

Yes	No
GO to **B5** .	REPAIR open in circuit 760 (PK/LB) between door ajar switch and GEM.

B5 CHECK GROUND CIRCUIT

- Jumper door ajar ground circuit to Circuit 760 (PK/LB).
- Read PID RRDR SW.

Does tester indicate door CLOSED?

Yes	No
CHECK door switch for open. REPLACE switch.	REPAIR open in ground circuit to door ajar switch.

B6 CHECK CIRCUIT 700 (W/P)

- Disconnect liftgate ajar switches.
- Read PID LGATESW.

Does tester indicate liftgate AJAR?

Yes	No
REPAIR ground short in Circuit 700 (W/P) between GEM and liftgate ajar switches.	CHECK liftgate ajar switches for short. REPLACE worn or damaged switches as required.

B7 CHECK CIRCUIT 761 (GY/R)

- Disconnect passenger door ajar switch.
- Read PID RFDR SW.

Does tester indicate passenger door AJAR?

Yes	No
REPAIR ground short in Circuit 761 (GY/R) between GEM and passenger door ajar switch.	CHECK passenger door ajar switch for short. REPLACE damaged switch as required.

B8 CHECK CIRCUIT 759 (LG/Y)

- Disconnect door ajar switch.
- Read PID LRDR SW.

tomsn048@gmail.com

Does tester indicate passenger door AJAR?

Yes	No
REPAIR ground short in circuit 759 (LG/Y) between GEM and left rear passenger door ajar switch.	CHECK left rear passenger door ajar switch for short. REPLACE damaged switch and RETEST.

B9 CHECK CIRCUIT 53 (BK/LB)

- Disconnect battery negative cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the PCM to relearn the adaptive strategy.

- Check for continuity between Circuit 53 (BK/LB) and the battery B+ terminal between interior lamp relay and lamps.

Is circuit OK?

Yes	No
GO to **B10** .	REPAIR battery short in Circuit 53 (BK/LB) between interior lamp relay and lamps.

B10 CHECK RELAY

- Check interior lamp relay for shorted contacts.

Does relay check OK?

Yes	No
CHECK pulse width dimmer module for short. REPLACE pulse width dimmer module.	REPLACE worn or damaged relay.

PINPOINT TEST C: DOME LAMP INOPERATIVE

C1 PRELIMINARY CHECKS

- Check fuse.
- Check connections for clean tight fit.
- Check for loose or damaged wires.

Do components and wiring check OK?

Yes	No

tomsn048@gmail.com

GO to C2 .	SERVICE or REPLACE as required. GO to C2 .

C2 CHECK INTERIOR LAMP BULB

- Check bulb for continuity.

Does bulb check OK?

Yes	No
GO to C3 .	REPLACE bulb.

C3 CHECK CIRCUIT 53 (BK/LB)

- Disconnect battery negative cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the PCM to relearn the adaptive strategy.

- Check Circuit 53 (BK/LB) for open between interior lamp relay and affected lamp.

Is circuit OK?

Yes	No
GO to C4 .	REPAIR open in Circuit 53 (BK/LB) between interior lamp relay and affected lamp.

C4 CHECK GROUND CIRCUIT

- Check for open in ground circuit to affected lamp.

Is ground circuit OK?

Yes	No
System OK.	REPAIR open in ground circuit 57 (BK).

PINPOINT TEST D: REAR DOME LAMP INOPERATIVE

D1 PRELIMINARY CHECKS

- Check cargo lamp bulb.

tomsn048@gmail.com

- Check fuses for continuity.
- Check connections for clean tight fit.
- Check for loose or damaged wires.

Do components and wiring check OK?

Yes	No
GO to **D2** .	SERVICE or REPLACE as required. GO to **D2** .

D2 FUNCTIONAL TEST

- Connect Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent to data link connector (DLC).
- Perform battery saver and illuminated entry functional test.
- Energize battery saver relay.
- Energize interior lamp relay.
- Place pulse width dimmer switch in illuminated position.

Does lamp illuminate?

Yes	No
GO to **D3** .	GO to **D4** .

D3 CHECK CIRCUIT 53 (BK/LB)

- Disconnect battery negative cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the PCM to relearn the adaptive strategy.

- Check for open in circuit between battery saver relay and cargo lamp switch.

Is circuit OK?

Yes	No
CHECK pulse width dimmer module for open. REPLACE module.	REPAIR open in Circuit 53 (BK/LB) between cargo lamp switch and interior lamp relay.

D4 CHECK CIRCUIT 53 (BK/LB) FOR OPEN

- Check for open in Circuit 53 (BK/LB) between cargo lamp switch and interior lamp relay.

Is circuit OK?

Yes	No

tomsn048@gmail.com

GO to **D5** .	REPAIR open in Circuit 53 (BK/LB) between cargo lamp switch and interior lamp relay.

D5 CHECK CIRCUIT 53 (BK/LB) FOR CONTINUITY

- Check for open in circuit between pulse width dimmer module and cargo lamp.

Is circuit OK?

Yes	No
GO to **D6** .	REPAIR open in circuit between pulse width dimmer module and cargo lamp.

D6 CHECK LAMP GROUND CIRCUIT

- Check ground circuit to cargo lamp.

Is circuit OK?

Yes	No
System OK.	REPAIR open in ground circuit to cargo lamp.

PINPOINT TEST E: GLOVE COMPARTMENT LAMP INOPERATIVE (AEROSTAR)

E1 CHECK GLOVE COMPARTMENT LAMP SUPPLY

- Disconnect glove compartment lamp connector.
- Using a voltmeter check Circuit 54 (LG/Y) (Aerostar) for voltage.

Is voltage present?

Yes	No
REPLACE glove compartment lamp bulb. RESTORE vehicle. RETEST system.	SERVICE Circuit 54 (LG/Y) for open circuit. RESTORE vehicle. RETEST system.

PINPOINT TEST F: VANITY MIRROR LAMPS INOPERATIVE (AEROSTAR)

F1 CHECK VANITY MIRROR LAMPS SUPPLY

tomsn048@gmail.com

- Remove vanity mirror lamp assembly as outlined.
- Disconnect vanity mirror.
- Using a voltmeter check Circuit 54 (LG/Y) (Aerostar) for voltage.

Is voltage present?

Yes	No
GO to **F2** .	SERVICE Circuit 54 (LG/Y) for open circuit. RESTORE vehicle. RETEST system.

F2 CHECK VANITY MIRROR LAMPS GROUND

- Remove vanity mirror lamp bulb.
- Using an ohmmeter connected to a known good ground, check ground side of bulb socket for continuity.

Is there continuity?

Yes	No
GO to **F3** .	SERVICE ground for open circuit. RESTORE vehicle. RETEST system.

F3 CHECK VANITY MIRROR LAMP BULB

- Using an ohmmeter, check continuity of bulb.

Is there continuity?

Yes	No
REPLACE vanity mirror assembly. RESTORE vehicle. RETEST system.	REPLACE vanity mirror lamp bulb. RESTORE vehicle. RETEST system.

PINPOINT TEST G: INDIVIDUAL COURTESY LAMP INOPERATIVE

G1 CHECK SUPPLY TO COURTESY LAMP

- Remove suspect courtesy lamp assembly.
- Using a voltmeter check Circuit 53 (BK/LB) for voltage.

Is voltage present?

Yes	No
GO to **G2** .	SERVICE Circuit 53 (BK/LB) for open circuit. RESTORE vehicle. RETEST system.

tomsn048@gmail.com

G2 CHECK GROUND CIRCUIT 57 (BK)

- Using an ohmmeter connected to a known good ground, connect second lead to Circuit 57 (BK), check continuity.

Is there continuity?

Yes	No
GO to **G3** .	SERVICE Circuit 57 (BK) for open circuit. RESTORE vehicle. RETEST system.

G3 CHECK COURTESY LAMP BULB

- Remove courtesy lamp bulb.
- Using an ohmmeter check bulb for continuity.

Is there continuity?

Yes	No
REPLACE courtesy lamp assembly. RESTORE vehicle. RETEST system.	REPLACE courtesy lamp bulb. RESTORE vehicle. RETEST system.

tomsn048@gmail.com

Inspection and Verification — Illuminated Entry

1. Verify the vehicle owner's original concern by operating the illuminated entry system to duplicate the condition.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Outside door handles	• Fuses blown/open • Circuitry open/shorted

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following symptom chart.

tomsn048@gmail.com

Symptom Chart — Illuminated Entry

NOTE: Use Rotunda New Generation Star (NGS) tester 007-00500 and 73 Digital Multimeter 105-R0051 or equivalent to perform electrical Pinpoint Tests.

ILLUMINATED ENTRY

Condition	Possible Source	Action
• Illuminated Entry System Not Operating Correctly	• Fuse blown/open. • Interior lamp switches damaged. • Circuitry open/shorted.	• GO to Pinpoint Test H.

tomsn048@gmail.com

Pinpoint Test H — Illuminated Entry

PINPOINT TEST H: ILLUMINATED ENTRY SYSTEM NOT OPERATING CORRECTLY

H1 PRELIMINARY CHECKS

- Check connections for clean tight fit.
- Check for loose or damaged wires.

Do components and wiring check OK?

Yes	No
GO to **H2** .	SERVICE or REPLACE as required. GO to **H2** .

H2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to data link connector (DLC).
- Retrieve continuous DTCs.
- Perform On-Demand Self Test. Refer to Section 18-04A .

Are any DTCs retrieved?

Yes	No
DTC B1445 self test — GO to **H3** . DTC B1371 self test and continuous — CHECK for ground short in Circuit 53 (BK/LB) to interior lamps. REPAIR as required.	GO to **H4** .

H3 CHECK CIRCUIT 930 (P/LG)

- Disconnect door handle switch harness connector.
- Read PID DRHNDL.

Does tester indicate OFF?

Yes	No
Switch stuck closed. REPLACE worn switch as	REPAIR ground short in Circuit 930 (P/LG)

tomsn048@gmail.com

required.	between GEM and door handle switches.

H4 CHECK IP FUSE 27 (15A)

- Check fuse for continuity.

Is fuse OK?

Yes	No
GO to **H5** .	GO to **H7** .

H5 CHECK CIRCUIT 930 (P/LG) CONTINUITY TO GROUND

- Ground Circuit 930 (P/LG) at harness connector.
- Read PID DRHNDL.

Does tester indicate OFF?

Yes	No
GO to **H6** .	REPAIR open in Circuit 930 (P/LG) between GEM and door handle switches as required.

H6 CHECK GROUND CIRCUIT

- Jumper door handle switch ground circuit to Circuit 930 (P/LG).
- Read PID DRHNDL.

Does tester indicate ON?

Yes	No
Switch is stuck open. SERVICE or REPLACE worn switch as required.	REPAIR open in door handle switch ground circuit.

H7 CHECK CIRCUIT 705 (LG/O)

- Check for ground short in Circuit 705 (LG/O) power feed to battery saver relay and interior lamp relay.

Is circuit OK?

Yes	No
CHECK for battery short on Circuit 930 (P/LG) between GEM and door handle switches. REPAIR as required. REPLACE fuse.	REPAIR ground short in Circuit 705 (LG/O) as required. REPLACE fuse.

tomsn048@gmail.com

tomsn048@gmail.com

Component Tests

Headlamp Switch

Refer to Section 17-01 for diagnosis and testing.

Illuminated Entry, Aerostar

NOTE: Before performing diagnosis, verify illuminated entry system function. The illuminated entry module will not turn off the interior lamp if it is turned on by the headlamp rheostat, or if the door is open.

Quick Checks

1. Verify that circuit to interior lamp is working. If not, check fuse.
2. With the ignition switch in ACC or RUN position, verify that other systems which share the same accessory fuse are functional. If not, check fuse.
3. If any of the above systems are not working properly, service the inoperative circuit and then recheck the operation of the illuminated entry system before proceeding with the following complete check-out procedure.

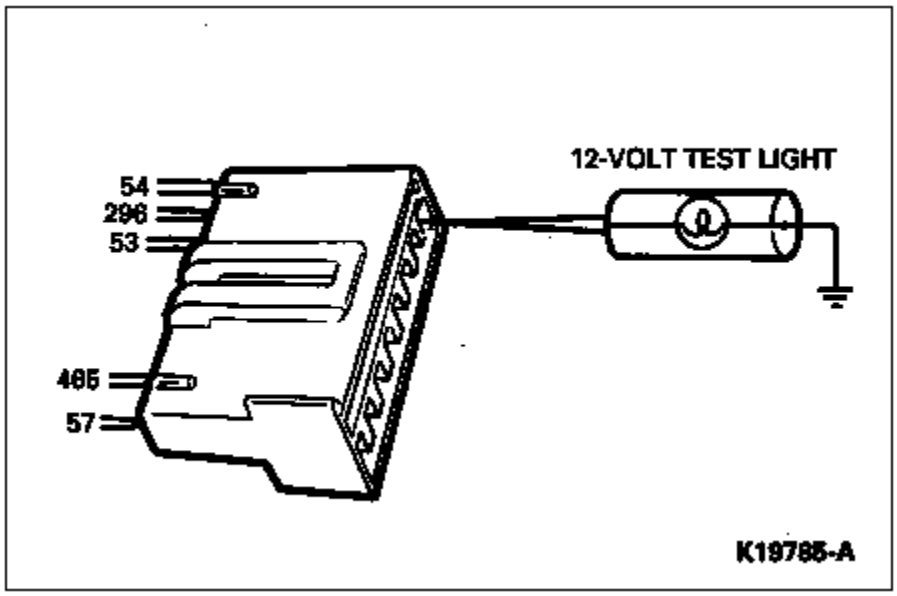
Pretest Checks

1. Terminal numbers referred to in the following procedure relate to the wiring connector attached to the illuminated entry actuator assembly. The terminals are numbered from left to right (when the connector is held as shown).
2. Any malfunctions diagnosed in Step 4 of the test procedure could be located in either front door.
3. To trace and/or service various circuits, refer to the respective vehicle wiring diagrams.
4. Check system fuses (two) before proceeding.

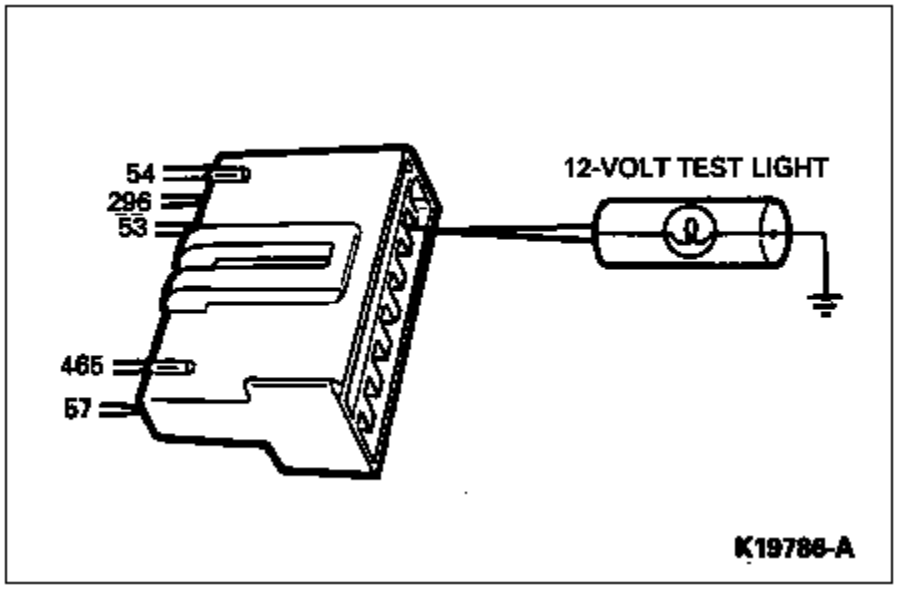
Test Procedure

1. Connect a 12-volt test light between Terminal No. 8 and a good ground. Test light should glow at all times with ignition switch in RUN or OFF position. If not, trace circuit 54 (light green with yellow stripe) back to fuse panel and service.

tomsn048@gmail.com

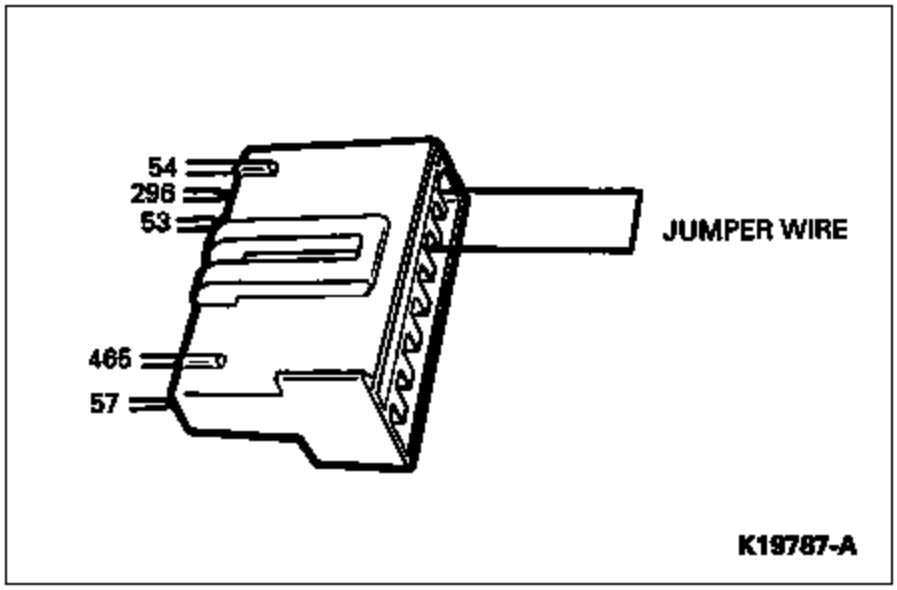


2. Connect a 12-volt test light between Terminal No. 7 and a good ground. The test light should glow when the ignition switch in ACC or RUN position and go out when the ignition switch is turned to OFF or LOCK position. If not, trace Circuit 296 (white-purple) back to fuse panel and service.



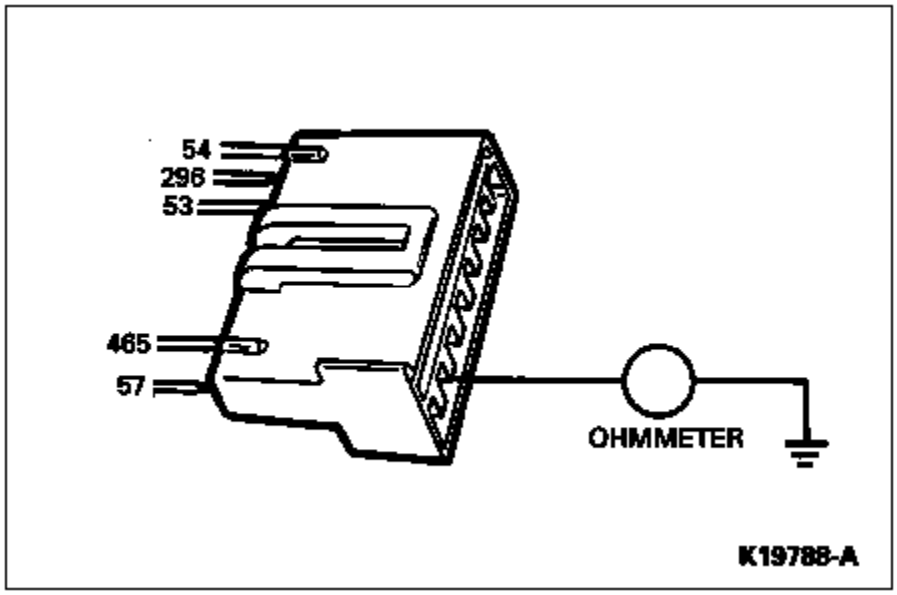
3. Connect a jumper wire between Terminals No. 6 and 8. With vehicle doors closed, interior lamp should be on. If not, trace Circuit 53 (black with light blue stripe) and service.

tomsn048@gmail.com



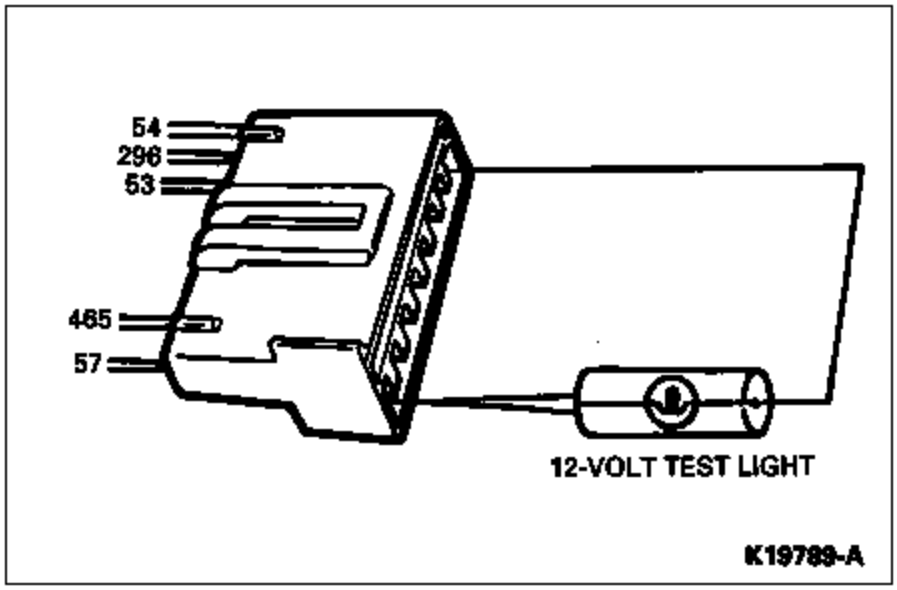
4. **NOTE: When operating door handle, hold in raised position.**

   Connect an ohmmeter between Terminal No. 2 and a good ground. The ohmmeter should show over 10,000 ohms (open). Then, operate each outside door handle in turn; ohmmeter should show not more than 50 ohms (closed). If readings are not as specified, then trace Circuit 465 (white with light blue stripe) back to latch switches and service.



5. Connect a 12-volt test light between Terminal No. 1 and Terminal No. 8. The test light should glow. If not, trace Circuit 57 (black) back to ground and service.

tomsn048@gmail.com



After Testing

If all tests check out OK and the illuminated entry system is still malfunctioning, the actuator assembly is the cause of the problem and must be replaced.

---

tomsn048@gmail.com

Lamp, Dome

To replace miniature bulb (13466), carefully snap pillar/dome lamp lens (13783) out of interior lamp body (13786) and remove miniature bulb from retainers.

To remove interior lamp body, remove retaining screws, and carefully pry wedge at each end of interior lamp body from retainer clip.

To install, position interior lamp body over screw holes and install retaining screws. Push on pillar/dome lamp lens to snap into position.

tomsn048@gmail.com

Lamp, Map

To replace miniature bulb (13466) in center section, carefully snap lens out of interior lamp (13776) and remove miniature bulb from retainers.

To replace miniature bulb in the movable gimble, carefully depress the legs of the bulb cover with a thin tool and remove. Gently snap miniature bulb from socket.

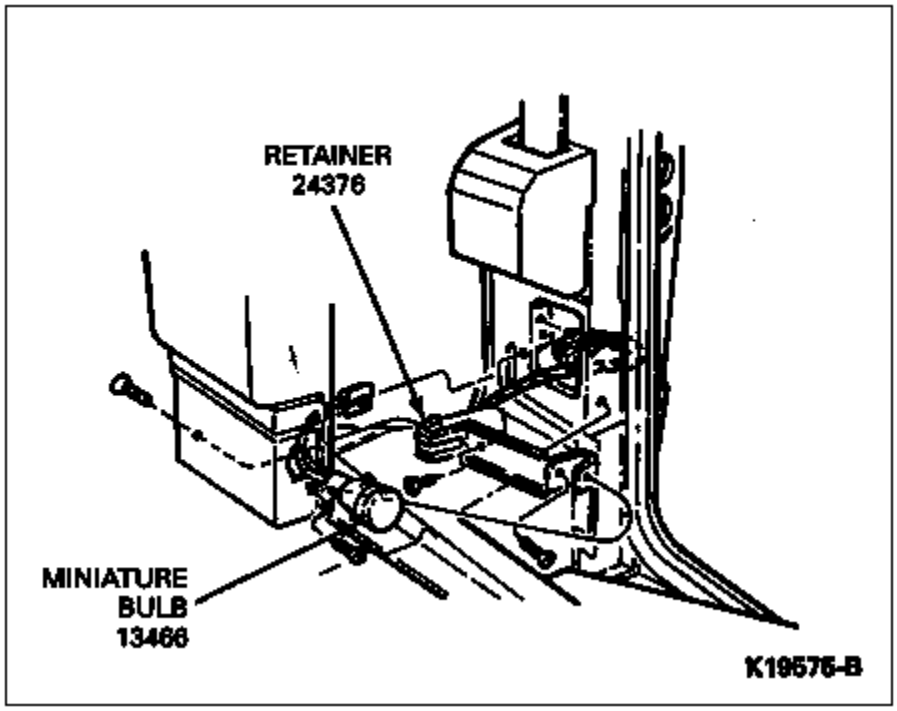
tomsn048@gmail.com

Lamp, Courtesy, Stepwell, Aerostar

Removal and Installation

1. Remove "B" pillar trim attaching screws (do not remove the trim panel).
2. Carefully pull the bottom of the trim panel away from the sheet metal to gain access to the lamp assembly wiring connector.
3. Disconnect the wiring.
4. Pull the interior lamp (13776) slightly away from the trim panel and depress the two locking tabs (top and bottom).
5. Remove interior lamp from trim panel.

To install, reverse removal procedure.



tomsn048@gmail.com

tomsn048@gmail.com

Bulb, Stepwell Lamp, Aerostar

Removal and Installation

1. Use a small, thin flat-blade screwdriver in the lens slot to pop out the pillar/dome lamp lens.
2. Pull the miniature bulb straight out from the interior lamp and insert the new miniature bulb by pushing in.
3. Push pillar/dome lamp lens back into the interior lamp until it snaps into place.

tomsn048@gmail.com

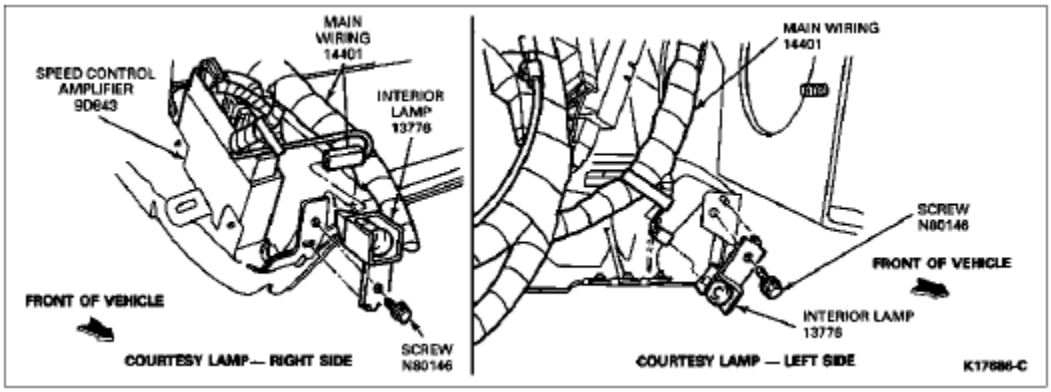
Lamps, Courtesy, Lower Instrument Panel, Aerostar (with Optional Light Group)

Removal and Installation

1. Remove miniature bulb (13466) from interior lamp (13776).
2. Remove the screw retaining the interior lamp to the instrument panel (04320).
3. Disconnect the main wiring (14401) from the interior lamp.

For installation, follow removal procedures in reverse order.

Optional Courtesy Lamps, Aerostar



tomsn048@gmail.com

Courtesy Lamp, Switch, Aerostar

Removal

1. Unscrew the hex sleeve nut from the pillar.

2. Extract lamp switch (13713) and pull the main wiring (14401) off the lamp switch.

    - Retention of lamp switch to the main wiring is by one of three tabs positioned 120 degrees apart on the lamp switch.
    - When the lamp switch is disconnected from the main wiring, the engaged locking tab breaks off, the lamp switch must be rotated 120 degrees to engage a new tab.
    - When all three tabs have been broken, the lamp switch must be replaced.

Installation

1. Pull the main wiring through the switch mounting hole in the pillar to interior lamp switch (13752). Connect the lamp switch to the main wiring.

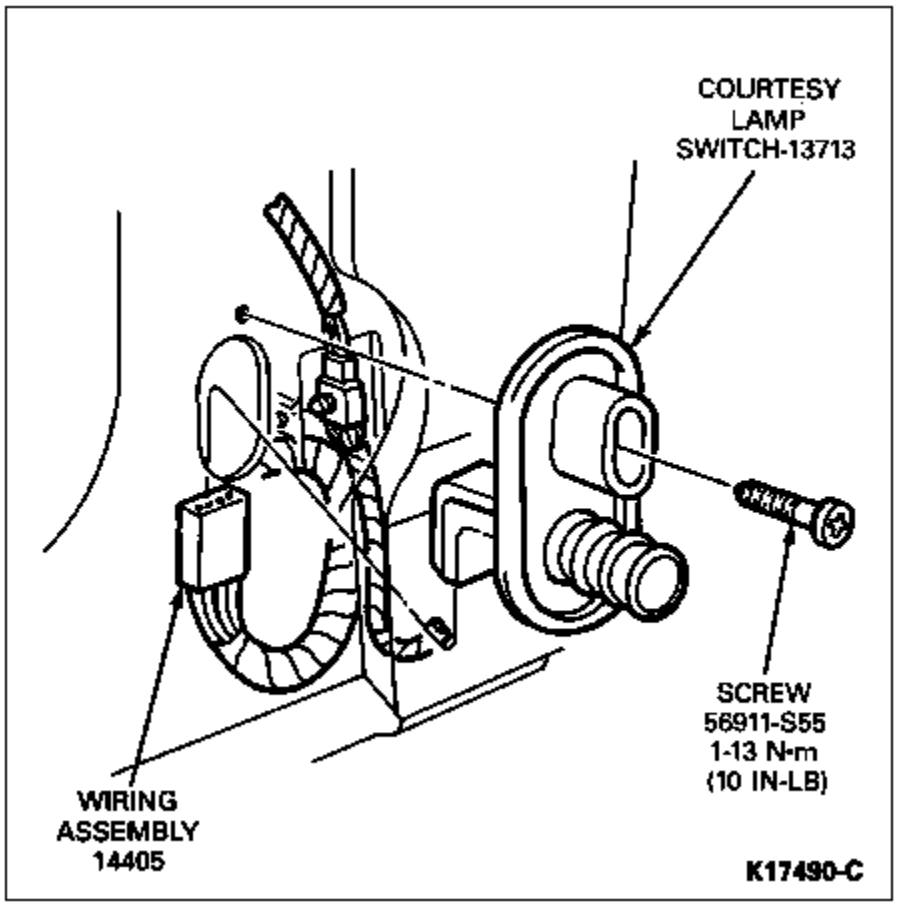
2. Twist main wiring and lamp switch 4-1/2 turns counterclockwise, and push the main wiring and connector back through the mounting hole.

3. Screw the lamp switch into the pillar until seated.

4. Close and open the front door (20124) to make sure the interior lamp (13776) is operating properly.

Courtesy Switch, Driver's Door, Aerostar

tomsn048@gmail.com



tomsn048@gmail.com

Hi-Mount Stoplamp/Cargo Lamp (Ranger)

1. Remove the two screws from the surface of the pillar/dome lamp lens (13783).
2. After removing the screws, remove rear hi-mount lamp (13A613).
3. Remove the socket by rotating it 45 degrees and pulling it out of the rear hi-mount lamp that contains the burned-out miniature bulb (13466) and replace the miniature bulb.
4. To install, push the bulb socket into the rear hi-mount lamp and rotate 45 degrees.
5. Position the rear hi-mount lamp on vehicle.
6. Secure with two screws.

tomsn048@gmail.com

Bulb, Cargo Lamp, Aerostar

To remove pillar/dome lamp lens (13783), remove retaining screws.

To remove miniature bulb, depress and rotate in counterclockwise direction.

To replace interior lamp door, disconnect courtesy or interior lamp switch wiring (13A709) and remove retaining screws at bottom of interior lamp door (13788).

To install, connect courtesy or interior lamp switch wiring to interior lamp door, position interior lamp door to vehicle and install retaining screws. Insert miniature bulb (13466) into socket and install pillar/dome lamp lens and retaining screws.

tomsn048@gmail.com

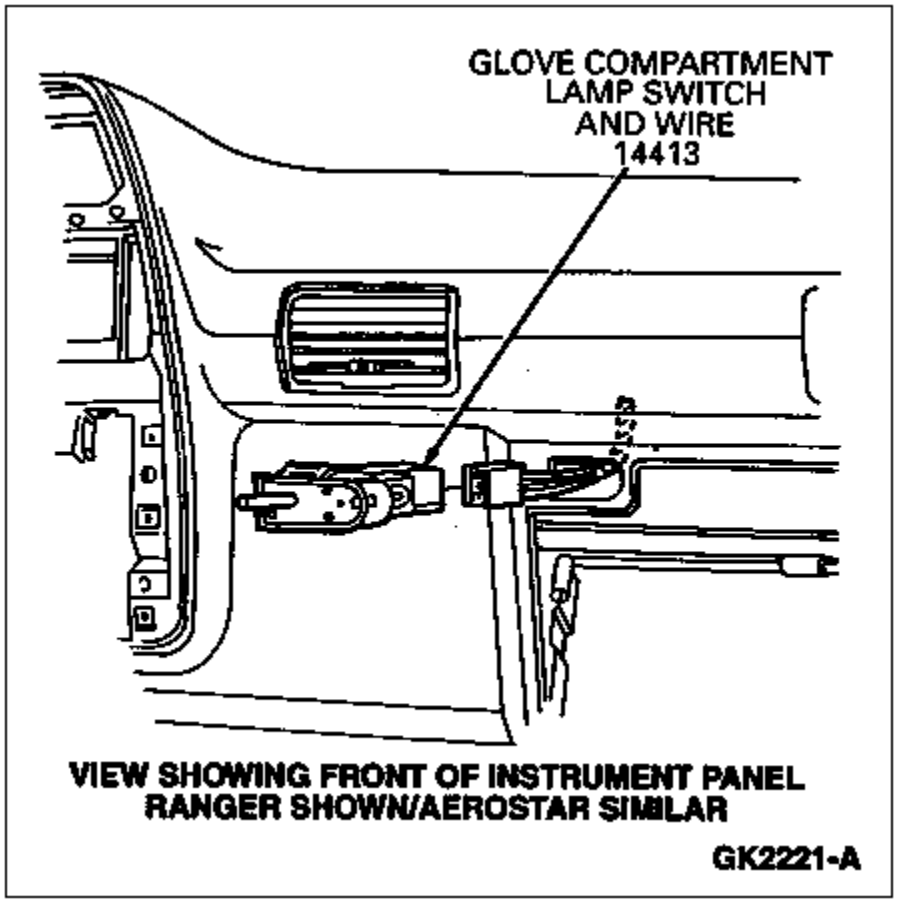
Lamp, Glove Compartment, Aerostar

Removal

1. From behind interior lamp (13776), depress lock tabs and pull interior lamp out of instrument panel (04320).
2. Disconnect main wiring (14401) from interior lamp.
3. To replace miniature bulb (13466), pull straight out of interior lamp and push new miniature bulb in.

Installation

1. Connect main wiring.
2. Push interior lamp into instrument panel until it locks in place.



tomsn048@gmail.com

tomsn048@gmail.com

Lamp, Ash Receptacle, Ranger

Removal and Installation

1. **NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Disconnect battery ground cable (14301).

2. Remove the instrument panel ash receptacle (04810) by depressing tab in center and pulling out.

3. Remove the two screws that attach the ash receptacle retainer to the instrument panel (04320) and pull the retainer rearward to disengage retention clip.

4. Squeeze the sides of the interior lamp (13776) together and lift off of receptacle retainer.

5. Disconnect courtesy or interior lamp switch wiring (13A709) from interior lamp.

6. Replace miniature bulb (13466) if required.

For installation, follow removal procedures in reverse order.

Daytime Running Lamp (DRL) System

The DRL System is designed to turn the high beam headlamps on, with a reduced light output, and without illuminating the high beam indicator lamp in the instrument panel (04320) when the following conditions exist:

- The ignition switch (11572) is ON.
- The parking brake control (2780) is fully released.
- The headlamp switch (11654) is in OFF position.

Inspection and Verification

1. Verify the original concern by operating the DRL system to duplicate the concern.
2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged lamps	• Open instrument panel fuse • Damaged connectors • Circuitry open/shorted • Damaged DRL module • Damaged parking brake switch • Fuses

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following Symptom Chart.

Symptom Chart — Daytime Running Lamp Diagnosis

DAYTIME RUNNING LAMP DIAGNOSIS

Condition	Possible Source	Action
• High Beams Are On at Full Intensity/ High Beams Inoperative	• Daytime running lamps control is not installed. • Open or shorted circuitry. • Damaged DRL module.	• CHECK to see if daytime running lamps control is connected. If loose or disconnected, INSPECT connector and RECONNECT daytime running lamps control. • If the daytime running lamps control is properly connected, GO to Pinpoint Test A .
• High Beams On at Reduced Intensity with Ignition OFF	• Damaged ignition switch. • Shorted wiring. • Damaged daytime running lamps control.	• GO to Pinpoint Test B .
• High Beams On at Reduced Intensity with Parking Brake Applied	• Open wiring or poor ground. • Damaged parking brake switch. • Damaged daytime running lamps control.	• GO to Pinpoint Test C .
• High Beams On at Reduced Intensity With Headlamp Switch ON	• Damaged headlamp switch. • Damaged DRL module.	• GO to Pinpoint Test D .
• No High Beam Indicator with Headlamps in the High Beam Position	• Burned-out bulb. • Open in wiring. • Damaged daytime running lamps control.	• GO to Pinpoint Test E .

Pinpoint Tests

PINPOINT TEST A: HIGH BEAMS ARE AT FULL INTENSITY/HIGH BEAMS INOPERATIVE

A1 CHECK PARKING BRAKE CIRCUIT

- Disconnect parking brake switch connector.

Did headlamps go to reduced intensity?

Yes	No
SERVICE parking brake switch as necessary. RESTORE vehicle. RETEST system.	GO to **A2** .

A2 CHECK DRL MODULE IGNITION INPUT

- Turn ignition key to ON position.
- With test lamp check for voltage to Pin 2 (Ranger) or Pin 3 (Aerostar) at DRL module connector.

Did test lamp illuminate?

Yes	No
GO to **A4** .	GO to **A3** .

A3 CHECK IGNITION SUPPLY CIRCUIT TO DRL MODULE

- Using test lamp check for voltage at output side of fuse 26 (15A, Ranger) or 5 (15A, Aerostar).

Did test lamp illuminate?

Yes	No
SERVICE Circuit 298 (P/O) for open circuit. RESTORE vehicle. RETEST system.	SERVICE fuse as necessary. RESTORE vehicle. RETEST system.

A4 CHECK BATTERY FEED TO DRL MODULE

- Using test lamp check for voltage to Pin 4 (Ranger) or Pin 7 (Aerostar) at DRL module connector.

Did test lamp illuminate?

Yes	No
GO to **A5** .	SERVICE Circuit 54 (Ranger) or Circuit 195 (Aerostar) for open circuit. RESTORE vehicle. RETEST system.

A5 CHECK FOR LOW BEAM INPUT

- Using test lamp check for voltage at Pin 7 (Ranger) or Pin 6 (Aerostar) at DRL module connector.

Did test lamp illuminate?

Yes	No
SERVICE Circuit 1058 (Ranger) or Circuit 13 (Aerostar) for short to voltage. RESTORE vehicle. RETEST system.	REPLACE daytime running lamps control. RESTORE vehicle. RETEST system.

PINPOINT TEST B: HIGH BEAMS ON AT REDUCED INTENSITY WITH IGNITION OFF

B1 CHECK IGNITION SWITCH INPUT

- With ignition switch off, use a test lamp and check for voltage to Pin 2 (Ranger) or Pin 3 (Aerostar) at DRL module.

Did test lamp illuminate?

Yes	No
GO to **B2** .	REPLACE daytime running lamps control. RESTORE vehicle. RETEST system.

B2 CHECK CIRCUIT 640 (R/Y) OR 298 (P/O)

- Remove fuse 26 (Ranger) or fuse 5 (Aerostar).
- Using a test lamp, check for voltage at Pin 2 (Ranger) or Pin 3 (Aerostar) at DRL module.

Did test lamp illuminate?

Yes	No
SERVICE Circuit 298.	GO to Section 11-05 , Component Tests for Ignition Switch Test procedures.

PINPOINT TEST C: HIGH BEAMS ON AT REDUCED INTENSITY WITH PARKING BRAKE APPLIED

C1 CHECK PARKING BRAKE SWITCH

- Turn ignition switch to RUN, turn headlamps off.
- Disconnect parking brake switch; using a jumper wire, connect Circuit 162 to a known good ground.

Did high beams turn off?

Yes	No
REPLACE parking brake control. RESTORE vehicle. RETEST system.	GO to **C2** .

C2 CHECK CIRCUIT 162 (LG/R) FOR OPEN

- With jumper wire still connected, disconnect daytime running lamps control.
- Using an ohmmeter connected to a known good ground, measure resistance of Circuit 162.

Is resistance 5 ohms or less?

Yes	No
REPLACE daytime running lamps control. RESTORE vehicle. RETEST system.	SERVICE Circuit 162 for open circuit. RESTORE vehicle. RETEST system.

PINPOINT TEST D: HIGH BEAMS AT REDUCED INTENSITY WITH HEADLAMP SWITCH ON

D1 CHECK DRL MODULE

- Turnignition switch to RUN, disconnect daytime running lamps control connector.

Did headlamps turn off?

Yes	No
REFER to Section 17-01 . SERVICE as necessary.	REPLACE daytime running lamps control. RESTORE vehicle. RETEST system.

PINPOINT TEST E: NO HIGH BEAM INDICATOR WITH HEADLAMPS IN THE HIGH BEAM POSITION

E1 CHECK HIGH BEAM INDICATOR LAMP

- Remove high beam indicator lamp at instrument cluster. Carefully inspect the bulb.

Is bulb burned out or damaged?

Yes	No
REPLACE indicator lamp bulb. RESTORE vehicle. RETEST system.	Go to **E2** .

E2 CHECK CIRCUIT 932 (GY/W) FOR VOLTAGE

- Reinstall high beam indicator lamp.
- Turn ignition switch to RUN, actuate headlamps to high beam.
- Using a test lamp check for voltage at DRL module, Pin 1.

Did test lamp illuminate?

Yes	No
SERVICE Circuit 932 open circuit. RESTORE vehicle. RETEST system.	GO to **E3** .

E3 CHECK DRL MODULE

- Using a jumper wire, connect one end to Pin 4 (Ranger) or Pin 7 (Aerostar), connect other end to Pin 1.

Did high beam indicator illuminate?

Yes	No
REPLACE daytime running lamps control. RESTORE vehicle. RETEST system.	GO to Section 13-01 . SERVICE indicator lamp as necessary.

Control Module, Daytime Running Lamp (DRL)

Removal and Installation

1. Remove retaining screw(s).
2. Disconnect wiring at daytime running lamps control (15A272) and remove from vehicle.

For installation, follow removal procedures in reverse order. Tighten retaining screw(s) to 2.0-3.0 Nm (18-27 lb-in).

Multiplex Communications Network (MCN)

Aboard this vehicle are several electronic components which can be controlled by an off-board tester to provide valuable self-diagnostic information. These components are part of an electrical system network, designed to control powertrain, chassis and body subsystems. The overall electronic network system consists of two microprocessor-based modules which interface through a common communication link. This communication link consists of a twisted wire pair (Data Bus Plus and Data Bus Minus) routed throughout the vehicle. Multiplex communications network signals are carried over an unshielded twisted pair. No special cabling is needed for the multiplex communication network. The wire pair is arranged in a "bus" configuration or party line, and is routed throughout the vehicle. Modules in the system connect to this bus so that the bus serves as a common tie point to each module.

Fault Tolerance

The multiplex communication network system will remain operational even with the severing of one of the bus wires. Communications will also continue if one of the bus wires is shorted to ground or battery positive voltage (B+) or a termination resistor is lost. This faulted condition is detected and reported to the host by the module's network bus interface circuits. In addition, one or more failed modules will not inhibit communications on the remainder of the network.

Purpose

This section contains information necessary for diagnosis of communication link conditions which may affect normal functional operation of the vehicle. Customer symptom may be directly related to these conditions. In order to effectively diagnose the communication link between all modules, the diagnostic procedures outlined in this section should be followed with each step performed in the order presented.

tomsn048@gmail.com

Diagnostic Communications Network

The diagnostic communication network consists of a single wire circuit which allows communication between an off-board tester and the related modules.

Fault Tolerance

Unlike the multiplex communications network, the diagnostic communications network will not tolerate grounding of Circuit 70 (LB/W). The diagnostic communications network will also fail if Circuit 70 (LB/W) is shorted to B+. Also, if one of the modules on the diagnostic communications network loses power or shorts internally, communications to that module will fail.

Purpose

This network consists of a single wire, Circuit 70 (LB/W). This circuit is used to access certain subsystem modules to perform on-board diagnostics with an off-board tester.

The recommended tester is the Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent. The tester accesses the control modules via the data link connector (DLC) located to the right of the steering column beneath the instrument panel.

Information on this network is contained in messages. Each module on the network has the ability to send and receive messages to and from the NGS tester.

Module-to-module communication is not possible as with the multiplex communication network. Communication involves only the NGS tester and the individual module being addressed during the testing of the module and its system. The modules will not communicate with the NGS tester unless the tester requests information by sending the module a signal.

The diagnostic communication network, Circuit 70 (LB/W), is located on Pin 7 of the data link connector (DLC). The voltage at Pin 7, Circuit 70 (LB/W), during vehicle operation without the NGS tester connected to the DLC will float between ground and battery voltage. When the NGS tester is connected to the DLC, the voltage on Pin 7, Circuit 70 (LB/W), should be greater than 90% of battery voltage.

To begin communications with selected vehicle module, the NGS tester grounds Pin 7, Circuit 70 (LB/W). The NGS tester then sends signals to the module by switching Circuit 70 (LB/W) between battery voltage and ground. The selected module interprets these digital commands and performs the requested function.

New Generation STAR (NGS) Tester Usage

The Service Bay Diagnostic System (SBDS), Rotunda Part Number 001-00001, may also be used to diagnose this system.

New Generation STAR Tester Hookup and Vehicle Selection

NOTE: Before any diagnostics can be performed on the communication system, use Rotunda New Generation STAR Tester 007-00500 or equivalent.

1. Turn ignition switch to OFF position.
2. Select the appropriate program card for the vehicle.
3. With the New Generation STAR (NGS) Tester control unit facing away from you, insert the program card into the slot on the back. If you insert the card incorrectly, NGS will not work.
4. Plug the NGS data link connector (DLC) cable to the vehicle DLC port (OBD II Connector).
5. Turn ignition switch to RUN position.
6. Plug the power cable into the vehicle's cigar lighter or into the battery hookup adapter if using the alternative hookup. NGS will perform an initialization, which checks that the NGS memory verifies the vehicle interface module matches the program card software. If the screen displays an error message, refer to Appendix C New Generation STAR Tester Operator Handbook, System Messages.
7. Menu item "Vehicle and Engine Selection" is highlighted. Press trigger to select.
8. Rotate dial to menu item "Select New Vehicle Model and Year" - press trigger.
9. Select year, Vehicle and appropriate engine by rotating dial to highlight selection, then press trigger to select. (If the selected vehicle is not displayed on first row, then repeat steps 8 and 9. Otherwise, rotate dial to Selected Vehicle top row and press trigger.)

tomsn048@gmail.com

tomsn048@gmail.com

Data Link Diagnostics

1. **NOTE: The ignition switch must be in RUN position or test will fail. This test is used to verify the proper operation of communication circuit of each module on the multiplex communication network or diagnostic communication network or diagnostic communication network.**

   Perform New Generation STAR Tester Hookup and Vehicle Selection as outlined.

2. Rotate dial to menu item "Diagnostic Data Link" and press trigger.

3. If results of Circuit 914 (+) = 0000 and Circuit 915 (-) = 0000, then the Multiplex Communication Network link test passed. If non-zeros returned, then go to Network Diagnostic Trouble Code (DTC) Index.

4. If results of Circuit 70 (LB/W) = 0, then the Diagnostic Communication Network Link Test passed. If non-zeros returned, then go to Network Diagnostic Trouble Code (DTC) Index.

On-Demand Self-Test

NOTE: This test is used to verify operation of module being tested.

1. Perform New Generation STAR Tester Hookup and Vehicle Selection as outlined.

2. **NOTE: The ignition switch must be in RUN position or test will fail.**

   Rotate dial to menu item Diagnostic Data Link and press trigger.

3. Select module to test by rotating dial to highlight module and press trigger.

4. Menu item Diagnostic Test Modes is highlighted. Press trigger.

5. Rotate dial to highlight menu item On-Demand Self Test. Press trigger, then press start (Button 3).

6. Prepare the vehicle for entry condition as specified for each module - press trigger.

Retrieve/Clear Continuous DTCs

1. Perform New Generation STAR Tester Hookup and Vehicle Selection as outlined.

2. **NOTE: The ignition switch (11572) must be in RUN position or test will fail.**

   Rotate dial to menu item Diagnostic Data Link and press trigger.

3. Select module to test by rotating dial to highlight module and press trigger.

tomsn048@gmail.com

4. Menu item Diagnostic Test Modes is highlighted. Press trigger.
5. Rotate dial to menu item Retrieve/Clear Continuous DTC, press trigger, then press start (Button 3).
6. Clear individual DTC from selected module, highlight DTC by rotating dial then press Button 8.
7. Clear all DTCs from selected module, press Button 7.

Retrieve PID Information

1. **NOTE: This test is used to verify operation of input circuitry to the module being tested. The ignition switch must be in RUN position or test will fail.**

   Perform New Generation STAR Tester hookup and Vehicle Selection as outlined.
2. Rotate dial to menu item Diagnostic Data Link and press trigger.
3. Select module by rotating dial to highlight module and press trigger.
4. Rotate dial to highlight menu item PID/Data Monitor and Record, press trigger.
5. Select PID acronyms by rotating dial to highlight a PID and then press trigger. Repeat this process until all PIDs are selected. (* - indicates that a PID has been selected.)
6. Press Button 7 to view all selected PIDs.

Diagnostic Commands

1. **NOTE: This test is used to verify the operation of the output circuitry of the module being tested. The ignition switch must be in RUN position or test will fail.**

   Perform New Generation STAR Tester Hookup and Vehicle Selection as outlined.
2. Rotate dial to menu item Diagnostic Data Link and press trigger.
3. Select module by rotating dial to highlight module and press trigger.
4. Rotate dial to highlight menu item Active/Command Modes, press trigger.
5. Rotate dial to selected command and press trigger. Command the output by rotating dial and pressing trigger as needed.

Retrieve Module Identification

1. **NOTE: Refer to New Generation STAR (NGS) Tester Manual for more details.**

   NOTE: This test is used to verify the correct version level of the module being tested. The ignition switch must be in RUN position or test will fail.

tomsn048@gmail.com

Perform New Generation STAR Tester Hookup and Vehicle Selection as outlined.

2. Rotate dial to menu item Diagnostic Data Link and press trigger.
3. Select module by rotating dial to highlight module and press trigger.
4. Rotate dial to highlight menu item Module Identification, press trigger.

tomsn048@gmail.com

Inspection and Verification

1. Verify the customer's original concern.
2. Inspect to determine if one of the following electrical concerns apply:

VISUAL INSPECTION CHART

Electrical
• Check electrical connections for obvious damage, opens or shorts.

3. Inspect Pin 2, Pin 7 and Pin 10 on the data link connector (DLC) for loose, bent, deformed, corroded or broken pins. If pin is damaged, service or replace pin, verify communication with Rotunda New Generation STAR Tester 007-00500 or equivalent.
4. If the concern(s) remains after the inspection, continue with New Generation STAR Tester Driven Diagnostics.

tomsn048@gmail.com

New Generation STAR Tester Driven Diagnostics

Vehicle Set Up

Perform the following vehicle set-up prior to running any New Generation STAR tests:

- Ignition switch in RUN
- Vehicle transmission range (TR) position in P (PARK)
- Driver seat not occupied
- Parking brake must be applied
- All passenger compartment, hood and luggage compartment doors closed
- All switches in the nominal OFF position

Do not touch any handle, control or switch that may produce a module input unless instructed to do so by New Generation STAR program.

1. Hookup New Generation STAR Tester and perform Vehicle Selection. Use diagnostic procedure outlined under New Generation STAR Tester Operation, New Generation STAR Tester Hookup and Vehicle Selection.

2. Perform Data Link Diagnostics Test to check the Multiplex Communication Network. Use diagnostic procedure outlined under New Generation STAR Tester Operation, Multiplex Communication Network Data Link Diagnostics Test. If the MCN Data Link Diagnostics Test passed and concern(s) still remains, then go to Step 3, if data link diagnostic test did not pass go to Multiplex Communication Network DTC Index or Diagnostic Communication Network DTC Index.

3. Retrieve continuous DTCs from selected module. Use diagnostic procedure outlined under New Generation STAR Tester Operation, Retrieve/ Clear Continuous DTCs.

4. Record all continuous DTCs, then clear all DTCs from the selected module using the diagnostic procedure outlined under New Generation STAR Tester Operation, Retrieve/ Clear Continuous DTCs.

5. **NOTE: The Self-Test program for an individual module may produce observable outputs.**

   Perform On-Demand Self-Test on the selected module. Use diagnostic procedure outlined under New Generation STAR Tester Operation, On-Demand Self-Test.

6. Record all On-Demand Self-Test DTCs and go to Diagnostic Trouble Code (DTC) Chart to continue diagnosis. If On-Demand Self-Test passed and concern(s) still remains, then go to Step 7.

7. Use the continuous DTCs recorded in Step 4 and go to Diagnostic Trouble Code (DTC) Chart to continue diagnosis. If no continuous DTCs retrieved in Step 4, then concern(s) is not related to Multiplex Communication Network. Return to referred section for non-network related problem(s).

Wiggle Test

tomsn048@gmail.com

The wiggle test is designed to help identify and locate intermittent failures in the vehicle wiring harness and system components. Upon entering wiggle test, several inputs and outputs of the module are monitored for change of state. When a state change is encountered, an audible tone can be heard and/or a diagnostic trouble code (DTC) will be displayed on the New Generation STAR (NGS) tester 007-00500. For modules which store DTCs, the DTC description will determine an open circuit, short to ground or a short to B+. By initiating wiggle test and pulling on different areas of the vehicle harness, intermittent open and short circuits can be located and serviced.

1. Perform New Generation STAR Tester Hookup and Vehicle Selection as outlined.
2. **NOTE: The ignition switch must be in RUN position or test will fail.**

   Rotate dial to menu item Diagnostic Data Link and press trigger.
3. Select module to test by rotating dial to highlight module and press trigger.
4. Menu item Diagnostic Test Modes is highlighted. Press trigger.
5. Rotate dial to highlight menu item Wiggle Test. Press trigger, then press start (Button 3).

---

tomsn048@gmail.com

System Pre-Check — ISO 9141

NOTE: Before running Data Link Diagnostic Test, turn the ignition switch to RUN.

SYSTEM PRE-CHECK — ISO 9141

PC1 RUN THE DATA LINK DIAGNOSTICS TEST

- Run the DATA LINK DIAGNOSTICS Test.

Is the result displayed for CKT70 = SYSTEM PASSED?

Yes	No
GO to Inspection and Verification of the subsystem section related to the system failure.	GO to **PC2** .

PC2 CHECK FOR SYSTEM FAIL RESPONSE

Is the result displayed for CKT70 = 00000000F?

Yes	No
GO to Pinpoint Test F .	GO to **PC3** .

PC3 CHECK FOR NO RESPONSE/NOT EQUIPPED

Is the module of interest listed after the CKT70 result followed by: NO RESPONSE/NOT EQUIPPED?

Yes	No
GO to the Symptom Chart.	Test Passed.

tomsn048@gmail.com

tomsn048@gmail.com

System Pre-Check — SCP (Circuits 914 and 915)

SYSTEM PRE-CHECK — SCP

SC1 RUN THE DATA LINK DIAGNOSTICS TEST

- Run the Data Link Diagnostic Test.

Are the results displayed for CKT914 = SYSTEM PASSED and for CKT915 = SYSTEM PASSED?

Yes	No
GO to Inspection and Verification of the subsystem section related to the system failure.	GO to **SC2** .

SC2 CHECK FOR SYSTEM FAIL RESPONSE

Are the results displayed for CKT914 = 00000001 or for CKT915 = 00000001?

Yes	No
GO to Pinpoint Test E .	GO to **SC3** .

SC3 CHECK FOR NO RESPONSE/NOT EQUIPPED

Is the module of interest listed after the CKT914 or CKT915 results followed by:
NO RESPONSE/NOT EQUIPPED
or NO RESPONSE ON CKT914 (BUS+)
or NO RESPONSE ON CKT915 (BUS-)?

Yes	No
GO to Pinpoint Test E .	Test passed.

Symptom Chart

Symptom Chart

Condition	Possible Source	Action
• The Anti-Lock Brake System (ABS) Module Does Not Respond to the NGS	• Ignition switch not in RUN. • Communication circuit ISO (circuit 70).	• GO to Pinpoint Test A.
• The Generic Electronic Module (GEM) Does Not Respond to the NGS	• Ignition switch not in RUN. • Communication circuit ISO (circuit 70).	• GO to Pinpoint Test B.
• The Integrated Air Bag Diagnostic Monitor (IABM) Does Not Respond to the NGS	• Ignition switch not in RUN. • Communication circuit ISO (circuit 70).	• GO to Pinpoint Test C.
• The Remote Anti-Theft Personality (RAP) Module Does Not Respond to the NGS	• Ignition switch not in RUN. • Communication circuit ISO (circuit 70).	• GO to Pinpoint Test D.
• The Powertrain Control Module (PCM) Does Not Respond to the NGS	• Ignition switch not in RUN. • Communication circuit SCP (circuits 914, 915).	• GO to Pinpoint Test E.
• No Module/Network Communication on ISO 9141 Link Circuit	• Ignition switch not in RUN. • Communication circuit ISO (circuit 70).	• GO to Pinpoint Test F.

tomsn048@gmail.com

Pinpoint Tests

Equipment: 12-volt test lamp or Rotunda 73 Digital Multimeter 105-R0051 and New Generation STAR (NGS) Tester 007-00500 or equivalent.

When necessary to trace and/or service the circuits, refer to the appropriate electrical schematics.

The following is a step-by-step process of elimination procedure that must be performed in sequence in its entirety in order to obtain reliable results. If a specific failure condition is known, you may refer instead to the Electrical and Vacuum Troubleshooting Manual to Wperform a quick check to determine cause and corrective action.

PINPOINT TEST A: THE ANTI-LOCK BRAKE SYSTEM (ABS) DOES NOT RESPOND TO THE NGS

NOTE: Before disconnecting or connecting a module, the ignition switch must be turned OFF.

A1 CHECK CIRCUIT 70 AT ABS CONNECTOR PIN 16

- Disconnect ABS connector.
- Inspect pin 16 (circuit 70) and the wire connection to the pin.

Are the pin and the wire connection OK?

Yes	No
GO to **A2** .	SERVICE the pin and/or the wire on the ABS connector. RESTORE connections and RUN the Data Link Diagnostic Test.

A2 CHECK CIRCUIT 70 BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE 4WABS CONNECTOR

- Measure the resistance between the 4WABS connector pin 16 and the DLC connector pin 7.

Is the resistance 5 ohms or less?

Yes	No
REPLACE the ABS module. RESTORE the connections and RUN the Data Link Diagnostic Test.	GO to **A3** .

A3 CHECK HARNESS CONNECTOR C1

tomsn048@gmail.com

- Disconnect harness connector C1.
- Inspect harness connector pin 16 (circuit 70) and the wire connection to the pin.

Are the pin and the wire connections on both sides of the harness connector OK?

Yes	No
GO to **A4** .	SERVICE pin and/or wire at harness connector. RESTORE the connections and RUN Data Link Diagnostic Test.

A4 CHECK CIRCUIT 70 BETWEEN THE ABS MODULE AND HARNESS CONNECTOR C1

- Measure the resistance between pin 16 of the ABS connector and male pin 16 of harness connector C1.

Is the resistance 5 ohms or less?

Yes	No
REPLACE circuit 70 between the harness connector C1 and the DLC connector. RESTORE the connections and RUN the Data Link Diagnostic Test.	REPLACE circuit 70 between the harness connector C1 and the ABS module. RESTORE the connections and RUN the Data Link Diagnostic Test.

PINPOINT TEST B: THE GENERIC ELECTRONIC MODULE (GEM) DOES NOT RESPOND TO THE NGS

NOTE: Before disconnecting or connecting a module, the ignition switch must be turned OFF.

B1 CHECK RESISTANCE BETWEEN DLC CONNECTOR AND GEM CONNECTOR

- Disconnect GEM connector.
- Measure resistance between GEM connector pin J1-25 and DLC connector pin 7.

Is the resistance 5 ohms or less?

Yes	No
GO to **B2** .	SERVICE circuit 70 for open between the GEM connector and DLC connector. RESTORE the connections and RUN Data Link Diagnostic Test.

B2 CHECK GEM CONNECTOR

- With GEM connector disconnected, inspect GEM connector pin J1-25 and the wire connection to the

tomsn048@gmail.com

pin.

Are pin J1-25 on GEM connector and wire connection to the pin OK?

Yes	No
GO to **B3** .	SERVICE connector. RESTORE the connections and RUN Data Link Diagnostic Test.

B3 CHECK DLC CONNECTOR

- Inspect DLC connector pin 7.

Are pin connection and housing OK?

Yes	No
REPLACE GEM. RESTORE the connections and RUN Data Link Diagnostic Test.	SERVICE connector. RESTORE the connections and RUN Data Link Diagnostic Test.

PINPOINT TEST C: THE INTEGRATED AIR BAG DIAGNOSTIC MONITOR (IABM) DOES NOT RESPOND TO THE NGS

NOTE: Before disconnecting or connecting a module, the ignition switch must be turned OFF.

C1 CHECK CIRCUIT 70 BETWEEN THE DATA LINK CONNECTOR (DLC) AND THE IABM MODULE CONNECTOR

- Deactivate the air bag system; refer to Section 01-20B .
- Disconnect the IABM connector and measure the resistance between IABM connector pin 12 and DLC connector pin 7.

Is the resistance 5 ohms or less?

Yes	No
GO to **C2** .	SERVICE circuit 70 between the IABM connector and the DLC connector. RESTORE the connections. REACTIVATE the air bag system; refer to Section 01-20B . RUN the Data Link Diagnostic Test.

C2 CHECK THE IABM MODULE CONNECTOR

- With the IABM disconnected, inspect IABM connector pin 12 and the wire connections to the pin.

tomsn048@gmail.com

Are the pin and the wire connections to the pin OK?

Yes	No
GO to **C3** .	SERVICE the connector. RESTORE the connections. REACTIVATE the air bag system; refer to Section 01-20B . RUN the Data Link Diagnostic Test.

C3 CHECK THE DLC CONNECTOR

- Inspect DLC pin 7.

Are pin 7 and the wire leading to the pin OK?

Yes	No
REPLACE the IABM. RESTORE the connections. REACTIVATE the air bag system; refer to Section 01-20B . RUN the Data Link Diagnostic Test.	SERVICE the connector. RESTORE the connections. REACTIVATE the air bag system; refer to Section 01-20B . RUN the Data Link Diagnostic Test.

PINPOINT TEST D: THE REMOTE ANTI-THEFT PERSONALITY (RAP) MODULE DOES NOT RESPOND TO THE NGS

NOTE: Before disconnecting or connecting a module, the ignition switch must be turned OFF.

D1 CHECK RAP CONNECTOR PIN A-3

- Disconnect the RAP connector.
- Inspect pin A-3 (circuit 70) and the wire connections to the pin.

Are the pin and the wire connections OK?

Yes	No
GO to **D2** .	SERVICE the pin and/or the wire at the RAP connector. RESTORE the connections and RUN Data Link Diagnostic Test.

D2 CHECK CIRCUIT 70 BETWEEN THE DLC CONNECTOR AND THE RAP CONNECTOR

- Measure resistance between the RAP connector pin A-3 and the DLC connector pin 7.

Is the resistance 5 ohms or less?

Yes	No

tomsn048@gmail.com

REPLACE RAP module. RESTORE the connections and RUN Data Link Diagnostic Test.	GO to D3 .

D3 CHECK HARNESS CONNECTOR C2

- Disconnect the harness connector C2.
- Inspect pin 51 and the wire connections to the pin.

Are the pin and the wire connections on both halves of the harness connector OK?

Yes	No
GO to D4 .	SERVICE the pin and/or the wire at harness connector. RESTORE the connections and RUN the Data Link Diagnostic Test.

D4 CHECK CIRCUIT 70 BETWEEN RAP MODULE TO HARNESS CONNECTOR C2

- Measure the resistance between pin A-3 of the RAP connector and male pin 51 of the harness connector C2.

Is the resistance 5 ohms or less?

Yes	No
REPLACE circuit 70 between the harness connector C2 and the DLC. RESTORE the connections and RUN the Data Link Diagnostic Test.	REPLACE circuit 70 between the harness connector C2 and the RAP module. RESTORE the connections and RUN the Data Link Diagnostic Test.

PINPOINT TEST E: THE POWERTRAIN CONTROL MODULE (PCM) DOES NOT RESPOND TO THE NGS

NOTE: Before disconnecting or connecting a module, the ignition switch must be turned OFF.

E1 CHECK FOR CIRCUIT CONCERN

Was fault code 0001 retrieved for circuit 914?

Yes	No
GO to E2 .	GO to E10 .

E2 CHECK HARNESS CONNECTOR C3 (CIRCUIT 914)

tomsn048@gmail.com

- Disconnect harness connector C3.
- Inspect pin 16 and the wire connections to the pin.

Are the pin and wire connections on both halves of the harness connector OK?

Yes	No
GO to **E3** .	SERVICE pin and/or wire at harness connector. RESTORE the connections and RUN Data Link Diagnostic Test.

E3 CHECK CIRCUIT 914 BETWEEN DLC CONNECTOR AND HARNESS CONNECTOR C3

- Measure resistance between DLC connector pin 2 and harness connector C3 female pin 26.

Is the resistance 5 ohms or less?

Yes	No
GO to **E4** .	REPLACE circuit 914 and circuit 915 between DLC and harness connector. RESTORE the connections and RUN Data Link Diagnostic Test.

E4 CHECK PCM CONNECTOR PIN 16 (CIRCUIT 914)

- Disconnect PCM connector from PCM.
- Inspect pin 16 (circuit 914) and the wire connections to the pin.

Are the pin and wire connections OK?

Yes	No
GO to **E5** .	SERVICE pin and/or wire at PCM connector. RESTORE the connections and RUN Data Link Diagnostic Test.

E5 CHECK CIRCUIT 914 TO HARNESS CONNECTOR C3

- Measure the resistance between PCM connector pin 16 and harness connector C3 pin 26.

Is the resistance 5 ohms or less?

Yes	No
GO to **E6** .	REPLACE circuit 914 and circuit 915 between harness connector C3 and PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

tomsn048@gmail.com

E6 CHECK FOR SHORT TO GROUND

- With the PCM disconnected, connect harness connector C3.
- Measure the voltage between DLC connector pin 2 and pin 4.

Is the voltage 0 volts?

Yes	No
GO to **E8** .	GO to **E7** .

E7 CHECK FOR SHORT TO BATTERY

- Measure the voltage between DLC connector pin 2 and pin 16.

Is the voltage 0 volts?

Yes	No
GO to **E9** .	REPLACE PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

E8 CHECK FOR SHORT TO GROUND AT HARNESS CONNECTOR C3

- Disconnect harness connector C3.
- Measure voltage between DLC connector pin 2 and pin 4.

Is the voltage 0 volts?

Yes	No
REPLACE circuit 914 and circuit 915 between DLC connector and harness connector C3. RESTORE the connections and RUN Data Link Diagnostic Test.	REPLACE circuit 914 and circuit 915 between harness connector C3 and PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

E9 CHECK FOR SHORT TO BATTERY AT HARNESS CONNECTOR C3

- Disconnect harness connector C3.
- Measure voltage between DLC connector pin 2 and pin 16.

Is the voltage 0 volts?

Yes	No
REPLACE circuit 914 and circuit 915 between DLC connector and harness connector C3. RESTORE the connections and RUN Data LInk Diagnostic Test.	REPLACE circuit 914 and circuit 915 between harness connector C3 and PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

tomsn048@gmail.com

E10 CHECK HARNESS CONNECTOR C3 (CIRCUIT 915)

- Disconnect harness connector C3.
- Inspect pin 7 (circuit 915) and wire connections to the pin.

Are the pin and the wire connections on both halves OK?

Yes	No
GO to **E11** .	SERVICE pin and/or wire at harness connector. RESTORE the connections and RUN Data Link Diagnostic Test.

E11 CHECK RESISTANCE BETWEEN DLC AND HARNESS CONNECTOR C3

- Measure resistance between DLC connector pin 10 and the harness connector C3 pin 33.

Is the resistance 5 ohms or less?

Yes	No
GO to **E12** .	REPLACE circuit 914 and circuit 915 between DLC and harness connector C3. RESTORE the connections and RUN Data Link Diagnostic Test.

E12 CHECK PCM CONNECTOR PIN 15 (CIRCUIT 915)

- Disconnect PCM connector from PCM.
- Inspect pin 15 (circuit 915) and the wire connection to the pin.

Are the pin and the wire connections OK?

Yes	No
GO to **E13** .	SERVICE the pin and/or wire at PCM connector. RESTORE the connections and RUN Data Link Diagnostic Test.

E13 CHECK RESISTANCE BETWEEN PCM AND HARNESS CONNECTOR C3

- Measure resistance between PCM connector pin 15 and harness connector C3 pin 33.

Is resistance 5 ohms or less?

Yes	No

tomsn048@gmail.com

GO to **E14** .	REPLACE circuit 914 and circuit 915 between C3 and the PCM connector.

E14 CHECK FOR SHORT TO GROUND

- With the PCM disconnected, connect harness connector C3.
- Measure the voltage between DLC connector pin 10 and pin 4.

Is the voltage 0 volts?

Yes	No
GO to **E16** .	GO to **E15** .

E15 CHECK FOR SHORT TO BATTERY

- Measure the voltage between DLC connector pin 10 and pin 16.

Is the voltage 0 volts?

Yes	No
GO to **E17** .	REPLACE PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

E16 CHECK FOR SHORT TO GROUND AT HARNESS CONNECTOR C3

- Disconnect harness connector C3.
- Measure voltage between DLC connector pin 10 and pin 4.

Is the voltage 0 volts?

Yes	No
REPLACE circuit 914 and circuit 915 between DLC connector and harness connector C3. RESTORE the connections and RUN Data Link Diagnostic Test.	REPLACE circuit 914 and circuit 915 between harness connector C3 and PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

E17 CHECK FOR SHORT TO BATTERY AT HARNESS CONNECTOR C3

- Disconnect harness connector C3.
- Measure voltage between DLC connector pin 10 and pin 16.

Is the voltage 0 volts?

Yes	No

tomsn048@gmail.com

REPLACE circuit 914 and circuit 915 between DLC connector and harness connector C3. RESTORE the connections and RUN Data Link Diagnostic Test.	REPLACE circuit 914 and circuit 915 between harness connector C3 and PCM. RESTORE the connections and RUN Data Link Diagnostic Test.

PINPOINT TEST F: NO MODULE/NETWORK COMMUNICATION ON ISO 9141 LINK CIRCUIT

NOTE: Before disconnecting or connecting a module, the ignition switch must be turned OFF.

F1 CHECK THE DATA LINK CONNECTOR (DLC)

- Turn the ignition switch to the OFF position.
- Inspect DLC connector pin 7 and wire connections to the pin.

Are the pin and wire connections to the pin OK?

Yes	No
GO to **F2** .	SERVICE the connector and RUN the Data Link Diagnostic Test.

F2 CHECK CIRCUIT 70 FOR OPEN

- Deactivate the air bag system; refer to Section 01-20B .
- Disconnect the IABM connector.
- Measure the resistance between DLC pin 7 and IABM connector pin 12.

Is the resistance 5 ohms or less?

Yes	No
GO to **F3** .	SERVICE circuit 70 for open between the IABM connector and the DLC connector. RESTORE the connections and REACTIVATE air bag system; refer to Section 01-20B . RUN the Data Link Diagnostic Test.

F3 CHECK FOR SHORT AT IABM

- With the IABM connector disconnected, turn the ignition switch to RUN position and run the Data Link Diagnostic Test.

Is the fault code 0000000F displayed?

Yes	No

tomsn048@gmail.com

GO to **F4** .	REPLACE IABM. REACTIVATE air bag system; refer to Section 01-20B . RESTORE the connections and RUN the Data Link Diagnostic Test.

F4 CHECK FOR SHORT TO GROUND

- Measure the voltage between DLC pin 7 and DLC pin 4.

Is the voltage 0 volts?

Yes	No
GO to **F6** .	GO to **F5** .

F5 CHECK FOR SHORT TO BATTERY

- Measure the voltage between DLC pin 7 and DLC pin 16.

Is the voltage 0 volts?

Yes	No
GO to **F6** .	CHECK New Generation STAR Tester operation.

F6 CHECK FOR SHORT AT HARNESS CONNECTOR C1

- Disconnect the harness connector and run the Data Link Diagnostic Test.

Is fault code 0000000F retrieved?

Yes	No
GO to **F8** .	GO to **F7** .

F7 CHECK FOR SHORT AT 4WABS

- Connect harness connector C1 and disconnect the ABS connector.
- Run the Data Link Diagnostic Test.

Is fault code 0000000F retrieved?

Yes	No
SERVICE circuit 70 between ABS connector and harness connector C1. RESTORE the connections and RUN the Data Link Diagnostic	REPLACE the ABS module. RESTORE the connections and RUN the Data Link Diagnostic

tomsn048@gmail.com

Test.	Test.

F8 CHECK IF THE VEHICLE IS EQUIPPED WITH A RAP MODULE

Is the vehicle equipped with a RAP module?

Yes	No
GO to **F9** .	GO to **F11** .

F9 CHECK FOR SHORT AT HARNESS CONNECTOR C2

- Disconnect harness connector C2.
- Run Data Link Diagnostic Test.

Is fault code 0000000F retrieved?

Yes	No
GO to **F11** .	GO to **F10** .

F10 CHECK FOR SHORT AT RAP MODULE

- Connect harness connector C2 and disconnect the RAP connector.
- Run the Data Link Diagnostic Test.

Is fault code 0000000F retrieved?

Yes	No
SERVICE circuit 70 between RAP connector and harness connector C2. RESTORE the connections and RUN Data Link Diagnostic Test.	REPLACE RAP module. RESTORE the connections and RUN Data Link Diagnostic Test.

F11 CHECK IF THE VEHICLE IS EQUIPPED WITH A GEM

Is the vehicle equipped with a GEM?

Yes	No
GO to **F12** .	CHECK for short to power/ground in harness 14401, circuit 70.

F12 CHECK FOR SHORT AT GEM MODULE

tomsn048@gmail.com

- Disconnect GEM connector.
- Run the Data Link Diagnostic Test.

Is fault code 0000000F retrieved?

Yes	No
CHECK for short to power/ground in harness 14401, circuit 70.	REPLACE GEM. RESTORE the connections and RUN Data Link Diagnostic Test.

tomsn048@gmail.com

Communication Circuit Wiring Repair

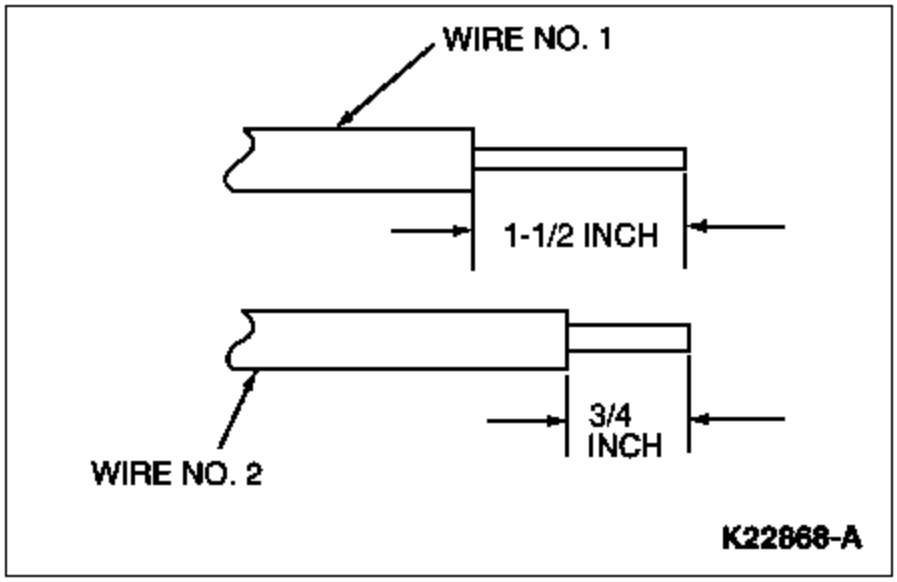
The following procedure is to be used to service both the twisted pair wiring and single wire communication circuits.

Durability of a wire splice is dependent on getting a joint that does not oxidize. Soldering is effective in keeping the air (oxide) out of the joint electronic circuits. Very high current circuits may fail because of oxidized joints that are not visible with the naked eye.

Durability of a splice is also dependent on keeping the moisture out of the joint. Heat shrink tubing alone won't do it. The tubing must contain a "hot melt wax" which is squeezed from the ends (both ends) of the tubing during heating and forms an adhesive seal between the wire insulation and the tube.

NOTE: Use a heat gun only. Do not use a hair dryer or any type of flame to heat the shrink tubing.

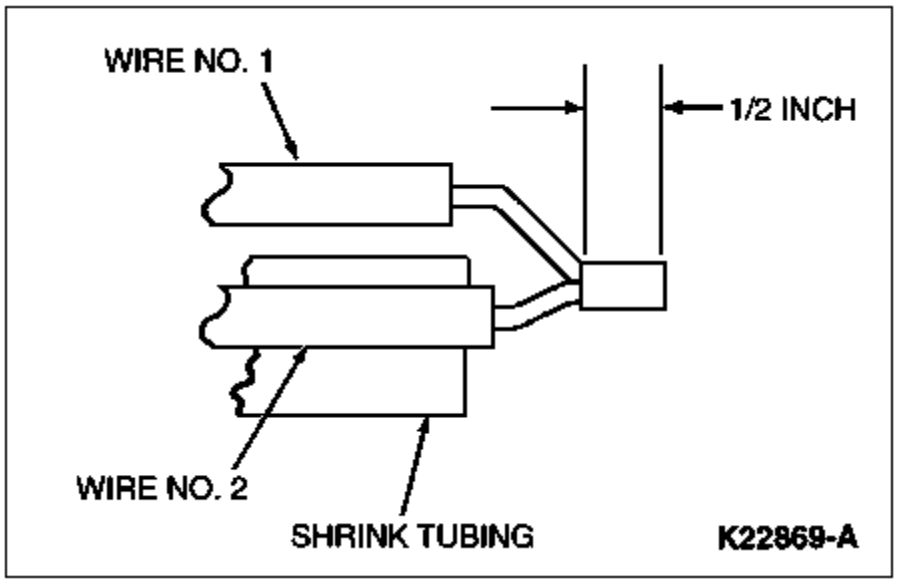
1. Correctly strip the wire.



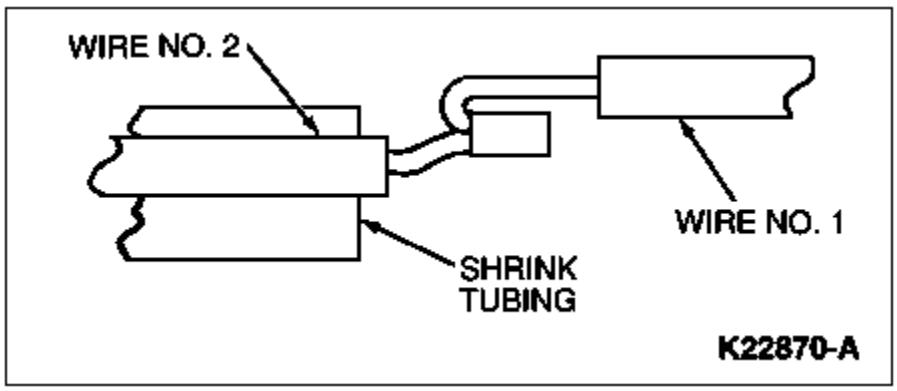
2. **NOTE: Install heat shrink tubing first.**

   Twist and solder the wire. Use resin core mildly activated (RMA) solder. Do not use acid core solder.

tomsn048@gmail.com

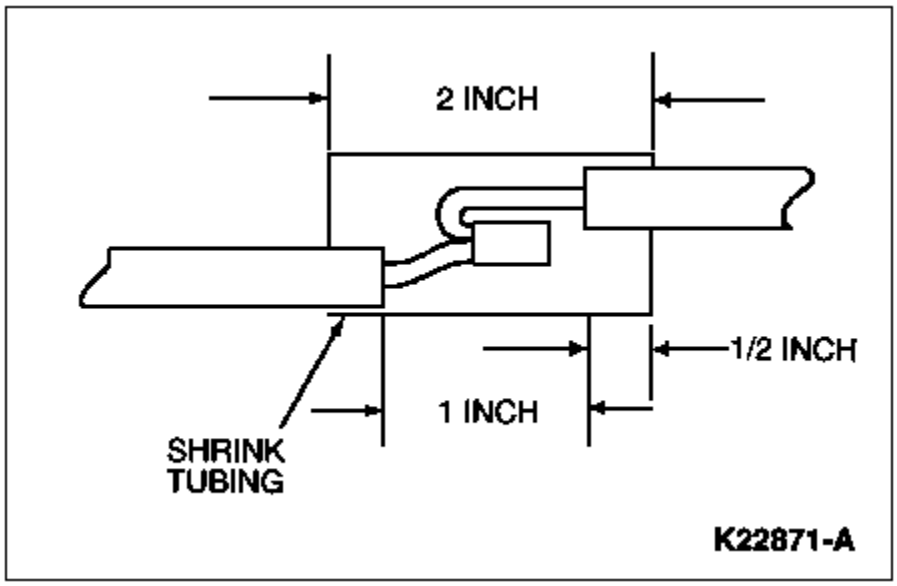


3. Form (bend) the circuit into shape for sealing.

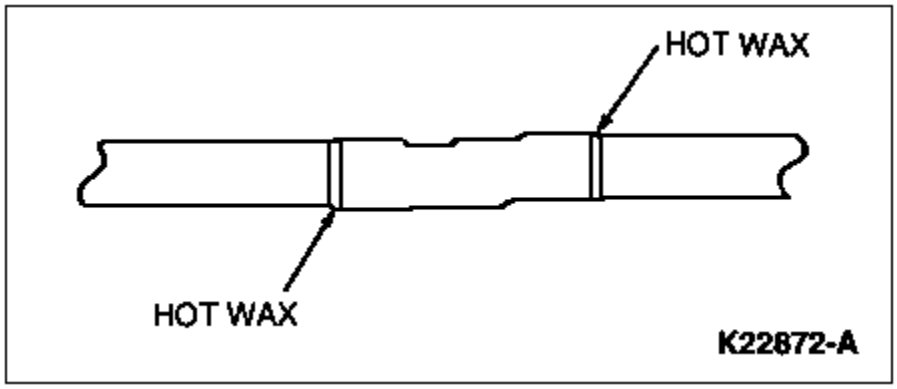


4. Reposition shrink tubing over splice.

tomsn048@gmail.com



5. Use Rotunda Heat Gun, 107-R0301 or equivalent to heat the entire length of the shrink tubing until the hot wax comes out of both ends. When the hot wax flows out of both ends, remove heat.



tomsn048@gmail.com

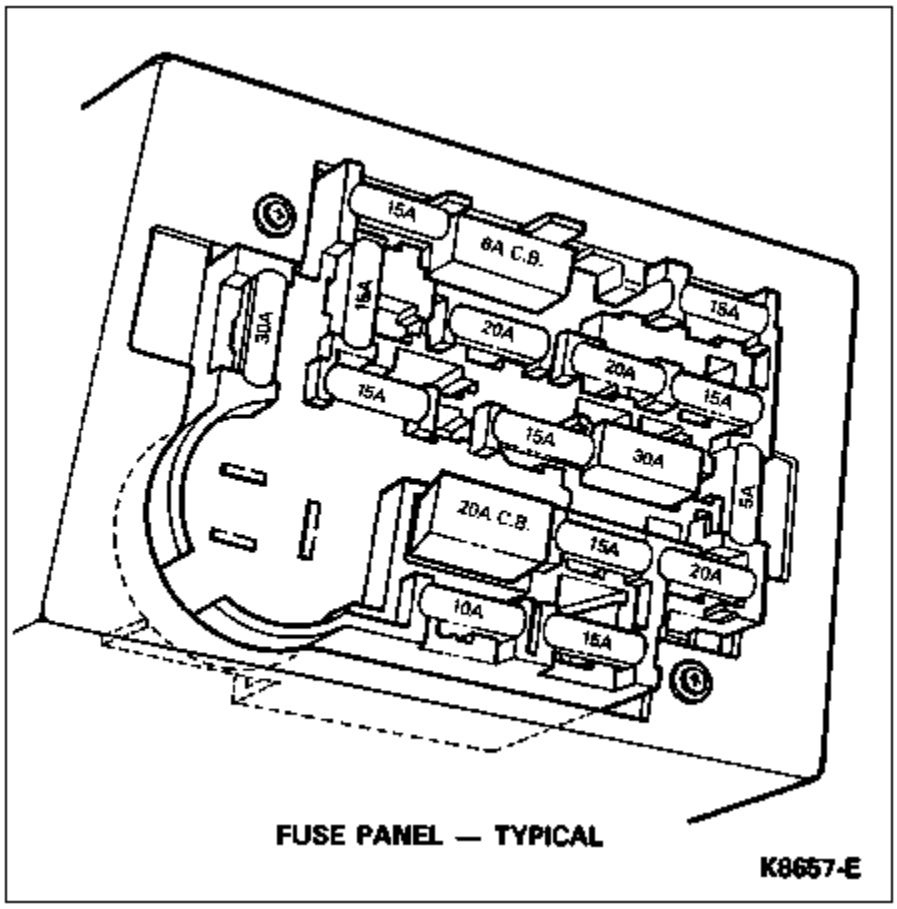
Electrical Power Supply

For convenience purposes most of the replaceable fuses for the electrical system are located on the fuse panel under the instrument panel to the left of the steering column tube (3514) on the Aerostar, and on the left end of the instrument panel (04320) on Ranger.

Fuse Junction Panel, Aerostar

The fuse panel is located under the instrument panel to the left of the steering column tube (3514). Remove the fuse panel cover (14A003) by pushing on the center of the fuse panel cover while pulling one of the two end tabs.

A 4.5-amp circuit breaker is located on the fuse block bracket for the liftgate wiper on Aerostar. A 30 amp fuse is taped to the harness, near the fuse block bracket for the power locks.



FUSE PANEL — TYPICAL

K8657-E

Fuse Junction Panel, Ranger

The fuse panel is located on the left end of the instrument panel (04320).

A power distribution box is located under the hood (16612) and over the front fender apron (16055).

Remove the instrument panel fuse door (045D62) by placing a finger in the indentation provided and pull the instrument panel fuse door away from the instrument panel.

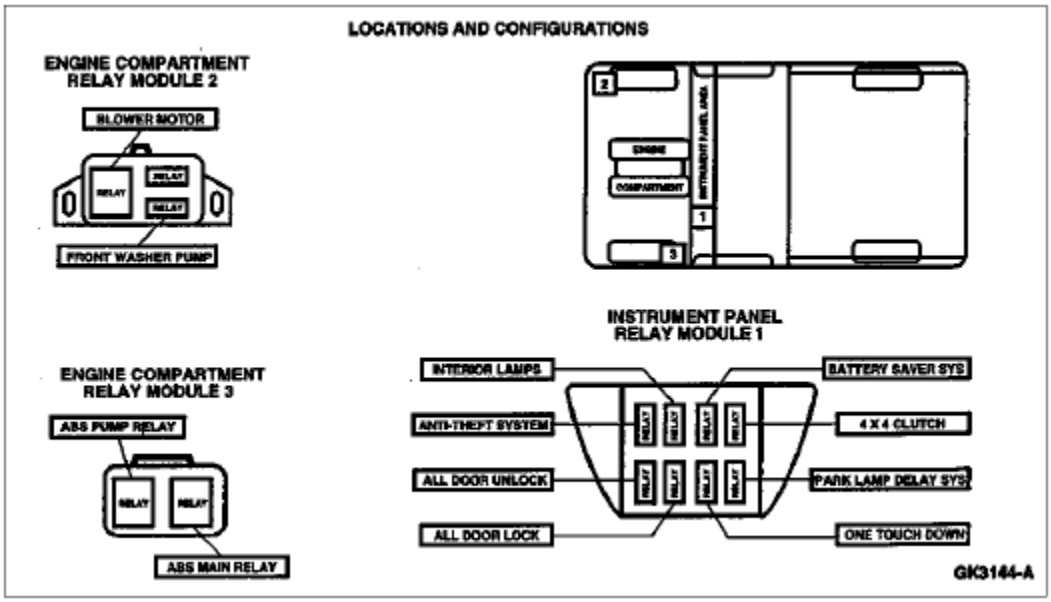
Fuse Links

The fuse link is a short length of special, Hypalon (high temperature) insulated wire, integral with the engine compartment wiring harness, and should not be confused with standard wire. It is several wire gauges smaller than the circuit which it protects. Under no circumstances should a fuse link replacement repair be made using a length of standard wire cut from bulk stock or from another wiring harness.

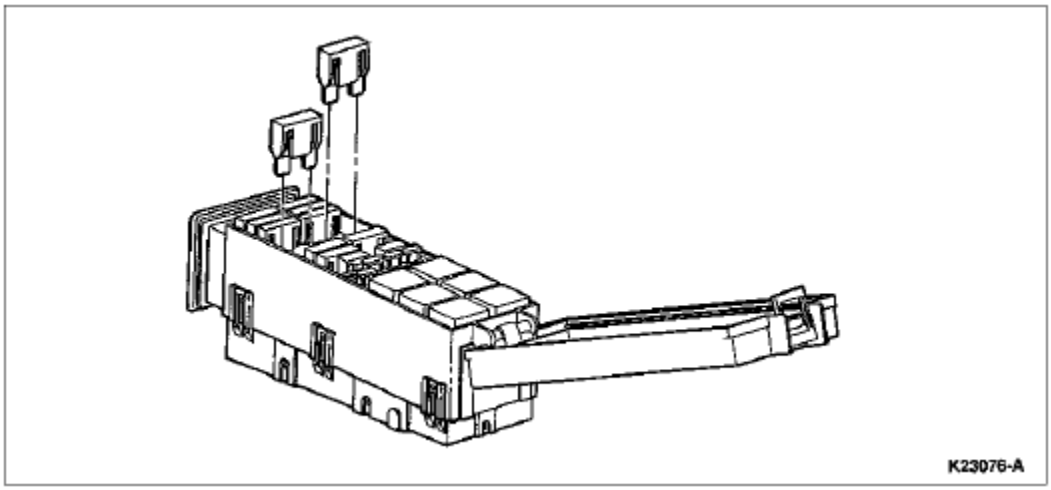
The higher melting temperature properties and additional thickness of the Hypalon insulation will usually allow the undersized internal fuse wire to melt and disintegrate within the Hypalon casing with little damage to the high temperature insulation other than discoloration or bubbling of the insulation surface. In extreme cases of excessive circuit current the insulation may separate after the fuse wire has disintegrated. However, the bare wire will seldom be exposed. When it becomes difficult to determine if the fuse link is burnt open, perform a continuity test. When heavy current flows, such as when a booster battery is connected incorrectly or when a short to ground occurs in the wiring harness, the fuse link burns out and protects the generator (GEN) (10300) or wiring.

Fuse Panel

Relay Modules — Ranger (High Content Models)



Fuse Panel, Engine Compartment — Ranger, Typical



Fuses and Circuit Breakers

WARNING: ALWAYS REPLACE A BLOWN FUSE OR FUSE LINK WITH THE SAME RATING AS SPECIFIED. NEVER REPLACE WITH A HIGHER AMPERAGE RATING BECAUSE SEVERE WIRING DAMAGE AND POSSIBLE FIRE CAN RESULT.

The following illustrations show the locations of fuses and circuit breakers.

Indicator Flasher Location

The turn signal hazard flasher is located on the front of the fuse panel on the Aerostar. The Ranger uses the same flasher for both turn signal and hazard indicator operation. It is located behind the instrument panel steering column cover (04459) on the left side of the steering column.

Trailer Towing Package Wiring

Vehicles equipped with the trailer towing package have the following additions to support the trailer wiring:

- On Aerostar, two relays are located behind the left rear quarter trim panel, in the trailer tow relay module. Aerostar also has four fuses in the trailer tow relay module. The connectors on the trailer tow extension wiring harness are located behind the middle of the rear frame crossmember.
- The trailer feed wiring (13A576) is supplied with the vehicle and installed by the customer.
- The Aerostar is equipped with a backup lamp relay for trailers equipped with backup lamps.

Trailer Wiring Relays

Aerostar

The trailer tow relays are located in the trailer tow relay module, behind the left rear quarter trim panel, and mounted just below the rear lamp wiring (14405) harness.

The trailer feed wiring connects to the trailer tow extension wiring connectors located behind the rear frame crossmember. The trailer tow extension wiring enters the rear of the luggage compartment through a grommet in the floor pan and connects to the rear lamp wiring. The trailer tow extension wiring has the trailer tow relay module on it.

A connector end matching the trailer to be towed is to be installed on the end of the trailer feed wiring. This installation should be done by an authorized camper/trailer repair center.

The trailer end of the trailer feed wiring has the following feeds for trailer wiring:

Wire Color	Circuit Number	Circuit Description
BR	14	Trailer Park Lamps
BK	57	Trailer Ground
O/LB	5	Trailer Turn Signal, Stoplamps and Hazard Lamps (RH)
LG/O	9	Trailer Turn Signal, Stoplamps and Hazard Lamps (LH)
BK/PK	140	Backup Lamps

Wire Color Code

NOTE: Whenever a wire is labeled with two colors, the first color listed is the basic color of the wire, and the second color listed is the stripe marking of the wire.

Code	Color	Code	Color
BL	Blue	N	Natural
BK	Black	O	Orange
BR	Brown	PK	Pink
DB	Dark Blue	P	Purple
DG	Dark Green	R	Red
GN	Green	T	Tan
GY	Gray	W	White
LB	Light Blue	Y	Yellow
LG	Light Green		

Wiring and Circuit Protection

Inspection and Verification

1. Check the trailer feed wiring (13A576) and the added trailer connector for obvious signs of damage.
2. Check fuses for damage.
3. If the concern remains after these checks, proceed to the following Symptom Chart.

Symptom Chart — Wiring And Circuit Protection

WIRING AND CIRCUIT PROTECTION

Condition	Possible Source	Action
• Trailer Lamps Inoperative	• Fuse. • Trailer tow extension wiring. • Trailer feed wiring. • Trailer wiring or bulbs.	• GO to Pinpoint Test A .
• Trailer Stop, Turn or Hazard Lamps Inoperative	• Fuse. • Trailer tow extension wiring. • Trailer feed wiring. • Trailer wiring or bulbs.	• GO to Pinpoint Test A .
• Trailer Tail Lamps and Running Lamps Inoperative	• Fuse. • Trailer tow extension wiring. • Trailer feed wiring. • Trailer wiring or bulbs.	• GO to Pinpoint Test A .
• Single Trailer Lamp Inoperative	• Trailer wiring or bulbs.	• Have trailer serviced by an authorized camper/trailer repair center.

Pinpoint Test

PINPOINT TEST A: TRAILER LAMPS INOPERATIVE

A1 CHECK LIGHTING OPERATION

- Disconnect trailer from vehicle and disconnect trailer feed wiring from trailer tow extension wiring, Aerostar.
- Check operation of vehicle exterior lighting systems for any concerns.

Does the exterior lighting system of vehicle operate properly?

Yes	No
GO to **A2** .	SERVICE any vehicle exterior lighting concerns. REFER to Section 17-01 .

A2 CHECK FUSES

- Check the following fuses:
  a. Fuse panel, fuse 1 (15A)
  b. Fuse panel, fuse 4 (15A)
  c. Fuse panel, fuse 5 (15A)
  d. Trailer tow relay module, left turn lamp fuse (3A)
  e. Trailer tow relay module, right turn lamp fuse (3A)
  f. Trailer tow relay module, parklamps fuse (10A)
  g. Trailer tow relay module, backup lamp fuse (5A)

Are fuses OK?

Yes	No
GO to **A3** .	SERVICE as required. RETEST trailer lighting system. If concern is still present, GO to **A3** .

A3 CHECK TRAILER GROUND FEED

- Using volt-ohmmeter check resistance between Circuit 57 (BK) of trailer feed wiring end and known good ground.

Is resistance less than 5 ohms?

Yes	No
GO to **A4** .	GO to **A9** .

A4 CHECK TRAILER TAIL LAMP FEED

- With the ignition switch in the RUN position, turn the headlamps on.
- Using volt-ohmmeter, measure voltage of trailer feed wiring end Circuit 14 (BR).

Is voltage greater than 10V?

Yes	No
GO to **A5** .	GO to **A9** .

A5 CHECK TRAILER RH TURN, STOP AND HAZARD FEED

- With the ignition switch in the RUN position, turn the RH turn lamp on.
- Using volt-ohmmeter, measure voltage of trailer feed wiring end Circuit 5 (O/LB).

Does voltage modulate from greater than 10V to less than 1V?

Yes	No
GO to **A6** .	GO to **A9** .

A6 CHECK TRAILER LH TURN, STOP AND HAZARD FEED

- With the ignition in the RUN position, turn the hazard lamps on.
- Using volt-ohmmeter, measure voltage of trailer feed wiring end Circuit 9 (LG/O).

Does voltage modulate from greater than 10V to less than 1V?

Yes	No
GO to **A11** .	GO to **A7** .

A7 CHECK RELAY GROUND

- Locate relay connector for circuit.
- Using volt-ohmmeter, check resistance of Pin 85 of trailer tow extension wiring connector and known good ground.

Is resistance less than 5 ohms?

Yes	No
GO to **A8** .	SERVICE open in Circuit 57 (BK).

A8 CHECK RELAY POWER

- Locate relay connector for circuit.
- Using volt-ohmmeter, check voltage of Pin 30 of trailer tow extension wiring connector.

Is voltage greater than 10V?

Yes	No
GO to **A9** .	SERVICE open in relay power circuit.

A9 CHECK TRAILER TAIL LAMP FEED TO RELAY

- With the ignition in the RUN position, turn the headlamps on.
- Using volt-ohmmeter, measure voltage of Pin 86 of the trailer parklamps relay.

Is voltage greater than 10V?

Yes	No
GO to **A10** .	SERVICE open in relay coil feed.

A10 CHECK TRAILER HAZARD FEED

- With the ignition in the RUN position, turn the hazard lamps on.
- Using volt-ohmmeter, measure voltage of fused feeds, Circuit 52 (Y) and Circuit 64 (DG).

Does voltage modulate from greater than 10V to less than 1V?

Yes	No
GO to **A11** .	SERVICE open in fused feeds.

A11 CHECK TRAILER WIRING FEED WIRING

- Using a volt-ohmmeter, check the following relay pins and circuits for continuity:
  a. Trailer park lamps relay Pin 87 to trailer feed wiring end Circuit 14 (BR).
  b. Trailer backup lamps relay Pin 87 to trailer feed wiring end Circuit 140 (BK/PK).

Do all circuits have continuity?

Yes	No
REPLACE relay for circuit not functioning properly.	SERVICE open in trailer feed wiring, trailer tow extension wiring for circuit(s) that indicated no continuity.

Aerostar

86	14 (BR)	Coil Power
87	195 (T/W)	Park Lamps Fuse Feed
87A	—	Not Used

Fuse Junction Panel Cover

Instrument Panel

To remove the instrument panel (04320) fuse panel cover on the Aerostar, push on the center of the instrument panel fuse panel cover while pulling one of the two end tabs. To remove the instrument panel fuse door (045D62) on the Ranger, place a finger in the indentation provided and pull the instrument panel fuse door away from the instrument panel.

Power Distribution Box Cover

To remove the cover on the power distribution box, release the locking tab on the end of the power distribution box cover and pull the end of the cover up, swinging it back on its hinge.

Power Distribution Box, Ranger

The power distribution box is located in the engine compartment on the left inner fender, next to the power brake booster (2005) for Ranger. It contains fuses, relays and diodes. Some fused circuits feed to the instrument panel (04320) fuse panel. The power distribution box is part of the wiring assembly. The power distribution box slides and locks into a fuse junction panel mounting bracket (14A254).

Power Distribution Box Service

To remove the power distribution box from the fuse junction panel mounting bracket, press both locking arms at the same time and pull the power distribution box up. The bottom cover is attached with two screws and a hinge.

Fuses, Relays or Circuit Breakers

To check or replace a fuse, relay or circuit breaker:

1. Locate and remove the suspect fuse, relay or circuit breaker by pulling it out of its cavity (no special tools required).

2. **CAUTION: Never install a replacement fuse, relay or circuit breaker with a higher or lower amperage rating than indicated for a circuit.**

   Replace fuse, relay or circuit breaker with one of the proper amperage rating for the circuit by pushing straight in until fuse, relay or circuit breaker seats itself fully in cavity.

Wiring Harness, Aerostar

The illustrations in this section show the complete wiring harness installation for Aerostar vehicles. Refer to the illustrations for the harness being replaced while performing the following Removal and Installation procedures. Refer to the appropriate Electrical and Vacuum Troubleshooting Manual for overviews of wiring harnesses.

Removal

NOTE: Refer to Section 01-05B if it is necessary to remove any trim panels to gain access to the harness.

1. Disconnect battery ground cable (14301).
2. Disconnect all wiring harness connectors.
3. Disengage harness from all locators, straps or clips as necessary, including ground wire eyelets. Remove harness from vehicle.

Installation

1. Position harness in vehicle, making sure that harness is engaged in all locators, straps or clips.
2. Connect all harness connectors to components or other harnesses as necessary.
3. Secure ground eyelets to body as necessary.
4. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable and check all applicable circuits for proper operation.
5. Install any trim removed during harness removal. Refer to Section 01-05B for trim panel installation.

Front End and Fender Apron Wiring, Right, All Engines — Aerostar

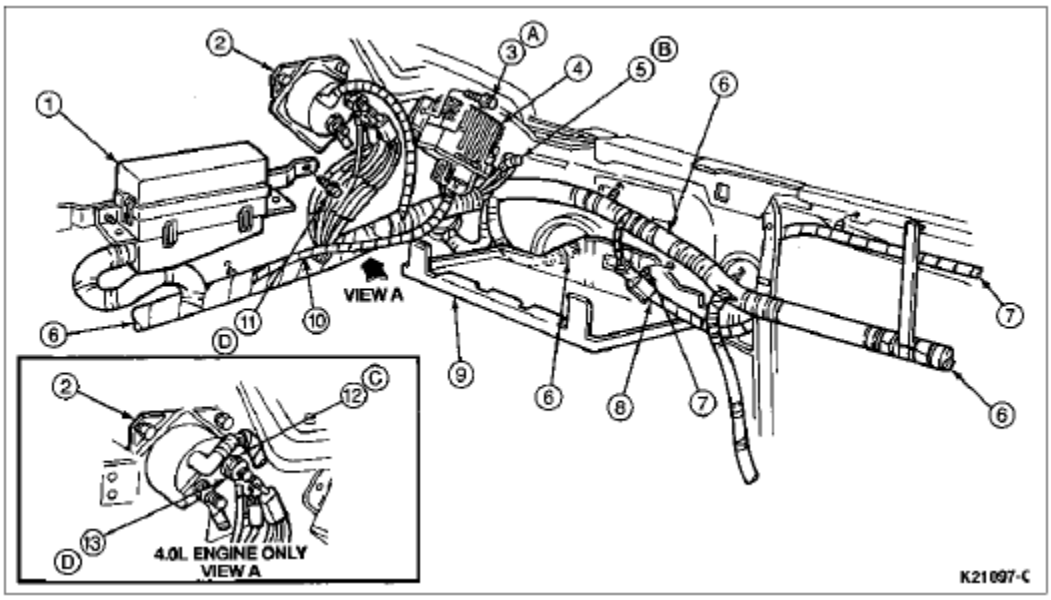
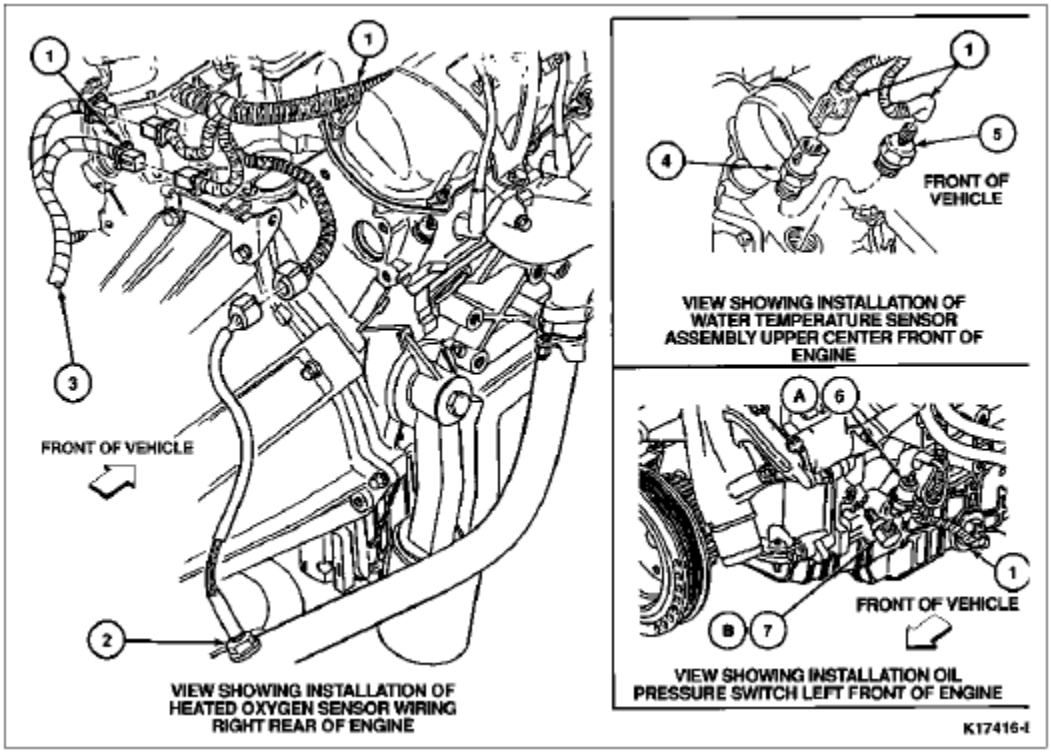
5	—	To Standard Heater (Part of 12A581)
6	14305	Generator Voltage Regulator Wiring
7	—	To Air Conditioning (3.0L Engine) (Part of 14305)
8	—	To Horn Assembly (Part of 12A581)
9	—	To Canister Purge Solenoid
10	—	To Purge Flow Sensor/Thermistor

Front End and Fender Apron Wiring, Left, All Engines — Aerostar



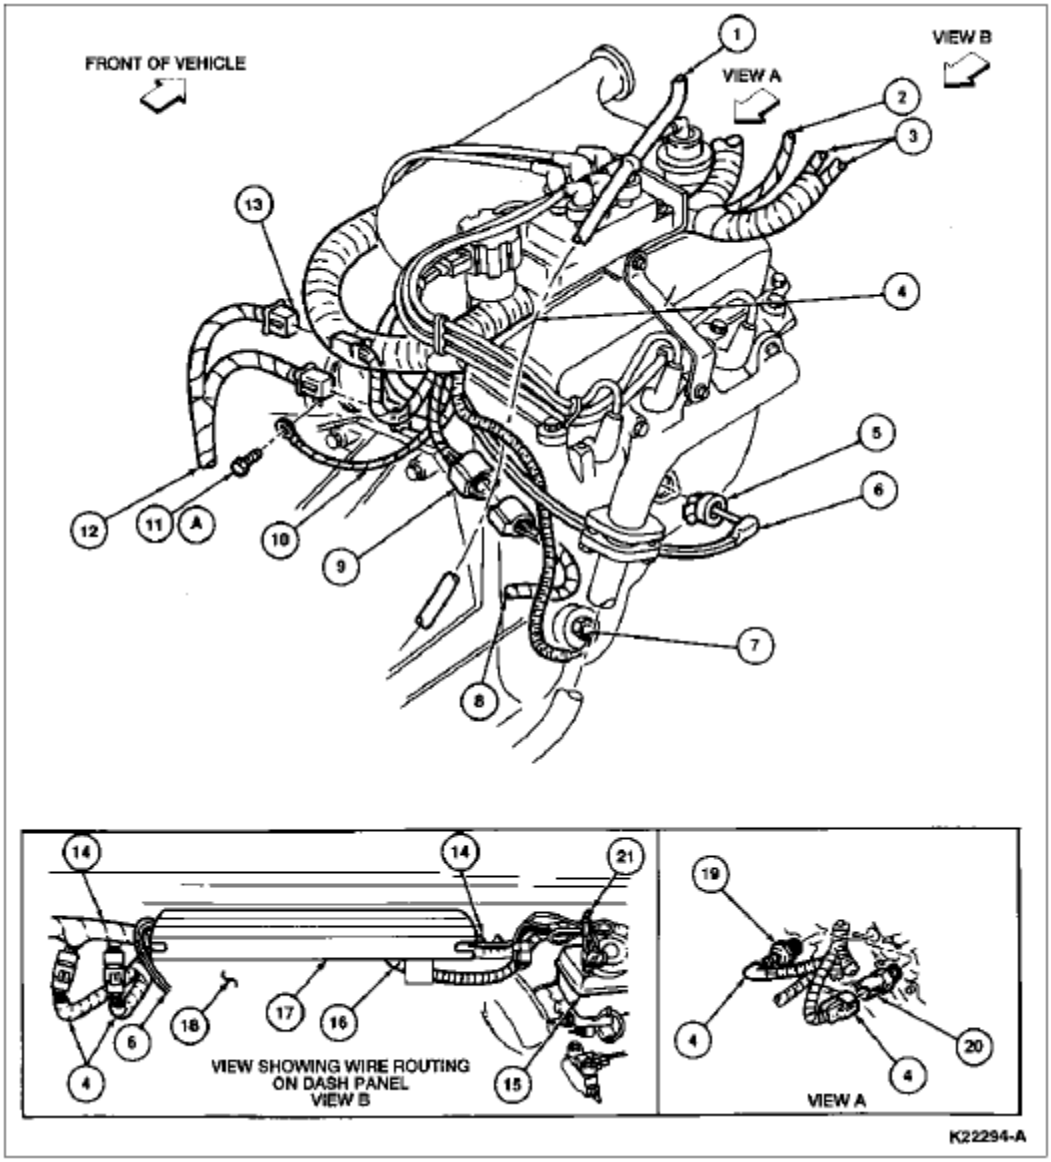
Item	Part Number	Description
1	9C392	Air Suspension Compressor Relay and Bracket
2	11450	Starter Motor Solenoid Relay Switch
3	N610957-S2	Screw
4	15A272	Daytime Running Lamps Control
5	N805375-S36	Bolt
6	12A581	Engine Control Sensor Wiring
7	—	To Center Air Bag Sensor (Part of 12A581)
8	—	Center Air Bag Sensor Connector (Part of 12A581)
9	10732	Battery Tray
10	—	To Daytime Running Lamp Control (Part of 12A581)
11	N610958-S36	Screw
12	381561-S39	Nut and Washer (4.0L Only)
13	381561-S39	Nut and Washer
A	—	Tighten to 2.5-3.0 Nm (22-26 Lb-In)
B	—	Tighten to 5-6 Nm (45-53 Lb-In)
C	—	Tighten to 5-10 Nm (45-88 Lb-In)
D	—	Tighten to 7-9 Nm (62-80 Lb-In)

Engine Wiring, 4.0L V-6 Engine — Aerostar



Item	Part Number	Description
1	9D930	Fuel Charging Wiring
2	9F472	Heated Oxygen Sensor (HO2S)
3	12A690	Engine Control Sensor Extension Wiring
4	12A648	Engine Coolant Temperature Sensor
5	10884	Water Temperature Indicator Sender Unit
6	9278	Oil Pressure Sensor
7	9B339	Oil Pressure Sender Fitting
A	—	Tighten to 11-24 Nm (9-18 Lb-Ft)
B	—	Tighten to 11-16 Nm (9-12 Lb-Ft)

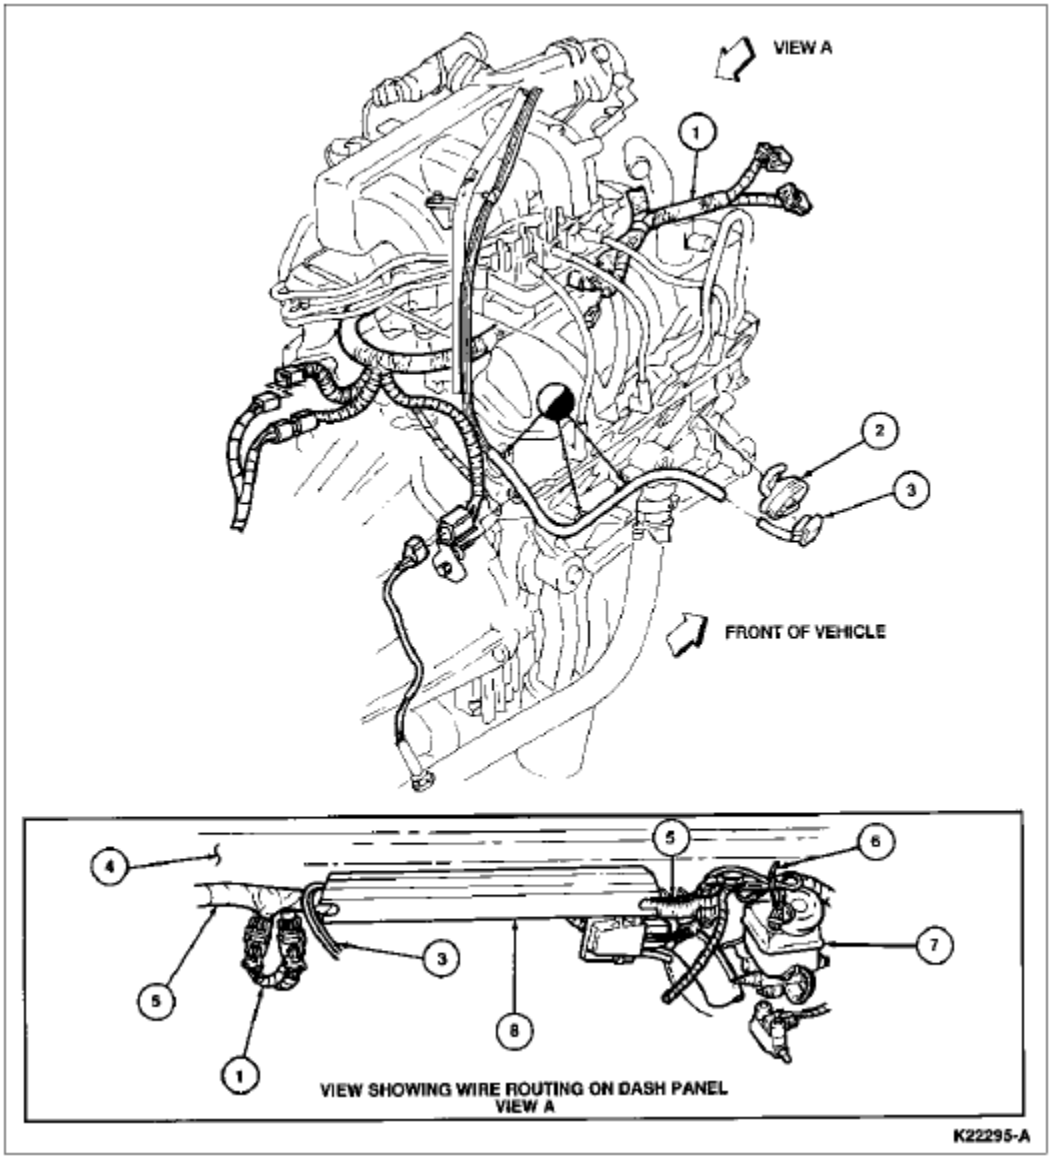
Engine Wiring, Right, 3.0L V-6 Engine — Aerostar



Item	Part Number	Description
1	—	Transmission Fill Tube
2	—	To ACT Wiring
3	—	To 12A581 Wiring Assembly
4	9D930	Fuel Charging Wiring
5	6A051	Block Heater
6	6B018	Block Heater Wiring
7	6C624	Low Oil Level Sensor
8	—	Wiring to Heated Oxygen Sensor (HO2S)
9	—	To Engine Temperature Control (Part of 9D930)
10	—	RH Ground Wire
11	N605798	Bolt

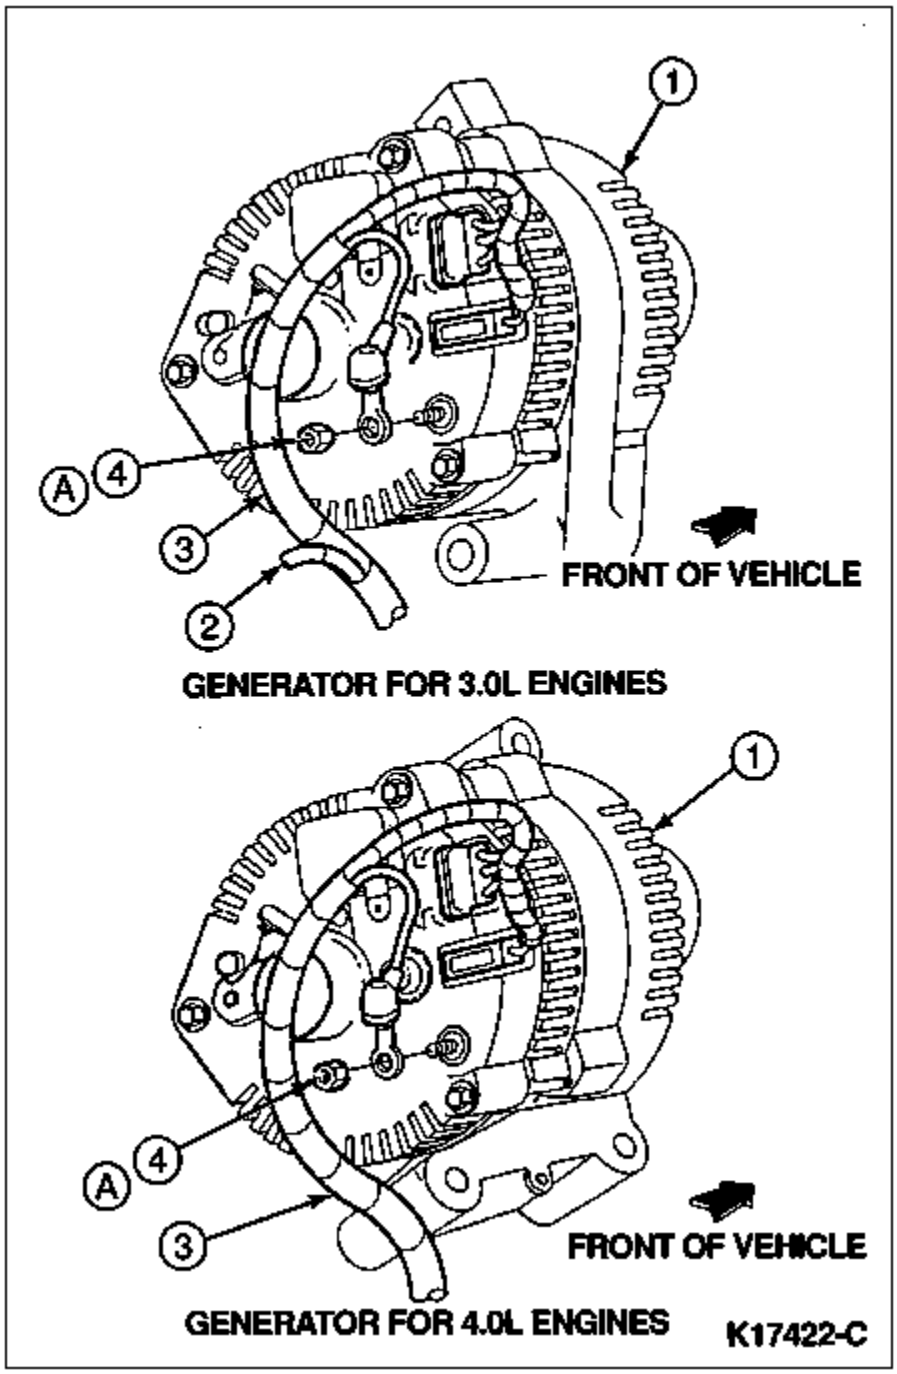
12	12A690	Engine Control Sensor Extension Wiring
13	9D930	Fuel Charging Wiring
14	12A581	Engine Control Sensor Wiring
15	2140	Brake Master Cylinder
16	—	To Windshield Wiper Motor (Part of 12A581)
17	14A163	Wiring Harness Retainer
18	01610	Dash Panel
19	10884	Water Temperature Indicator Sender Unit
20	12A648	Engine Coolant Temperature Sensor
21	13A506	Rear Lamp Wiring Retainer
A	—	Tighten to 11-13 Nm (8-10 Lb-Ft)

Engine Block Heater and Wiring, 4.0L V-6 Engine — Aerostar



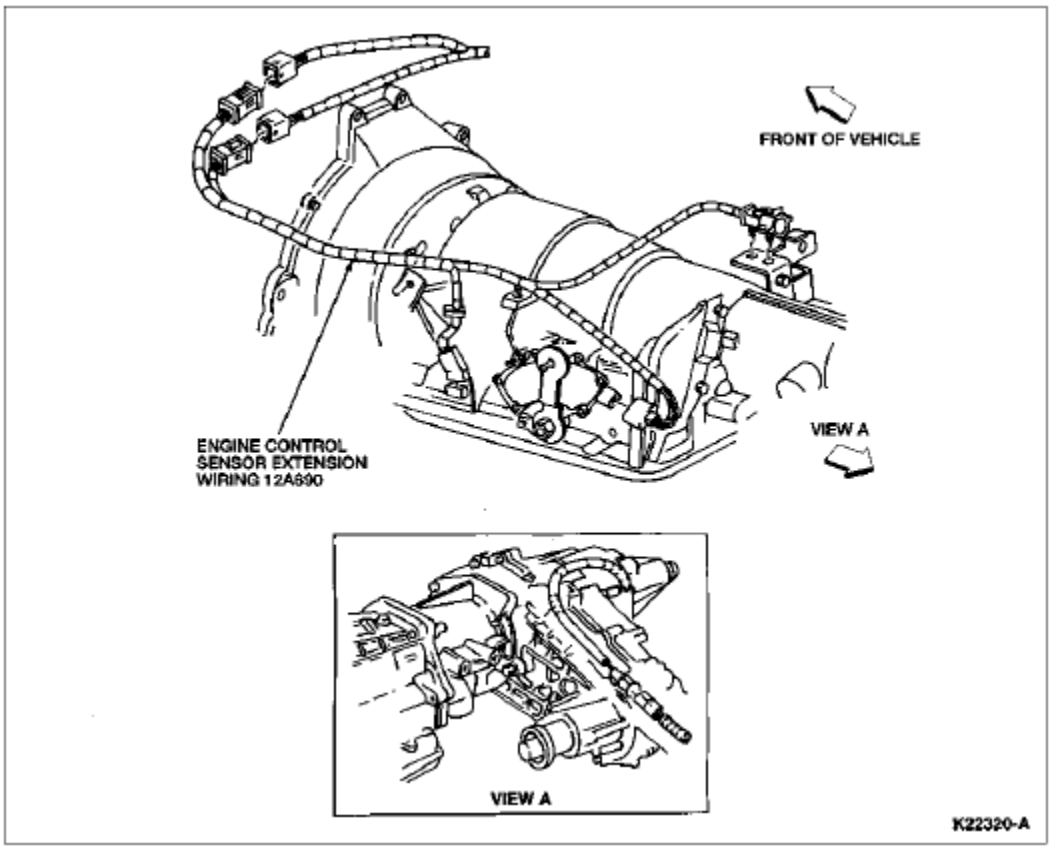
Item	Part Number	Description
1	9D930	Fuel Charging Wiring
2	6A051	Block Heater
3	6B018	Block Heater Wiring
4	01610	Dash Panel
5	12A581	Engine Control Sensor Wiring
6	13A506	Rear Lamp Wiring Retainer
7	2K478	Brake Master Cylinder Reservoir
8	14A163	Wiring Harness Retainer

Generator and Wiring, 3.0L and 4.0L Engines, Standard Production, Aerostar

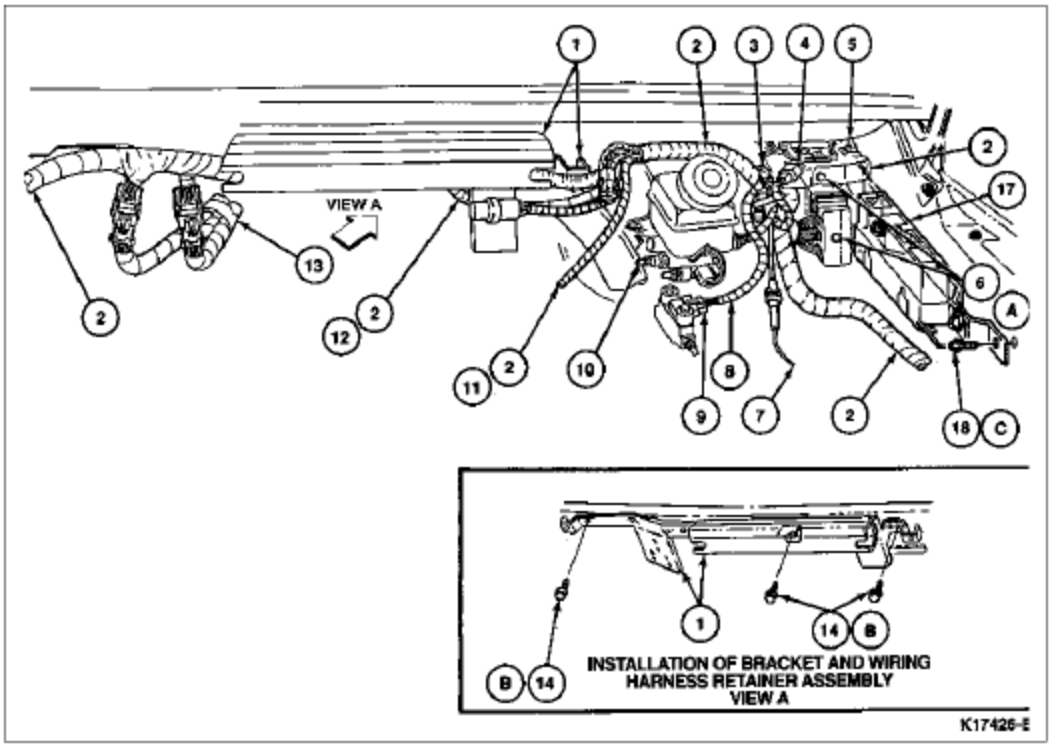


Item	Part Number	Description
1	10300	Generator
2	—	To A/C Clutch
3	14305	Generator Voltage Regulator Wiring
4	N805320-S36	Nut
A	—	Tighten to 5-6 Nm (40-57 Lb-In)

Automatic Transmission — Aerostar



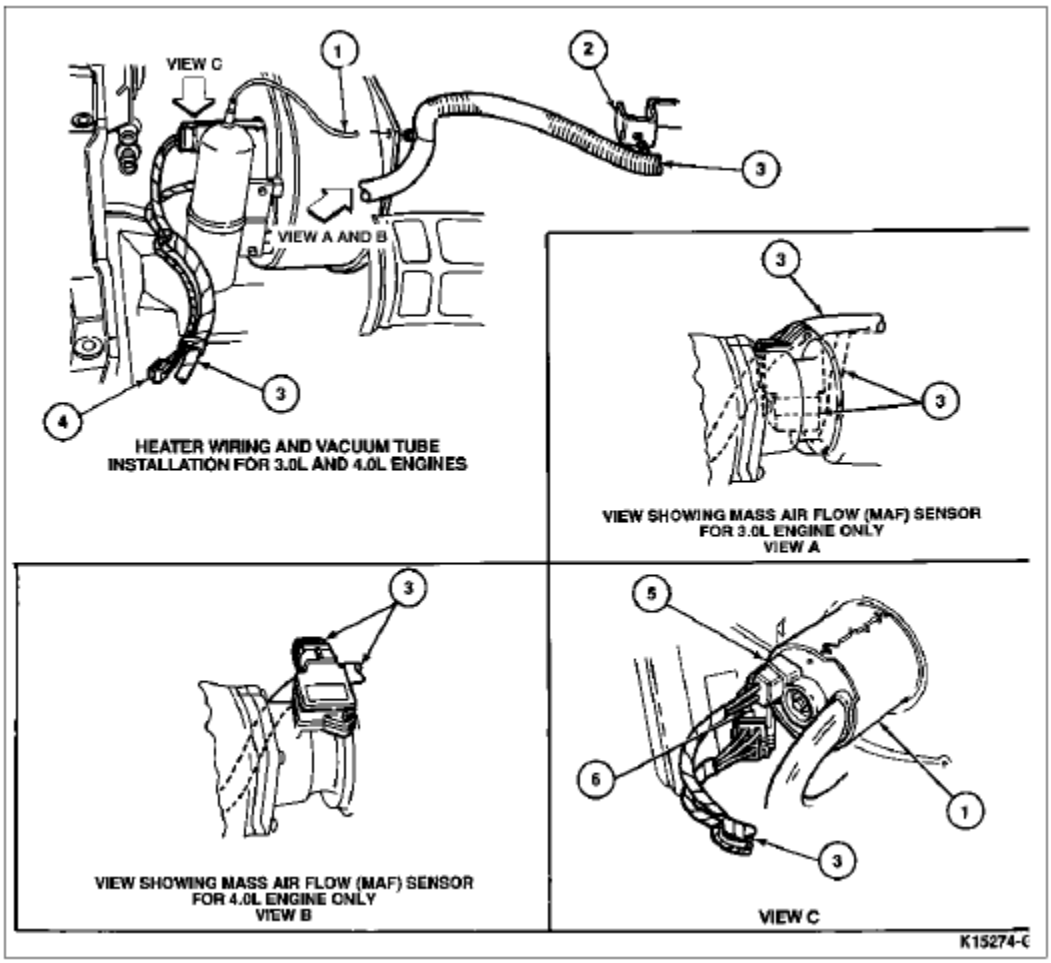
Dash Panel Wiring, Left, All Engines — Aerostar



Item	Part Number	Description
1	14A163	Wiring Harness Retainer
2	12A581	Engine Control Sensor Wiring
3	—	To 15K702 Wiring
4	—	To Octane Adjust (Part of 12A581) (4.0L Engine Only)
5	12A650	Powertrain Control Module
6	—	Screw (Part of 12A581)
7	—	To Battery Ground (Part of 12A581)
8	—	Wiring To Brake Valve Assembly (Part of 12A581)
9	—	Connector To Brake Valve Assembly (Part of 12A581)
10	2140	Dual Brake Master Cylinder
11	—	To A/C Compressor (Part of 12A581) (4.0L Engine Only)
12	—	To Windshield Wiper Motor (Part of 12A581)
13	9D930	Fuel Charging Wiring
14	N805375-S36	Screw
15	—	Relay and Bracket (Part of 12A581)
16	N610958-S36	Bolt

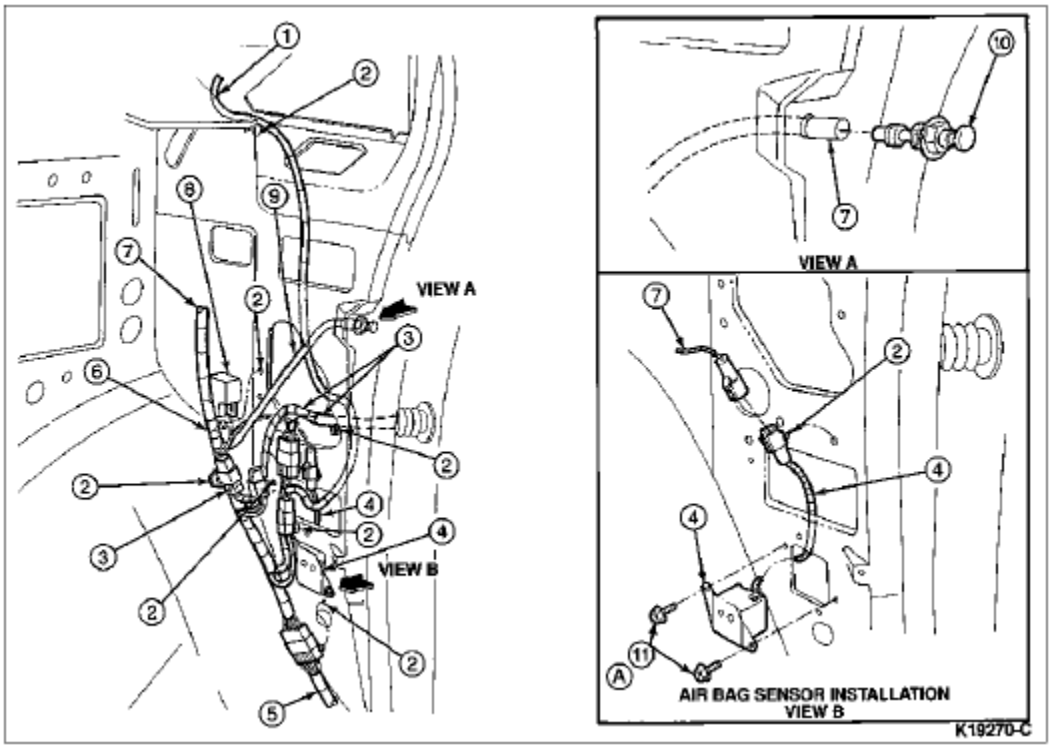
A	—	Tighten to 5.5-6.8 Nm (49-60 Lb-In)
B	—	Tighten to 7.5-10.5 Nm (66-93 Lb-In)
C	—	Tighten to 6.8-9.2 Nm (60-81 Lb-In)

Dash Panel Wiring, Right, 3.0L and 4.0L Engines — Aerostar



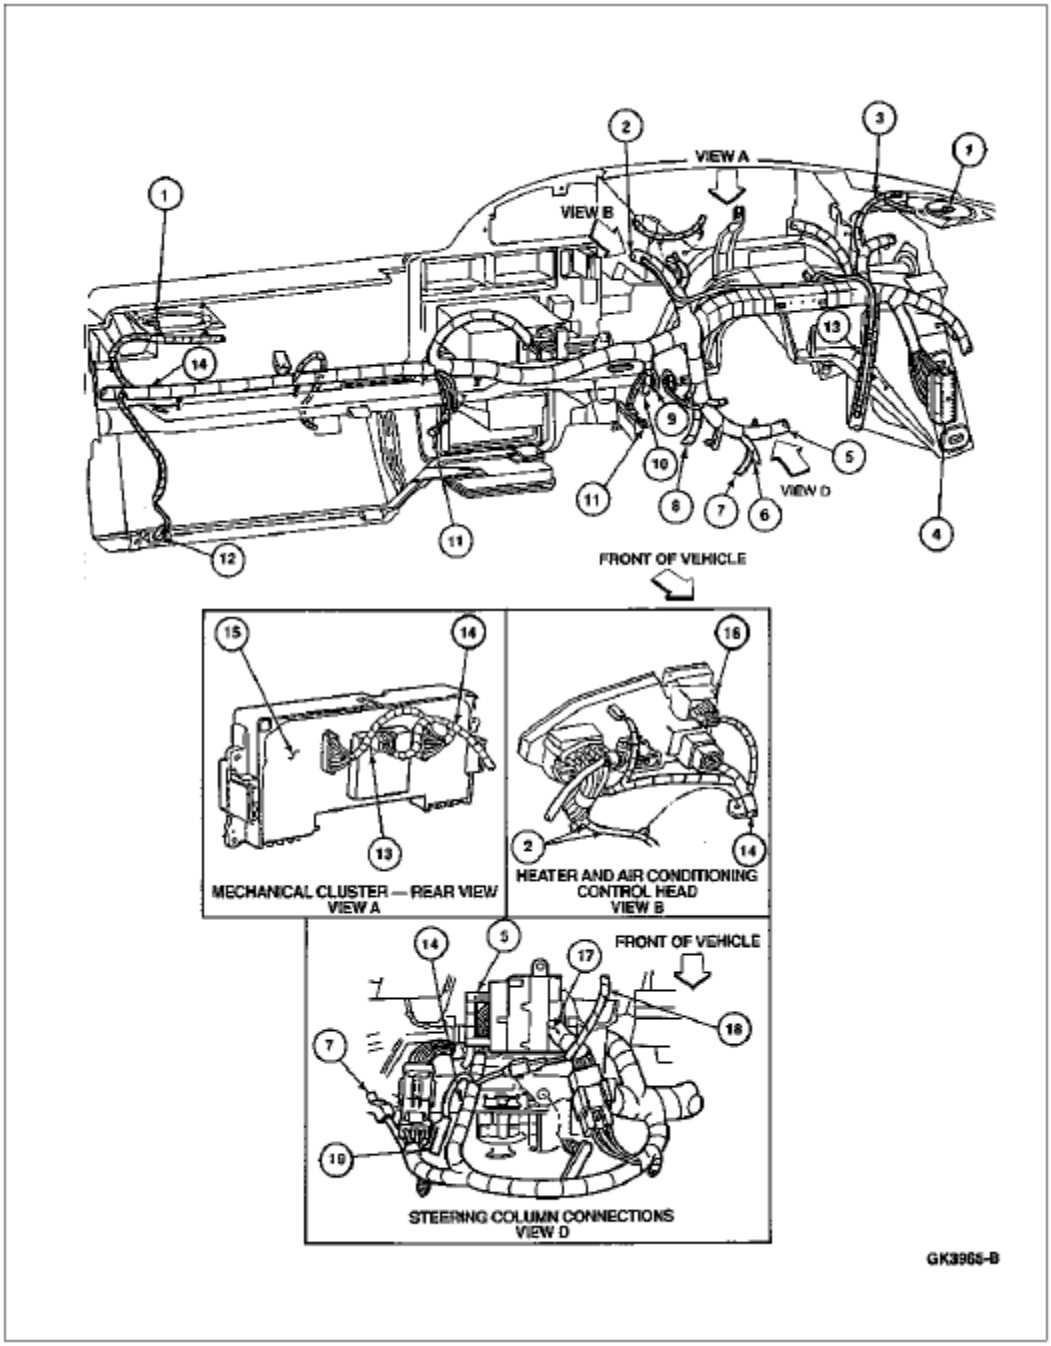
Item	Part Number	Description
1	18458	Heater Blower Case
2	14A163	Wiring Harness Retainer
3	12A581	Engine Control Sensor Wiring
4	—	To A/C Pressure Switch (Part of 12A581)
5	19805	A/C Blower Motor
6	19A706	A/C Blower Motor Resistor

Cowl Side, Right, Aerostar



Item	Part Number	Description
1	17C710	Vanity Lamp Wiring
2	—	Harness Retainer (Part of 17C710)
3	14630	Front Window Regulator Wiring
4	14B004	Air Bag Sensor
5	14014	Wiring to Power Locks
6	14401	Main Wiring
7	14401	Main Wiring
8	9341	Inertia Fuel Shutoff Switch
9	—	To Courtesy Lamp Switch (Part of 14401)
10	13713	Lamp Switch
11	N806327-S190	Screw (2 Req'd)
A	—	Tighten to 10-14 Nm (8-10 Lb-Ft)

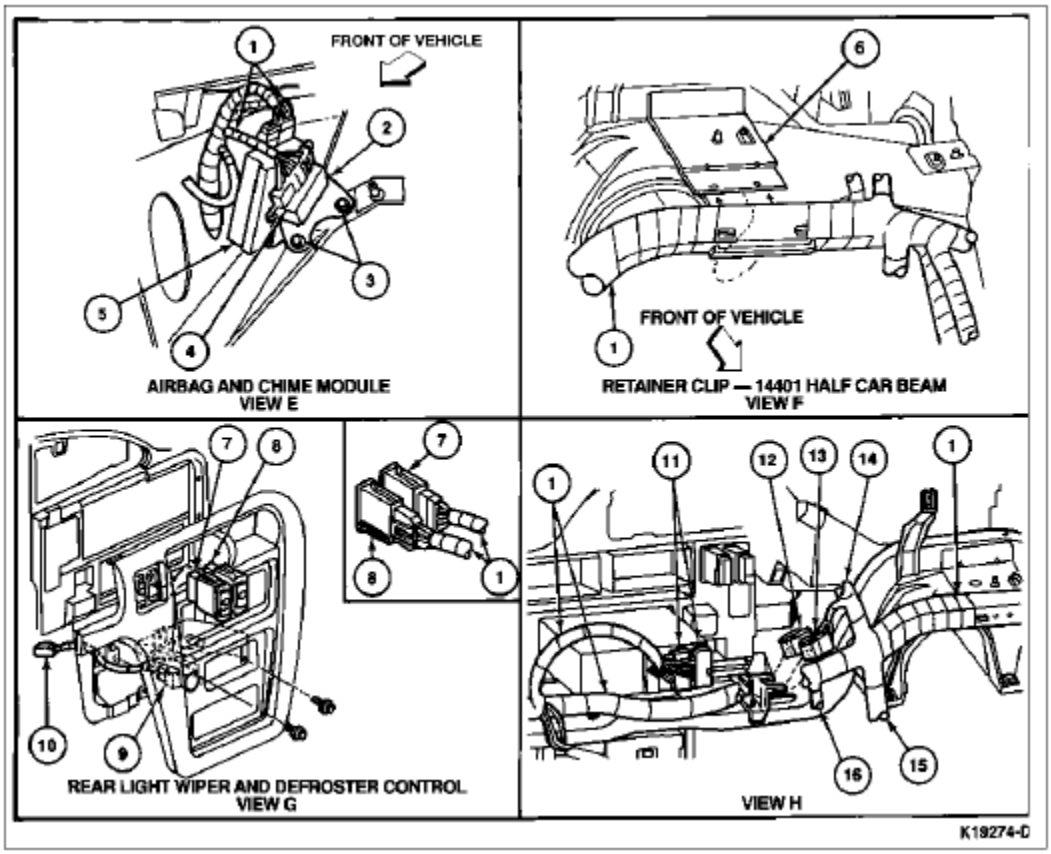
Instrument Panel Wiring, Mechanical Cluster — Aerostar



Item	Part Number	Description
1	18808	Radio Speaker
2	19D699	Vacuum Hose Harness Assembly
3	11654	Headlamp Switch
4	—	To 12A581 Wiring
5	—	To Ignition Switch
6	—	Wiring
7	13480	Stoplamp Switch

8	—	To Wiper Control Module
9	—	To 14K006 Wiring
10	—	To Rear Anti-Lock Brake Module and Bracket
11	N801846-S36MG (2 Req'd)	Screw
12	13776	Interior Lamp
13	—	To Speed Control Amplifier
14	14401	Main Wiring
15	10849	Instrument Cluster
16	18578	Heater Blower Motor Switch
17	9C899	Horn Wiring
18	14A664	Air Bag Sliding Contact
19	—	Brake Shift Interlock

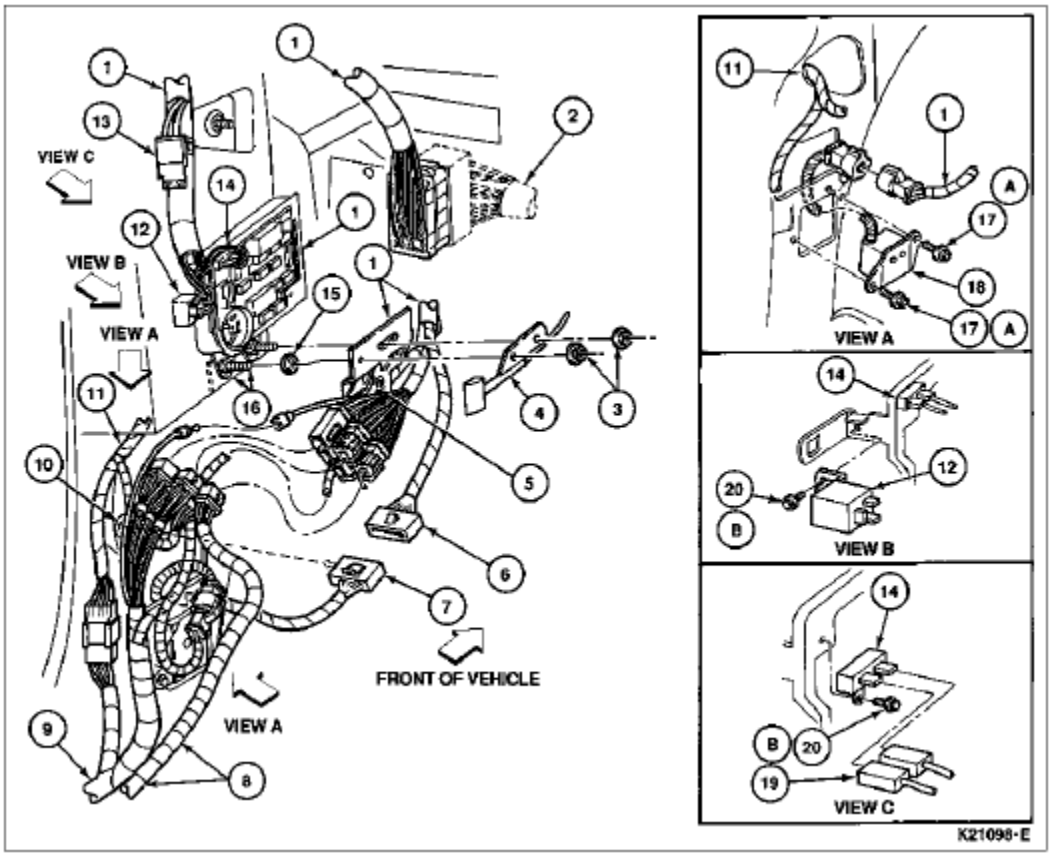
Instrument Panel Wiring Mechanical Cluster Standard and A/C — Except for Deluxe — Aerostar



Item	Part Number	Description

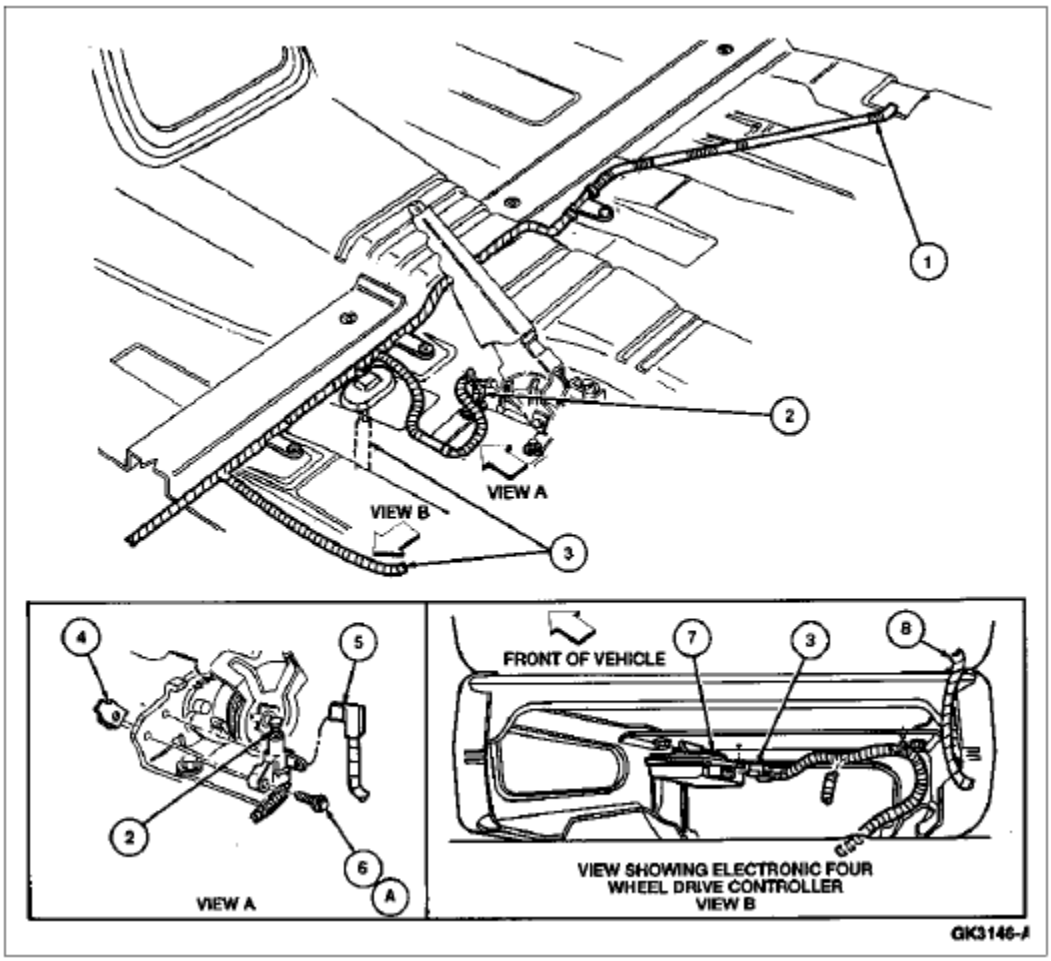
1	14401	Main Wiring
2	14B058	Air Bag Monitor Bracket
3	N806339-S2	Screw
4	10D840	Safety Belt Warning Chime
5	14B056	Air Bag Diagnostic Monitor
6	—	Attachment of 14A194 Shield to Instrument Panel
7	—	Liftgate Wiper/Washer Switch
8	18C621	Heater Blower Motor Switch
9	14K006	Cigar Lighter Wire
10	—	To 14401 Wiring Assembly
11	—	To Radio
12	14B193	To Door Ajar Relay
13	—	To Horn Relay
14	—	To A/C Controls
15	—	To Ignition Switch
16	—	To RABS Module and Bracket Assembly

Cowl Side, Left — Aerostar



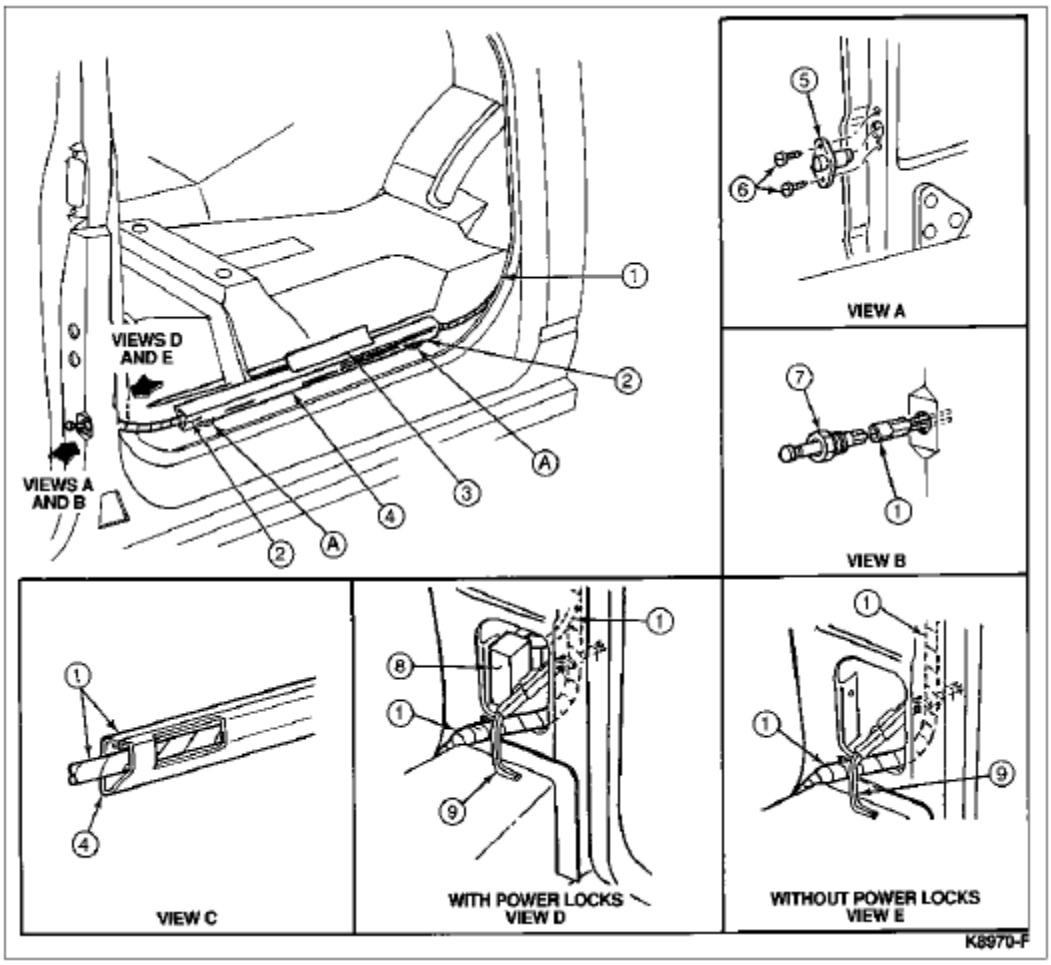
Item	Part Number	Description
1	14401	Main Wiring
2	12A581	Engine Control Sensor Wiring
3	N620481-S2 (2 Req'd)	Nut
4	16700	Hood Latch Handle/Bracket Assembly
5	19C829	Auxiliary A/C Vacuum Hose
6	—	Connector to Fuel Tank Sender Jumper Wiring (Part of 14401)
7	14407	Fuel Tank Sender Jumper Wiring
8	14405	Rear Lamp Wiring
9	14631	Front Window Regulator Wiring
10	—	Bracket (Part of 14405)
11	14631	Front Window Regulator Wiring
12	13350	Turn Signal Flasher
13	—	Power Door Lock In-Line Fuse (Part of 14401)
14	14526	Liftgate Wiper Circuit Breaker
15	W623483-S100	Pal Nut
16	—	Stud Bracket (Part of 04320)
17	N806327-S190 (2 Req'd)	Screw
18	14B005	Front Air Bag Sensor and Bracket
19	—	To Liftgate Wiper Motor Circuit Breaker
20	56928-S36	Screw
A	—	Tighten to 11-13 Nm (8-10 Lb-Ft)
B	—	Tighten to 1.1-1.5 Nm (9.7-13.3 Lb-In)

Parking Brake Warning Lamp and Optional Premium Bucket Seat Wiring, and Optional All-Wheel Drive Controller and Wiring, Aerostar



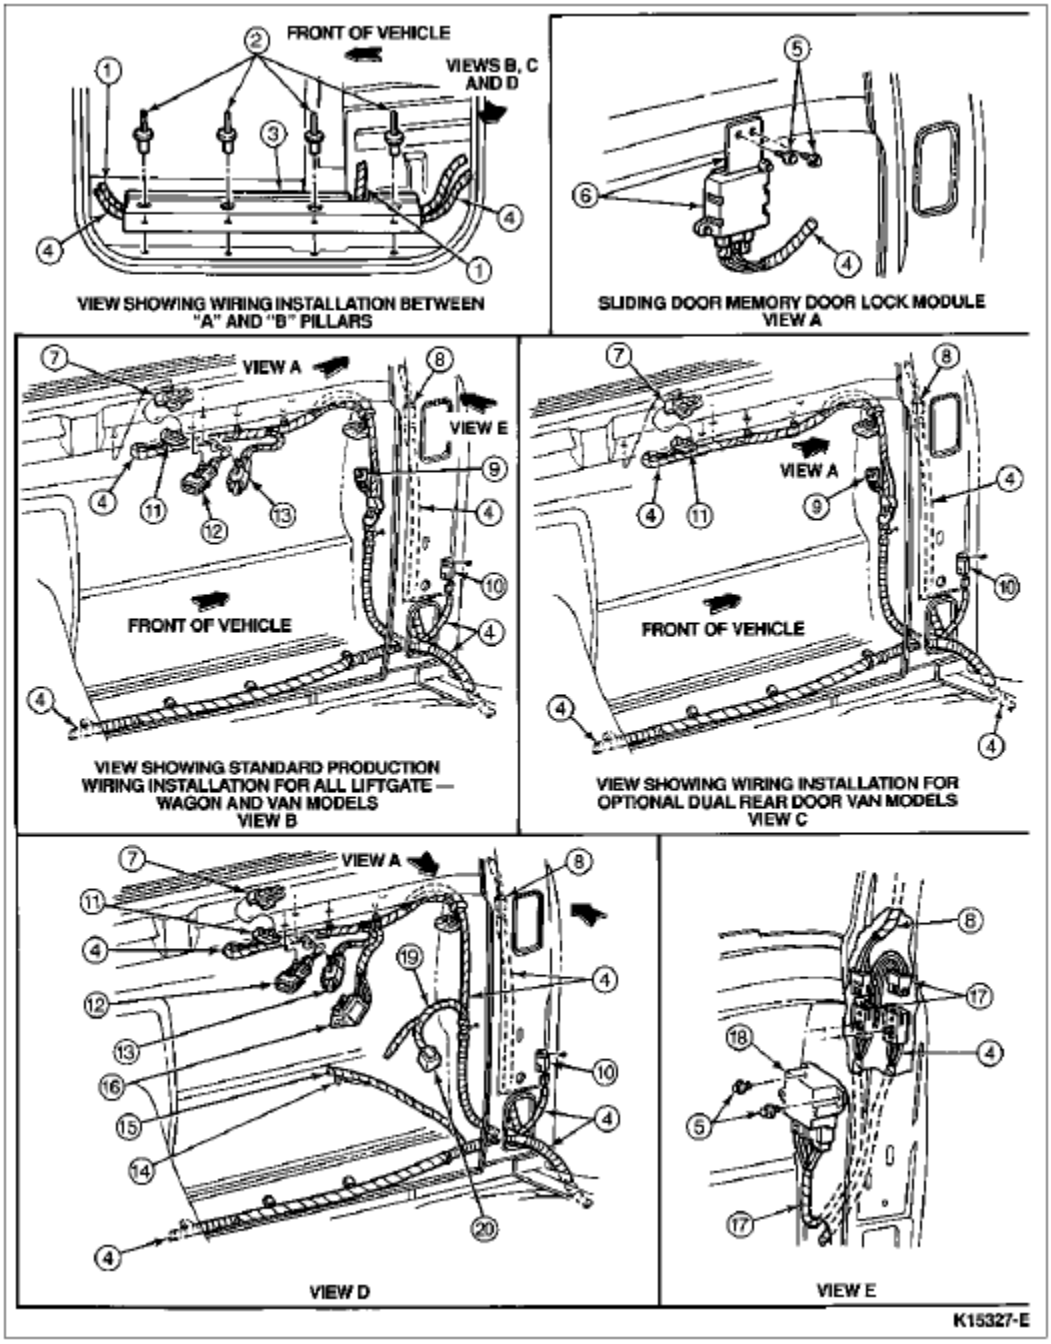
Item	Part Number	Description
1	14407	Wiring Assembly, Standard Production
2	15A851	Parking Brake Signal Switch and Bracket
3	—	Wiring Assembly, To All-Wheel Drive
4	N804081-S36M	Nut
5	—	Wiring Assembly Connector to Parking Brake Signal Switch
6	N611041-S36	Screw
7	7A377	All-Wheel Drive Transfer Case Controller Assembly
8	—	To Seat Belt Buckle Switch
A	—	Tighten to 1.4-2.2 Nm (12.4-19.5 Lb-In)

Floorpan Wiring and Sliding Door Courtesy Lamp Switch Wiring, Right, Aerostar



Item	Part Number	Description
1	14014	Door Lock Wiring
2	—	Drain Hole Plug (Part of 14405)
3	ESB-M3G58-A	Tape (2 In. x 4 In. Long)
4	—	Shield (Part of 14014)
5	13A786	Courtesy Lamp Switch Actuator
6	381801-S55	Screw
7	13713	Lamp Switch
8	14677	Relay
9	—	To Interior Lamp 13776
A	—	Cutouts in Shield Must Clear Drain Hole Plugs

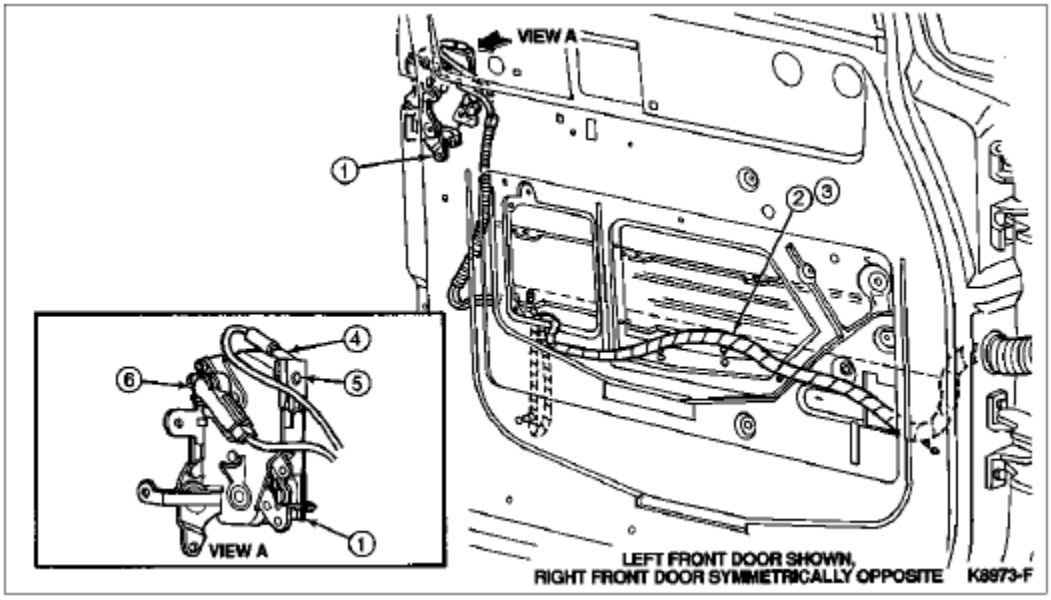
Floorpan Wiring, LH Side — Aerostar



Item	Part Number	Description
1	14407	Fuel Tank Sender Jumper Wiring
2	N803739-S	Rivet
3	14A099	Wiring Shield
4	14405	Rear Lamp Wiring
5	54928-S2	Screw
6	—	Door Lock Control Module

7	18A900	Radio Receiver Rear Seat Speaker Wiring
8	14334	Interior Lamp Wiring
9	—	To Stereo Speaker (Part of 14405)
10	—	Lamp Switch
11	—	To Remote Radio Headphone Box (Part of 14405)
12	—	To Rear Control Lighting (Part of 14405)
13	—	To Cigar Lighter (Part of 14405)
14	—	To Refrigerant Valve Solenoid (Part of 14405)
15	14405	To Auxiliary Heater Blower Motor
16	—	To Auxiliary Blower Motor Switch (Part of 14405)
17	13B712	Courtesy Lamp Feed Wire
18	13C718	Illuminating Entry Actuator
19	—	To Auxiliary Blower Motor Resistor and Vacuum Tube (Part of 14405)
20	—	To Auxiliary A/C Relay (Part of 14405)

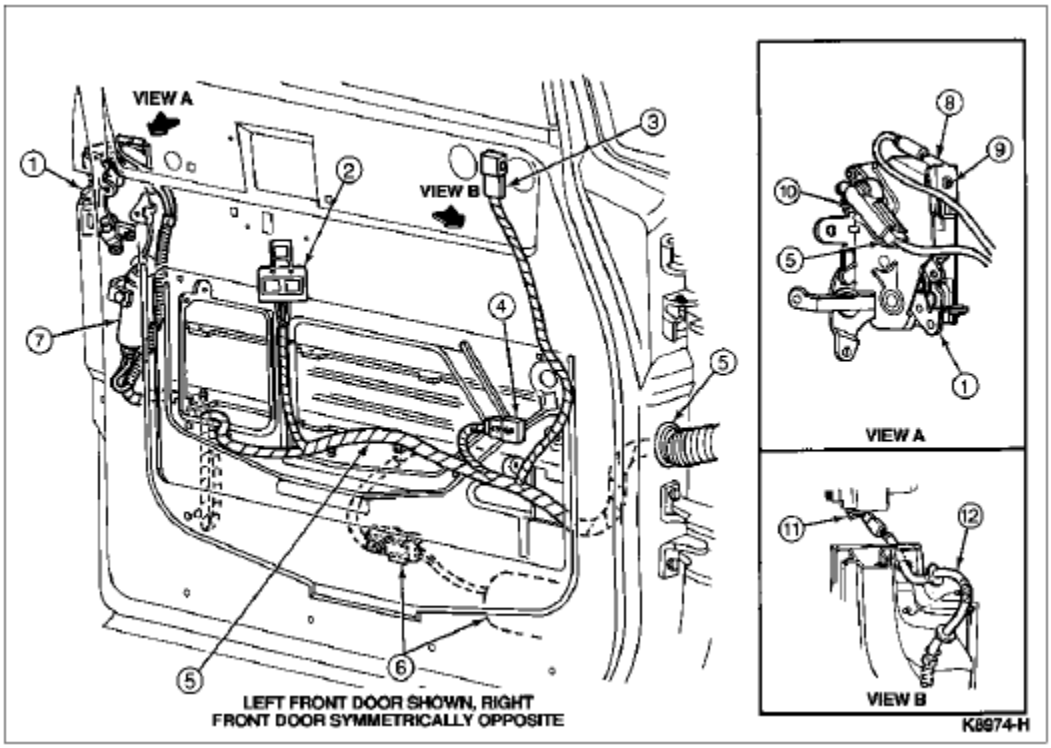
Door Wiring, Left, with Optional Light Group, Aerostar



Item	Part Number	Description
1	21812	Front Door Latch
2	14631	Front Window Regulator Wiring (LH Door)

3	14630	Front Window Regulator Wiring (RH Door)
4	13752	Interior Lamp Switch
5	55928-S36	Screw
6	14A018	Door Ajar Switch

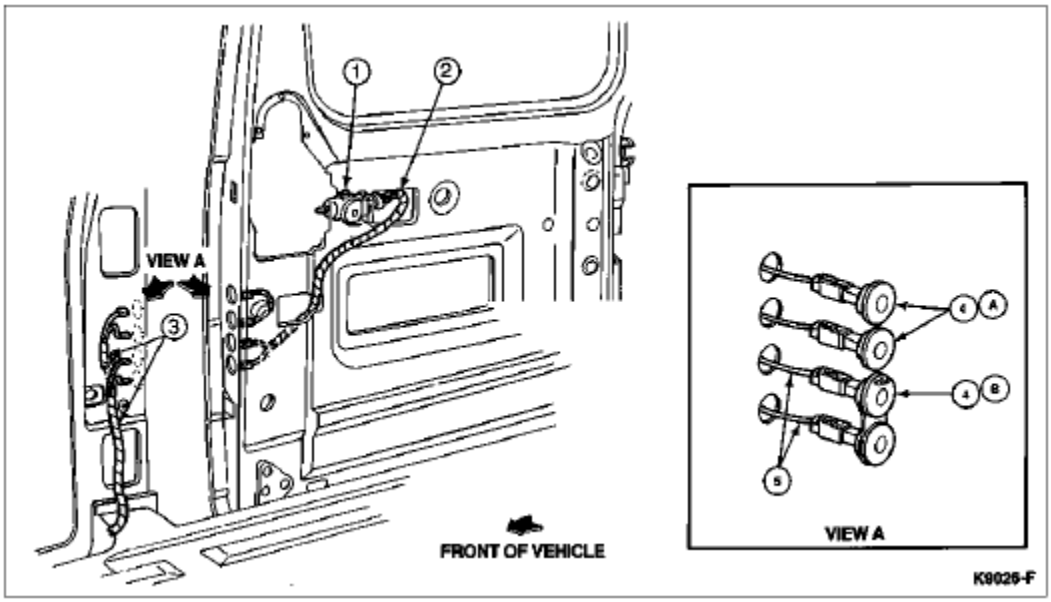
Door Wiring, Left, with Power Locks and Windows, Aerostar



Item	Part Number	Description
1	21812	Front Door Latch
2	—	To Window and Door Lock Control Switch (Part of 14631)
3	—	To Power Mirror Wiring
4	—	To Power Mirror Switch (Part of 14631)
5	14631	Front Window Regulator Wiring
6	23394	Window Regulator Electric Drive
7	218A42	Power Door Lock Actuator
8	13752	Interior Lamp Switch
9	55928-S36	Screw
10	14A018	Door Ajar Switch
11	17682	Outside Rear View Mirror

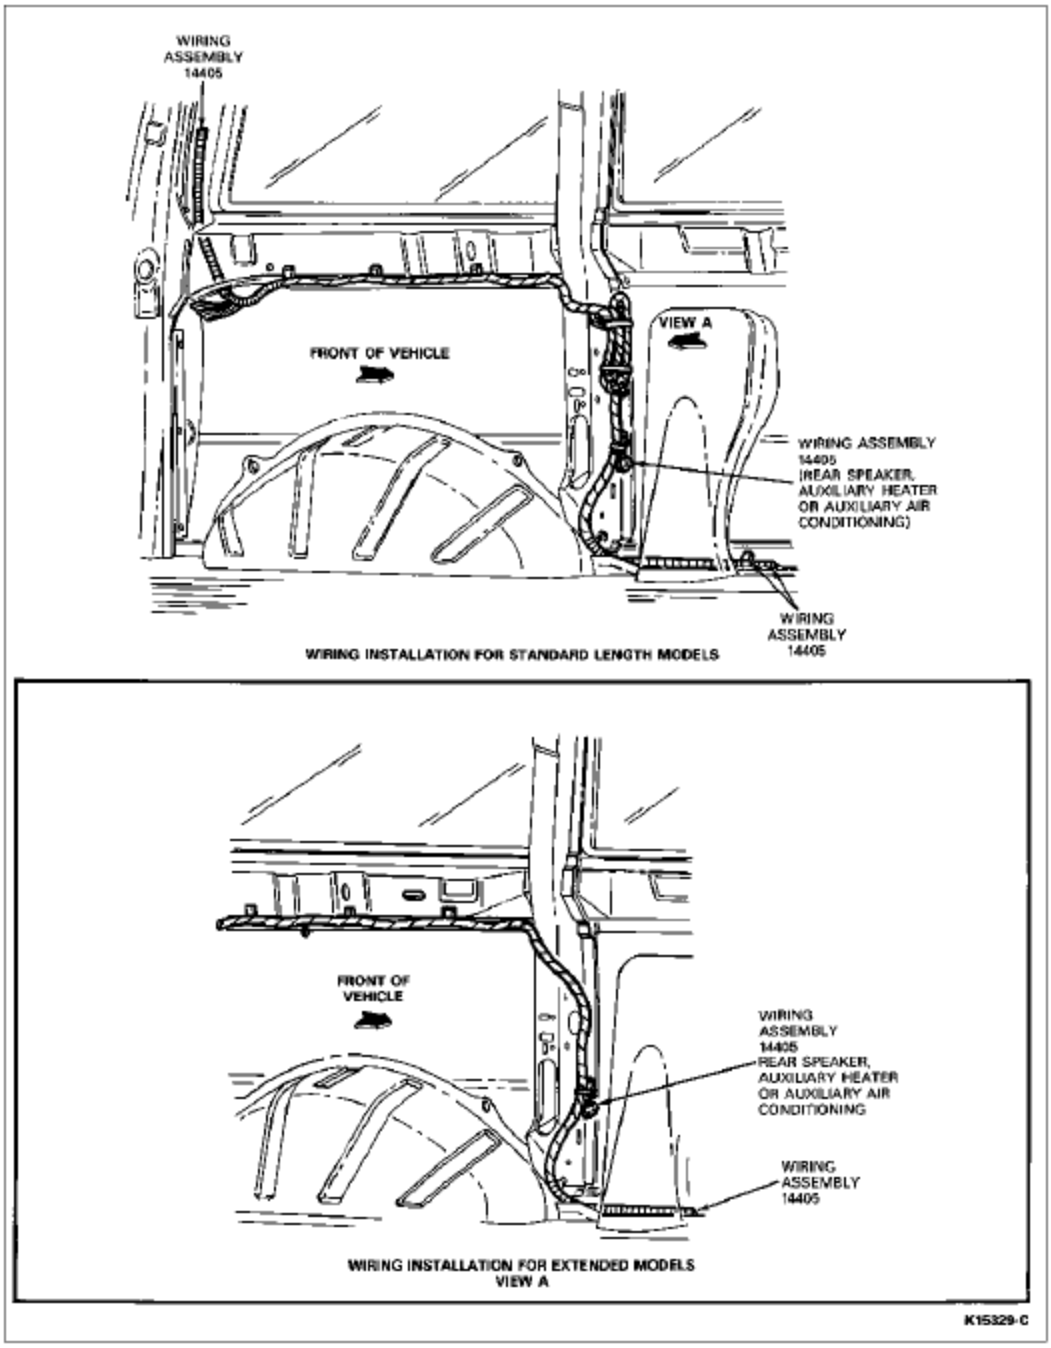
12	17D708	Power Mirror Wiring

Door Wiring, Sliding, with Power Locks — Aerostar

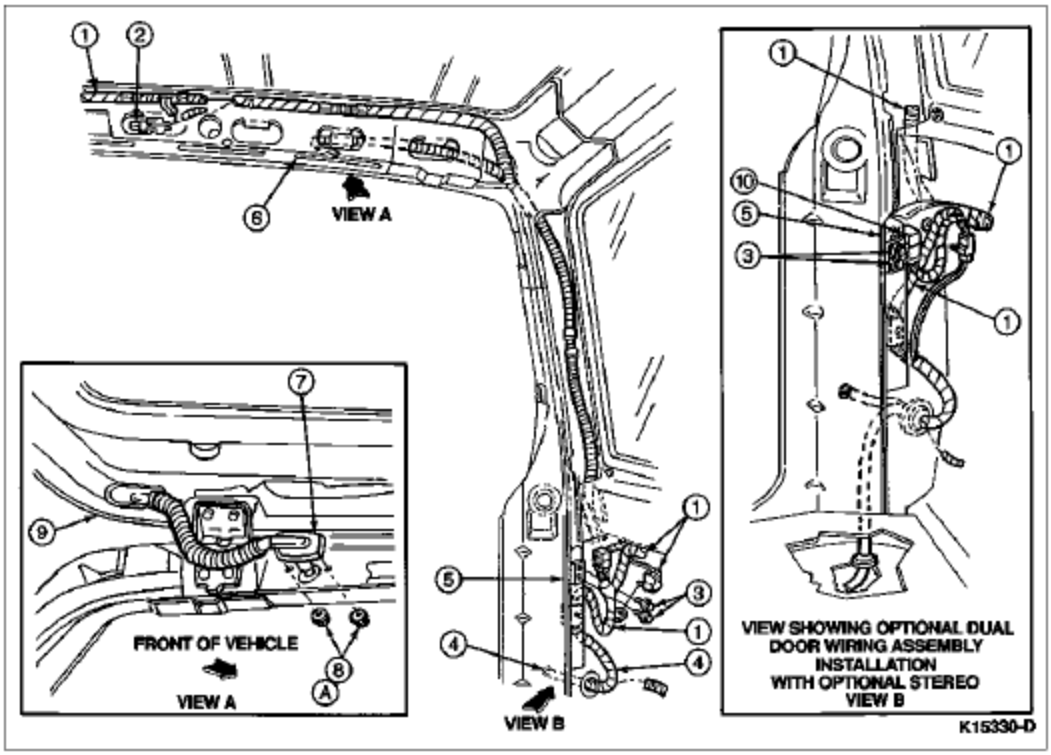


Item	Part Number	Description
1	58218A42	Power Door Lock Actuator
2	14790	Door Open Warning Lamp Wiring
3	14014	Door Lock Feed Wiring
4	14A658	Terminal Assembly Contact
5	—	To Power Door Locks
A	—	Door Ajar Switch Contacts
B	—	Power Door Lock Contacts

Wiring Between C- and D-Pillars, Left, Aerostar

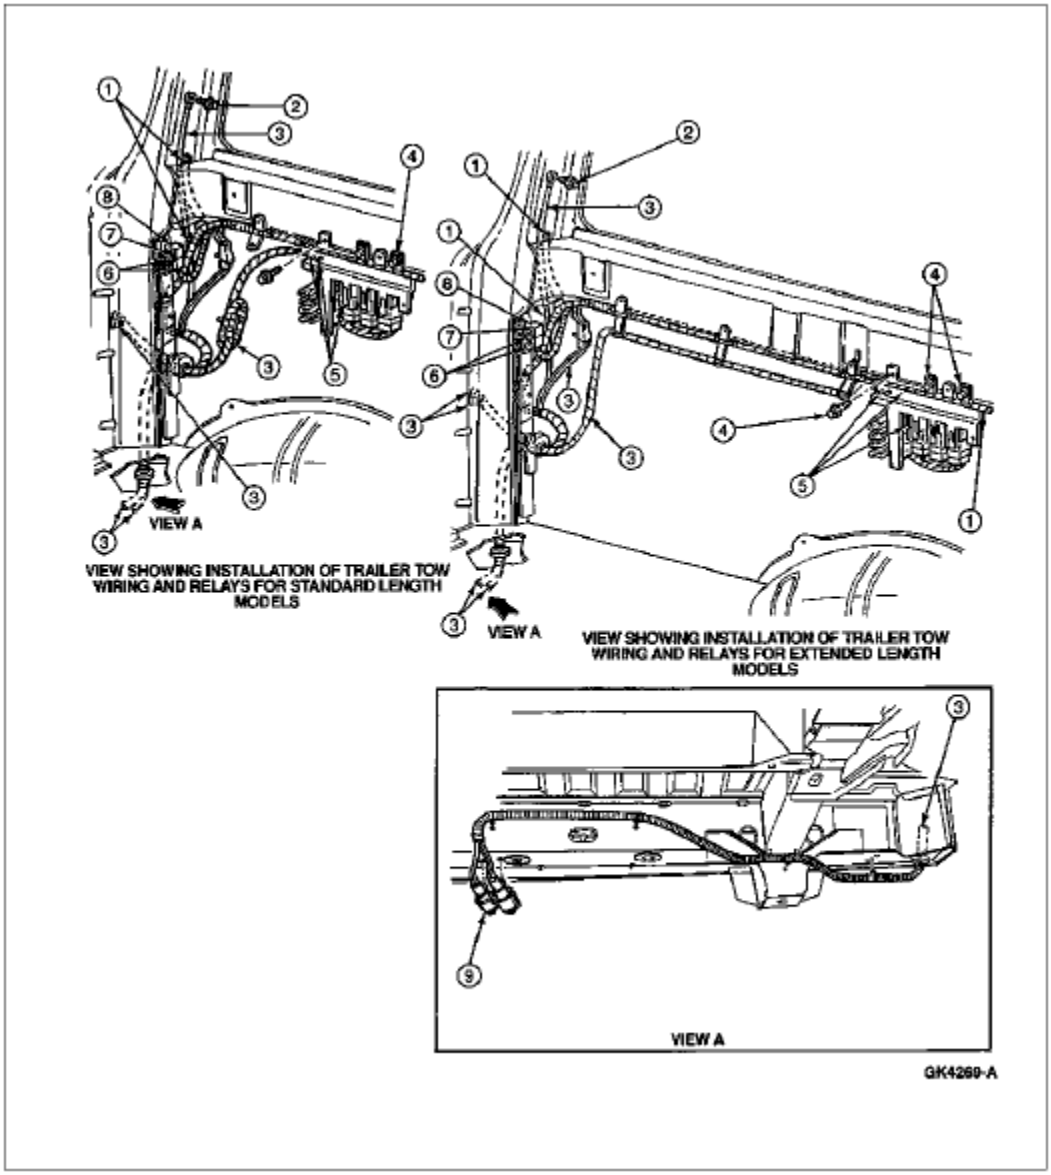


D-Pillar Wiring, Left — Aerostar



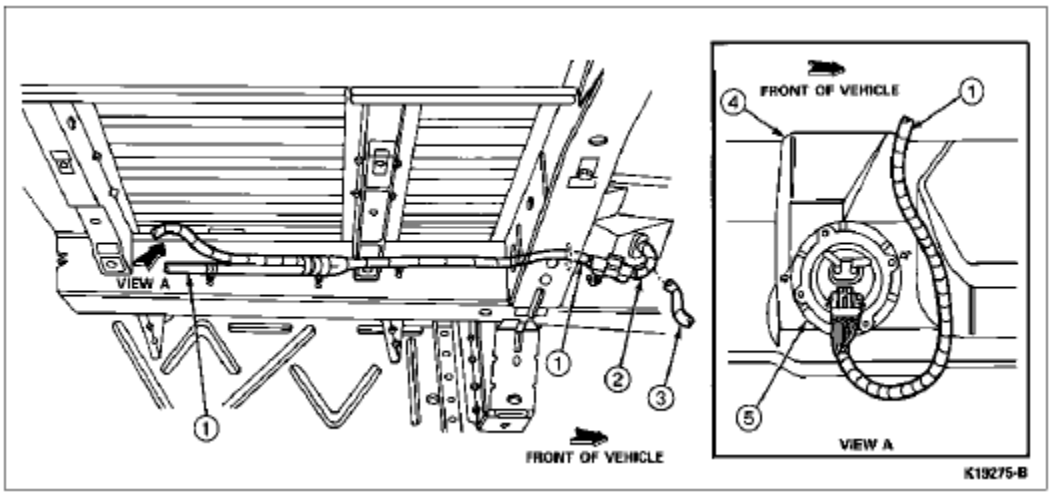
Item	Part Number	Description
1	14405	Rear Lamp Wiring
2	13788	Interior Lamp Door
3	N802761-S36	Screw
4	13A409	Rear Lamp Connector Wiring
5	14A206	Wire Connector Bracket
6	—	To Rear License Lamp Feed Wiring
7	13B440	Liftgate Jumper
8	N621901-S36	Nut
9	40010	Liftgate
10	13A775	Courtesy Lamp Relay
A	—	Tighten to 2-3 Nm (18-26 Lb-In)

Trailer Tow Wiring and Relay Installation — Aerostar



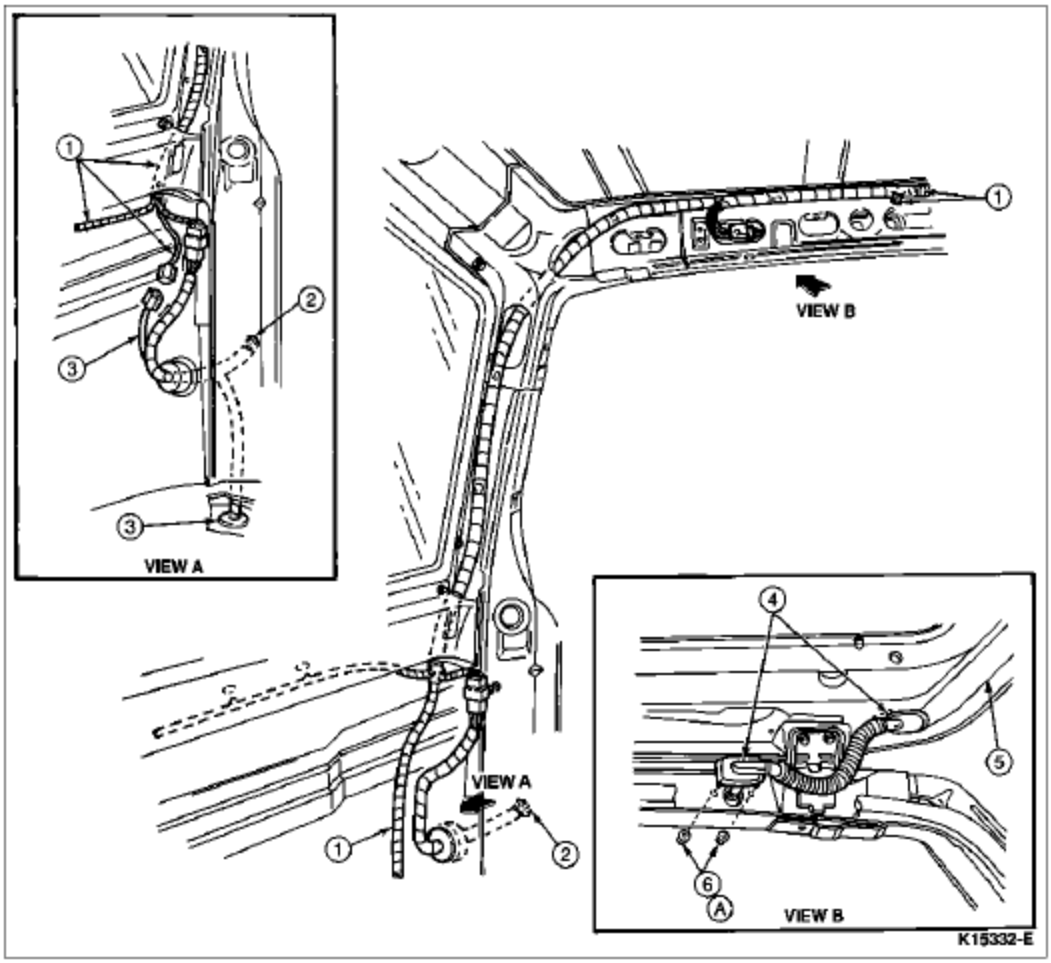
Item	Part Number	Description
1	14405	Rear Lamp Wiring
2	N801846-S36	Screw
3	13A409	Rear Lamp Connector Wiring
4	56902-S2	Screw
5	14677	Relay
6	N802761-S36	Screw
7	14A206	Wire Connector Bracket
8	13A775	Courtesy Lamp Relay
9	—	Trailer Tow Connectors (Part of 13A409)

Fuel Tank and Underbody Wiring, Aerostar



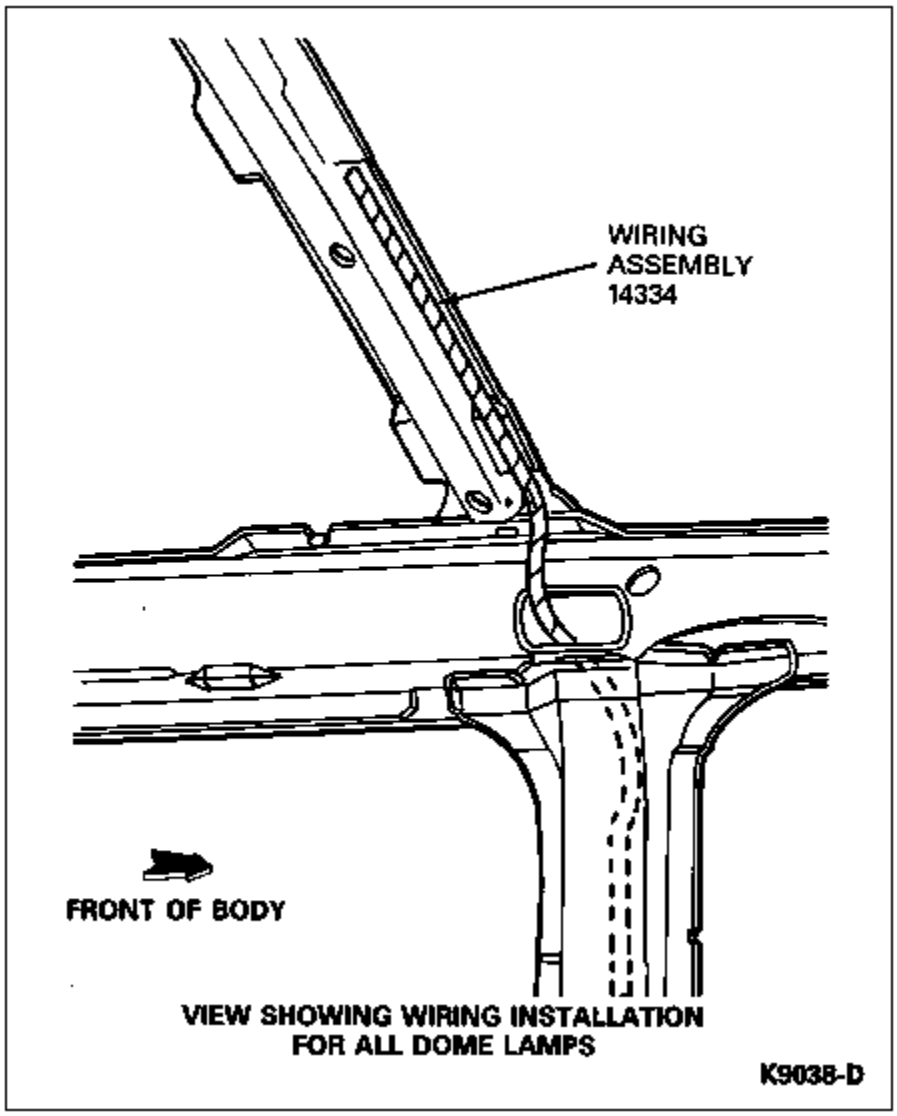
Item	Part Number	Description
1	14406	Fuel Tank Sender Wiring
2	14407	Fuel Tank Sender Jumper Wiring
3	14407	Fuel Tank Sender Jumper Wiring, for Optional All-Wheel Drive Vehicles Only
4	9002	Fuel Tank
5	9275	Fuel Tank Sending Unit

D-Pillar Wiring, RH — Aerostar

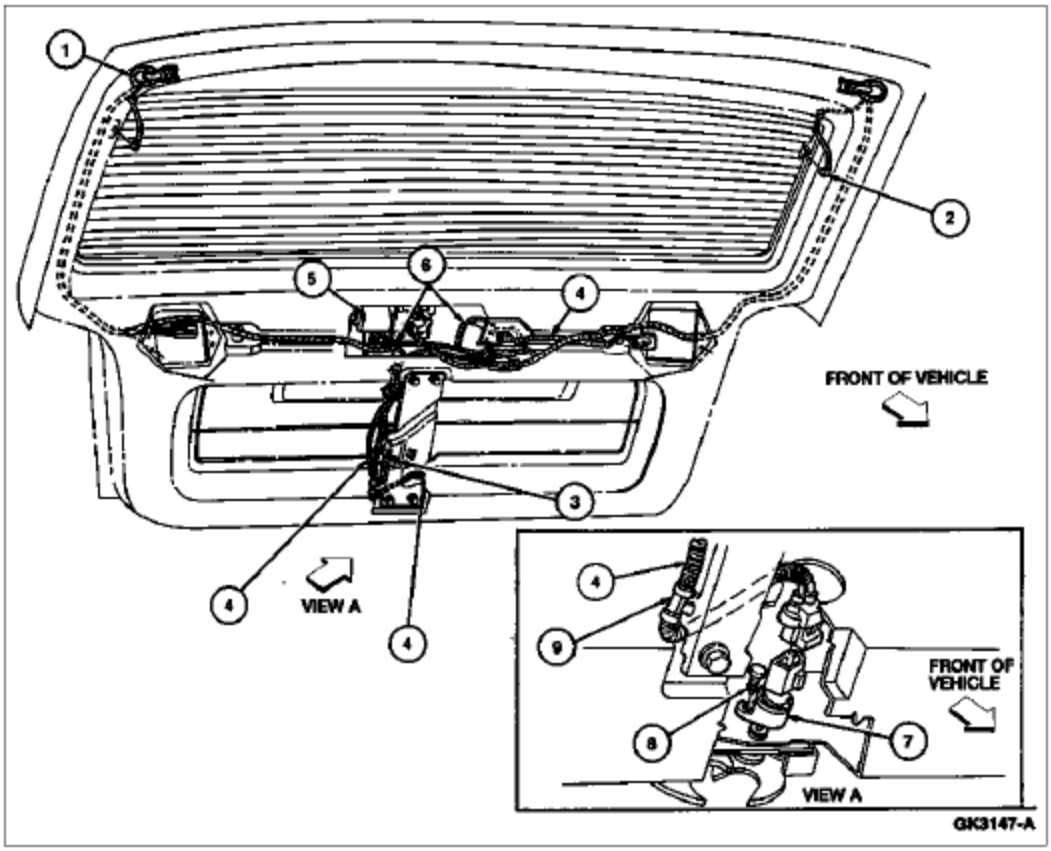


Item	Part Number	Description
1	14405	Rear Lamp Wiring to Optional Rear Washer Reservoir
2	—	To Rear Lamps (Part of 14405)
3	13A409	Rear Lamp Connector Wiring
4	—	Liftgate Wiring
5	40010	Liftgate
6	N621901-S36	Nut
A	—	Tighten to 2-3 Nm (18-26 Lb-In)

Dome Lamp, Aerostar

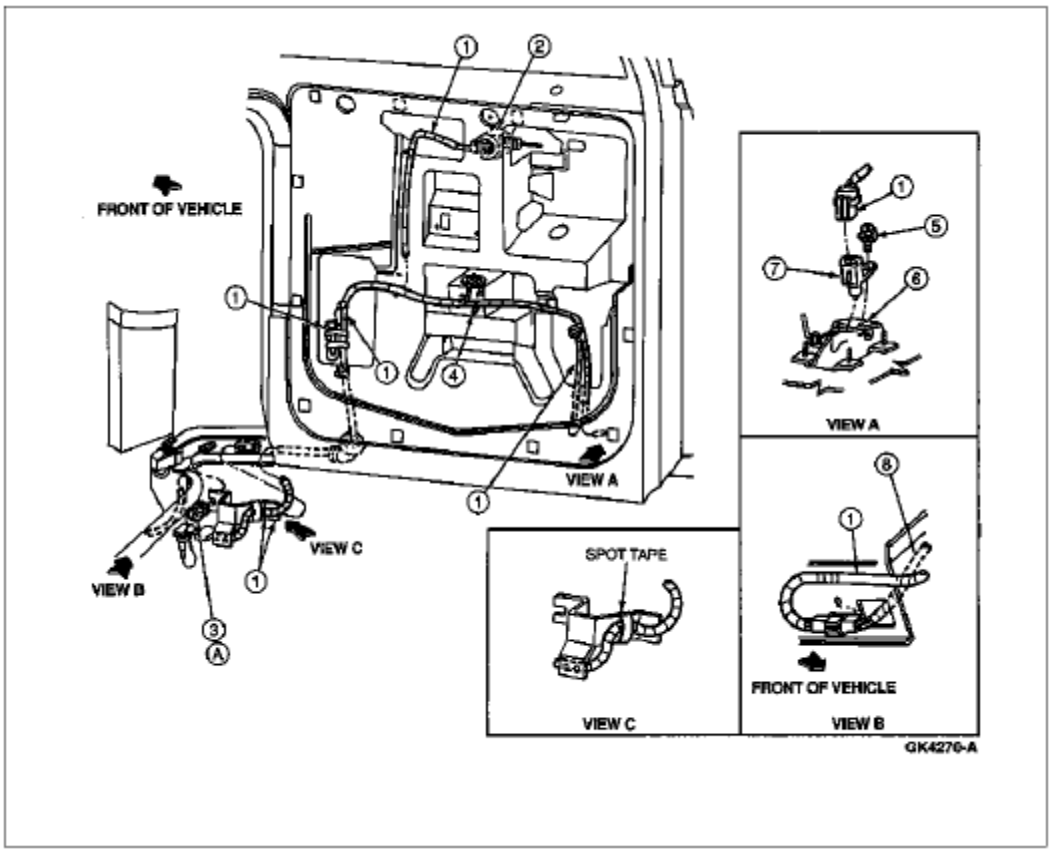


Liftgate — Aerostar



Item	Part Number	Description
1	13B440	Liftgate Jumper Wiring for Optional Power Door Locks/Windows — All Wagon Models and Included in RV Converter Deluxe Van
2	—	Heated Back Window Control Wiring (Part of 13B440)
3	431A38	Door Lock Actuator
4	13412	Rear License Lamp Wiring and Socket, for Optional Rear Window Wiper with or Without Door Ajar or Optional Rear Electric Defroster — All Models
5	—	Liftgate Wiper Motor
6	13410	Lamp Socket and Wiring, License Lamps
7	10C872	Door Ajar Switch
8	52780-S2	Screw
9	14A163	Wiring Harness Retainer

Rear Door Wiring, Right Side Dual Rear Doors, License Lamp Wiring, Aerostar



Item	Part Number	Description
1	14A412	Door Lock Lead Wire
2	218A42	Power Door Lock Actuator
3	N804456-S54	Nut
4	—	To License Lamp
5	52780-S2	Screw
6	43288	Rear Door Latch
7	10C872	Door Ajar Switch
8	13A409	Rear Door Wiring
A	—	Tighten to 5.0 Nm (44 Lb-In)

Wiring Harness, Ranger

The illustrations in this section show the complete wiring harness installation for Ranger vehicles. Refer to the illustrations for the harness being replaced while performing the following removal and installation procedures. Refer to the Electrical and Vacuum Troubleshooting Manual for overviews of wiring harnesses.

Removal

1. Disconnect battery to starter relay cable (14300).
2. **NOTE: Refer to Section 01-05A to remove any trim panels to gain access to the harness.**

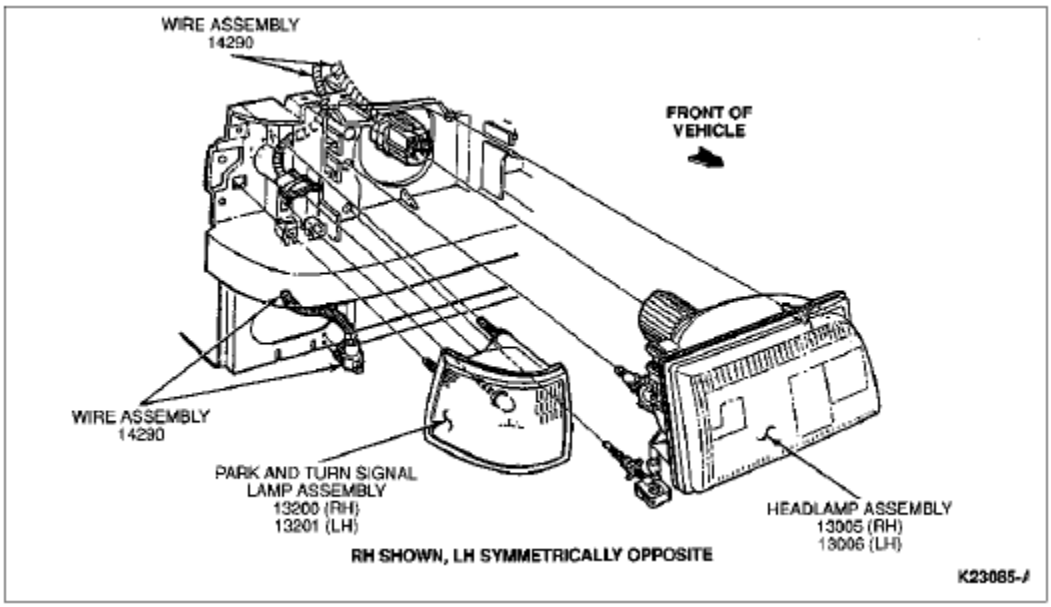
   Disconnect all wiring harness connectors.
3. Disengage harness from all locators, straps or clips as necessary, including ground wire eyelets. Remove harness from vehicle.

Installation

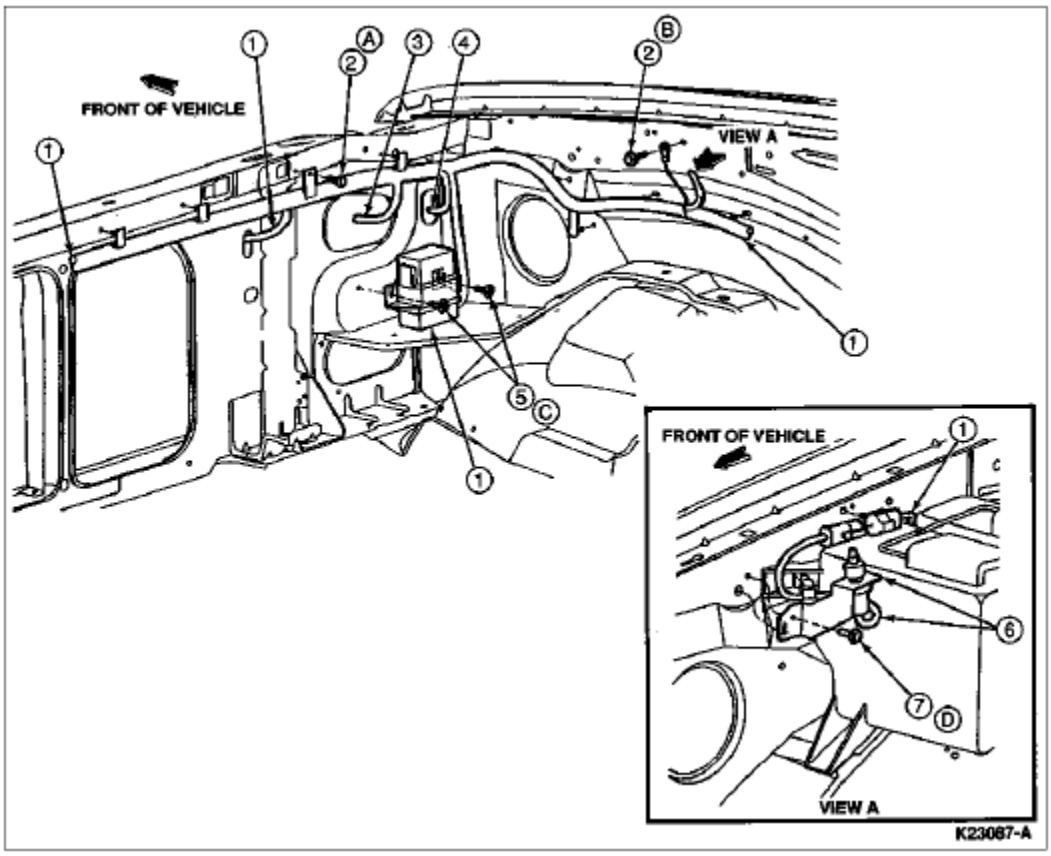
1. Position harness in vehicle. Make sure that harness is engaged in all locators, straps or clips.
2. Connect all harness connectors to components or other harnesses as necessary.
3. Secure ground eyelets to body as necessary.
4. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery to starter relay cable. Check all applicable circuits for proper operation.
5. Install any trim removed during harness removal.

Headlamp and Wiring, Ranger



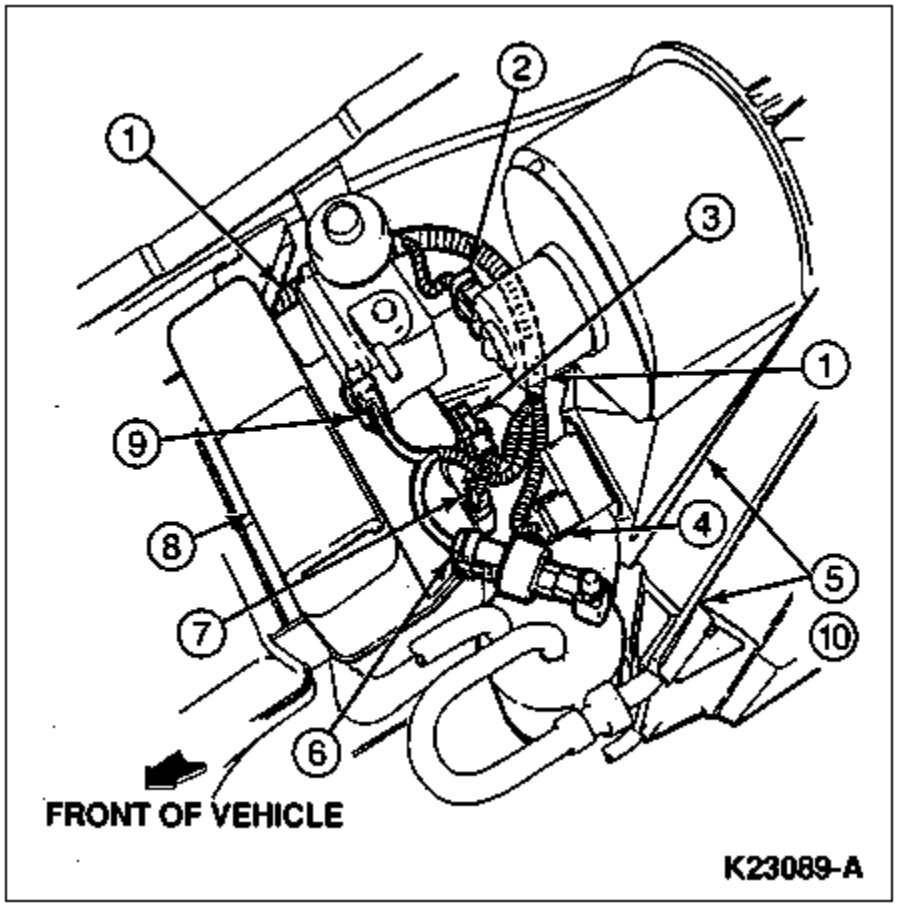
Front End and Fender Apron Wiring, RH, Ranger



Item	Part Number	Description
1	14290	Headlamp Dash Panel Junction Wire

2	N805375-S36MG	Screw
3	—	To Headlamp
4	—	To Park and Turn Signal Lamp
5	N804234-S36MG	Screw
6	19A434	Anti-Theft Control Bracket and Switch
7	N800312-S2	Screw
A	—	Tighten to 3.1-4.3 Nm (27-38 Lb-In)
B	—	Tighten to 11-13 Nm (91-122 Lb-In)
C	—	Tighten to 3.6-4.6 Nm (32-40 Lb-In)
D	—	Tighten to 5-6 Nm (40-55 Lb-In)

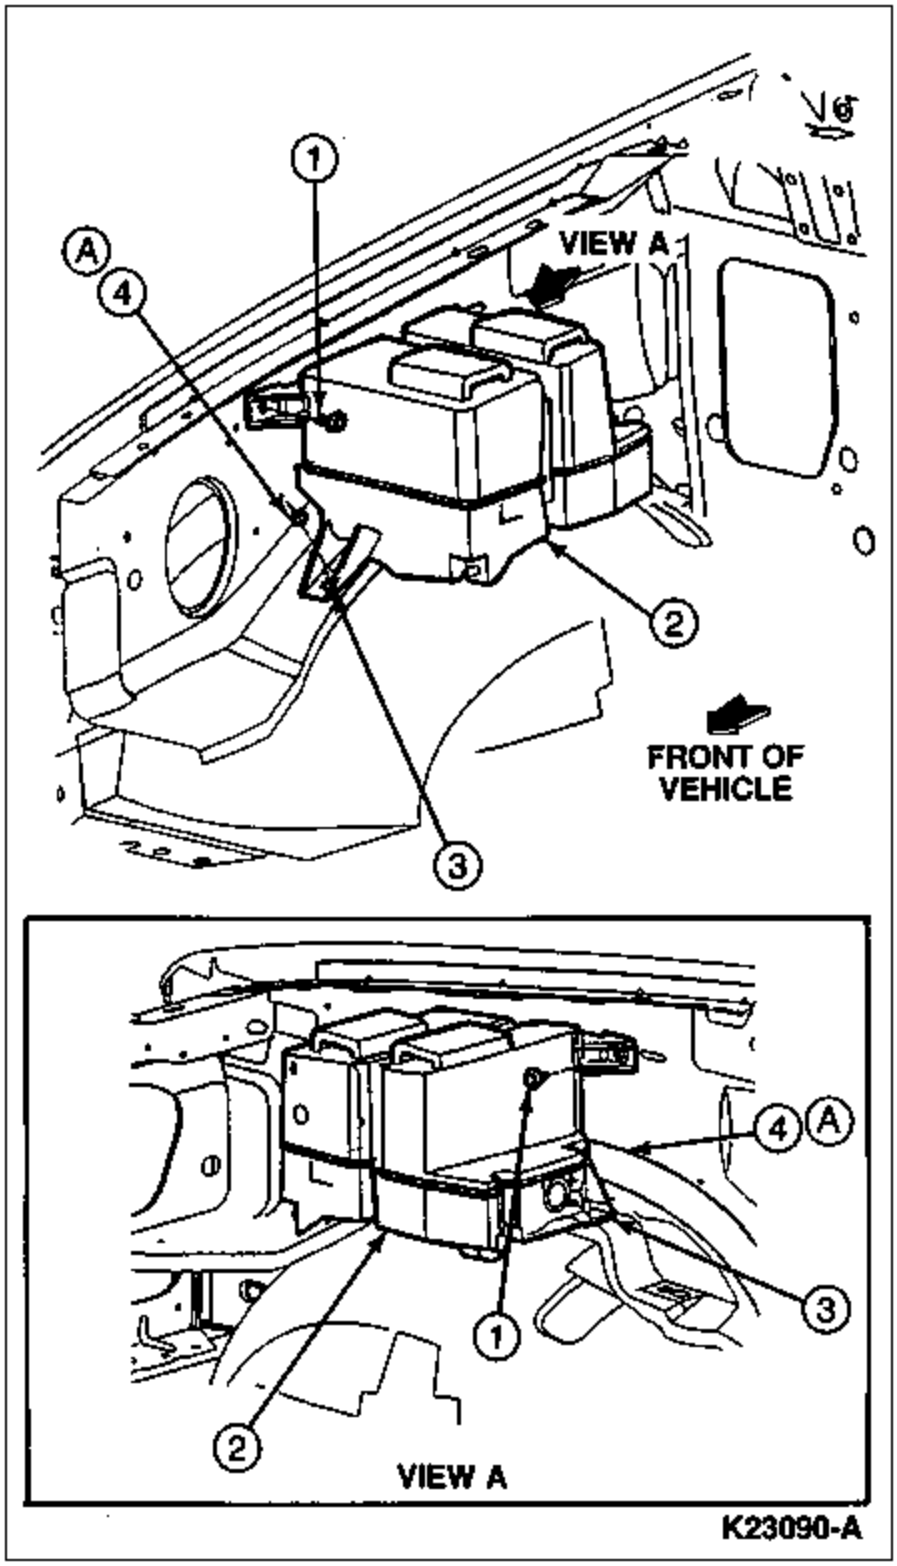
Fender Apron and Dash Panel Wiring, RH, Ranger



Item	Part Number	Description

1	14290	Headlamp Dash Panel Junction Wire
2	—	To Blower Motor
3	—	To Low Washer Fluid Sensor (Explorer Only)
4	—	To Blower Resistor
5	18A484	Heater Plenum Chamber Case
6	—	To A/C Cycle Pressure Switch
7	—	To Windshield Washer Pump
8	17618	Windshield Washer Reservoir
9	—	To Speed Control
10	19850	A/C Evaporator Housing

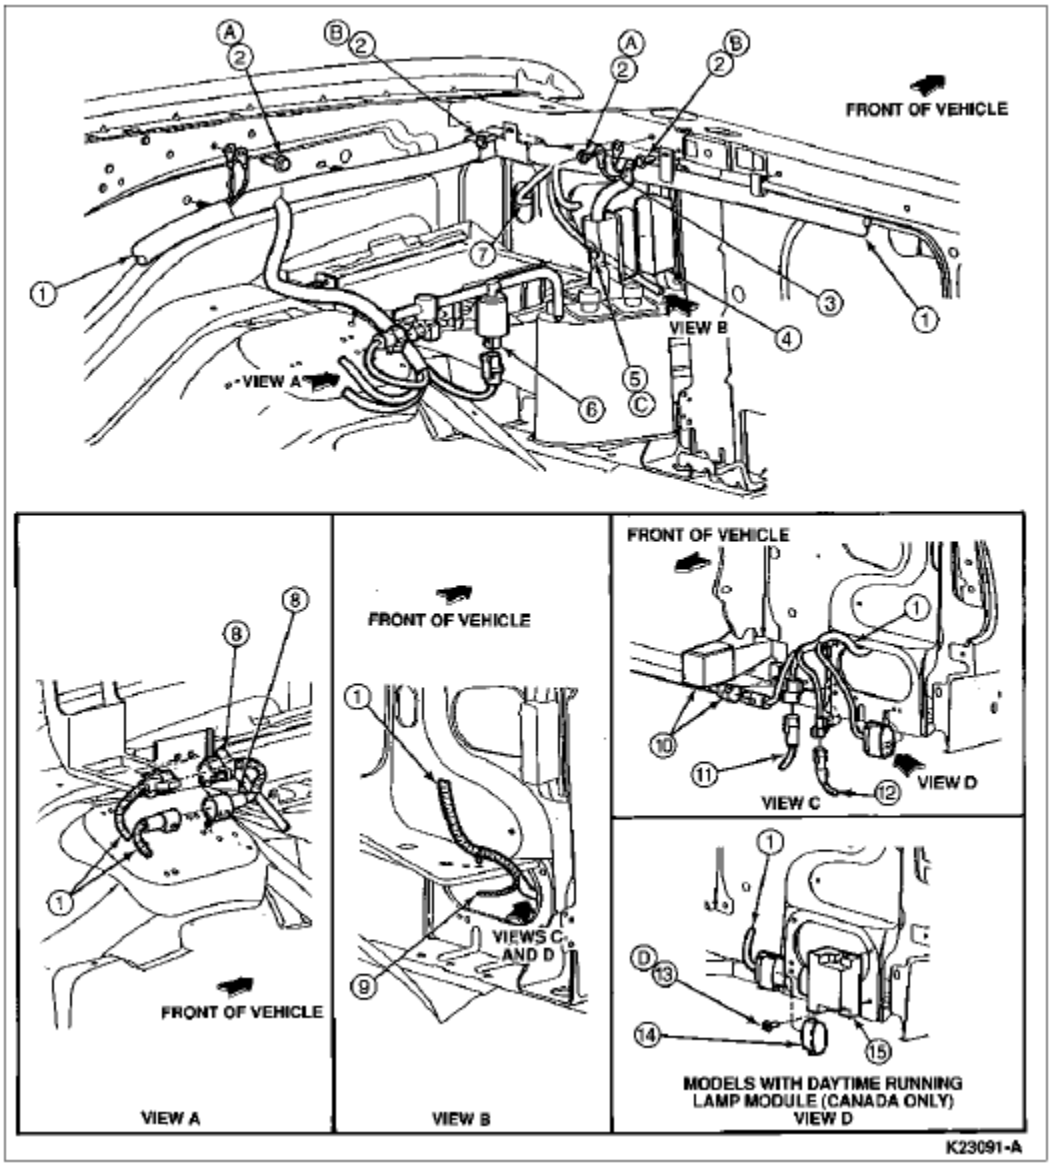
Coolant Overflow and Windshield Washer Reservoir



Item	Part Number	Description
1	W611102-S36	Screw
2	17618	Windshield Washer Reservoir

3	N800946-S36	Retainer
4	N621905-S36	Nut
A	—	Tighten to 5-6 Nm (41-55 Lb-In)

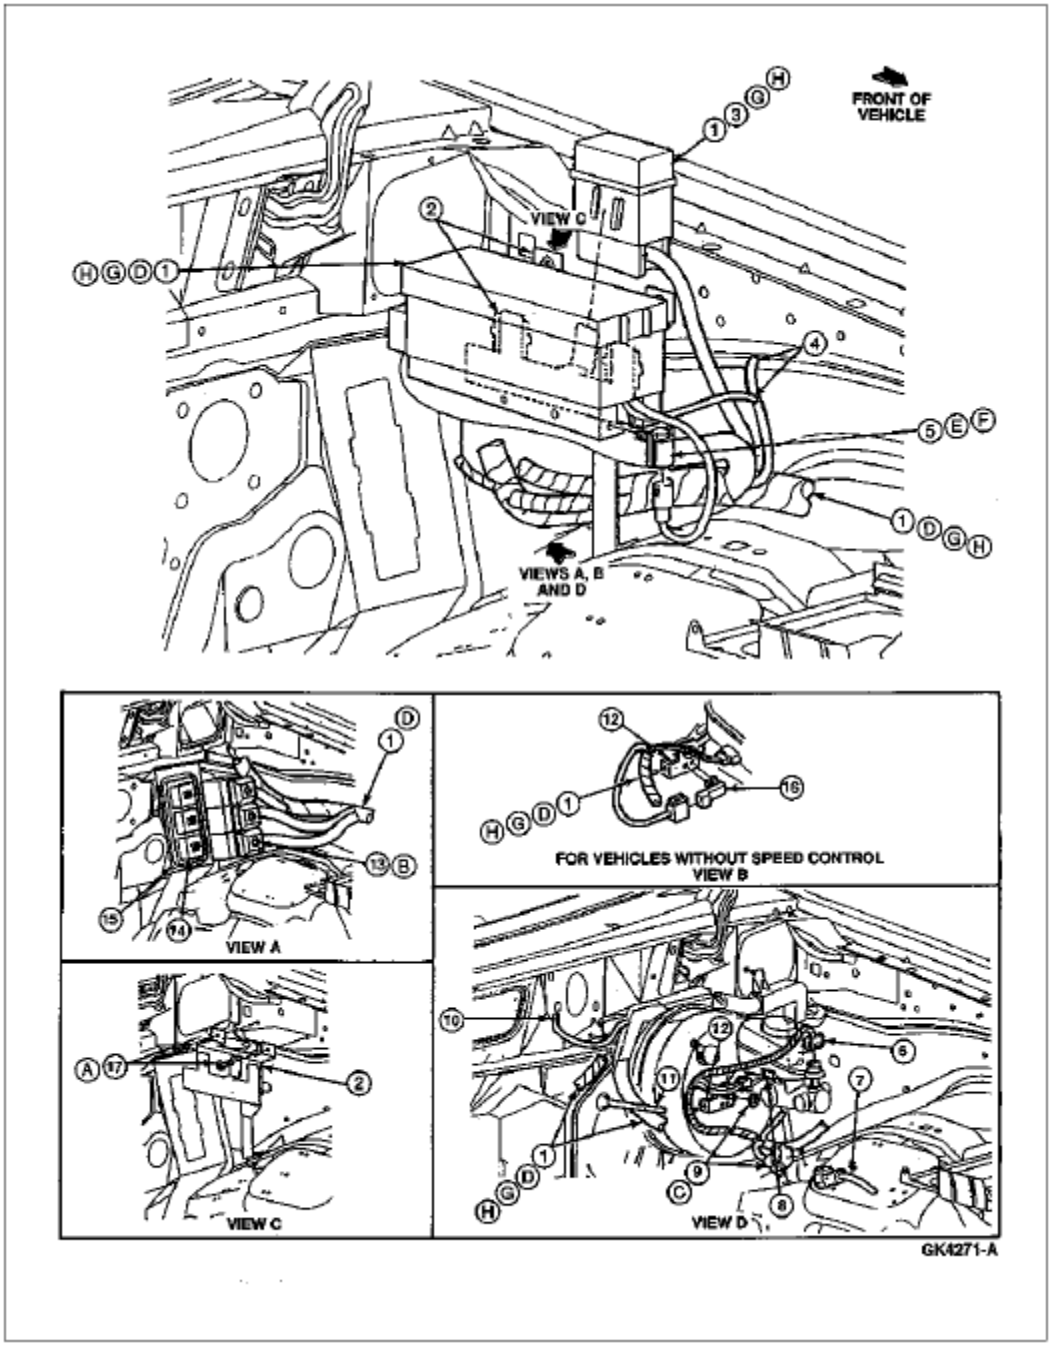
Front End and Fender Apron Wiring, LH, Ranger



Item	Part Number	Description
1	14290	Headlamp Dash Panel Junction Wire
2	N805375-S36MG	Screw
3	—	To Body Ground
4	12A199	Ignition Control Module

5	—	Bolt (Part of 14290)
6	9D653	Evaporative Emissions Canister Control Valve
7	—	To Headlamp and Park/Turn Signal Lamp
8	—	To Anti-Lock Brake System Hydraulic Motor
9	—	To Horn (13832)
10	14B004	Front Air Bag Sensor and Bracket
11	15200	Fog Lamp
12	—	To Anti-Lock Brake Sensor (2L373)
13	N807522-S36	Screw
14	—	Wiring Connector Plug (Part of 14290)
15	15A272	Daytime Running Lamps Control
A	—	Tighten to 11-13 Nm (8-10 Lb-Ft)
B	—	Tighten to 3.1-4.3 Nm (28-38 Lb-In)
C	—	Tighten to 2.7-3.7 Nm (24-32 Lb-In)
D	—	Tighten to 2.3-3.3 Nm (21-29 Lb-In)

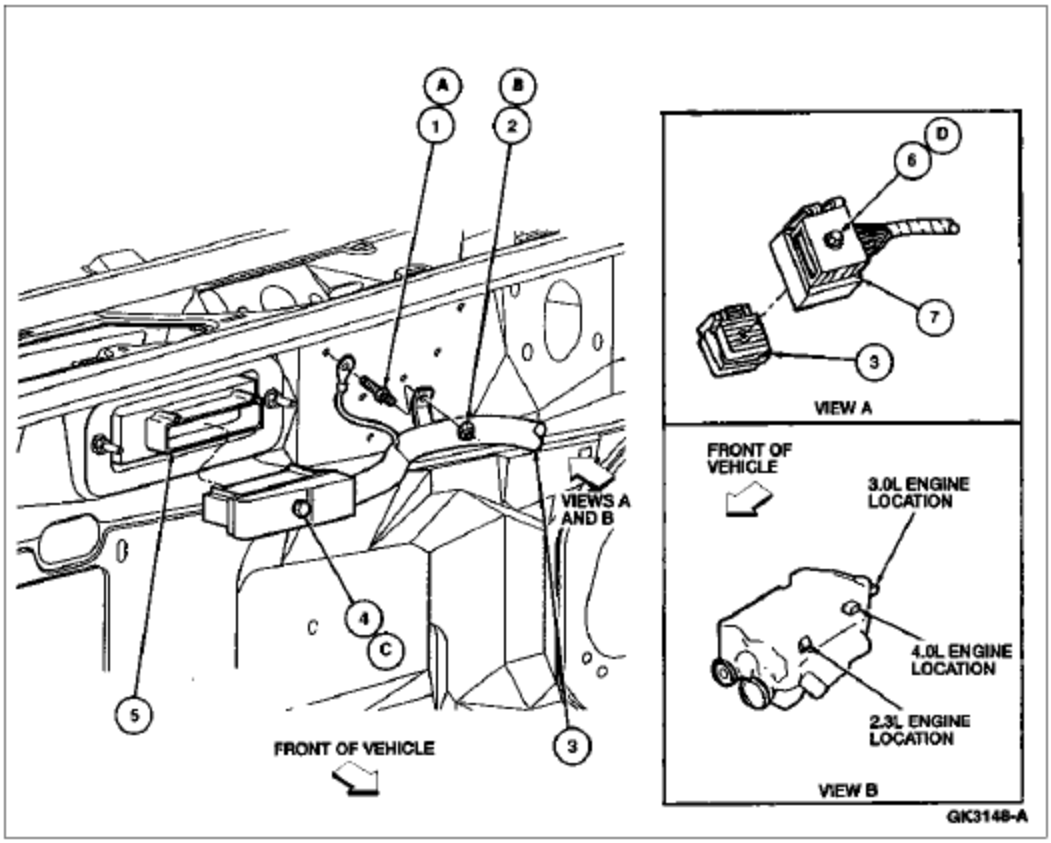
Fender Apron and Dash Panel Wiring, LH, Ranger



Item	Part Number	Description
1	14290	Headlamp Dash Panel Junction Wire
2	14A254	Fuse Junction Panel Mounting Bracket
3	—	Relay Module Assembly (Part of 14290)
4	—	To Starter Motor Solenoid Relay Switch (11450)
5	14A428	Wire Connector Cover
6	—	Speed Control Pressure Switch Connector
7	14305	Generator Voltage Regulator Wiring

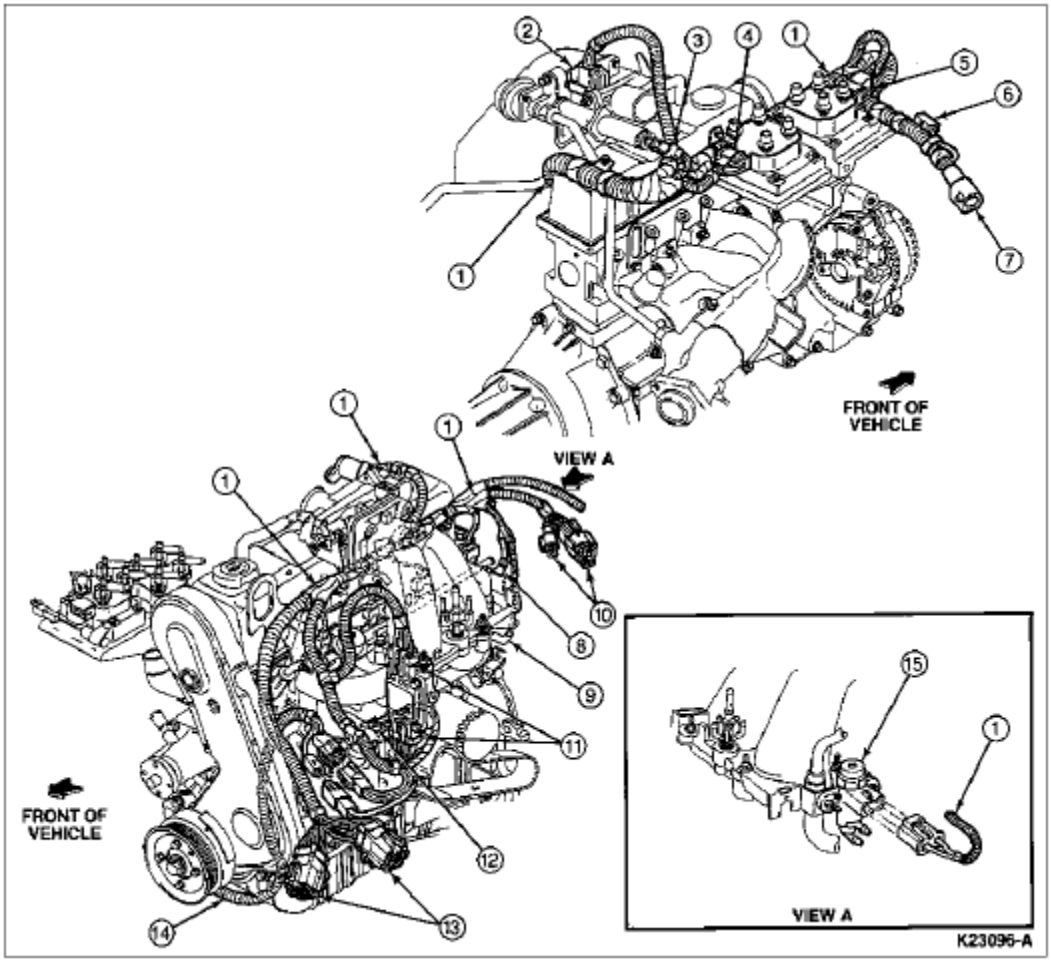
8	—	Brake Fluid Level Sensor (Part of 2K478)
9	382802-S2	Nut
10	—	To Windshield Wiper Motor (17504)
11	9A758	Accelerator Cable
12	7B085	Wiring Harness Retainer
13	—	Screw (Part of 14290)
14	14401	Main Wiring
15	14A541	Main Wiring Harness to Dash Panel Seal
16	14A666	Wiring Connector Plug
17	N610959-S36	Screw
A	—	Tighten to 5-6 Nm (40-55 Lb-In)
B	—	Tighten to 4.5-5.6 Nm (36-49 Lb-In)
C	—	Tighten to 11-13 Nm (8-10 Lb-Ft)
D	—	Power Distribution Box (Part of 14290)
E	—	To RABS Test Connector
F	—	Harness Routing for 2.3L and 4.0L Engines
G	—	Harness Routing for 3.0L Engine

Powertrain Control Module Wiring and Engine Wiring Interconnect



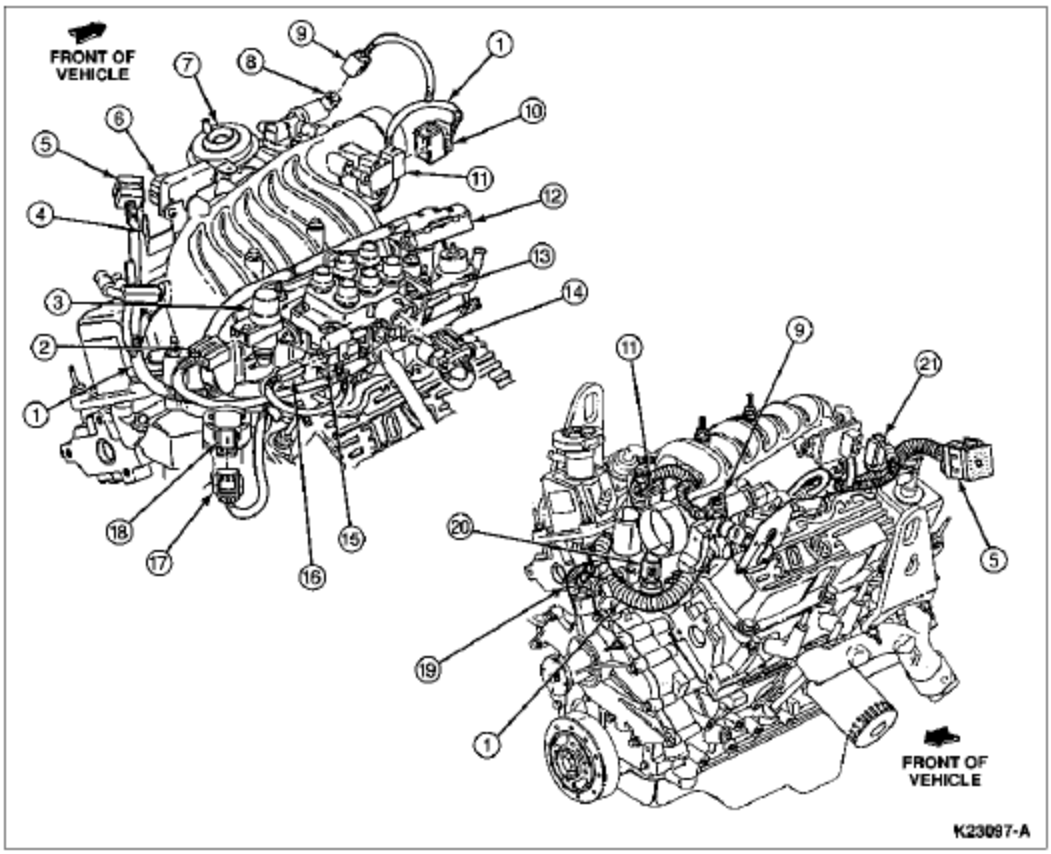
Item	Part Number	Description
1	N806925-S36M	Stud
2	N621906-S301	Nut
3	12A581	Engine Control Sensor Wiring
4	—	Bolt (Part of 12A581)
5	12A650	Powertrain Control Module
6	—	Bolt (Part of 14290)
7	14290	Headlamp Dash Panel Junction Wire
A	—	Tighten to 11-13 Nm (8-10 Lb-Ft)
B	—	Tighten to 6-8 Nm (53-71 Lb-In)
C	—	Tighten to 6-7 Nm (46-63 Lb-In)
D	—	Tighten to 4.0-5.6 Nm (36-49 Lb-In)

Engine Wiring, 2.3L Engine



Item	Part Number	Description
1	9D930	Fuel Charging Wiring
2	9B989	Throttle Position Sensor
3	9F715	Idle Air Control Valve
4	12A310	Primary Coil
5	12A310	Secondary Coil
6	—	To Radio Capacitor (18801)
7	—	Connector to Engine Coolant Temperature Sensor
8	9278	Oil Pressure Sensor
9	10884	Water Temperature Indicator Sender Unit
10	—	To 12A690 Transmission Wiring Assembly
11	—	To Ignition Control Module (12A199)
12	—	To Distributor Stator (12A112)
13	—	To 14290 and 12A581 Wiring Assemblies
14	—	To Crankshaft Position Sensor (6C315)
15	9J459	EGR Vacuum Regulator Solenoid

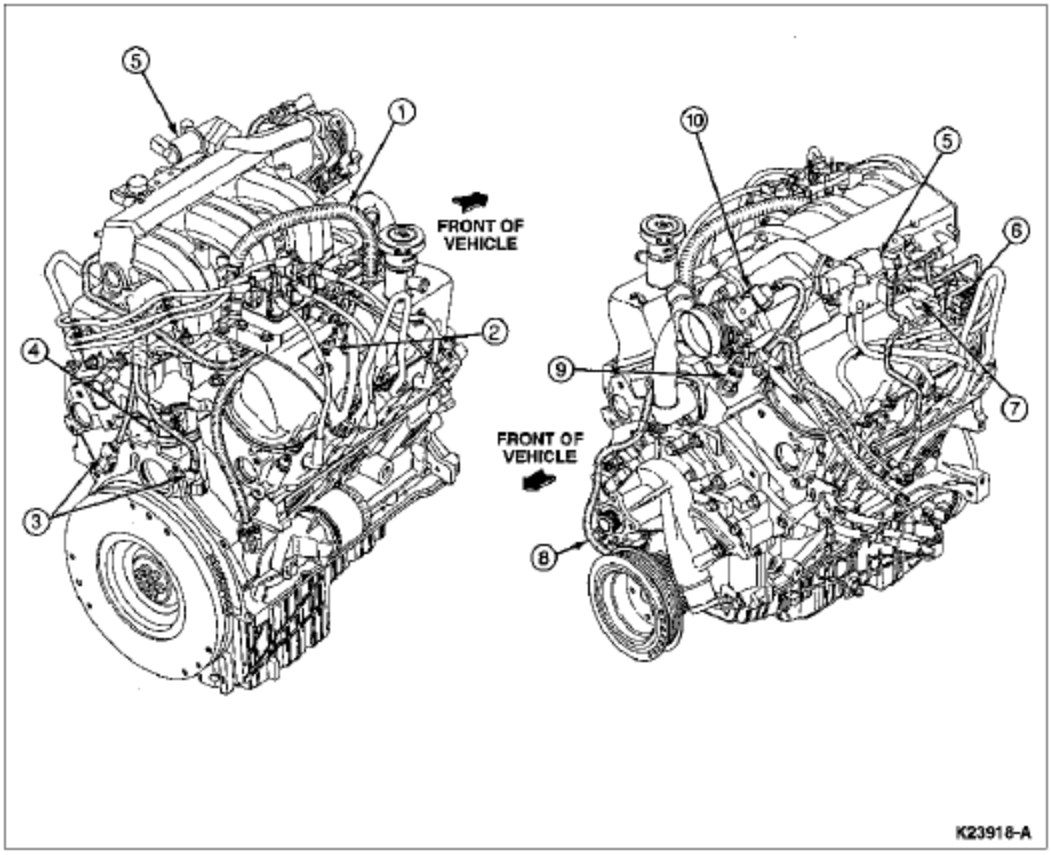
Engine Wiring, 3.0L Engine



Item	Part Number	Description
1	9D930	Engine Control Sensor Wiring
2	—	Connector to EGR Vacuum Regulator Control (Part of 9D930)
3	9J459	EGR Vacuum Regulator Solenoid
4	—	EGR Transducer Bracket (Part of 9J433)
5	—	42-Pin Connector to Engine Compartment Wiring Assembly (Part of 9D930)
6	9J433	EGR Transducer
7	9D475	EGR Valve
8	9F715	Idle Air Control Valve
9	—	Connector to Idle Air Control Valve (Part of 9D930)
10	—	Connector to Throttle Position Sensor (Part of 9D930)
11	9B989	Throttle Position Sensor
12	—	PCM Connector (Part of 9D930)

13	12029	Ignition Coil
14	—	Connector to Ignition Coil (Part of 9D930)
15	18801	Radio Ignition Interference Capacitor
16	—	Connector to Radio Interference Capacitor (Part of 9D930)
17	—	Connector to Camshaft Position Sensor (Synchronizer) (Part of 9D930)
18	12A112	Camshaft Position Sensor
19	10884	Water Temperature Indicator Sender Unit
20	12A648	Engine Coolant Temperature Sensor
21	—	Connector to EGR Transducer (Part of 9D930)

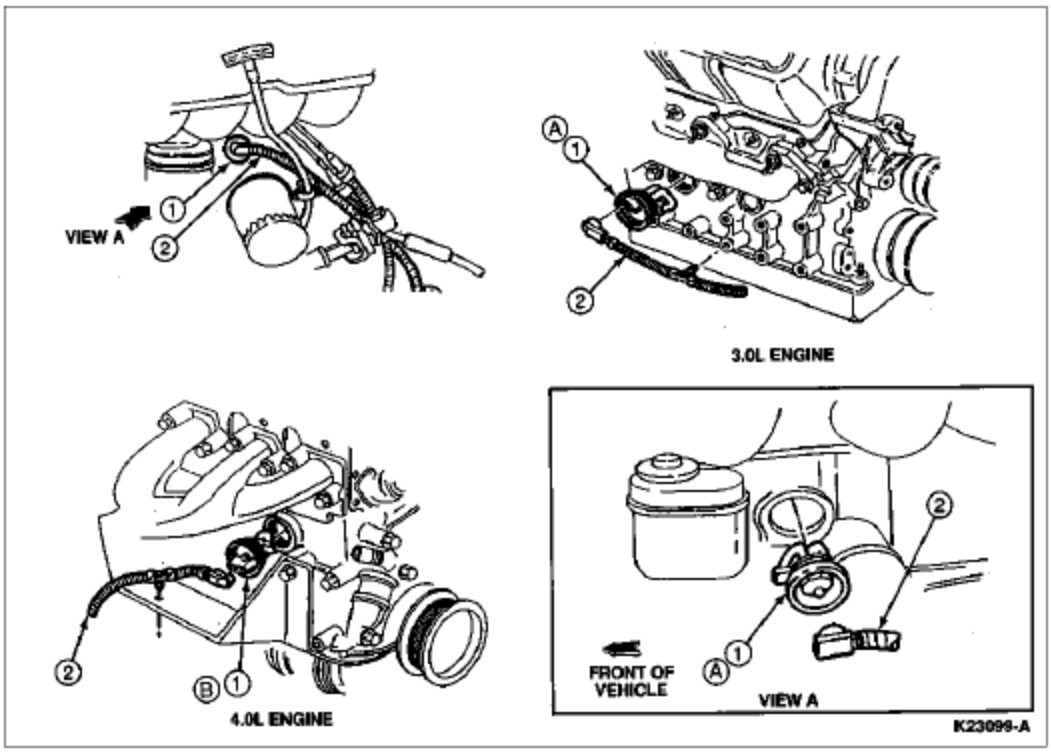
Engine Wiring, 4.0L Engine



Item	Part Number	Description
1	9D930	Fuel Charging Wiring
2	—	To Radio Capacitor (18801)
3	—	To Heated Oxygen Sensors (9F472)

4	—	To Distributor Stator (12A112)
5	9F715	Idle Air Control Valve
6	—	To Headlamp Dash Panel Junction Wire and Engine Control Sensor Wiring Assemblies
7	9J459	EGR Vacuum Regulator Solenoid
8	—	To Crankshaft Position Sensor (6C315)
9	12A648	Engine Coolant Temperature Sensor
10	9B989	Throttle Position Sensor

Block Heater and Wiring



Item	Part Number	Description

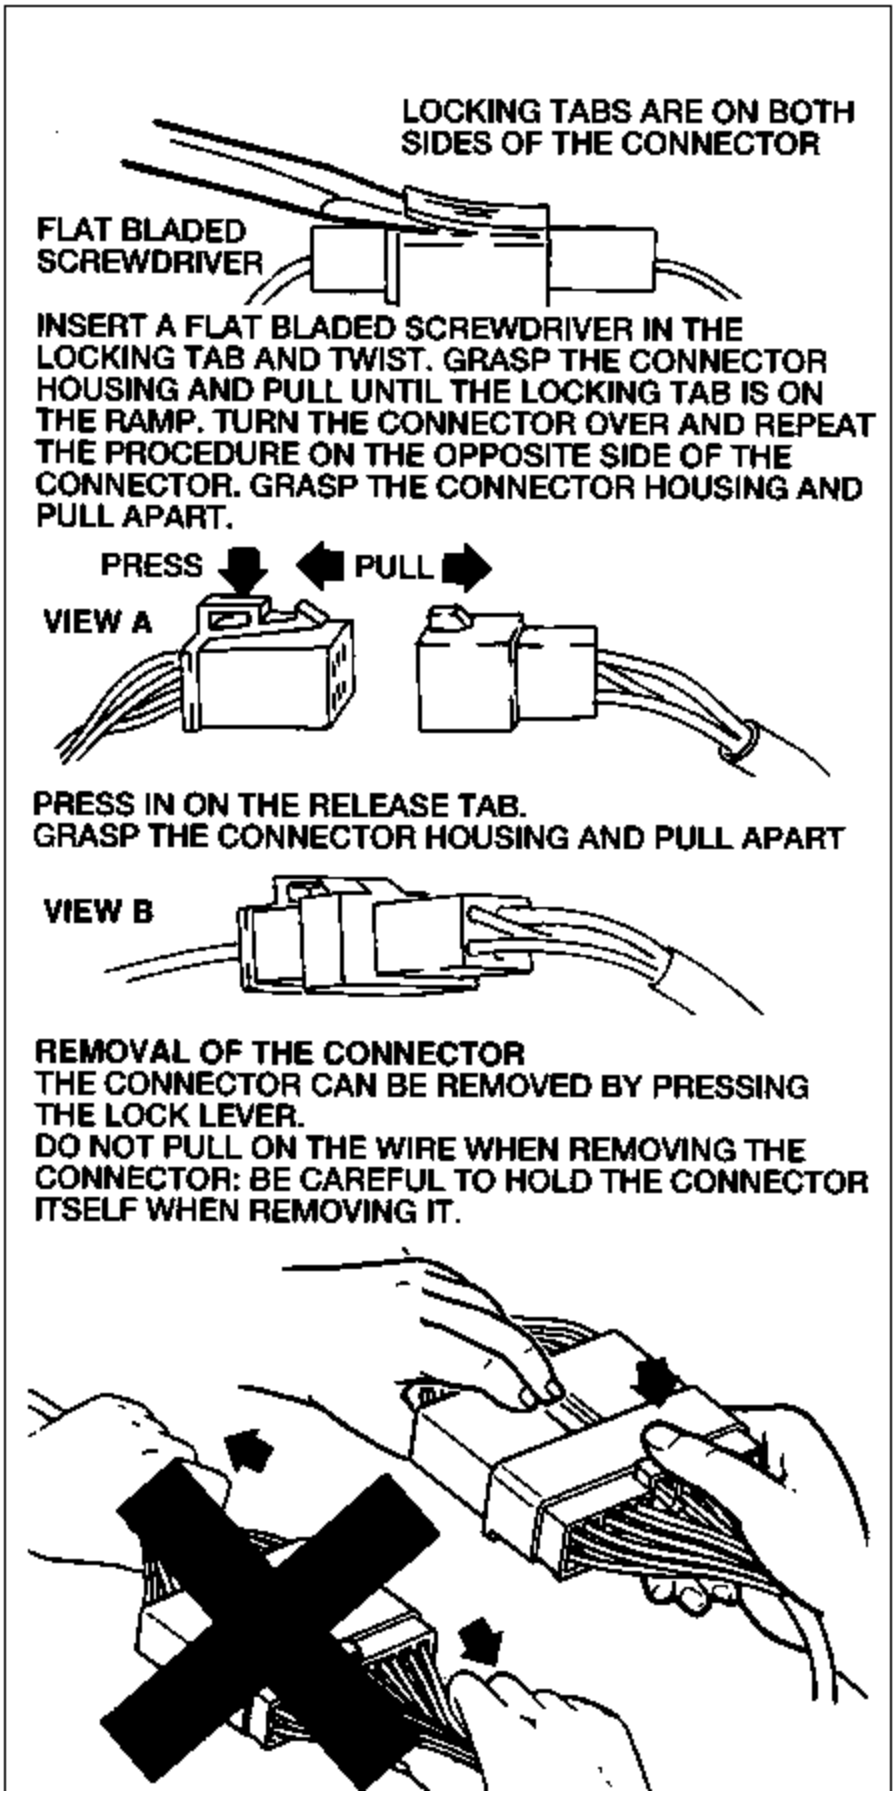
Connectors

Disconnect and Reconnect

The various connector disengagement procedures should be used when disconnecting the various types of connectors.

Connectors, In-Line

To avoid connector damage during service, adhere to the following procedures.

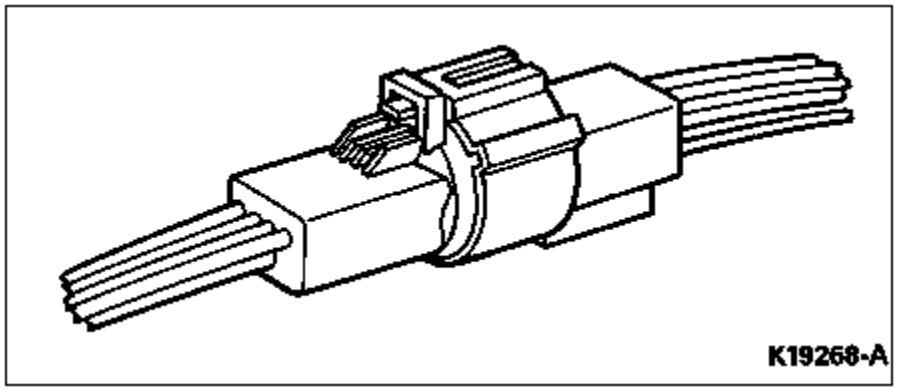


LOCKING TABS ARE ON BOTH SIDES OF THE CONNECTOR
FLAT BLADED SCREWDRIVER
INSERT A FLAT BLADED SCREWDRIVER IN THE LOCKING TAB AND TWIST. GRASP THE CONNECTOR HOUSING AND PULL UNTIL THE LOCKING TAB IS ON THE RAMP. TURN THE CONNECTOR OVER AND REPEAT THE PROCEDURE ON THE OPPOSITE SIDE OF THE CONNECTOR. GRASP THE CONNECTOR HOUSING AND PULL APART.
PRESS
PULL
VIEW A
PRESS IN ON THE RELEASE TAB.
GRASP THE CONNECTOR HOUSING AND PULL APART
VIEW B
REMOVAL OF THE CONNECTOR
THE CONNECTOR CAN BE REMOVED BY PRESSING THE LOCK LEVER.
DO NOT PULL ON THE WIRE WHEN REMOVING THE CONNECTOR: BE CAREFUL TO HOLD THE CONNECTOR ITSELF WHEN REMOVING IT.

Connector Disengagement, In-Line Connectors, Submergible Pin-Type

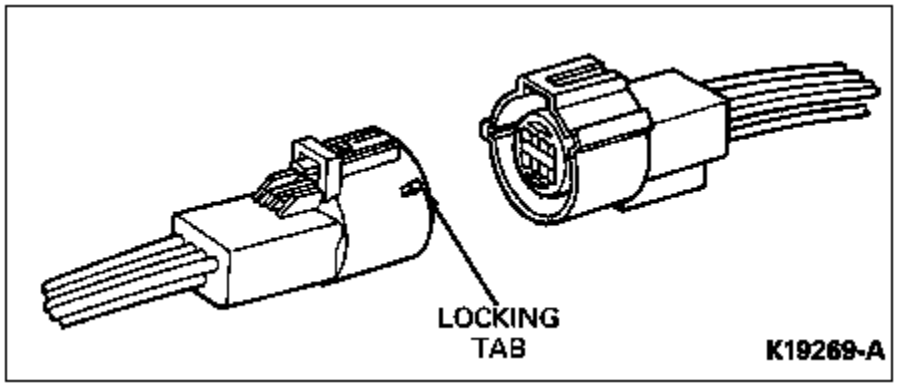
CAUTION: Removal of connector by pulling wire will damage connector's locking mechanism, resulting in a loose fitting connection when installed.

1. Grasp each end of connector body.



2. While holding connector body, use thumb pressure to depress locking tab and pull connector apart.

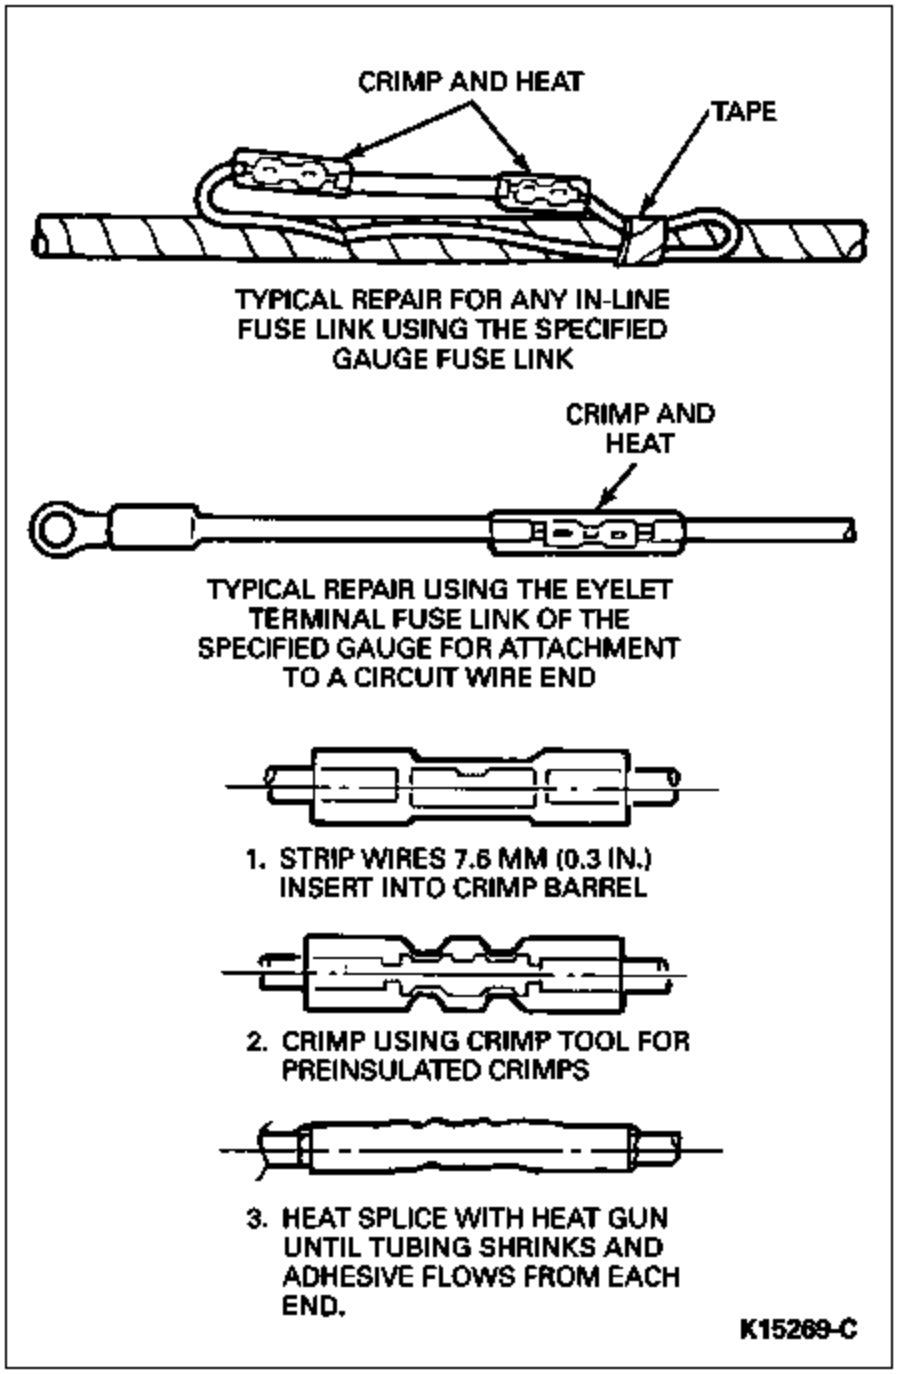
   Wiggling the parts will make separation easier.



Fuse Link and Butt Connector

If it becomes necessary to replace a fuse link in a wiring assembly, make sure the replacement fuse link is a duplicate of the one removed with respect to gauge, length and insulation. Original and Ford replacement fuse links have insulation that is flameproof. Do not fabricate a fuse link from ordinary wire because the insulation may not be flameproof.

If a circuit protected by a fusible link becomes inoperative, inspect for a blown fuse link. If the fuse link wire insulation is burned or opened, disconnect the feed wire part of the wiring and cut out the damaged portion as close as possible behind the splice in the harness. If the damaged fuse link is between two splices (weld points in the harness), cut out the damaged portion as close as possible to the weld points.



CRIMP AND HEAT
TAPE
TYPICAL REPAIR FOR ANY IN-LINE FUSE LINK USING THE SPECIFIED GAUGE FUSE LINK
CRIMP AND HEAT
TYPICAL REPAIR USING THE EYELET TERMINAL FUSE LINK OF THE SPECIFIED GAUGE FOR ATTACHMENT TO A CIRCUIT WIRE END
1. STRIP WIRES 7.6 MM (0.3 IN.) INSERT INTO CRIMP BARREL
2. CRIMP USING CRIMP TOOL FOR PREINSULATED CRIMPS
3. HEAT SPLICE WITH HEAT GUN UNTIL TUBING SHRINKS AND ADHESIVE FLOWS FROM EACH END.

E6FZ-14488-B	FOR NOS. 14 AND 16 GA. WIRE (BLUE)
E6FZ-14488-A	FOR NOS. 18 AND 22 GA. WIRE (RED)

K8660-D

To service any blown fusible link or to splice broken wires, use the following procedure.

1. Determine which circuit is damaged, its location and the cause of the blown fuse link. If the damaged fuse link is one of three fed by a common No. 10 or 12 gauge feed wire, determine the specific affected circuit.

2. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

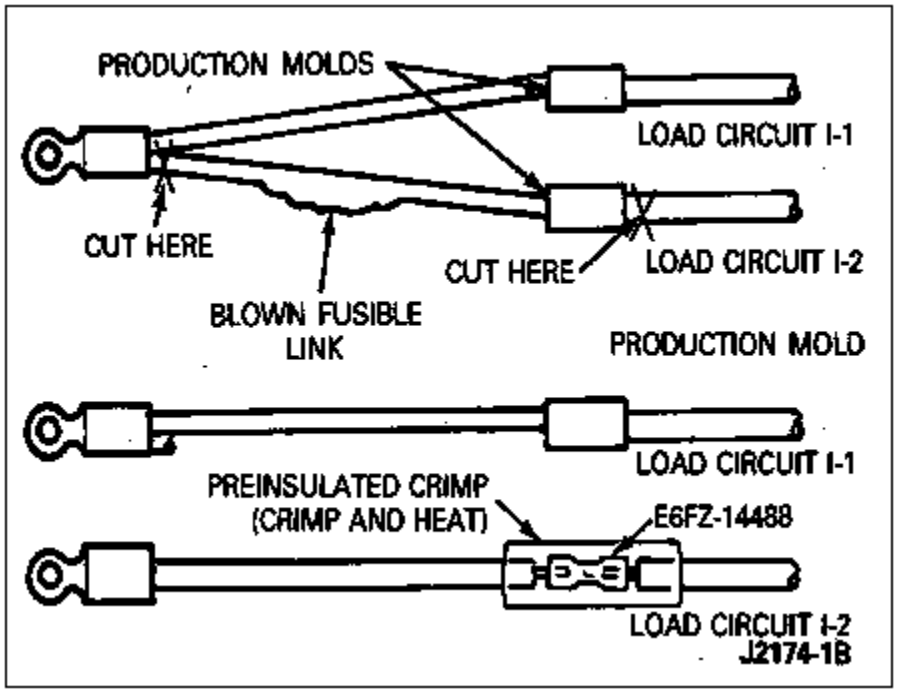
   Disconnect the battery to starter relay cable (14300).

3. Cut the damaged fuse link from the wiring harness and discard it. If the fuse is one of three circuits fed by a single feed wire, cut it out of the harness at each splice and discard it.

4. Identify and procure the proper fuse link and butt connectors for attaching the fuse link to the harness.

5. To repair double-terminated fusible links when only one link has blown and the other link is not damaged:

   a. Cut out blown link (two places).
   b. Position correct eyelet type service fusible link and bare butt connector.
   c. Crimp serviced joint and heat with heat gun until tubing shrinks and adhesive flows from each end.



6. Strip 7.6mm (0.3 inch) of insulation from wires and insert into proper gauge wire connector, crimp and heat splice insulation until tubing shrinks and adhesive flows from each end of connector.

7. To replace any fuse link on a single circuit in a harness, cut out the damaged portion. Strip approximately 13mm (1/2 inch) of insulation from the two wire ends and attach the appropriate replacement fuse link to the stripped wire ends with two proper size wire connectors. See previous illustration.

8. To repair any fuse link which has an eyelet terminal on one end such as the charging circuit, cut off the blown fuse link behind the weld, strip approximately 13mm (1/2 inch) of insulation from the cut end and attach the appropriate size wire connector.

9. **NOTE: Do not mistake a resistor wire for a fuse link. The resistor wire is generally longer and**

has print stating: Resistor — Do not cut or splice.

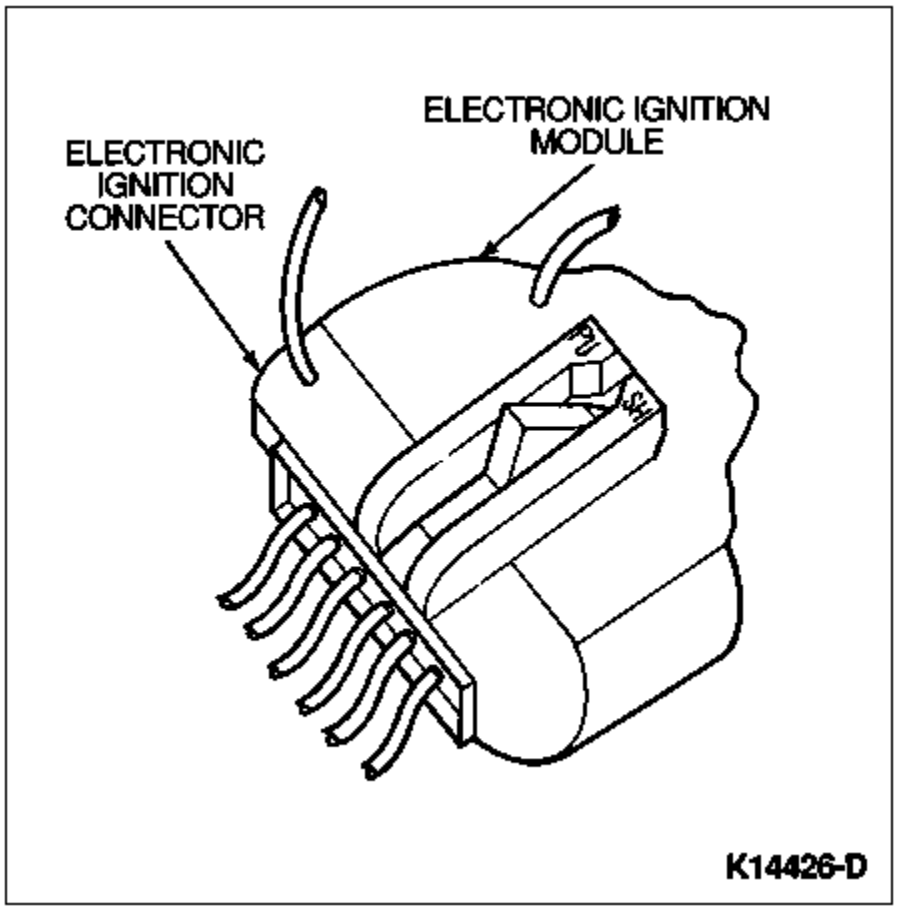
NOTE: When attaching a No. 16, 18 or 20 gauge fuse link to a heavy gauge wire, always double the stripped wire end of the fuse link before inserting and crimping it into the wire connector for positive wire retention.

If the damaged fuse link is between two splices (weld points in the harness), cut out the damaged portion as close to the weld points as possible.

10. Reconnect the battery to starter relay cable to the battery and test the system for proper operation.

Module Connector Disengagement

Push down on end of beam indicated by letters PUSH and pull all wires rearward for removal.

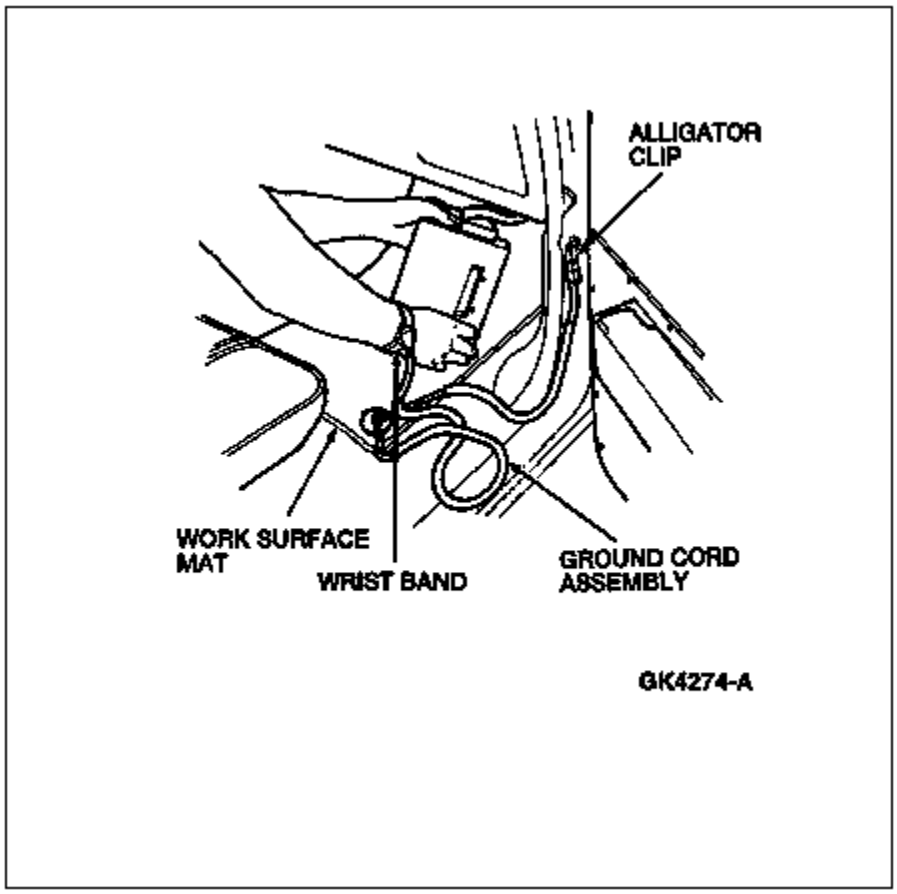


Service Precautions

Electronic modules such as instrument clusters, powertrain controls and radios incorporate the latest technology. Some of the components used in these modules are sensitive to static electricity damage at voltage levels far below what the human body can sense. While a person cannot feel or hear the "snap" of a static discharge until the charge level is about 3000 volts, some of the electronic module components can be damaged or weakened by as little as 100 volts.

Use the following safeguards to avoid static electrical damage.

1. Leave the electronic modules in their original packaging until ready to install in vehicles.
2. Avoid touching module connector pins.
3. Avoid laying modules on nonconductive surfaces.
4. As an added safeguard, this kit contains special wrist straps, a 15-inch by 24-inch flexible conductive mat, grounding cords and full instructions.



STATIC CHARGE GENERATION VALUES

Activity	Relative Humidity	
	Low (10-20%)	High (65-90%)
	Volts	Volts
Walking across carpet	35,000	1,500
Walking over vinyl floor	12,000	250
Working at bench	6,000	100
Sliding across vehicle seat	25,000	1,000

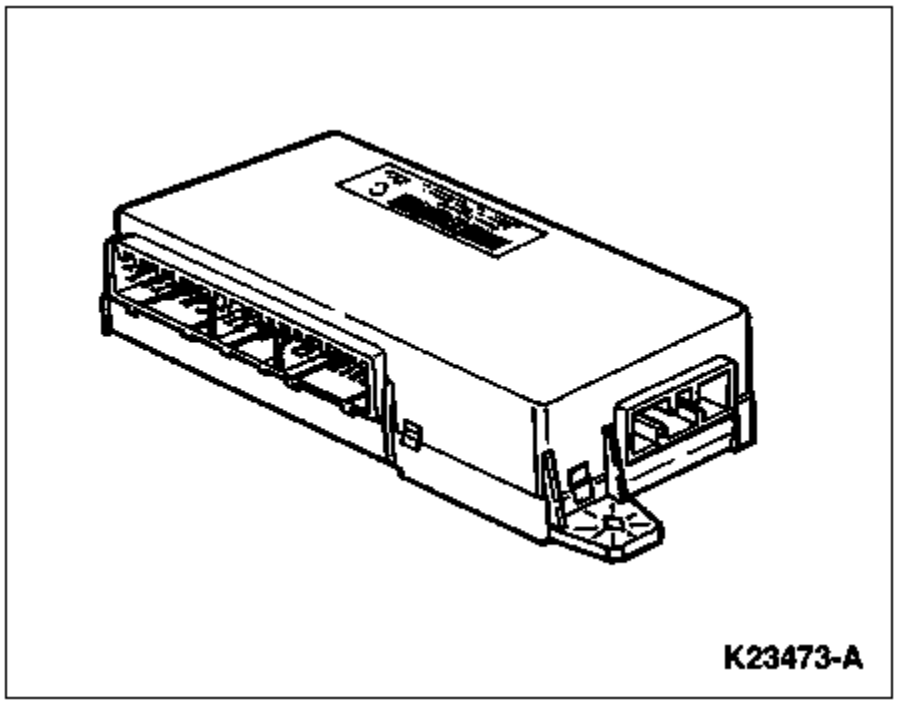
GEM Controlled Functions

The Generic Electronic Module (GEM) incorporates the functions of several different modules into one and offers diagnostics to easily locate and repair concerns affecting the subsystems that it controls.



The GEM constantly monitors the system and reports concerns in the form of diagnostic trouble codes (DTCs). The DTCs can be retrieved with the Rotunda New Generation STAR (NGS) Tester 007-00500 or equivalent through the communication link.

The NGS is a menu-driven tester, allowing the user to run specific diagnostic tests. The NGS can isolate faults in the GEM subsystems through a symptom-driven diagnostic procedure. Connecting the tester to the GEM communication link will NOT alert the GEM. If the GEM is "asleep" when the diagnostic connector is plugged in, the GEM must be "awakened." If the communication link cannot be established, it is advised to turn the ignition to RUN.

NOTE: The GEM has a sleep function to minimize battery consumption. During the sleep mode, the GEM turns off all outputs and monitors only the following:

- Door ajar (driver door and passenger door)
- Key in ignition
- Key in RUN or ACCY
- Door handles (driver or passenger)
- Two-step unlock switch
- Neutral safety switch
- Illuminated entry request — RAP module

If a change of status occurs at one of these inputs while the GEM is asleep, the GEM will "wake up." When

tomsn048@gmail.com

the GEM awakens, it performs an internal self-test, and begins normal operation. At this point, the GEM will have all of its functions operational.

The GEM will go into the sleep mode immediately after both of the following conditions have been met:

- Key in OFF or key not in ignition
- After 45 minutes with no change on any wake-up input

The GEM control system has two modes of operation, the normal operating mode and tester dependent diagnostics mode.

The normal operation of the GEM can detect errors. An integral part of the normal GEM operation is the continuous diagnostics capability. Continuous diagnostics detects errors and changes the GEM control strategy. There is no warning light for the GEM; therefore, a DTC concern will direct you to the GEM. Examples of faults that may be detected during normal operation include:

- GEM continuous self-test (RAM, ROM, EEPROM, A/D checking)
- Output driver monitoring (open circuit/short to GND, short to battery)

  NOTE: The GEM can only detect open circuit/ short to GND faults when the GEM is not energizing a load, and short to battery faults when the GEM is attempting to energize a load.

- Illogical combinations of input signals

A description of the subsystems controlled by the GEM follows.

Windshield Wiper Control and Interval Timer

There are five modes of operation for the front wipers: MIST, INTERVAL, LOW, HIGH and WASH.

These modes are only active with the ignition switch (11572) in the RUN or ACCY position.

Front Windshield Wiper Control (Interval Wiper)

Modes: OFF, Interval, LOW, HIGH, and WASH.

The GEM responds to the windshield wiper control commands by interpreting inputs from the steering column seven-position delay/wash and four-position mode select switches.

The GEM relay drivers control three external relays: wiper high/low speed relay, dynamic brake-run relay, and the washer pump relay. When the washer switch is activated longer than 300 ms, the wash and wiper (low speed) functions are provided until the switch is released. The release of the switch will be followed by three low speed wipes. If the switch is pressed between 100 ms and 300 ms (with the mode in the OFF position), the wiper system will provide one wipe at low speed with no wash.

INTERVAL

For standard interval, the time between low-speed wipes will range from 1.5 - 20 seconds.

HI

tomsn048@gmail.com

This is the fastest wiper speed with no dwell. It is selected when the multi-function switch (13K359) is in the HI speed position. If the wash button is pressed for 0.3-10 seconds, the washer pump will energize until the wash button is released.

LO

This is the slowest wiper speed with no dwell. It is selected when the multi-function switch is in the LO speed position. If the wash button is pressed for 0.3-10 seconds, the washer pump will energize until the wash button is released.

WASH

If the wash button is pressed for 0.3-10 seconds, the washer pump will energize until the wash button is released.

tomsn048@gmail.com

Chime Warning

There are audible warning tones and warning lights that the GEM controls. The GEM performs a prove out on all warning light miniature bulbs (13466) (except the seat belt, 4x4 and door ajar) by turning on the miniature bulb for two seconds after the ignition switch (11572) is turned to RUN from START. The warning chimes and lamps are described below.

Headlamp On Warning

A chime sounds when the exterior lamps are on (parking, license plate and headlamps (13008)) and:

- Ignition switch in the OFF position.
- The driver front door (20124) is ajar (or open).
- NO key in ignition switch.

Door Ajar Warning

When at least one door is ajar and the key is in the RUN position, the door ajar cluster lamp is activated and remains on until all doors are closed. A warning tone will sound once any time the key is in the ignition switch and any door is open. The GEM's flexibility allows customizing of different warnings (i.e., a steady tone for the driver door ajar).

Driver Seat Belt Warning

If the driver seat belt is unbuckled when the ignition switch is placed in RUN, a chime sounds for 6 seconds (or until the driver seat belt is buckled) and a warning light is turned on for 61 seconds (or until the driver seat belt is buckled).

Key In Ignition

Any time the key is in the ignition switch in the OFF or ACC position and the driver door is open, the module sounds a chime (120 chimes per minute) until either the key is removed from the ignition or the driver door is closed.

tomsn048@gmail.com

tomsn048@gmail.com

Battery Saver

NOTE: The exterior lamps are not part of the battery saver protection, and will remain on even if the GEM turns the interior lamps off.

The battery saver feature removes extended interior lamp power drains to the battery (10655). The GEM keeps power to these loads for 45 minutes after the ignition switch (11572) is turned off.

The GEM keeps power available for all interior lights, key ring lights, cargo lamp, and hood lamp circuits for 45 minutes after the ignition switch is turned off. The battery saver timer is reset by lifting a door handle (receiving an illuminated entry request), activating a door ajar switch, changing the ignition to START, or moving the key to the RUN or ACCY position. No lamp or chime indication is provided.

A WAKE-UP command is sent when:

- any door becomes ajar or is opened or closed.
- the front door handle is lifted (if equipped with illuminated entry).
- the key is inserted or removed.
- the ignition switch is turned from OFF to RUN.
- the ignition switch is turned from OFF to ACCY.
- a wake up request is received from the RAP module.

tomsn048@gmail.com

Courtesy Lamps

The GEM illuminates the interior courtesy lamps when any door is set ajar or is opened. The following are inputs used for controlling the courtesy lamps:

- Vehicle speed sensor input
- All door ajar switches
- Door handle switches
- Illuminated entry request with RAP module

All interior courtesy lamps are turned off when any of the following occurs:

- Twenty-five seconds have elapsed after all the doors are closed.
- The ignition switch (11572) is turned to RUN.
- Vehicle speed is over 8 km/h (5 mph).
- A power door lock command is received before the five seconds have elapsed.

tomsn048@gmail.com

Illuminated Entry

The interior courtesy lamps will be turned on if any front door handle is lifted or if any door is ajar. If the lamps are turned on by lifting the front door handle or by illuminated entry request from the RAP module, the lamps stay on for 25 seconds.

The interior courtesy lamps are turned off when the following conditions are met.

- 25 seconds have elapsed since the illuminated entry feature was activated and the interior lamp control is not activated.
- The GEM receives a request from the RAP module and the courtesy lamp is not activated.
- The ignition switch is in the RUN or START position, and the interior lamp control is not activated.

Delayed Accessory

The module provides temporary power to the power windows for ten minutes after the ignition switch is moved from the RUN to OFF position. If during this ten-minute period either front door (20124) is opened, the delayed accessory relay will be de-energized.

tomsn048@gmail.com

One-Touch Window

When the power switch for driver window control is held down (between 0.04 and 0.4 seconds) and then released with the ignition switch (11572) in RUN or ACC, the driver window will automatically move to its full down position.

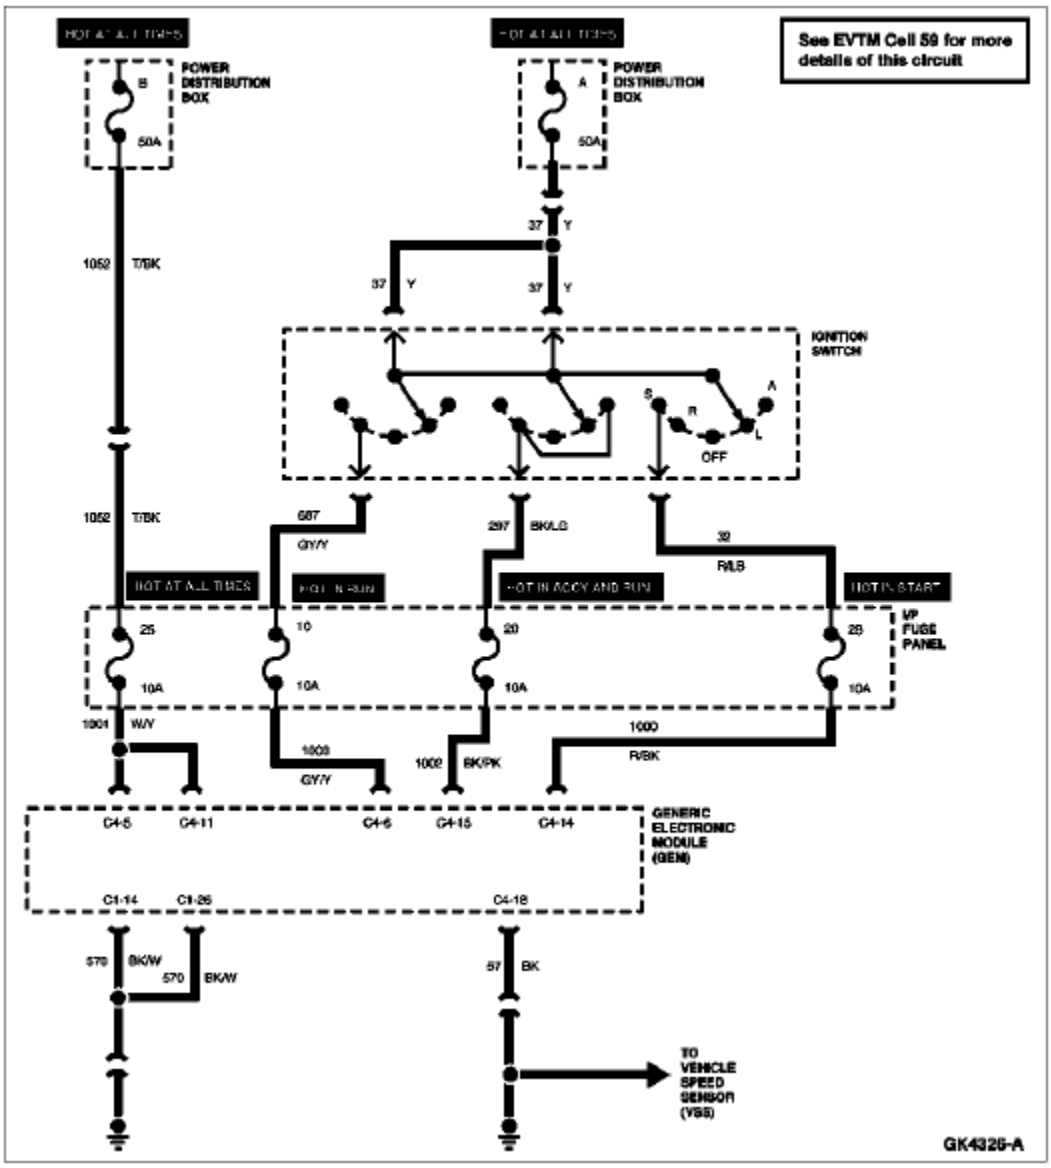
Only the driver window has this feature. Holding the switch down longer allows the operator to stop the window as soon as the switch is released.

tomsn048@gmail.com

Four-Wheel Drive Electronic Shift-on-the-Fly

This feature electronically shifts the vehicle transfer case between 2WD, 4WD, and 4WD LOW. The system mode is selected by the operator through a three-position rotary switch on the instrument panel. The operator is informed which mode the system is in by two cluster indicator lamps, one for 4WD HIGH, and one for 4WD LOW (in 4WD LOW, both lamps are on). The GEM accomplishes shifts between different system modes by interpreting inputs from 4x4 selector switch, the vehicle speed signal, and the transfer case contract plates. Based on these inputs, two relays (L2H and H2L directional control), the transfer case motor, and an output for the transfer case electric clutch, are used to shift into 2WD, 4WD HIGH, or 4WD LOW. The GEM will not allow shifts into 4WD LOW unless the brake is depressed, the vehicle is in NEUTRAL (with automatic transmission vehicles), the clutch is pressed (in manual transmission vehicles), and the speed is less than 5 km/h (3 mph).

GEM Power and Ground System, Ranger

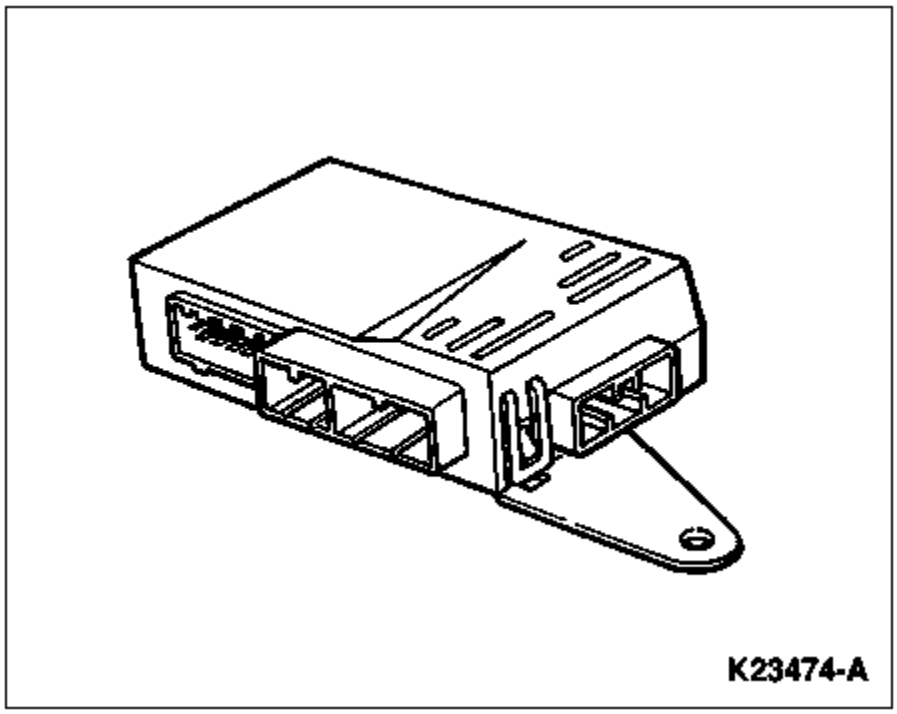


tomsn048@gmail.com

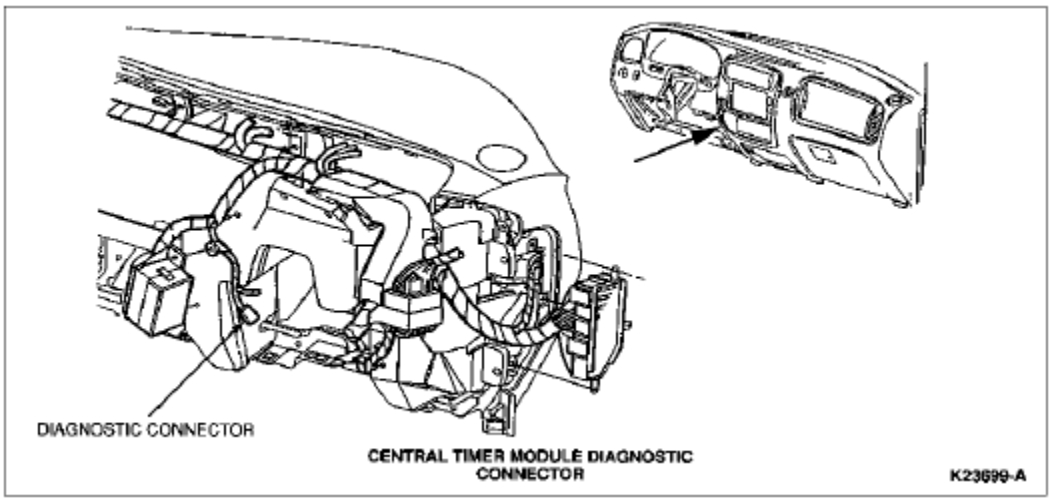
tomsn048@gmail.com

CTM Controlled Functions

The Central Timer Module (CTM) incorporates the function of several different electronic modules into one.



Central Timer Module Diagnostic Connector



Windshield Wiper/Washer Control

tomsn048@gmail.com

MIST

When the wash button is tapped for less than 0.3 seconds with the multi-function switch (13K359) in the OFF position, the wiper motor will perform a single wipe without a wash. If the wash button is held longer (up to 10 seconds), the washer pump runs followed by three extra low-speed wipes after the button is released.

INTERVAL

For standard interval, the time between low-speed wipes will range from 1.5 - 20 seconds.

HI

This is the fastest wiper speed with no dwell. It is selected when the multi-function switch is in the HI speed position. If the wash button is pressed for 0.3-10 seconds, the washer pump will energize until the wash button is released.

LO

This is the slowest wiper speed with no dwell. It is selected when the multi-function switch is in the LO speed position. If the wash button is pressed for 0.3-10 seconds, the washer pump will energize until the wash button is released.

WASH

If the wash button is pressed for 0.3-10 seconds, the washer pump will energize until the wash button is released.

Chime Warning

The CTM will not generate more than one audible warning at any given time. When more than one condition requiring a CTM-generated audible warning is present, the CTM will stack the warning conditions and sound them in order of decreasing priority according to the table below. However, the CTM will not delay the illumination of any warning indicator lamp, even in cases where its associated audible warning is being delayed by the sounding of a higher priority audible warning. For any given condition requiring an audible warning, the CTM will sound that warning only after all higher priority warnings have completed sounding, the given condition still exists, and the associated indicator lamp, if any, is still illuminated.

PRIORITY TABLE FOR AUDIBLE WARNINGS

Warning Condition	Lamp Duration	Audible Duration	Audible Output
Safety Belt	60 Seconds	6 Seconds (±0.5 Seconds)	Chime, 60/Min. 740 Hz
Key in Ignition	—	continuous	Chime, 120/Min. 740 Hz
Headlamps On	—	Continuous	Chime, 240/Min. 740 Hz
Door Ajar	Continuous	1 Second	Tone, 1000 Hz

Headlamp On Warning

A chime sounds when the exterior lamps are on (parking, license plate and headlamps (13008) and:

- There is no key in the ignition switch (11572).
- The driver's front door (20124) is ajar (or open).
- Ignition switch is in OFF position.

tomsn048@gmail.com

Door Ajar Warning

When at least one door is ajar and the key is in the RUN position, the door ajar cluster lamp is activated and remains on until all doors are closed. A warning tone will sound once any time the key is in the ignition switch and any door is open.

Driver Seat Belt Warning

During the first 60.0 seconds after the ignition switch state is changed to RUN and remains in RUN or START, the CTM will activate the safety belt warning indicator lamp any time during this period that the driver safety belt is not buckled.

Key In Ignition

Any time the key is in the ignition switch and the driver door is open, the module sounds a chime (120 chimes per minute) until either the key is removed from the ignition or the driver's door is closed.

Battery Saver

NOTE: The exterior lamps are not part of the battery saver protection, and will remain on even if the GEM turns the interior lamps off.

The battery saver feature removes extended interior lamp power drains to the battery (10655). The CTM keeps power to these loads for 45 minutes after the ignition switch is turned off.

The CTM will keep power available for all interior lights, key ring lights, cargo lamp, and hood lamp circuits for 40 minutes after the ignition switch is turned off. The battery saver timer is reset by lifting a door handle, activating a door ajar switch, changing the ignition to START, or moving the key to the RUN or ACCY position. No lamp or chime indication is provided.

A WAKE-UP command is sent when:

- Driver door handle switch is activated.
- Any door becomes ajar or is closed.
- The key is inserted or removed.
- The ignition switch is turned from OFF to RUN.
- The ignition switch is turned from OFF to ACCY.

Courtesy Lamps

The CTM illuminates the interior courtesy lamps when any door is set ajar or is opened. All interior courtesy lamps are turned off when any of the following occurs:

- Twenty-five seconds have elapsed after all the doors are closed.
- The ignition switch is turned to RUN.
- Vehicle speed is over 8 km/h (5 mph) (once the interior courtesy lamps are turned OFF, a new ajar signal will be honored only if vehicle is speed is below 16 km/h [10 mph]).
- A power door lock command is received before the five seconds have elapsed.

tomsn048@gmail.com

Illuminated Entry

The interior courtesy lamps will be turned on if the driver door handle is lifted or if any door is ajar. If the lamps are turned on by lifting the driver door handle or by illuminated entry request from the RAP module, the lamps stay on for 25 seconds.

The interior courtesy lamps are turned off when the following conditions are met.

- 25 seconds have elapsed since the illuminated entry feature was activated and the interior lamp control is not activated.
- The GEM receives a request from the RAP module and the courtesy lamp is not activated.
- The ignition switch is in the RUN or START position and the interior lamp control is not activated.

Inspection and Verification

GEM Diagnosis

The GEM diagnostic system is composed of the New Generation STAR (NGS) tester, the GEM and all GEM-associated components. They allow you to determine if a GEM subsystem has a fault and provides the capability to isolate the fault.

tomsn048@gmail.com

Diagnosis Instructions

As in all microprocessor systems, communications must be provided to monitor system operation and to allow diagnosis of any concerns that may develop in the system. Diagnosis communication is provided through the data link connector (DLC) and the Rotunda New Generation STAR (NGS) tester 007-00500 or equivalent.

ISO 9141 Data Link Connector (DLC)

Data link connector (DLC) (diagnostic connector) is located under the instrument panel on the driver's side just to the left of the steering column. The diagnostic connector allows communication between the generic electronic module (GEM) and Rotunda New Generation STAR (NGS) tester 007-00500 or equivalent.

Test Equipment

New Generation STAR (NGS) Tester 007-00500 or equivalent:

- Allows individual commands for inputs and outputs of the GEM System.
- Allows retrieval of diagnostic trouble codes (DTCs) from the GEM.

All testing in this manual can be accomplished using the NGS.

Diagnostic trouble codes (DTCs) are reported to the NGS through the DLC. DTCs are cleared manually by the NGS or after a planned period of time not seeing the same DTC (e.g., 80 start cycles) by the GEM.

Action that may be taken by continuous diagnostics are as follows:

- Manage the fault
- Store a diagnostic trouble code
- Illuminate a warning lamp

The GEM diagnostics mode has the ability to interface with you via the NGS. This diagnostic operation allows the best fault isolation capability. You have the ability to communicate with the GEM subsystem when the NGS is in the diagnostics mode. Interaction with the GEM is achieved by the following:

- Requesting the GEM to perform tasks (e.g., turn ON the wipers)
- Transmitting GEM control states (e.g., switch status)
- Physically interacting (e.g., connecting/disconnecting wires) with the vehicle hardware

The tester has a menu-driven user interface allow you the ability to run a specific diagnostic test. You can separate faults in the GEM through a symptom-driven diagnostic process, exercising specific functional tests, or retrieving diagnostic trouble codes.

The majority of the GEM diagnostic strategy is in the GEM. The NGS requests the GEM for input and output status. It then sends commands to actuate the output devices and has the GEM run diagnostic tests and report stored DTCs.

Detecting and Storing Diagnostic Trouble Codes

tomsn048@gmail.com

When the GEM energizes an external device, a short circuit condition can momentarily exist. This fault is not immediately stored as a diagnostic trouble code since the fault can disappear after a few milliseconds. The GEM repeatedly attempts to energize the device for one second to confirm that the fault still exists.

If the device is successfully energized before one second elapses, a diagnostic trouble code is not stored and fault management action is not taken. If the fault continues after the predetermined fault time, a diagnostic trouble code is stored and appropriate fault management action is then taken.

Detecting Faults in the GEM Output Circuits

Battery shorts can only be detected when the device being controlled is actuated (e.g., relays, lamps or solenoids).

All faults are monitored continuously during the vehicle operation.

Reporting Trouble Codes

Faults are displayed after the continuous DTCs and the On-Demand DTCs are retrieved. Continuous DTCs should be retrieved from the GEM before an On-Demand Self Test is run. These DTCs are then compared against the diagnostic trouble codes retrieved after running an On-Demand Self Test.

Clearing Continuous DTCs

Continuous DTCs must be cleared when the problem has been fixed. Trouble codes can be cleared by sending a request from the NGS to clear them.

Automatically Clearing Codes

Automatic clearing of individual trouble codes is done when the fault is not present for 80 start cycles. These trouble codes are automatically cleared after 80 start cycles.

Tester-Dependent Diagnostic Capability and Fault Isolation

The tester-dependent diagnostics allows you to communicate with the GEM through a tester connected to the DLC.

Running a diagnostic test may require the GEM to energize an output device. Some output devices might be limited to the amount of time that they can be actuated. The tester can reactivate the device by exiting the diagnostic test and entering the test again. The GEM will not protect for enter/exit condition of the tester.

During the tester-dependent diagnostics mode, the tester can only command the GEM to perform tests on disabled functions. A response is sent to the tester if a diagnostic test request is made on a function that is not disabled.

The NGS can request the GEM to activate or deactivate an output device.

Vehicle Conditions for On-Demand Self Test

During on-demand self-test the GEM disables all output functions.

On-demand self-test requires the following vehicle conditions:

tomsn048@gmail.com

- All doors are closed
- The ignition switch is in the RUN position
- The wiper control is in the OFF position and the wiper blades are parked
- The headlamps are off
- All the windows are in the up position
- All vehicle switches are deactivated
- The driver seat belt is not buckled

Running a Diagnostic Control Test

The tester controls the GEM by performing diagnostic tests. Diagnostic tests are done only when the GEM has disabled the function being controlled. These control tests allow the tester to control the GEMs outputs and to synchronize the GEMs inputs.

On-Demand Self Test Results

The results of the on-demand self-test is in the form of DTCs. The on-demand self-test DTCs are requested after the test has run.

The On-Demand Self Test detects faults within milliseconds as opposed to one second for the continuous fault code detection. The shorter period of time reduces the overall test time and can help identify intermittent faults.

Requesting a Parameter Identification (PID)/Data Monitor

For the GEM to detect a battery short, the device must be activated. During continuous state, a PID may fluctuate between both short and normal when a battery short is present.

tomsn048@gmail.com

NGS Parameter Identification Display (PID) (GEM)

The following chart lists all of the acronyms displayed on the NGS Scan Tool for GEM related diagnostics.

NGS PID Name	PID Description
VSS _GEM	Vehicle Speed
TRANSGR	Transmission Gear Position
CLTCHSW	Transmission Clutch Interlock Switch
NEUT _SW	Neutral Safety Switch Input
TRA _RSP	Transmission Transfer Case Rear Speed
TRA _	Transmission Transfer Case front Speed
MTR _H2L	Transmission Transfer H2L Motor Output
MTR _L2H	Transmission Transfer L2H Motor Output
HALLPWR	Center Axle Hall Power
AXL _EN	Center Axle Engage Status
4WDELCL	4WD Electronic Clutch Output Status
4WDCLST	4WD Clutch PWM Output Status
4WDLOW	4WD-Wheel Low Output State
4WDHIGH	4WD-Wheel High Output State
4WD _SW	4WD Input Switch Status
AXLSTAT	4WD Center Axle Disconnect
AXL _DIS	4WD Center Axle Disconnect
PLATE _D	Transmission Transfer Case Contact Plate
PLATE _C	Transmission Transfer Case Contact Plate
PLATE _B	Transmission Transfer Case Contact Plate
PLATE _A	Transmission Transfer Case Contact Plate
PLATEPW	Transmission Transfer Case Contact Plate
BOO _GEM	Brake Switch Input Status
PWR _RLY	ABS Power Relay Feedback Input
LFSBELT	Left Front Seat Belt Status
IPCHIME	External Chime Request
PARK _SW	External Lamp Control INP Switch STA
LGATESW	External Access Ajar SW Status
RRDR _SW	External Access Ajar Switch Status
LRDR _SW	External Access Ajar Switch Status
RFDR _SW	External Access Ajar Switch Status
LFDR _SW	External Access Ajar Switch Status

tomsn048@gmail.com

LFDHNDL	External Access Handles Switch Status
LFFTDWN	Left Front Window Down
LFPW __SW	Left Front Window Up
DR __UNLK	All Doors Unlock Output State
LFPWRLY	Left Front Power Window Status
LFPWAMP	PWR Window Left Front Motor Current
LFPWPK	PWR Window Left Front Peak Amp Motor Current
IGN __KEY	Ignition Key Status
IGN __GEM	Ignition Switch Status
WPPK __PK	Wiper Park-to-Park Time
WPMODE	Wiper Control Mode Select
WPPRKSW	Windshield Wiper Status
SBLTLMP	Washer Fluid/Seat Belt Lamp
WPHISP	Wiper Two Speed Relay
WPRUN	Wiper Motor Run Relay
WASHRLY	Washer Pump Relay Circuit
DRAJA __L	Door Ajar Warning Lamp Circuit
BATSAV	Battery Saver Relay Circuit
INTLMP	Illuminated Entry Relay Circuit
ACCDLY	Accessory Delay Relay Circuit
ILLE __SW	Illuminated Entry Input Switch
DR __DSRM	Door Unlock Disarm Input Switch
VBATGEM	Battery Voltage
4WDCLCH	4WD Clutch PWM Output Status

Using Rotunda New Generation STAR (NGS) Tester

The Rotunda New Generation STAR (NGS) tester is a menu-driven device that allows specific diagnostic testing and DTC retrieval.

Interface

The NGS tester communicates to the GEM through the data link connector. The connector is located in the passenger compartment on the driver's side under the steering column.

Retrieving Diagnostic Trouble Codes (DTC)

The GEM monitors the system during normal operation and reports concerns in the form of diagnostic trouble codes (DTCs). The DTCs can be retrieved with the NGS tester through the communication link.

Functional Tests

tomsn048@gmail.com

Active Test Modes

In addition to retrieving DTCs, the GEM can also be commanded to turn on lamps, relays or solenoids. This eliminates the need to perform more traditional pinpoint tests and speeds up repair times. The following active mode tests are available.

Front Windshield Wipers

The NGS tester can command the GEM to turn on or to turn off the:

- speed relay
- wiper relay
- washer relay

Warning Lamps and Chimes

The NGS tester can command the GEM to turn on or to turn off the:

- door ajar lamp
- seat belt lamp
- chime

Battery Saver/Illuminated Entry

The NGS tester can command the GEM to turn on or to turn off the:

- battery saver relay
- illuminated entry relay

One-Touch Window/Accessory Delay

The NGS Tester can command the GEM to turn on or to turn off the:

- driver side window relay
- accessory delay relay

Wiggle Test

Wiggle tests are not functional on the Ranger.

tomsn048@gmail.com

tomsn048@gmail.com

On-Demand Self-Test (CTM)

Interface

The CTM diagnostic mode is entered by grounding the dedicated diagnostic mode input. This one-pin connector is located under the instrument panel.

The diagnostic mode is exited (returned to normal operation) immediately upon removal of the ground on the diagnostic mode input.

Retrieving Diagnostic Trouble Codes (DTC)

The diagnostic mode is made up of the three following separate steps:

1. Tone and door ajar lamp test
2. Trouble code test
3. Input test

   Step 1 is run immediately upon entry into the diagnostic mode.

   Step 2 is run without the key in the ignition.

   Step 3 is run with the key in the ignition.

   The operator may switch between Steps 2 and 3 indefinitely until the diagnostic mode input is ungrounded.

Step 1 — Tone and Door Ajar Lamp Test

When the diagnostic mode is first entered, the CTM will generate a tone and light the door ajar lamp for three seconds. If the key is in the RUN or ACCY position, use the following table to diagnose problems entering the diagnostic mode.

Door Ajar Lamp	Tone	Meaning
Lights	Sounds	Door Ajar Lamp and Chime are Functioning Correctly.
Doesn't Light	Sounds	One of the Following Problems May Exist: • Door Ajar Lamp Is Burned Out. • Door Ajar Lamp Connection Is Faulty. • Door Ajar Lamp Output on CTM Is Bad, Use the Trouble Code Output Mode to Diagnose.

tomsn048@gmail.com

Lights	Does Not Sound	Chime Circuitry is Faulty.
Doesn't Light	Does Not Sound	Connection to the Diagnostic Input Is Probably Faulty. Check Connections and Try Again.

After the three-second test, the CTM will pause for one-second and then proceed to either Step 2 or Step 3 depending on whether the key is in the ignition.

The diagnostic mode is used to test the central timer module (CTM) and associated connections while the CTM is in the vehicle. While in this mode, the technician can retrieve and clear the internally stored trouble codes and also individually test each of the CTM inputs. The normal CTM functions are disabled while in the diagnostic mode. The wiper functions are also disabled while in the diagnostic mode. The wiper motor output is operated by the washer switch input during the input test to allow testing of the wiper motor status switch input.

Step 2 — Trouble Code Output

When the CTM is in the normal mode of operation, it is continually monitoring itself. When a fault occurs it is recorded. The trouble code output mode shows these codes, if any, to the technician by flashing the door ajar lamp and simultaneously sounding the chime in a certain order. These codes may then be used to help diagnose potential intermittent failures.

Step 3 — Input Test

The input test allows an operator to individually test the CTM inputs. It is entered when the operator puts the key in the ignition. The inputs may be cycled in any order. As an input is toggled on or off, the door ajar lamp and tone outputs will be activated for one second for confirmation. At any time, if the key is removed from the ignition assembly, the trouble code output will be re-entered.

Viewing Trouble Codes

Trouble codes are output to the operator through flashing of the door ajar lamp and sounding of the chime. Each code is represented by a two-digit number. The high digit is output first followed by a one second pause followed by the second digit. Each two-digit code is separated by a three-second pause. Each digit is also made up of one to nine one-second lamp flashes.

Erasing Trouble Codes

Trouble codes are erased when either:

1. The ignition has been moved to the start position at any time during the diagnostic mode or
2. **NOTE: The following chart lists all the trouble codes generated by the CTM.**

   Power is removed from the CTM.

---

tomsn048@gmail.com

tomsn048@gmail.com

Central Timer Module (CTM) Trouble Code Table

Code	Description
11	No trouble codes are currently stored.
12	The wiper/washer mode switch was open at least 30 seconds.
13	The wiper delay interval switch was open at least 30 seconds.
14	An internal software failure was detected.
15	An internal hardware failure was detected.
21	The wiper/high low speed relay coil shorted.
22	The wiper/brake run relay coil shorted.
23	The battery saver relay coil shorted.
24	The courtesy lamp relay coil shorted.
31	The washer pump relay coil shorted.
32	The safety belt lamp relay coil shorted.
34	The door ajar relay coil shorted.

NOTE: The entire set of stored trouble codes will be repeated indefinitely until either the input test mode is entered or the ground is removed from the diagnostic input. This table shows all of the possible trouble codes.

tomsn048@gmail.com

Generic Electronic Control Module (GEM), Central Timer Module (CTM)

Removal and Installation

1. **NOTE: The automatic ride control switch must be turned to the OFF position when the vehicle is hoisted, jacked, towed, jump-started or raised off the ground to avoid unnecessary operation of the system and/or possible damage to its components.**

   Disconnect battery ground cable (14301).

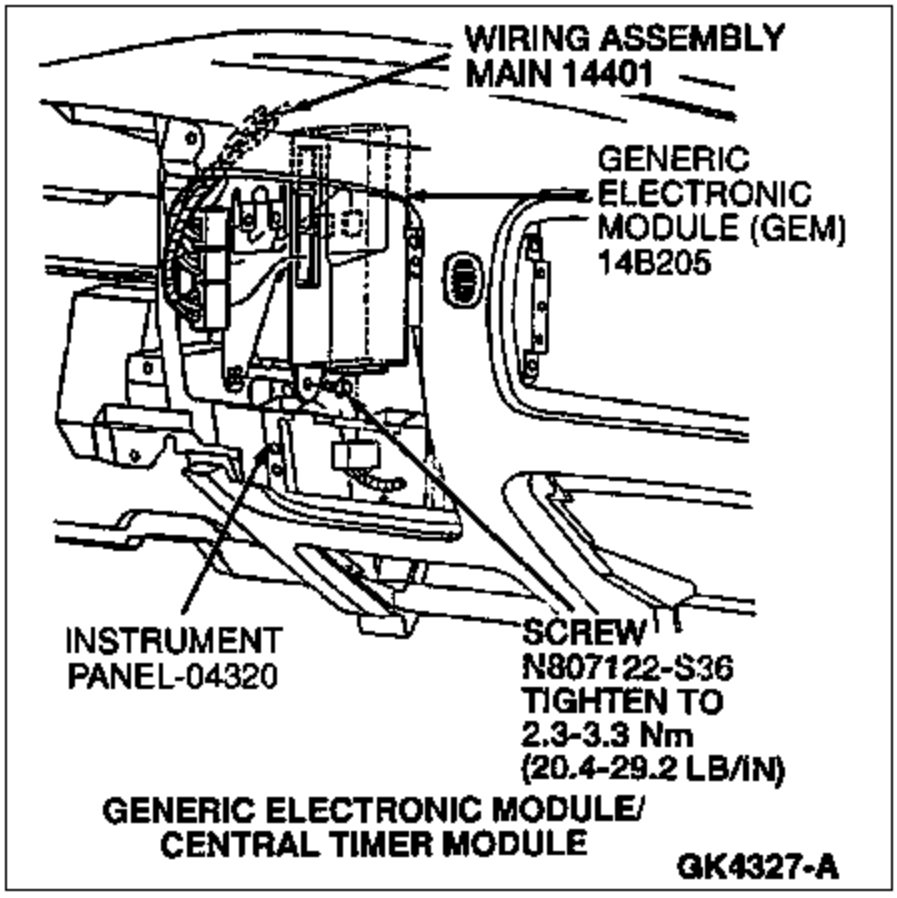
2. Remove radio; refer to Section 15-00 .

3. Remove radio bezel.

4. Remove retaining screw.

5. Slide GEM/CTM toward front of vehicle, off retaining tabs.

6. Disconnect electrical connectors.



tomsn048@gmail.com

NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

For installation, follow removal procedures in reverse order. Tighten retaining screw to 2.3-3.3 Nm (20.4-29.2 lb-in).

tomsn048@gmail.com

SPECIFICATIONS

Remote Control Alarm and Lock System

The Remote Alarm and Lock system combines the functions of the Electronic Door Lock Control system and the Vehicle Anti-Theft system into a single module called the receiver assembly. In the New Generation Star (NGS) Tester, the system and module are called RAP which stands for Remote Anti-Theft Personality.

As a remote entry receiver assembly, the module performs the following functions:

Remote Entry (Key Fob)

- Unlock driver's door
- Unlock all doors
- Lock all doors
- Panic alarm
- Issue interior lamps ON (when unlocking) and OFF commands (when locking) to the Generic Electronic Module (GEM)
- Horn chirp verify when fob LOCK pressed twice
- Double horn chirp notify when door left open
- Deactivate a triggered perimeter alarm
- Arm/Disarm Anti-Theft system
- Allow up to four transmitters to be programmed

Anti-Theft

- Perimeter sensing — doors, hood
- Ignition keylock cylinder sensing
- Starter interrupt
- LED flashing when system is armed
- Alarm (horn and lights)

Inputs and Outputs

The receiver assembly processes inputs from the following:

- (1) Remote Entry Transmitter (key fob)
- Door disarm switches (driver and passenger key cylinders)
- Ignition keylock cylinder sensor
- Hood switch
- Door ajar output from GEM module
- Door lock switches (driver and passenger)
- Door unlock switches (driver and passenger)

The system distributes output to the following:

tomsn048@gmail.com

- Driver door unlock relay
- All door unlock relay
- Lock all door relay
- Horn relay
- Parklamp relay
- Anti-theft (starter interrupt) relay
- Illuminated Entry request output to GEM module
- THEFT LED (not lamp) in Instrument Cluster

This section covers service procedures directly related to the receiver assembly. For service and diagnostic procedures related to the anti-theft subsystem, refer to Section 13-11 . For the electronic doors subsystem, refer to Section 01-14B .

Inspection and Verification

The receiver assembly communicates on the New Generation Star (NGS) Tester diagnostics interface. Diagnostic testing is controlled by turning on outputs, reading inputs, retrieving DTCs, clearing DTCs, direct memory reference and initiating functional tests. Some of the tester's specific capabilities are listed below.

- Self Test and Fault Code reporting on inputs
- Recall last eight alarm trigger events (PIDs)
- Activate all outputs
- Monitor all inputs
- Transmitter TIC/Data Menu
    - Identifies all TICs (Transmitter Identification Codes) programmed to the system
    - Identifies last TIC and button press received

The on-demand self test consists of a module self test and a receiver assembly subsystem input/output self test. Continuous DTCs are not affected when running an on-demand self test.

NOTE: Do not press any buttons or switches during the on-demand self test.

The receiver assembly is well equipped to identify bad inputs, but can do little to diagnose bad outputs. The individual testing the system must look for certain outputs to operate during the 10-second self test. The self test should be used for a quick overview of the system to determine if certain subsystems are operating correctly.

The tester PID/DATA menu and the ACTIVE COMMANDS have a full set of tests for alarm and lock systems. Depending upon the option content of a vehicle, certain inputs or outputs may not respond because they are not installed at the time of vehicle manufacture.

Follow the procedure outlined in Pinpoint Test A: NGS System Diagnostics and On-Line Self Test to start the 10-second receiver assembly self test.

Using Rotunda New Generation Star (NGS) Tester

Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent is a menu-driven device that allows self test diagnostics and DTC retrieval.

Interface

The NGS Tester communicates to the receiver assembly through the On-Board Diagnostic (OBD-II) data link connector. The connector is located in the passenger compartment on the driver's side under the steering column.

Parameter Identification (PID) Codes

Not all parameter identification (PID) codes displayed on the NGS Tester are functional on Ranger. Following is a list of the applicable PID codes and a description of each code.

tomsn048@gmail.com

PARAMETER IDENTIFICATION (PID) CODES

PID	PID Description
IGN RES	Ignition Tamper Sensor Resistance
IGN RAP	Ignition Switch Input
DOORRAP	Door Ajar — from GEM
DD LOCK	Door Lock Switches
DR DARM	Door Disarm Switches (Key Unlock)
HOOD SW	Hood Switch Input
NOTHEFT	No Theft Jumper
NOREMOT	No Remote Jumper
LATCHIO	Latch Input/Output (Loose Wiring)
AL EVT1	Alarm Trigger Event — Most Recent
AL EVT2	Occurred Just Before AL EVT1
AL EVT3	Occurred Just Before AL EVT2
AL EVT4	Occurred Just Before AL EVT3
AL EVT5	Occurred Just Before AL EVT4
AL EVT6	Occurred Just Before AL EVT5
AL EVT7	Occurred Just Before AL EVT6
AL EVT8	Occurred Just Before AL EVT7

tomsn048@gmail.com

Symptom Chart — Diagnostic Trouble Codes (DTC's) Remote Control Alarm And Lock System

DIAGNOSTIC TROUBLE CODES (DTC'S) REMOTE CONTROL ALARM AND LOCK SYSTEM

Condition	Possible Source	Action
• NGS Tester Does Not Establish Communications with System Receiver Assembly	• Battery feed to receiver assembly.	• GO to Pinpoint Test A , Test Step 4.
• B1309 Pwr. Door Lock — Short to GND	• Wiring short in door harness.	• GO to Section 01-14B .
• B1341 Pwr. Door Unlock — Short to GND	• Wiring short in door harness.	• GO to Section 01-14B .
• B1522 Hood Switch — Short to GND	• Hood switch circuit shorted.	• GO to Section 13-11 .
• B1562 Door Lock Cyl. — Short to GND	• Wiring short in door harness. • Wiring short in door cylinder switch.	• GO to Section 13-11 .
• B1845 Ignition Tamper — Ckt. Failure	• Missing ignition tamper sensor. • Damaged ignition tamper sensor. • Wiring short/open in sensor circuit.	• GO to Section 13-11 .

tomsn048@gmail.com

Pinpoint Tests

NOTE: Use Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent to perform this pinpoint test.

PINPOINT TEST A: NGS SYSTEM DIAGNOSTICS AND ON-LINE SELF TEST

A1 NGS SYSTEM SELF-TEST

- Close hood.
- Doors do not have to be closed. NGS Tester does not monitor door ajar switch states during RAP self test.
- Select RAP, Diagnostic Test Modes, On-Demand Self-Test.
- Perform self test.
- Monitor vehicle for the following outputs:
  - One horn chirp
  - One park lamp flash
  - THEFT LED in instrument cluster lit for 5 seconds.
  - Anti-Theft relay clicking on and off for 5 seconds.

Did module perform self test?

Yes	No
GO to **A2** .	NGS Tester indicates module not responding. GO to **A4** .

A2 DIAGNOSTIC TEST CODES (DTC'S)

Did NGS Tester respond that system had passed?

Yes	No
GO to **A3** .	GO to Symptom Chart.

A3 SELF TEST RESULTS

Did system pass self test?

Yes	No
NGS Tester indicates system is operating	

tomsn048@gmail.com

properly. If necessary, REFER to symptom charts in Section 01-14B or 13-11.	GO to Self Test Diagnostic Chart.

A4 DIAGNOSTIC COMMUNICATION RESTART

- Review NGS Tester troubleshooting comments.
- Turn ignition to RUN or ACCY. (Turning ignition OFF with communication established in one of the NGS Tester sub-menus may or may not cause the string of communications with the receiver assembly to stop.)
- Retry attempt to communicate with receiver assembly.

Does receiver assembly respond to the NGS Tester now?

Yes	No
GO to **A1** or RETURN to other pinpoint test where communication was disrupted.	GO to **A5** .

A5 RECEIVER ASSEMBLY POWER AND GROUND

- Disconnect the receiver assembly.
- Measure for battery voltage at the receiver assembly connector Pin C2 Circuit 645 (W/LB).
- With the key in the RUN position, measure for RUN/ACCY voltage at the receiver assembly connector Pin C1 , Circuit 1002 (BK/PK).
- Measure the resistance between known grounding point and connector Pin C2 , Circuit 570 (BK/W).

Are the voltages >9V and the resistance <100 ohms?

Yes	No
GO to **A6** .	CHECK and REPLACE a blown fuse or SERVICE the appropriate circuit for an open or short.

A6 DIAGNOSTIC COMMUNICATION SERIAL LINK

- Unplug all electronic control modules attached to diagnostic input, Circuit 70 (LB/W) and disconnect the NGS Tester.
- Confirm that there is no short to ground or open between the OBD-II connector Pin 7 and the receiver assembly Pin C1.

Is Circuit 70 (LB/W) OK?

Yes	No
GO to **A7** .	REPAIR Circuit 70 (LB/W).

tomsn048@gmail.com

A7 DIAGNOSTIC COMMUNICATION TROUBLESHOOTING

- Reconnect NGS Tester and receiver assembly only.
- Retry attempt to communicate with receiver assembly.

Does system respond to the NGS Tester now?

Yes	No
DETERMINE and REPLACE the other module that disturbs communication when connected to Circuit 70.	GO to Section 18-00 .

Self Test Diagnostic Chart

SELF TEST DIAGNOSTIC CHART

Output	Action
One Horn Chirp	GO to Section 13-11 .
One Park Lamp Flash	GO to Section 13-11 .
THEFT LED in Instrument Cluster Lit for 5 Seconds	GO to Section 13-11 .
Anti-Theft Relay Clicking On and Off for 5 Seconds	GO to Section 13-11 .
NGS Tester Responds That System Passed	GO to Section 13-11 .

Loose Wiring Connection Diagnosis with NGS Tester

To confirm a break in the wiring or a poor connection between a blade and terminal at a connector, use Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent to test receiver assembly circuit inputs. Follow these steps:

1. Turn ignition switch to ON position.
2. Connect the NGS Tester.
3. Select the vehicle type, Data Link, RAP, ACTIVE COMMANDS
4. Select PID LATCH
5. Select PIDS
6. Select the input(s) to be monitored, LATCHIO and then START.
7. Press or activate the switch on the circuit in question and keep it in its active state.

   LATCHIO is the latch input/output PID. At this point it counts the number of times that any input or output changes state. All other inputs will lock on the first change in state that is seen while on this PID LATCH screen.
8. Wiggle the wire at the point where connection is questionable.

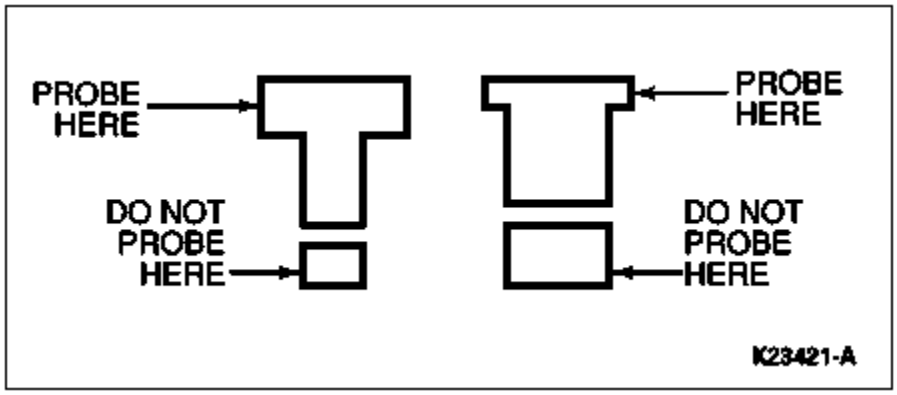
tomsn048@gmail.com

The LATCHIO PID keeps count of all state changes (even after the specific input looks on the first change in value). If there is a loose connection, the LATCHIO number increase quickly as the wire is wiggled.

Probing the Receiver Assembly Harness Hardshells

Probe the RAP module harness hardshells through the larger "T" shaped holes. Each "T" shaped hole exposes the same terminal as the smaller slotted hole where the blade enters the hardshell.

Wiring Connector Probe Points



NOTE: Forcing large probes, paper clips, etc. into the smaller slots will distort the terminal and create an intermittent connection between the blade and the terminal.

tomsn048@gmail.com

RAP Module

Removal and Installation

1. Remove interior trim panel at the middle of the driver's "B" pillar. Refer to Section 01-05A .
2. Remove the two retaining screws for the bracket.
3. Remove the bracket from the module by lifting on the module plastic tabs which lock into holes on the bracket fingers.
4. **NOTE: If the module is to be reinstalled, disconnect the smaller 22-pin connector. If the larger 26-pin connector is disconnected first, the module will register an ignition tamper and will trigger the alarm when the wiring is reconnected.**

   Disconnect two connectors and the antenna plug.
5. To install, reverse removal procedure.
